<b>horticult.</b> , horticultural.	<b>trib.</b> , tributary.
<b>h.p.</b> , horse-power.	<b>univ.</b> , university.
<b>hr.</b> , hour.	<b>urb.</b> , urban.
<b>i.e.</b> , that is.	<b>vil.</b> , village.
<b>in.</b> , inch(es).	<b>vol.</b> , volume
<b>inhab.</b> , inhabitant(s).	<b>W.</b> , west ; western
	<b>Wm.</b> , William
	<b>yd.</b> , yard.

The article ABBREVIATIONS contains a list of those in general use.  
See also ABBREVIATION (music) and ELEMENTS (chemical symbols).

**Hase, Karl August von** (1800-90), Ger. theologian, b. at Steinbach in Saxony. In 1829 he was appointed prof. of philosophy at the Univ. of Leipzig, and prof. of theology at Jena in 1830. His best known works are *Die Leipziger Disputation* (1827) *Leben Jesu* (1829, Eng. trans. 1881), in which he anticipated the arguments put forward by Strauss; *Theologische Streit-schriften* (1834-37), *Die Tübinger Schule* (1856), *Hutterus Redivivus* (1883), *Lehrbuch der Kirchengeschichte* (1886, Eng. trans. 1895), *Die Beiden Erzbischöfe* (1839) and an ed. of *Libri Symbolici Ecclesiae Evangelicae*. See life by R. Buerkner 1900.

**Hasek, Jaroslav** (1883-1923), Czech writer, b. at Prague, author of *The Adventures of the Excellent Soldier Schwejk during the World War* (1921). See further under CZECHOSLOVAKIA—Literature.

**Hasselrigg, Sir Arthur** (also *Hesselrigg, Hazelrigg*), one of the five members whom Charles I. ordered to be arrested for high treason on Jan. 3, 1612. The others were Pym, Hampden, Hollis, and Strode. The Commons refused to give them up.

**Hashish, or Hashheesh**, Arabic name, meaning literally 'dried herb', for the various preparations obtained from the flowering tops of the Indian hemp plant (*Cannabis indica*). It is used as an intoxicant in sev. E. countries (called 'bhang' in India), and is either smoked, chewed, or drunk. It is valuable as a narcotic, and is sometimes employed in medicine as an anodyne. The Eng. word 'hashish' is probably derived from the Arabic 'hashshin', i.e. hemp-eaters, who committed great excesses when under the influence of hashish. See HEMP.

**Haskerland**, com. in the prov. of Friesland in the Netherlands. Pop. about 8000.

**Haslemere**, mkt. tn. and par. of England in the co. of Surrey in the Guildford div., 10 m. from Farnham, and 8 m. from Godalming. Near by is Aldworth House, Tennyson's last home. The tn. is situated in very picturesque surroundings, and is a favourite residential place. There is a Royal School for Naval and Marine Officers' daughters at H. Hind head Common with its celebrated Devil's Punch Bowl is quite near. Pop. 13,300.

**Haslingden**, mkt. tn. and municipal bor. of England in the co. of Lancashire. It is in the diocese of Manchester, and has two railway stations, Haslingden and Helmshore. It has a church dating from the thirteenth century. It manufs. cottons, silks, woollens. There are coal-mines in the vicinity. Pop. 15,700.

**Haemoneans**, see AMONEANS and MACYABRES.

**Haage**, tn. in Germany, prov. of Westphalia, noted as the seat of an important iron and steel industry, and manufs. scythes, etc. Pop. 25,000.

**Hassall, Arthur** (1833-1931), Eng. historian, b. at Bebbington, Cheshire; second son of Henry Burton H. Educated at Uppingham and Oxford. In 1880 he became a lecturer and tutor in hist. at Keble College, and in 1883 at Christ Church. His works include: *Life of Rottingbroke* (Statesmen Series, 1889), *Louis XIV.* (Heroes of the Nations, 1895), *The Making of the British Empire* (1896), *A Handbook of European History* (1897), *The Balance of Power* (1896, 1898, in the Periods of European History Series, of which he was editor), *A Class Book of English History* (1901), *History of France* (1901), *The French People* (1901), *Mazarin*, (Foreign Statesmen Series 1903), *History of France* (Temple Primers, 1903), *The Tudor Dynasty* (1904), *A Brief Survey of European History* (1906), *The Expansion of Great Britain* (1907), *Castlereagh* (1908), *The Great Rebellion* (1909), *Modern Europe* (1910), *The Great Napoleon* (1911), *History of British Foreign Policy* (1912), *France, Medieval and Modern* (1918), *A British History chronologically arranged from 55 B.C.* (1919).

**Hassan**, dist. of Mysore state, India. The chief tn. is H. in the centre of the dist. H. is bounded on the S. partly by the state of Coorg, and on the S.W. by the Madras dist. of S. Kanara. Its area is 2547 sq. m. The dist. is divided into two portions, the Malnad, or hill-country, including some of the highest ranges of the W. Ghats, and the Maldan, or plain country, in the direction of Mysore to the S. Staple cultivation, dry and wet crops. Pop. 600,000.

**Hassan and Hussein**, sons of Ali and Mohammed's daughter Fatima:

**Hassan** (623-69) succeeded his father as Caliph at Kufa in 660, but in a few months retired in favour of his rival Mouweeyah, and went to live at Medina, where he attained a great reputation for piety. He is said to have been poisoned by one of his wives.

**Hussein, or Hosein** (629-80), succeeded his brother Hassan as Imam of the Shiites, and claimed the caliphate also. In attempting to depose Mouweeyah, he was killed by the latter's troops at Kerbela. The two brothers are held in the greatest veneration by the Shiites, who hold an ann. festival in their honour, at which their deaths are dramatically represented. See G. Weil, *Geschichte der Chalifen*, 1815; Sir L. Pelly, *The Miracle-Play of Hasan and Hosein*, 1879; and M. Arnold 'A Persian Passion-Play' in *Essays in Criticism*, 1882.

**Hasselt** (*Hasselholt*, hazel grove), chief tn. of the prov. of Limbourg in Belgium. It is 16 m. from Maastricht by rail. It has manufs. of linen fabrics, tobacco, and gin-distilleries. Chicory is largely cultivated in the surrounding dist. The

Belgians were defeated here by the Dutch in 1831. Pop. 29,200.

**Hassler** (or **Häslar**), **Hans Leo** (1564-1612), Ger. composer, b. at Nuremberg, the most famous member of a distinguished musical family. He began his career as an organist, his father being his teacher; he studied in Venice under **Andrea Gabrieli**, composer of choir and organ music. With **Michael Praetorius** (real name **Schulz**; 1571-1621) a composer, and author of a valuable compendium of the musical knowledge of the time entitled *Syntagma musicum* (3 vols., 1615-19), he is regarded as a master in the period of Ger. renaissance. His chief works are church music and songs. He wrote the familiar Passion chorale, *O Haupt voll Blut und Wunden*, and a number of well-known chorale melodies in the motet form. Most of his organ pieces, motets and madrigals, which are important in the hist. of Ger. music, have been republished in modern times.

**Hastinapur**, ruined city of India, in the **Meerut** dist., United Provs., on banks of former bed of Ganges. At one time it was the cap. of the **Pandava** kingdom.

**Hastings**, **Francis Rawdon** (1754-1826), first **Marquis** (1817), a Brit. soldier and administrator, b. in Co. Down, Ireland, the son of Sir **John Rawdon** of **Moira**: later **Earl of Moira**: educated at **Harrow** and **Oxford**, and entered the army. From 1775-82 he was on service in the Amer. war, fighting at **Bunkers Hill**, **Brooklyn**, **White Plains**, **Camden**, **Charleston**, etc., and was created a peer, as **Baron Rawdon**, on his return in 1783. In 1794 he fought against the Fr. in **Flanders**; was appointed commander-in-chief in **Scotland**, 1803; became master-general of the ordnance, 1806; and governor-general of **India** in 1813. The chief events of his administration were the wars against **Nepal** (1814-16) and the **Mahrattas** and **Pindaris** (1817-18). He retired in 1823, and was appointed governor of **Malta** in 1824.

**Hastings**, **Sir Patrick Gardiner** (b. 1881), Eng. lawyer. Elected **Labour M.P.** for **Wallsend**, 1922, and again in 1924, when he became **Attorney-general** for the first **Labour** gov. in **England**. Publications: (plays), *The River* (1925), *Scotch Mist* (1926), and *Eacort* (1942), and *The Autobiography of Patrick Hastings* (1948).

**Hastings**, **Selina**, see **HUNTINGDON**, **SELINA**, **COUNTRESS OF**.

**Hastings**, **Warren** (1732-1818), first governor-general of **India**, went out in 1750 to **Calcutta**, where the influence of his uncle had secured for him a cadetship in the **E. India Company's** service. He rose rapidly, and became a person of such considerable importance that eleven years after his arrival in the country he, having already filled other posts with credit, was appointed a member of the **Calcutta** council. In 1764 he returned to **England**. Unlike most of his colleagues, he had made no attempt to amass a private income, and had nothing but his savings to live upon, and these were so inconsiderable that they were already ex-

hausted when, in 1769, he accepted the **Company's** offer to go out to **Madras** as second in council. Two years later he was promoted to the governorship of **Bengal**. He now fulfilled the hopes of the directors at home, and proved himself a wise and far-seeing administrator. He instituted reforms, both in the gov. of the prov. and in the law courts, that were taken as models by his successors. He upheld treaty rights and removed abuses, but was vigorously opposed by some members of his council, his most bitter opponent being (Sir) **Philip Francis**, whom in 1780 he wounded in a duel. In 1785,

WARREN HASTINGS

having done magnificent work, he resigned his office and returned to **England**. At once an agitation was set on foot by **Francis** and others, who enlisted the support of **Burke**, and he was impeached in 1783 for corruption and cruelty. The trial dragged on for seven years, when he was acquitted on all counts. His expenses in connection with it amounted to £70,000, his entire fortune. Thereupon the **E. India Company**, very rightly, but to the great indignation of **Burke**, granted him a handsome pension, which enabled him to fulfil his long-cherished dream of repurchasing the family estate of **Daylesford**. In later days, largely owing to the kindly influence of the **Prince Regent** (afterwards **George IV.**), he was reinstated in popular opinion, though his impeachment was never officially reversed. **Mill**, the historian of **India**, declared that 'few men would be found whose character would present a higher claim to indulgence than his,' and this view is now generally accepted. There are biographies by **G. E. Gleig**, 1841, and by **L. J. Trotter**, 1874. See **E. Gilliat**, *Heroes of Modern India*, 1911; **M. E. Monckton-Jones**, *Warren Hastings in Bengal*, 1918;

H. Dodwell, *Letters to Sir John Macpherson*, 1921; P. Moon, *Warren Hastings and British India*, 1948.

Hastings, watering place, parl., municipal, and co. bor. in Sussex, England, 33 m. E. of Brighton and 62 m. S.S.E. of London by rail. On the S. it is open to the Eng. Channel, but elsewhere surrounded by high cliffs. It has an old and new tn., the former—described as the 'new burgh' in the Domesday Book—between the E. and W. Hills, being chiefly inhabited by fishermen. A fine promenade runs for 3 m. along the sea front to St. Leonards-on-Sea, which is within the bor. Apart from catering for visitors, fishing is the chief industry, and there is a fish mkt. Being sheltered by the hills inland from easterly and northerly winds, H. is a well-known resort for those suffering from pulmonary complaints, in the winter and spring. The climate is dry, mild, and salubrious. There are sev. public gardens, the chief of which is the extensive Alexandra Park and the tn. has 410 ac. of public open spaces. Among the centres of entertainment and recreation are the White Rock Pavilion, the White Rock Gardens, and the bathing pool. Some 6 m. from H. is the great Abbey, St. Martin's of Battle, which Wm. I., to commemorate his victory at the 'Battle of Hastings,' built on Senlac Hill, the actual site of the battle. 14 m. from H. is Bodiam Castle, a splendid example of a medieval fortress, with round towers, gateway and moat. It was presented to the nation by the Marquess Curzon in 1925. 10 m. from H. is Pevensey Castle containing three fortresses—the coast guard fortress of Anderida, a stone keep built by Robert of Mortain and a fort round the keep built in the thirteenth century. It derives its name from Hæst (or Hæsten), the intrepid Dane who 150 years ago founded the *new* or settlement which, as Hastings, rose to eminence as a port during Saxon times and, in the reign of Athelstan, boasted not only a busy harbour but a Mint. It was the chief of the five ports which were amalgamated by Edward the Confessor into the Confederation of the Cinque Ports. In the Norman period it was the chosen port of embarkation and return for the Norman court when the monarchs visited their continental domains. The great castle founded by Wm. the Conqueror, the ruins of which dominate the tn. to-day, was the scene of many royal ceremonies. After John lost Normandy in 1204 H. declined rapidly. The harbour was gradually silted up by the 'eastward drift' of the sea—a process coincident with the building of bigger and yet bigger ships drawing more water. By the fourteenth century H. was little more than a fishing vil., and its decline was accelerated in the same century through being four times sacked by marauding Fr. In its heyday H. contributed twenty ships fully manned to the Cinque Ports navy. In 1400 its contribution was only three. There was a brief revival of former glory in the days of Elizabeth when, in 1588, H. again furnished its full

complement of twenty ships to help fight the Armada. As a reward the queen gave the tn. its Charter and the Bailiff of H. was given the title of mayor. Attempts to reconstruct the harbour, however, failed, and H. soon sank again into obscurity. Its next appearance in the pages of hist. was during the eighteenth century—as a notorious centre for smuggling. During the latter half of the eighteenth century, the tn.'s present reputation as a watering place was founded—a development more or less concurrent with that of Brighton. A Dr. Bailey, supported by John Collier, mayor of Hastings, publicised the air of the tn. as especially favourable for pulmonary sufferers. The H. of the sixteenth and seventeenth centuries was practically confined to what is to-day called the 'Old Town' but during the last years of the eighteenth century and the early years of the nineteenth the tn. rapidly extended beyond the W. Hill, and such fashionable suburbs as George Street, Pelham Place, etc., came into being. In 1827 Decimus Burton, the architect, founded St. Leonards to the W. of the tn., soon, under royal patronage, to become the most fashionable resort in the country. St. Leonards and H. gradually developed into the composite whole which is now the co. bor. of H. with a resident pop. of 65,000.

H. and St. Leonards declined somewhat during the 'nineties and the first decade of the present century owing to lack of enterprise; but between the two World Wars, over £1,000,000 was spent in improving the attractions and amenities of the tn. Then came the Second World War and H. from 1940 onwards found itself in the front line. It suffered 87 raids: 550 H.E. bombs and 15 V-1 rockets burst in the bor. The old parish church of St. Leonard's was completely destroyed, and the Church-in-the-Wood, associated with Charles Lamb, was damaged. Nearly 16,000 properties were destroyed or damaged—more than two-thirds of the bor.'s total. The pop. at its lowest ebb, fell to 15,000. The whole front was, however, transformed into a tremendously strong defence line. In 1944, evacuees returned in fairly large numbers, and in 1945 the pop. had reached 44,000. Between May 1945 and May 1948, 21,000 people were re-housed and the pop. practically re-established at its pre-war level.

**Hastings:** (1) Bor. of New Zealand, N. Island, in Hawkes Bay co., 11 m. S.S.W. of Napier. Its industries are of an agric. nature and there is a canning factory, the largest in New Zealand. Pop. 22,000. (2) City of Nebraska, U.S.A., in Adams co. It has an altitude of 1917 ft., and is 130 m. W.S.W. of Omaha. It is served by four railways and is a shipping centre for grain and live stock. It is the seat of Hastings College and a Catholic Academy. Pop. 15,100. (3) City in Michigan, U.S.A., cap. of Barry co., on Michigan Central, and the Chicago, Kalamazoo, and Saginaw railways. Pop. 5000.

**Hastings, Battle of**, the usual name given to the great battle at Senlac, near

**Hastings**, where Wm, duke of Normandy, defeated the Eng. under Harold in 1066. The battle took place on a hill, to which a later chronicler gave the name of Senlac, about 6 m. from Hastings. On its summit was firmly posted Harold's force—the Normans being ranged in three divs., the centre one of which was commanded by the duke himself. The Normans were repeatedly driven back by the Eng., but at length, by a feigned flight, the latter were drawn from their stockade, and routed.

**Hastings Beds or Sands**, part of the Lower Cretaceous series and a lower div. of the Wealden beds. They vary in thickness from 500 to 1000 ft., and consist mainly of sand and sand-stone with subordinate layers of clay. They have been deposited in shallow fresh water and fine specimens of ripple marks are often to be seen in the sand. The strata, which differ only slightly from those of the overlying Weald clay, are highly fossiliferous and contain numerous saurian reptiles and the remains of sea chelonians, besides the remarkable *Ichthyosaurus* and other fish belonging to the ganoid or placoid orders.

**Haswell**, tn. in the co. of Durham, England, 6 m. E. of Durham. Pop. 6000.

**Hat**, covering for the head like all articles of apparel, has a hist., and its very interest is to trace its gradual

evolution from earliest times in the simple close-fitting cap to the many elaborate structures supplied by the demands of a twentieth century civilisation. The word *hat* comes from the A. S. *hæt*, and Ger. *Hut*, hat. The A. S. *hæt* consisted of a woollen cap, and was worn by the higher class of the A. S. But centuries before this time caps or coverings for the head were worn amongst the Oriental nations, when they had a certain religious significance, as in the case of the 'pilos' worn by the Jewish levitical priest. It is conjectured that the oldest head covering was the circular close-fitting cap, either plain or braided, which was worn by captives from Palestine in Assyria, and which also appeared on the heads of various duties among the heathen tribes. There were two kinds of headcovering worn by the Greeks in early times, the 'pilos' and the 'petasus'. The pilos had no brim, whilst the petasus was made of felt, and had a wide brim to protect the wearer from the rays of the sun. The Eng. felt *H* may be said to be the direct descendant of the Grk. petasus, but did not come into vogue in England till the year 1510. At the time of the Norman conquest the Phrygian cap flat bonnet, and brimmed *H* were worn. With the advance of centuries new fashions crept in, adopted from intercourse with other nations. This is especially noticeable in

Tudor times, where we meet with wide Hs. crowned with plumes and feathers, and with low-crowned caps with upturned brims. Beaver felts in many shapes came into vogue in Queen Elizabeth's reign, and were the common form of head covering for three centuries. That the H. has played its part in the making of hist. is evident from the fact that in the Civil war in Charles I.'s reign, the distinguishing feature of the Roundheads or Puritans was the high-steepled H. of plain felt, whilst the Cavaliers' head-covering was adorned with feathers. A century later the three-cornered cocked H. became the prevailing fashion, owing, no doubt, to the necessity of looping up the extravagant width of the brim. At one time felt Hs. were manufd. exclusively of beaver-fur, but the scarcity of this animal made it necessary to use other materials such as fur, a mixture of fur and wool or wool only. The fur or hair of rabbits, beaver, musk-rat, and camel was used for the finer Hs., whilst sheep's wool was used for the inferior felted Hs. The cheapest kinds of felt were also made with wool mixed with cotton and other vegetable fibres; in this case they were not really felted, but cemented by varnish which helped to hold together the fibres and to stiffen the H. body. The manuf. of the silk H., a stiff body with a covering of a plush of silk, almost universally worn by men of the upper and middle classes during the Victorian and Edwardian eras, began early in the nineteenth century in England. It was invented in Florence about 1760, but the fashion was not accepted till half-a-century later. Its manuf. was not introduced into France till about 1825 and its development has taken place entirely since that date. Now, after a century-and-a-half, the silk tite, or top-hat, has gradually gone out of use except for ceremonial occasions. In the days before the Second World War grey top-hats were worn at Ascot and at other fashionable events. The folding, or collapsible opera-hat, made of dull material, was used with evening dress for theatre-going etc. in the early days of the century. Before the late war the blocked black felt homburg hat, known as the 'Anthony Eden' was worn with evening dress by younger men; and also very considerably by day as well, with tin. clothes. For golf and walking rather large tweed caps, often with check pattern, were affected in the thirties (a fashion sponsored by the duke of Windsor, as was the wearing of the small Basque beret). Berets continue to be worn by men for country pursuits, often those made familiar during the war years—the airborne and tank corps berets. The hard felt bowler hat, worn very widely in the early part of the century, has gone almost completely out of fashion and has been superseded by the soft felt hat, or the blocked homburg. The agric. worker or farm labourer continues to wear a cap when working, often of a small, old-fashioned type, although the average young man walking in the country goes hatless.

The shapes and sizes of women's hats

change almost from season to season. For the last few years the tendency has been for hats to be worn well to the back of the head; small round caps, felt bonnet shaped hats, large cartwheel shapes. Trimmings are varied—veiling, ribbon loops and bows, flowers of all descriptions, and now feathers, have been introduced in an attempt to soften the rather severe plain styles which were worn during the 1939-45 war years, if indeed hats were worn at all. During the war years most women, at any rate the younger women, went hatless and instead of buying new hats as they had done in the past went in for elaborate and varied hair styles. It was quite a common and hitherto unusual sight to see smart and hatless women in the West-End of London. Those who wished to have their heads partially covered used to twist scarves round their head to form a sort of bandeau, leaving the crown of the head uncovered, or tied triangular scarves under the chin in peasant fashion: this style persisted and became almost a uniform in many parts of the country, probably because it is practical and tidy in all weathers. The difficulty of buying Hs. and the resulting practice of going hatless resulted in a relaxation in many churches of the custom of admitting women only when their heads were covered. Light weight felts are taking the place of straw hats for summer wear.

**Hatay**, Turkish name for the Sanjak of Alexandretta (q.v.).

**Hatfield**, or **Bishop's Hatfield**, mkt. tn. of Hertfordshire, England, on the Len, 17½ m. from London by rail and 6½ m. W.S.W. of Hertford. Apart from Hatfield House (q.v.), there are the ruins of a palace, once the residence of the bishops of Ely. Pop. 7000.

**Hatfield**, vil. of Yorkshire (W. Riding), England, on the Don, about 7 m. from Doncaster. With the opening of coal-mines the vil. has become a prosperous colliery centre. Hatfield Chase, the dist. around the vil., was once a forest and hunting ground of kings. This forest lay between the rivs. Don, Idle, and Thorne. A great part of it was marsh, and in 1626 it was drained by Dutch engineers.

**Hatfield Forest**, 3 m. E. of Bishop's Stortford, Essex, with 1049 acs. of rolling country and some pine timber. It was part of the Royal Forest of Essex maintained from Tudor times till 1915. It includes an ant. camp at Portinbury Hills, and a lake for boating and fishing.

**Hatfield House**, Hertfordshire residence of the marquess of Salisbury and one of the finest Jacobean houses in England. Stands in a park some 10 m. in circumference. It consists to-day of three wings, a main north wing, with the other two projecting southwards from its E. and W. ends, and the remains of the Old Palace. The Old Palace was built about 1496 by bishop Morton of Ely. The splendid hall which now remains is only a portion of the original building. The palace passed eventually to the Crown and Queen Elizabeth spent much of her childhood there. In James I.'s reign

H. H. was given to Robert Cecil, first earl of Salisbury, in exchange for Theobalds. Two wings of the palace were then pulled down and the materials used for the foundations of the house which was built between 1607 and 1611, with Robert Lynnhage as architect. The features of the house are the lofty marble hall, which contains the original panelling, a finely-carved musicians' gallery, and a number of portraits, including two of Queen Elizabeth. There is a third portrait (by Zuccaro) of the queen, at the foot of the grand staircase, with its gracefully carved newel posts topped with cherubs and heraldic animals. Near the head of these stairs hangs one of the very earliest English sporting paintings—the picture of Queen Elizabeth's white horse and its groom dated 1591. In the long gallery, which runs above the marble dining hall, is a carved oak cupboard containing Elizabeth's genealogical tree, tracing her ancestry back to Adam. In James I.'s drawing-room so called from the statue of him above the fireplace, are family portraits by Romney, Reynolds and others, and a fine Wilkie portrait of the duke of Wellington. All along the S. side of the first-floor runs the panelled Long Gallery; and from the windows is a fine view of the formal garden and maze. See J. S. Brewer, *English Studies*, 1881.

Hathaway, Anne (1556-1623), wife of Wm. Shakespeare. She was probably Agnes, daughter of Richard Hathaway, of Shottery, near Stratford-on-Avon, where the Hathaways' cottage still stands. She was married in 1582, about six months before the birth of her daughter Susannah, May, 1583. Her only other children, Judith and Hamnet (twins), were born 1585. Hamnet died in 1596. Under her husband's will, Anne took only his second-best bedstead.

Hathersage, vil. of Derbyshire, about 34 m. from Manchester and 161 m. from London, on the Midland Region railway. Around the vil. is some of the finest of the Derbyshire scenery. Little John, henchman of Robin Hood, is traditionally supposed to have been buried in the churchyard. Pins and needles are made here. Some 3 m. S. of H. is Froggatt Wood, purchased in 1939 by the Sheffield and Peak Dist. Branch of the Council for the Preservation of Rural England.

Hathor, see ATHOR.

Hathras, tn. of India in the United Provs. An important commercial centre. Pop. 40,000.

Hats and Caps, name given to two political parties in Sweden, which existed for a period of thirty-five years. The Hats, under Tessin, were in power in 1738, but were ousted by the Caps twenty-seven years later. The Caps then reigned for three years, from 1766 to 1769, when they had to make way again for the Hats. The Caps reconquered in 1771, but both parties were abolished in 1772.

Hathshesu, or Hatshepsut, queen of the eighteenth Egyptian dynasty, daughter of Thothmes I. and sole heiress to the Egyptian throne. For fifteen years she

reigned in Egypt as regent for her nephew, Thothmes III., governing well and energetically. She was instrumental in building the temple of Deir El-Bahari at Thebes, as well as many other monuments.

Hatsili, see NIKKO.

Hatteras, Cape, in N. Carolina, U.S.A., at the end of a long sandbank or is. separated by Pamlico Sound from the mainland. Violent storms often occur, producing a heavy sea, which makes the inlet dangerous to navigators.

Hatteria Punctata, see SPHENODON PUNCTATUS.

Hattiesburg, cap. of Perry co., Missouri, U.S.A. It has foundries, cottonseed oil mills, machine works, etc. Pop. 21,000.

Hatto I., archbishop of Mainz, came of a Swabian family, and obtained his archbishopric under Arnulf, a Ger. king, in 891. He was so popular with this monarch that he received the nickname of 'the heart of the king.' Upon the death of Arnulf, in 899, H. was appointed regent of Germany and guardian of the young king Louis. He exercised his power in a very arbitrary way, and was guilty of many crimes in the course of his career. This, no doubt, accounts for the legend of his being thrown into the crater of Mount Etna. He died in 913.

Hatto II., was archbishop of Mainz from 968-970; his name is associated with the legend of the Mouse Tower at Bingen, where he is reported to have been devoured by mice.

SIR CHRISTOPHER HATTON

Hatton, Sir Christopher (1540-1591), Eng. statesman and lord chancellor, b. at Holdenby. Was the reputed favourite courtier of Queen Elizabeth, through whose influence he became lord chancellor in 1587—a remarkable appointment in view of the fact that he was not a professional lawyer. Very little is known of his career which is what might be

expected in the case of a man whose success was due chiefly to his social qualities. He was educated at St. Mary's Hall, Oxford, and kept terms at the Inner Temple; but instead of following the law, he played the courtier, and, it is said, first attracted the queen's attention by his dancing at a masque. In J. O. Campbell's *Lives of the Lord Chancellors* (1868), he is described as a 'gay young cavalier, never called to the Bar, and chiefly famed for his handsome person, and his skill in dancing.' He appears, however, to have had sufficient natural capacity to acquit himself without disaster on the Woolsack; and sev. legal treatises, such as *A Treatise concerning Statutes or Acts of Parliament*, are ascribed, though not by lawyers, to him; and some attribute to him the authorship of the fourth act in the tragedy of *Tancred and Sigismunda*. His death was the result, according to some historians, of 'a broken heart' through the queen's demanding payment of a debt which he was unable to meet. See N. Harris Nicholas, *Life and Times of Sir Christopher Hatton*, 1847.

**Hatton, John Lipstrot** (1809-86), Eng. musical composer, b. at Liverpool. After holding many appointments as organist in Liverpool, he came to London in 1832, ten years later he was appointed conductor of Drury Lane Theatre, where his own operetta, *Queen of the Thames*, was produced. Some years later he was the accompanist of the St. James's Hall Ballad Concerts. He also composed the songs, *Goodnight Beloved*, *Sunon the Cellarer*, and *To Anthea*.

**Hat-trick**, in cricket, the name given to the feat performed by a bowler who takes three wickets with three successive balls, not necessarily in the same over. The term may have originated from the practice of giving hats to successful sportsmen, notably wrestlers, but is more likely to have come from the handing-round among the spectators of a hat for the purpose of making a collection of money for the player who has shown his prowess.

**Hattushash** (modern Bogaz Koy), cap. of Hittite (q.v.) empire.

**Hatvan**, tn. of Hungary, 30 m. E.N.E. of Budapest, with a large castle. Pop. 9,000.

**Hatzfeld**, see ZSOMBOLYA.

**Hauberk**, see under ARMOUR.

**Hauch, Johannes Carsten** (1790-1872), Dan. poet and dramatist, b. at Frederikshald, Norway, of Dan. parents. In 1816 he became prof. of Scandinavian languages at Kiel; in 1848 returned to Copenhagen, and from 1858-60 was director of the Dan. National Theatre. His works include collections of *Poems* (1842), and of *Lyrical Poems and Romances* (1861), *Valdemar Sejr* (1862, an historical epic), and some very fine tragedies produced between 1841 and 1866, including *Scend Grathe* (1841). *The Sisters at Kinnelulle*, *Marshal Stig* (1850), *Honour Lost and Won*, *Tycho Brahe's Youth*, *The King's Favourite*, and *Henry of Navarre*. He was one of the group of romantics around Oehlenschläger.

**Hauß, Wilhelm** (1802-27), Ger. author, b. at Stuttgart. In 1826 he produced *Lichtenstein*, an historical novel in the

tradition of Sir Walter Scott, which became very popular. His other work includes: *Mitteilungen aus den Memoiren des Sntan* (1826), *Hellerin vom Pont des Arts* (1826), *Phantasien im Bremer Kaskeller* (1827), and *Marchenulmanach auf das Jahr 1826* (1826), and some short poems. See Tidemann, *Hauß in Bremen*, 1929.

**Haug, Martin** (1826-76), Sanskritist, entered the univ. of Tübingen in 1848, where he studied the Oriental languages. He went to India in 1859 as prof. of Sanskrit at Poona. Besides writing *Essays on the Sacred Language*, *Writings*, and *Religion of the Parsees* (1862), he pub. valuable material for all students of the literatures of anc. India and Persia.

**Haugesund**, seaport in Norway, 36 m. N.W. of the tn. of Stavanger. Its harbour is from 17 to 50 ft. in depth. It has important fisheries. Pop. 18,000.

**Haughton, William** (c. 1575-1605), Eng. dramatic writer of the seventeenth century who collaborated in many plays with Henry Cheette and Thomas Dekker. Philip Henslowe mentions in his diary how he helped to release H. from 'the Clink' by a loan of ten shillings. He is supposed to have written the greater part of *The Pleasant Comodie of Patient Grissill* (1603).

**Haulbowline**, is. S. of co. Cork, Ireland, situated in Cork harbour, opposite Queens-town. It has a convict station, artillery barracks, and various ordnance works.

**HauMt-as-Suk**, see under JERBA.

**Hauptmann, Gerhardt** (1862-1946), Ger. dramatist, novelist, and poet, b. at Obersalzbrunn, Silesia, son of a hotel-keeper; educated there and at the Realschule in Breslau. He worked for a time on a farm at Jauer, and then returned to Breslau to study art, continuing his education at Jena Univ. and settling in Rome in 1883-1884. In 1888 he married and settled to literary work in Berlin. In 1891 he retired to Schreiberhau, Silesia. His first notable play, *Der Sonnenaufgang* ('Before Sunrise', 1889), a pioneer of the movement towards realism reproduced the harshness and debasement of Silesian peasant life; this was followed by *Ein-same Menschen* ('Lonely People', 1891), and then came his most famous play, *Die Weber* ('The Weavers', 1892), which dealt with the rising of the Silesian weavers in 1844 and was banned by the Licensor of Plays. His much praised play, *Die Versunkene Glocke* ('The Sunk Bell', 1896) is a poetic visionary dream not however devoid of external truth. *Hannele*, a drama on the fevered vision of a child, was produced in 1894, followed by realistic social and historical dramas, including *Fuhrmann Henschel* (1898), and *Der Rote Hahn* ('The Scarlet Hen', 1901). He wrote but few comedies, among them being *Der Biberpelz* ('The Beaver Cape', 1893). He was awarded the Grillparzer Prize in 1898 and in 1905 was made an honorary LL.D. of Oxford Univ. His later work is allegorical in treatment, with experiments in the supernatural bordering on the irrational. In 1911 he wrote a religious novel, *Der Narr in*

**Christo**: *Emanuel Quint*, and a long solemn pretentious philosophical poem, *Till Eulenspiegel* (1923), which represents a Ger. flying officer as prototype of the heroic Ger. character. In 1912 he was awarded the Nobel Prize for literature and he received many honours in Germany; but his increasing submission to the Nazi regime adversely affected his subsequent work. Prolific and poetical and, consistently serious in all he wrote, H. as a dramatist is too abstrusely romantic and wanting in human warmth, and, though he was early influenced by the realism of Maubert, Zola, and Ibsen, the manifest trend of his outlook was speculative, visionary, and symbolical. See his autobiography *Das Abenteuer meiner Jugend*, (1937), and study by E. Sulger-Gebing, 1909; also H. Marschan, *Das Milieu bei Hauptmann*, 1919 and H. Cysarz, *Sieben Weensbilder*, 1913.

**Hauraki**, gulf of the Pacific in North Is., New Zealand, 70 m. long and 40 m. broad. It has sev. excellent harbours, the tn of Auckland being situated on that of Waitemata, and it also contains many well-wooded is. A good outer breakwater is formed by the Great Barrier Is.

**Hauran** (Heb. *chauran*, the hollow land, so called from its numerous caves), dist. in Syria, comprising the mountainous plateau extending in the E. from the Jordan and into the E. of Thibrias. It consists of mt. ranges and large plains, with scattered eminences rising steeply from the valley of the Jordan to a height of about 2000 ft. above the Mediterranean. It is full of the remains of ant. cities and various monuments of the Gk. and Rom. periods. The whole country is inhabited only by wandering Bedouins and a few colonies of Druses.

**Hausas**, **Houssas**, or **Haussa**, W. African race, inhabiting a dist. of about 50,000 sq. m. in the W. and Central Sudan from the R. Niger to Bornu and including N. Nigeria. They represent a very high negro type, and have a strong admixture of Arab and Fula blood. The skin is very black, but the lips less thick and the hair less woolly than in most negroes. The men are of medium height, heavily built, and of great physical strength and endurance. Their language, which has a very wide range, is notable for its rich vocabulary. It belongs to the Hamitic group, and a large proportion of the words are connected with Arab and Semitic roots, thus tending to verify the native tradition that the origin of the race was beyond Mecca to the E. The language, which has become a lingua franca over a wide area, has been reduced to writing, in modified Arabic characters, by the natives themselves, and there is a certain amount of native literature. The Bible has been trans. into Hausa. The H. are a most industrious people. They are excellent agriculturists, have for long mined iron, tin, silver, lead, and salt, have developed numerous industries, including spinning, weaving, dyeing, and working in leather and glass. Kano, Katsena, and Yakoba are the chief centres. Their staple food is guinea corn. Family land-holdings are

clearly delimited, the whole Hausa country being covered with small holdings, ranging from 1 to 4 ac. The tenure remains one of user only, but the transfer of this right, subject to the sanction of the Emir, is now recognised by the native courts in Kano and Bornu. Though naturally peaceful, the H. make excellent soldiers. Since the early part of the nineteenth century their political significance in Nigeria has given way to that of the Fulani (see under FULANI). The pop. which numbers over 5,000,000, is predominantly Muslim. See C. H. Robinson, *Hausaland*, 1896; and *Dictionary of the Hausa Language*, 1925; G. P. Bargery, *Hausa Dictionary*, 1935; C. K. Meek, *The Northern Tribes of Nigeria*, 1925; W. Miller, *Yesterday and tomorrow in Northern Nigeria*, 1938; Lord Hailey, *An African Survey*, 1938; Sir A. C. Burns, *History of Nigeria*, 1943.

**Haushofer**, Karl (1869-1946), founder of Ger. geopolitics (q.v.), b. at Munich. He travelled in S.E. Asia between 1887 and 1919 and became prof. at Munich in 1921. His theories had much influence on the world-domination policies of the Nazis.

**Hausman**, **Georges Eugene**, Baron (1809-91), builder of modern Paris, b. in Paris. He was educated at Collège Henri IV., and studied for the law. In 1830 he became *sous-préfet* of Nérac; from 1849-51 was successively prefect of Var, Yonne, and Gironde, and in 1853 was made prefect of the Seine by Louis-Napoleon, who had vast schemes for the embellishment of Paris. The improvements carried out by H. transformed Paris, but their cost, which amounted to £31,000,000, led to considerable opposition, and in 1870 he was forced to resign by the gov. of Emile Ollivier. In 1877 he became Bonapartist deputy for Ajaccio. See his *Mémoires* (1890-93).

**Hautbois**, or **Hautboy**, see OBONE.

**Hautecloque**, **Vicomte de**, see LECLEUC DE HAUTECLOQUE, PHILIPPE.

**Hautefort**, **Viscount of**, see BERTHAN DE BORN.

**Haute-Garonne**, see GARONNE, HAUTE.

**Haute-Loire**, see LOIRE, HAUTE.

**Haute-Marne**, see MARNE, HAUTE.

**Haute-Saône**, see SAÔNE, HAUTE.

**Haute-Savoie**, see SAVOIE, HAUTE.

**Haute-Vienne**, see VIENNE, HAUTE.

**Hautes-Alpes**, see ALPES, HAUTES.

**Hautes-Pyrénées**, see PYRÉNÉES, HAUTES.

**Hautmont**, tn. of dept. Nord, France on the R. Sambre, 18 m. S.E. of Valenciennes. Pop. 11,100.

**Haut-Rhin**, see RHIN, HAUT.

**Haüy**, **Rene Just** (1712-1822), Fr. physicist and mineralogist. In 1781 he discovered the geometrical law of crystallisation associated with his name, which he afterwards expounded in his *Traité de minéralogie* (1801). For this he was elected to the Academy of Sciences in 1783. In 1802 he became Prof. of Mineralogy at the Museum of Natural Hist. His other works include *Traité élémentaire de physique* (1803), and *Traité de cristallographie* (1822). See life by G. Cuvier, 1823.

Haüy, Valentin, *see under* BLIND, *Institutions for the blind.*

Haüyite (or Haüyne), rock-forming mineral, named in honour of the Fr. mineralogist, Haüy (*q.v.*), consisting of silicates of aluminium and sodium, or aluminium and calcium, together with sodium and calcium sulphates. It is a vitreous, translucent substance, having a conchoidal fracture, a hardness of 5 to 5.5 and sp. gr. 2.2 to 2.5. It occurs in sky-blue, green or yellow cubes, crystallising in dodecahedra. The crystals often

tado Don Diego Velasquez, 'Llave del Nuevo Mundo' ('the New World's Key'), on account of its important position. By the Spaniards it was named San Cristobal de la Habana. It is the largest and most important city in the W. Indies. It occupies a peninsula, forming the entrance of a magnificent land-locked (towards the E. end of the N. coast of the Is.) harbour, averaging about 260 yds. in width and about 1400 yds. in length. This permits large vessels of all descriptions to come within the shelter of the harbour, which is

HAVANA : THE PRADO AND MORRO CASTLE

E.N.A.

contain symmetrically arranged inclusions of other minerals, so that the precise composition of H. is not yet certain. Frank Rutley thought that H. and nosean (*q.v.*) were mere varieties of the same species and X-ray examination has revealed its essential identity with nosean, sodalite, and the artificial ultramarines. Lapis lazuli is a member of the same group. On heating in the blow-pipe H. melts to a glass, whilst nosean only melts at the edges; both, however, are gelatinised with acids. H. occurs in volcanic rocks and especially associated with nepheline and leucite. It is found in Mount Somma, Puy de Dôme, Mount Vesuvius, the Laacher See near Koblenz, and elsewhere. It has occasionally been cut as a gemstone.

Havana, cap. of the Is. of Cuba, and one of the most important seaport tns. It was named by its founder, the Adelan-

divided into three distinct arms or bays, called Regla Bay, Guanabacoa Bay, and the bay of Atarés. The approach to H. from the sea is impressive, and beyond the surf-beaten coast the first conspicuous objects to strike the eye are the historic Morro Castle, whose venerable fortifications command the narrow bottle-necked entrance to the harbour, and its tall lighthouse, erected in 1844 by Governor-General O'Donnell. The Morro ('promontory'), erected on the left-hand side of the harbour, between 1589-97, is partly hewn out of the rock and partly constructed of solid blocks of rock, this giving it an irregular appearance. Its moat, 70 ft. deep, is crossed by a draw-bridge. The castle was captured by the Eng. under Lord Albemarle and Adm. Sir George Pocock in 1762. The first landing was made on June 7 to the E. of the harbour, and the Morro was closely

invested by land and sea, the Sp. fleet of twenty ships remaining in the harbour just as Adm. Cervera's ships were to do in 1898. The defence, after the Eng. had entered the fort, was gallant in the extreme, Velasco, the gov., being resolved to die rather than ask for quarter, and a battery to the E. of the castle perpetuates his memory. On the right is La Punta, another fort. Round the seaward side of the city is the fine driveway on a sea-wall, called the Malecon, with its gardens and handsome bandstand. Beyond the Morro on the left are the heights forming an amphitheatre S. and W. of the city, some of the hills being 1000 ft. high and crowned with fortifications known as the Cabanas, built in 1763-74. The fortress 'Castillo del Principe' is entered by a massive gateway approached by a drawbridge. It was in this harbour that the Amer. cruiser *Maine* was blown up on Feb. 15, 1898, when 270 men and 2 officers were killed, this being the immediate cause of the Sp.-Amer. war. In 1912 the *Maine* was raised, towed out to sea and sunk. Many improvements have been effected in H. since the U.S.A. military occupation, notably in the way of wider thoroughfares, better built houses, and general sanitation. Yellow fever, a very prevalent epidemic, was found to be caused through the sting of a mosquito (*Negombia*), and precautions were taken to remove the cause of offence.

The chief trade of H. is the tobacco industry, and there are numerous cigar factories. Sugar is also one of the principal products. There is an extensive export trade in sugar, tobacco, cigars, grape fruits, and other products. Trade is chiefly with the U.S.A., Great Britain, and France. There are sev. important public buildings, such as the Palace, the Exchange (El Mueble), and the custom-house. The handsome railway station of the United railways of Havana is near the S. of the city where once stood the arsenal. A series of parks and avenues cross H. from S. to N., following closely the direction of the old walls. From Parque Fraternidad, the Prado, or Paseo de Martí, a boulevard of laurel trees, extends to the Malecon. Facing Central Park are the handsome Capitol, crowned by a white dome, and the National Theatre, which can seat an audience of 3000. Obispo (Bishop) and O'Reilly Streets, narrow and highly picturesque, and the chief shopping centres, run parallel to the old Presidential Palace in the Plaza de Armas. O'Reilly Street was named after the Sp. general who entered the city by it while the Eng. left by Obispo Street when the city was given back to Spain at the end of the Seven Years' war. To the N. of the Plaza de Armas is La Fuerza, reputed to be the oldest fortress in the New World, and erected by Hernando de Soto in 1519. On its tower is the Habana, a figure emblematic of the city. On the W. side of the Plaza is the Cabildo (q.v.) or Ayuntamiento, or City Hall, in Sp. times the residence of the Captain-general. At the N.W. corner of the Plaza is the Supreme Court of Justice, once the resi-

dence of the archbishop and, later, the Senate House. The cathedral, dedicated to the Virgin of the Immaculate Conception, is near the junction of Empedrado and San Ignacio Streets. It was built in 1704 by the Jesuits, with twin towers and massive walls. H. has a National Library, schools of arts and trades, a fine univ. and sev. secondary schools, etc. H. is the terminus of the air-mail and passenger planes from the U.S.A. and a station for the air connection S.E. to Haiti, Central America, etc. It is the terminus of the chief railways of the Is. and has an excellent steamship service with the leading Amer. and European ports. Pop. 673,300. The prov. of H. has a pop. of 1,235,900.

**Havana, Declaration of, made by the Pan-Amer. Conference, July 30, 1940.** vetoing the transfer of the colonial dependencies of non-Amer. countries in the W. Hemisphere to other non-Amer. countries. The aim of the declaration was to prevent the seizure of Fr., Dutch, or other European colonies by Germany or Italy. The Conference arranged that if any transfer were attempted the possessions might be jointly administered by the Amer. republics, at least two-thirds of the republics participating, until such time as their definitive gov. should be decided by the free determination of their people. Any sudden attempt at seizure would be met by the U.S.A. acting in the defence of the continent of America. An other resolution recommended marketing agreements, including loans to producers, to keep stocks of S. Amer. commodities off the Ger. and Ital. mktts.—the agreement to be financed by a 500 million dollar fund of the Amer. Import and Export Bank.

**Havant, tn. of Hampshire, England,** near the head of Langstone Harbour. Near it is the Is. of Hayling. It has brewing and tanning industries, and manufs. parchment. Pop. with Waterlool, 26,300.

**Havel, riv. of Central Germany,** rising in Lake Dambeck, Mecklenburg, and flowing into the Elbe just above Wittenburg after a course of 231 m. It is largely canalised and joined to other rivs. and lakes by canals.

**Havelock, Sir Henry, (1795-1837), Eng. soldier,** entered the army in 1815, and went to India with the 13th regiment eight years later. He served in the Burmese war (1824-26), and was aide-de-camp to Sir Willoughby Cotton in the Afghan war of 1839. During the next years he rose steadily in his profession, and saw much active service. In the Indian Mutiny, during the last year of his life, he won worldwide renown. He captured Cawnpore in July, and was promoted maj.-gen.; and in the next few months effected the relief of Lucknow. A few days later he died. He had in Sept. been made K.C.B., and, before his death was known in this country, was created a baronet and granted a pension of £1000 a year. See life by J. C. Marshman, 1860.

**Havelock the Dane, see under ENGLISH LITERATURE.**

**Haverfordwest**, seaport of Pembroke-shire, S. Wales, on W. Cleddau It., 6 m. N.E. of Milford. It is a contributory parli. and municipal bor. and a co. of itself, having a lord-lieutenant. There are coal-mines. The tn. was settled by the Flemings in the reign of Henry I. The Grammar School was founded in 1613; the parochial Grammar School was founded in 1188. Pop. 7900.

**Haverhill**, (1) Mkt. tn. in Suffolk, England, on the borders of Essex and Cambridgeshire, 18½ m. S.E. of Cambridge on the Rom. road known as the Via Devana. Few relics of antiquity are left in the tn. as it was largely destroyed in a disastrous fire in 1663 in which the fine fourteenth-century par. church was much damaged; it has since been completely restored and enlarged. The manor house, now the vicarage, is of seventeenth-century date and contains some fine panelling. To the S.E. are some scanty remains of an earthwork known as Haverhill Castle. Two m. to the S. is Kedington with its church noted for its wonderful collection of tombs and fittings dating from the thirteenth to the nineteenth centuries. There are manufs. of ready-made clothing (dating from 1784), heavy hand-made gloves, hair canvas for stiffening coats and fibe mats. Other industries are the manuf. of agric. implements and brushes, and there are also a rope works and a large flour mill. Pop. 4150. (2) City in Essex co., Massachusetts, on l. b. of the Riv. Merrimac, 33 m. N. of Boston. It is connected with Bradford by a bridge. H. is the bp. of the poet Whittier, who was educated at the academy in the tn. The prin. business of the place is the manuf. of boots and shoes. Pop. 46,700.

**Haverstraw**, vill. of Rockland co., New York, U.S.A., on the R. Hudson, 35 m. N. of New York, overhung by limestone cliffs. Pop. 5900.

**Havildar** (Hindu *havelदार*), non-commissioned officer attached to a native regiment in India. The rank corresponds to that of a sergeant in a European regiment.

**Havre**, or **Le Havre**, seaport in France, is second in importance to Marseilles. It is the cap. of the arron. in the dept. of Seine Inférieure, and is situated on the N. side of the estuary of the Seine, being distant 113 m. from Paris, and 53 m. from Rouen. The larger portion of the tn. stands on the level ground surrounding the estuary, but the richer quarter is situated on the heights of La Côte. The basins or docks of Le Havre form a triangle in shape, and are entered by means of the Outer Port. There are nine basins, the oldest dating back to the seventeenth century. In recent years another new entrance was made by means of two breakwaters, whilst the Tancarville Canal permits riv. boats to approach the port direct, without attempting the estuary of the Seine. The chief basins are the Bassin Bolot, and the Bassin de l'Eure. This port trades with all the chief European ports, with America, Africa, and the W. Indies. Its chief imports are cotton, woollen goods, silk,

wheat, sugar, and coffee, whilst its exports are Fr. manufactured cloths, wine and spirits, and agric. and dairy produce. It is noted for mechanical engineering and shipbuilding trades. Its name was originally Havre de Grâce, because a chapel was built in 1516, dedicated to Notre Dame de Grâce. The chief buildings were the hôtel-de-ville, the law courts, and the exchange, but these and other buildings were seriously damaged or destroyed in 1944. It was used as a base and place for landing troops during the First World War, and the Belgian Gov. transferred their headquarters here. Trade, which had decreased since that War, had attained its previous standard prior to the outbreak of the Second World War.

H. was occupied by Ger. forces after the collapse of France in 1940. It was frequently bombed by the R.A.F. in 1940 and the succeeding years. It proved a thorn in the Allied side during the build-up of the invasion forces in Normandy, Ger. mine-laying aircraft and surface craft, based on the port, being awkward enemies. Attacks by Ger. light coastal craft, such as 'E' and 'It' boats, based on H. and on Cherbourg were made by the Gers. with a persistence equal to that of their air mine-laying effort. After Cherbourg fell a number of 'E' boats were sent to Brest, and the chief menace to the Allies then became concentrated at H., from which operations were directed primarily against Brit. anchorages. But successful attacks were made by Bomber Command against the docks, sinking a number of 'E' boats and other craft at their moorings. H. was cut off when the Allies had crossed the Seine (Aug. 1941), but the Ger. garrison rejected an ultimatum to surrender on Sept. 1 and the city was then invested by the Allies. Attacks were supported by heavy aerial bombing during which more than 11,000 tons were dropped on the city, half this total being dropped on Sept. 10. On Sept. 10 also the final ground attack was launched by the Brit. 10th Infantry Div. operating with the Canadian First Army under Gen. Crerar. This attack was supported by naval forces including the battleship *Harpis* and the monitor *Erebus*, which bombarded Ger. installations with 300 rounds of 15-in. shell. By noon on the 11th the N. and E. outskirts of the city had been reached and by midday on the next day the city surrendered with its garrison of 7000 troops. The damage done to the city was heavy and widespread, churches and other historic buildings, including the three museums, being destroyed. Pop. 106,900, arron. 322,100.

**Havre-de-Grace**, city in Hartford co., Maryland, U.S.A., on W. bank of Susquehanna R., 35 m. N.E. of Baltimore. Through it passes the Wilmington and Baltimore railroad, which crosses the Susquehanna by a steam-ferry. There are canning factories, flour and lumber mills. Pop. 4000.

**Hawaiian Islands**, or **Hawaii**, formerly the **Sandwich Islands**, form a ter. of the United States. They consist of a chain

of 20 is. in the N. Pacific Ocean between 18° 55'-22° 16' N. lat. and 154° 4'-160° 30' W. long., some 9 of which are inhabited. The inhabited is. extend for about 380 m. from E.S.E. to W.N.W., whilst the uninhabited ones continue the chain for many hundreds of m. W.N.W. All the is. are of volcanic origin, and nearly all of them are surrounded by coral-reefs. The names of the inhabited is. are Hawaii, Maui, with two smaller is., Kahoolawe and Lanai, Molokai, Oahu, Kauai, and Niihau. Hawaii Is. is in the shape of an irregular triangle, the sides of which measure 90 m., 75 m., and 65 m. This is. is the chief of the group, and it possesses the largest volcano in the world, the Mauna Loa (Great Mt.). This mt. has been the scene of many terrible eruptions, the last of which in 1907, was attended by an earthquake. The mt. has a huge crater, called Mokuaweoweo, and is 13,675 ft. high. The mt. of Kilauea erupted in 1924 and earthquakes have been numerous. A volcanic observatory is situated at Kilauea. Maui lies 26 m. distant from Hawaii, and consists of two mts. connected by the isthmus Wailuku about 8 m. long and 6 m. wide. The two small is., Kahoolawe and Lanai afford pasturage for sheep, and are private property. The is. of Molokai has a famous leper settlement called Kalawao, which is an *isthmus*, shut off from the rest of the is. by a rock wall, 2000 ft. high. The is. of Oahu is surrounded by a coral reef, and lies 23 m. from Molokai. It is very mountainous, with remarkably beautiful valleys and tropical vegetation. There are six craters on the lower mts. near the coast. The cap. Honolulu is situated on this is. The Federal Gov. of the U.S.A. to facilitate the protection of the Pacific coast and the control of the Panama Canal, constructed extensive naval works at Pearl Harbour, about 7 m. from Honolulu, and also military works at Honolulu and other places on the is. The dry dock at Pearl Harbour naval station was opened in Aug. 1919. Kauai is 63 m. from Oahu, and has been called the 'garden isle' on account of its fertile ground. Niihau completes the chain of inhabited is., and is remarkable for its coral reef in the W. and for the large salt lagoons in the S. For administrative purposes the Ter. of H. consists of four cos. The is. of Oahu is known as the city and co. of Honolulu. The remaining cos. are Hawaii (including the is. of that name), Maui (including the is. of Maui), Kahoolawe, Lanai and all Molokai, except its leper settlement; and Kauai (including the is. of Kauai), and Niihau. The Molokai leper colony, where Damien (g.v.) worked between 1873-1889, constitutes a fifth co., Kalawao, which is controlled by the Board of Hospitals and Settlements. The Amer. President appoints the Governor; there is a Senate of 15 and House of Representatives of 30 members; and the Ter. sends a delegate to Congress at Washington.

The natives of Hawaii were cannibals in earliest times, but they became more civilised with the influx of other races, and

they owe their Christian religion and general education to missionaries (see DAMIEN, FATHER), the first to arrive coming from America in 1820. The pop. is very varied, consisting of Europeans, Chinese, Amer., and Jap. The climate is most salubrious, and the cultivation of the sugar-cane forms the chief trade. The is. are very fertile and, besides the sugar cane, rice, pineapples, bananas, coffee and other tropical and subtropical products are largely grown. Valuable timber is procured from the vast forests. Services of steamers connect the is. with America, Australia, China and Japan, and there is an inter is. steam navigation company. There are telephones and wireless telegraphy, and Honolulu is lighted by electricity. Hawaii has a supreme court and circuit courts, and elementary education is compulsory and free. There is a normal school and a univ. (founded in 1907). Pop. of the is. by the census of 1930 was 388,336, an increase of 43.9 per cent over 1920.

*History*.—Captain Cook discovered the H. I. in 1778 and named the group Sandwich is. after the fourth earl of Sandwich then First Lord of the Admiralty; but in 1779 lost his life in an unimportant encounter at Kealahou Bay. Later some Brit. and other European sailors settled there, including two men, John Young and Isaac Davis, who became influential advisers to King Kamehameha I., called the Great, founder of the Hawaiian State and monarchy. The Hawaiians looked to Britain as their disinterested protector, as is shown by their flag devised early in the last century and consisting of narrow bands of red white and blue with the Union Jack in the upper canton. Kamehameha died in 1819 and his successor, Kamehameha II., disturbed over the changes through the growing intrusions of white men, resolved to visit England for advice, and with his queen, Kamamalu, and Polynesian retinue, landed in England in 1824; but the royal pair both succumbed to measles in London before their meeting with George IV. who, however, promised their followers that he would watch over their country. The Brit. Gov. then appointed Capt. Richard Charlton of the mercantile marine to be its first Consular Agent for 'the Sandwich, Friendly, and Society Islands' to reside at Honolulu. Charlton, after some years there, marked by sev. disputes, was succeeded in 1843 by Gen. Wm. Miller, with consular jurisdiction in all the Pacific Is. This change was due to a dispute between Charlton and Kamehameha III.'s Amer. adviser, Dr Judd, over an acting consular appointment made by Charlton. The Brit. co. only, apprehensive at the attitude of the Hawaiian Gov., protested to Adm. Thomas, Brit. naval commander-in-chief, who sent Capt. Lord Geo. Paulet to Honolulu in H.M.S. *Carysfort* to investigate the position. Paulet was soon involved in a dispute with Judd, who advised the king, pending the return from England of an Hawaiian envoy who had gone there to lay his case before the Brit. Gov., to cede the is. provisionally to

Queen Victoria, feeling confident that the Brit. Gov. would reject the offer. Judd was right in his expectation, Adm. Thomas reporting that Lord Aberdeen, the Brit. Foreign Secretary's decision was to the effect that he did not think it politic or advantageous for Great Britain to establish a paramount influence in the is. as against other Powers; and such remained the state of affairs until the reigning dynasty ended with the death of Kamehameha V. in 1873. Meanwhile, in 1862, an Anglican bishop arrived in H. despite the opposition of the Amer. missionaries, and, in 1863, Emma, widow of Kamehameha IV., and a granddaughter of John Young and his native wife, visited England as the guest of Queen Victoria. But notwithstanding these bonds with England, commercial and agric. developments in H., combined with the enhanced local position won by the Amer. missionaries through land ownership and business interests, resulted in the United States acquiring the paramount influence in the is. In 1874 Kalakaua was elected king as the candidate in favour of Amer. annexation against the dowager-queen, Emma, who was supported by the majority of Hawaiians. Great Britain opposed Amer. annexation, but James G. Blaine (q.v.), Amer. Secretary of State, informed the Brit. Gov. in 1881 that sooner or later H. would have to come under Amer. protection, but that time did not arrive until the Sp.-Amer. war, when America sought a stronghold and supply depot in the Pacific. H., which had been an independent native kingdom till 1893 and a republic from 1894-98, was formally annexed in 1898 and became a Ter. in 1900. The post of Brit. Consul-General in the Pacific is now held by the Governor of Fiji and high commissioner for the W. Pacific. A plebiscite held in the is. in 1940 on the issue whether the Ter. should apply for statehood resulted in a majority of two to one in favour of statehood, which, if accepted, would have made H. the forty-ninth State of the U.S.A. But in Dec. 1941 the Jap. launched their sudden and treacherous attack by plane and submarine on Pearl Harbour and H. thus became a pawn in the world conflict (see PEARL HARBOUR). By the summer of 1942 the Jap. had completed preparations for an attempt to capture Midway Is. as a stepping stone to an assault on H., but the decisive Amer. air-naval victory off Midway Is. (June 3-6, 1942) averted the danger for the rest of the war.

The pop. of the Ter. of H. is 525,100 (Honolulu Co. and city, 268,900; Hawaii Co. 73,800; Maui Co. 55,900; Kauai Co. 35,100). In 1940 some 80,000 of the pop. were aliens. The land area in the is. is 6435 sq. m. Prin. cities—Honolulu on the is. of Oahu, with a pop. in 1947, of 268,900; Hilo (on Hawaii) 29,100, until the Second World War, was Jap. and will probably remain so.

**Hawarden**, or **Harden**, mrkt. tn. and par. of Flintshire, N. Wales, 7 m. W. of Chester, and 195 m. N.W. of London. It is connected by a railroad with the banks

of the Dee. The tn. is large and well-paved, and contains a church, nearly destroyed by fire in 1857, but now restored. In the park is the ruined keep of a thirteenth-century castle, from which a fine view is obtained of the Dee. Lord Gladstone's seat, Hawarden Castle, dates from 1572. H. has coal-mines, clay-fields, brick works, and potteries, and manufs. tiles, pottery, etc. St. Deiniol's Library and Hostel for theological students was founded at H. in 1895 by Gladstone. Pop. (rural dist.) 31,000; (mrkt. tn.) 8000.

**Hawes**, **Stephen** (d. c. 1523), Eng. poet probably a native of Suffolk. Educated at Oxford, and afterwards travelled in Europe. Was attached to the court of Henry VII., his knowledge of Eng. poetry and literature procuring him an entry. His prin. work is *The Pastyme of Pleasure, or the History of Graunde Amoure and la Bel Pucel*, containing the knowledge of the Seven Sciences and the Course of Man's Life in this Worlde (1509), an elaborate allegory in forty-six chapters. He also wrote *The Convergence of Syceres* (1509) and *Comfort of Lovers* (1512). *The Temple of Glass* attributed by Warton to H. is ascribed to Lydgate by H. himself. See W. Minto, *Characteristics of English Poets*, 1874, and J. M. Berdan, *Early Tudor Poetry*, 1920.

**Haweswater**, lake in Westmorland, England, 5 m. N. of Kendal, and forming a fine catnaect on the road to Penrith. It is very narrow, but deep. The construction of an aqueduct from H. to Manchester was begun before the Second World War; it is intended to provide Manchester with 100,000,000 galls. of water a day.

**Hawfinch** (*Coccothraustes vulgaris*), species of the Grosbeak genus and Finch family, a good deal larger than the chaffinch. The male bird has brown and black markings on the head, black wing quills, and a white tip of the tail, and the neck crossed at the back by a broad band of ash colour. It is a timid bird and perches on the topmost branches of trees, where it commands a good outlook, and is not easily discovered. The nest is built in lichen-covered trees, of twigs and mosses. Its food consists of the fruit of the pine, hornbeam, plum, cherry, hawthorn, laurel, holly, etc. It is abundant in S. Europe, and is distributed in the temperate parts of Asia. It is not uncommon in some parts of England, but in Scotland is very rare.

**Hawick**, par. in the S.W. of Roxburghshire, Scotland, 52 m. by rail S.S.E. of Edinburgh, and 45 m. N.N.E. of Carlisle. The tn. adapts its topographical arrangement to the course of the river Teviot and Slitrig, a handsome bridge being built across the former. H. is a place of great antiquity, traces of which are seen in the Moat, an artificial earthen mound, and in part of Tower Hill, at one time the peel-tower of the Douglas family, and later a residence of the dukes of Monmouth. H. is the seat of a woollen manuf., the earliest branch seeming to be that of carpets, estab. in 1752. The fabrics principally made are hosiery, druggot,

checks, tartan, etc. The Common Riding, a traditional festival, is held annually. Stobs, a military camp, is 3 m. to the S. Pop. 17,200.

**Hawk**, term applied in a general way to all the diurnal birds of prey with the exception of vultures and eagles. Of the Hs. proper, the chief Brit. species are members of the genus *Accipiter*, the goshawk and sparrowhawk. Hs. are distinguished by their short wings, and not particularly strong beaks. See also FALCONRY.

HAWK

left sparrowhawk; right, goshawk

**Hawkbit**, genus (botanical name *Leon-*todon**) of plants of the order Compositae, allied to the dandelion. Three species are found in Britain. It has large yellow flowers and long leaves.

**Hawk-Eagle**, species of hawk of smallish size, belonging to the genera *Spizcaus* and *Morphnus*; natives of warm climates, and often very beautiful in form and colour. Some species are provided with well-developed crests which extend backwards from the crown of the head. An Indian species is called "peacock killer" and is exceedingly destructive to gamebirds of every description; and in Africa there is a species 31 in. long. Hs. are often termed "crested eagles," the crest being best seen in a species of *Morphnus* from Guiana, though it is absent in a bird of the genus *Nisactes* in India.

**Hawke**, Sir Edward, Baron Hawke of Lorton (1705-81), Eng. adm., b. in London; entered the navy in 1720, becoming commander in 1733. In 1744 he distinguished himself in the action off Toulon, commanding the *Berwick*, one of the few ships properly handled. In 1747 he became a rear-adm., and gained a victory over the Fr. off Finisterre. For this service he was knighted and became M.P. for Bristol the same year. He became an adm. in 1757. His chief fame was gained in 1759 after his attack on Marshal Conflant in Quiberon Bay, which resulted in the destruction of the Fr. fleet, and the

collapse of their invasion scheme. In 1760 he was made first lord of the Admiralty and created Baron H. for life. See M. Burrows, *Life of Hawke*, 1883.

**Hawke**, Martin Bladen, seventh Baron (1860-1938), Eng. cricketer. For the record period of twenty-eight years he captained the Yorkshire co. eleven; also led teams in Australia (1889-92; 1894-95) and in S. Africa (1895-96).

**Hawker**, Robert Stephen (1803-75), Eng. poet and antiquary, b. at Stoke Damerel, near Plymouth, Devonshire, eldest son of J. S. Hawker, vicar of Stratton, Cornwall. Educated at Cheltenham Grammar School and Pembroke College, Oxford. In 1827 he carried off the Newdigate prize, was ordained in 1831, and became vicar of Morwenstow on the Cornish coast in 1834. He laboured here for forty years, during which period he rebuilt the vicarage, restored the church, and built a school. His theological views were mainly those of the tractarians. H.'s ballads were direct and simple in style and composed in the true spirit of antiquity. None is better known than his spirited ballad based on the old Cornish refrain, "And shall Trelawney die?" Other of his poetical pieces are *Tendrils by Reuben* (1821), *Records of the Western Shore* (1822), *Reeds Shaken with the Wind* (1843), *Quest of the Sangrael* (1864), *Footprints of Former Men in Cornwall* (1893). See S. Baring Gould, *The Vicar of Morwenstow*, 1875; C. E. Byles, *Life and Letters of Robert Stephen Hawker*, 1905; M. F. Burrows, *Robert Stephen Hawker: A Study of his Thought and Poetry*, 1926; and M. Collins's novel, *Sweet and Twenty*, 1875, in which H.'s character is delineated under the name of Canon Tremaine.

**Hawkers and Pedlars**, itinerant dealers engaged in the business of carrying their goods for sale from place to place. The trade is regulated under special supervision of the legislature, this being made necessary by the opportunities afforded dealers with no fixed domicile of evading responsibility and practising fraud. By the Act of 1871, a pedlar is a person who sells articles, travelling without a horse or other beast, and certificates are supplied, to those desirous of carrying on the trade of a pedlar in good faith, by the chief officer of the police of the dist. for which they are asked. The Hawkers Act, 1888, defines a hawk as one who travels with a horse, or other beast, bearing or drawing a burden. A single act of selling does not constitute a pedlar, and persons who travel about seeking orders for goods, as agents, sellers of fish, fruit, victuals, and exposing goods for sale in a public mkt., do not come under the category. The fee for a pedlar's certificate is 5s., and a hawkier's licence can be taken out at a cost of 4s.

**Hawkes Bay**, or **Waikato**, in New Zealand, N. Is., between Auckland and Wellington, on the E. coast. It is enclosed on the N.E. by Mahia Peninsula, and extends S. to Cape Mata-mau, a total distance of about 60 m. In 1769 Cook entered it in the *Endeavour*, and in 1848 it was occupied by Europeans. H. B. receives sev. considerable streams,

**Hawkesbury**, one of the chief rvs. of New S. Wales, Australia, flowing eastward and formed by the union of the Nepean and Grove Rvs. The united stream forms the N., W., and E. boundaries of Cumberland co., and, after a course of about 80 m. eastwards, falls into Broken Bay. It is navigable for vessels of 100 tons, but is liable to great and rapid inundations, produced by the fall of rain on the Blue Mts. Its banks consist of fine alluvial soil. In 1889 railway connection between Adelaide and Brisbane was completed by a bridge over the riv. Total length, 330 m.

**Hawkesworth, John** (c. 1715-73), Eng. miscellaneous writer of humble parentage, b. in London. In 1744 he succeeded Dr. Johnson as compiler of the *Gentleman's Magazine*. In 1752 he started with Johnson and others *The Adventurer*. H. was the editor, and of the 140 papers, wrote some seventy-two or so. In 1755 he pub. *The Works of Jonathan Swift*, with historical notes and explanations, and prepared the account of Capt. Cook's first voyage, forming part of his own pub., *Voyages*. He also wrote an oratorio, *The Fall of Egypt* (1774), sev. essays, and some plays.

'Hawkeye State,' see IOWA.

**Hawkhurst**, par. partly in Kent and partly in Sussex, England, 12 m. N.W. by W. of Rye, by rail. Pop. 3000.

**Hawking**, see FALCONRY.

**Hawkins, Sir Anthony Hope** (1863-1933), Eng. author whose pseudonym was 'Anthony Hope'; second son of Rev. E. C. Hawkins, vicar of St. Bride's, Fleet Street. He began to write early, but it was not until he pub. *The Dolly Dialogues* (1891) that he became generally known. The best of his many books, are *The Prisoner of Zenda* (1894), *The King's Mirror* (1899), *Quisiam* (1900), and *Second String* (1910). A master of dialogue, he designed a large portrait-gallery of interesting characters from music hall singers to statesmen. His *Prisoner of Zenda* added to the language a new adjective, 'Kuriltanian,' whose use is to qualify modern gov. and to make it as like gov. in the Dark Ages as possible, for the sake of picturesqueness. H. was knighted in 1918. His later work includes: *A Young Man's Fear* (1915), *Captain Dieppe* (1918), *Beaumaris Home from the Wars* (1919), *Lucinda* (1920), *Little Tiger* (1925), *Memories and Notes* (1927). His plays include *The Adventure of Lady Ursula* and *Pilkerton's Persecution*. See Sir C. Mallet, *Anthony Hope and His Books*, 1935.

**Hawkins, Sir Henry, Baron Brampton** (1817-1907), Eng. judge, b. at Hitchin, Hertfordshire, and educated at Bedford School. In 1839 entered at the Middle Temple. Called to the Bar in 1843 and joined the home circuit and Hertfordshire sessions. Took silk in 1858, and for the next eighteen years was one of the most prominent leaders of the Bar. He was engaged in many important cases: his well-chosen language and lively intelligence succeeded in winning for him the verdicts of juries. In 1876 appointed judge of the High Court

of Justice: knighted and transferred to the Exchequer Div. the same year. H. figured in the Tichborne trials and many others of equal importance. As a criminal judge he had few equals, though Sir Edward Clarke, K.C., in *The Story of My Life* (1918), severely criticises his conduct as a judge with some justification. The so-called *Reminiscences* of H., pub. in 2 vols. in 1904, contain some amusing anecdotes; but the vols. are clearly the work of the editor, Richard Harris, the witty Q.C. who wrote the very entertaining *Hints on Advocacy* (1th ed.), 1880.

**Hawkins, or Hawkyns, Sir John** (1532-95), Eng. seaman and naval commander, b. at Plymouth. While quite a young man he made sev. voyages, and was the first Englishman to traffic in slaves. In 1573 he was made navy treasurer, and knighted as a reward for his services against the Armada in 1588. In the mustering of the Eng. fleet to defend the country against the Spaniards, H. was capt. of the *Victory*. While at Plymouth he served under Drake, and was a member of the council of war. In 1591 he served in an expedition, ordered to the W. Indies under the command of Drake, to the Sp. Main, but died at sea off Porto Rico. He left one son, Sir Richard H., also a naval commander. His *True Declaration of the troublesome roynage of M. John Hawkyns to the parties of Guinca and the West Indies*, was pub. in 1569.

**Hawk-moth**, species of Lepidoptera belonging to the family Sphingidae, sometimes also known as 'sphinx-moth,' the

name being derived from the resemblance shown in the caterpillar stage to the Egyptian Sphinx. The moths belonging to this family are all large and dull coloured, with a long proboscis, a small hinder pair of wings, and long and pointed body. The caterpillars are smooth and striped, and usually furnished with an erect horn at the hinder end. Allied

species are the privet H., the pine H., the deathhead moth, and the hummingbird H.

**Hawthshaw, Sir John** (1811-91), Eng. Engineer, b. at Leeds in the W. Riding of Yorkshire. He constructed various docks, Holyhead Harbour, the Severn tunnel (1887), Charing Cross and Cannon Street railway stations and bridges, and part of the Underground Railway of London. He was for a time engineer to the Manchester and Leeds Railway; and later on to the Lancashire and Yorkshire Railway.

**Hawthamoor, Nicholas** (1661-1736), Eng. architect, b. at E. Drayton, Nottinghamshire, and at the early age of eighteen obtained employment under Sir Christopher Wren. He became deputy-surveyor of the works at Greenwich Hospital in 1705. Through Wren he obtained the post of clerk of the works at Kensington Palace, an office which he held till 1715. He also assisted Wren in the erection of St. Paul's Cathedral from its commencement to its completion in 1710. Under Sir J. Vanbrugh he was also assistant surveyor at Blenheim Palace, Oxfordshire (1710-15). At Oxford H. was employed from an early period, and much of his work is seen there at the different colleges. At the close of Anne's reign he took a large part in the building of fifty new London churches. See H. S. Goodhart-Rendel, *Nicholas Hawthamoor* 1921.

**Hawthorn, or Hieracium**, genus of plants of the natural order Compositae. They are a perennial species of herbs, characterised by yellow, orange, or red flowers. The orange H., a native of Europe, is frequently cultivated in gardens by reason of its handsome blooms. The plant is very hairy, having a tuft of oblong leaves at the base. It is quite a pest in the meadows and pastures of New York state, and can only be overcome by cultivation.

**Hawthorn, Sir John de** (d. 1391), Eng. soldier and captain, b. at Sible Hedingham in Essex. He won both renown and riches as a condottiere in Italy, where he was known as Giovanni L'Acuto. He distinguished himself at Crécy and Poitiers, and was knighted by Edward III. From 1363 onward he fought in the It. wars on different sides, and was finally persuaded to fight the battles of Florence for an ann. pension. See J. T. Leader and G. Marcotti's life (trans. by Mrs. Leader Scott), 1889.

**Hawkins, Sir John**, see HAWKINS.

**Hawkins, Sir Richard** (c. 1562-1622), Eng. naval commander, son of Adm. Sir John H. He served under Drake, and took part in the defeat of the Armada (Aug. 1588) and in the subsequent descent on the Portuguese coast in 1590. Three years later he sailed in the *Dainty* on a voyage round the world. He touched Brazil, passed the Straits of Magellan, and took and plundered Valparaiso, but was defeated and wounded after a hard fight in San Mateo Bay, and imprisoned in Spain till 1602, when he was ransomed and knighted. Later he became vice-adm. of Devon and second-in-command in Sir Robert Mansell's fleet against the Algerine

pirates (1620-21). See his *Observations on his Voyage into the South Seas*, with biography by Sir C. R. Markham, 1878.

**Haworth, moorland vil.** and par. in the W. Riding of Yorkshire in the Kesteven div., 9 m. N.N.W. of Halifax. It has an area of about 10,540 acs. Charlotte Brontë, the novelist (1816-65) and her sisters resided here from their earliest years, and descriptions of the moorland scenery are to be found in their novels, notably *Wuthering Heights*, by Emily Brontë. The old church of H. has been ruthlessly demolished, but the graves of Charlotte and Emily Brontë are in the churchyard. The parsonage, where they lived, is now the Brontë museum. Pop. 6000.

**Hawthorn** (O.E. *haga*, *hæg*, or *hegethorn*), genus of shrub or small tree belonging to the species *Crataegus*, numbering about fifty, bearing fruit resembling in miniature that of the apple, and therefore belonging to the natural order Rosaceae, with spiny branches and alternate, simple or lobed leaves, smooth and shining. The flowers are sweet-scented, white, with a sometimes reddish tinge, and grow in flat-topped clusters. The H. is a native of the N. temperate regions, especially America, and is represented in the Brit. Isles by the H., whitethorn, or may. It thrives best in dry soils, and may be propagated from seeds or cuttings.

**Hawthorne, Nathaniel** (1801-64), novelist, is by common consent the greatest of all Amer. writers of fiction. He was b. at Salem, Mass., July 4, his ancestors being among the first settlers. Educated at Bowdoin College in Maine, he there met and won the friendship of H. W. Longfellow, afterwards to become celebrated as one of the greatest Amer. poets. His best-known works are *Twice-Told Tales* (two series, 1837, 1842), *Mosses from an Old Manse* (1846), *The Scarlet Letter* (1850), *The House of the Seven Gables* (1851), *The Blithedale Romance* (1852), and *The Marble Faun* (1866). While his earlier work won the praises of the critics, it secured for the author no recognition from the public, which was first attracted to his books when he pub. *The Scarlet Letter*, a story of New England in the seventeenth century. The admirable picture of the place and the spirit of the age, the tragic story so well unfolded, was at once acclaimed as the masterpiece it is still acknowledged to be. It is dark and gloomy, as a tale of human frailty and sorrow must be, and it would be painful to read were it not that the author so clearly shows that there is light beyond. Admirable as are H.'s other books, and especially *The House of the Seven Gables*, *The Scarlet Letter* stands apart, and above, all his works. Most of his fiction deals with the problems of evil and sin and their devastating effect upon human conscience, in large measure a sort of inheritance from his long line of Puritan forefathers. In the later years of his life he held a consular appointment in Liverpool. See lives by H.'s son, Julian, 1885; H. James, 1883; M. D. Conway, 1890; G. E. Woodberry, 1902; and C. Mather, *Nathaniel Hawthorne, A Ancestral Man*

1940; L. S. Hall, *Hawthorne, Actor of Society*, 1944.

**Hawtrey, Sir Charles Henry** (1858-1923), Eng. actor-manager and playwright; son of the Rev. John H., an Eton master. H. was first and foremost a racing man, but he achieved success both in England and in the U.S.A. as a first-class comedian. Took leading parts in: *The Man from Blankley's*; *The Private Secretary*; *The Little Damsel*; *The Naked Truth*; *Inconstant George*; *General John Regan*; and *Ambrose Applejohn's Adventure*.

**Hawtrey, Edward Craven** (1789-1862), headmaster and provost of Eton College, b. at Burnham, near Eton. Entered the school, with which his family had been connected for nearly 300 years, in 1799. See life by T. Thackeray, 1896.

**Hay**: (1) Mkrt. tn. and par. in Breconshire, Wales, 20 m. W. of Hereford, on the Wye, and 12 m. S. of New Radnor. Pop. 1300. (2) Post tn. and cathedral city of New South Wales, Waradgery co., in the middle of the Riverina dist., 70 m. N. of Deniliquin. Pop. 3000. (3) A riv. of Alberta, Canada, descending from the E. side of the Rocky Mts., and flowing into the Great Slave Lake, 350 m. in length, and navigable for 140 m.

**Hay, Sir George** (fl. 1456), Scottish poet and translator. In youth, in France, chamberlain to Charles VII. Returned about 1445. He resided with earl of Caithness and made trans. from Fr. for him. The prose consists of three books dealing with battles, chivalry, and princes' duties; found in MS. in the library of Sir Walter Scott. The poetry also is a translation from the Fr.—20,000 Scottish verses, called *The Buke of the Conqueror Alexander the Great*.

**Hay, James** (d. 1636), Brit. diplomat, accompanied James I. to England. Became earl of Carlisle, the first Scotsman to be created an Eng. peer. His previous titles were those of Baron H. and Viscount Doncaster. The king employed him in sev. embassies, notably to France to negotiate a marriage between the Prince of Wales and the Princess Henrietta Maria.

**Hay, John** (1838-1935), Amer. statesman and author, b. at Salem, Indiana. He was one of the private secretaries to President Lincoln, 1861-65. In 1879-81 he became first assistant secretary of state. In 1897, on the inauguration of President McKinley, H. was appointed ambassador to Great Britain, becoming subsequently secretary of state. After the war with Spain of 1898, he directed the peace negotiations. Among his most notable achievements were the Hay-Pauncefote treaty (q.v.) with Great Britain in 1901, and the settlement of the Alaskan boundary dispute between the U.S.A. and Canada in 1903. He pub.: *Pike County Ballads* (1871), of which the most famous are 'Little Breeches' and 'Jim Bludso'; *Castilian Days* (1871); a vol. of poems (1890); *Abraham Lincoln* (1890) in conjunction with G. Nicolay, etc. See *Addresses of John Hay*, 1906; *Letters from John Hay and Extracts from his Diary*, 1908; W. Thayer, *The Life and Letters of John Hay*, 1915.

**Hay and Ensilage.** Hay is composed of the stems and leaves of grasses, mown and dried for use as fodder. The object of the farmer in haymaking is to preserve the hay for winter use in a condition most nearly resembling the grass in its natural state, so preserving its nutritive value. To ensure this, the mowing should be done when the plants contain the largest amount of gluten, sugar and other soluble matter; this occurs when the grass is in flower. For the operation of mowing, dry sunny weather is required. After cutting, the grass is tedded, that is, shaken evenly abroad over the ground, on the first day, and afterwards put into small heaps, or 'cocks,' for the night. On the second and third day the same process is applied and if the weather has remained propitious, the hay should then be ready for stacking. A haymaking or 'tedding' machine, drawn by a horse, is adopted for use on a large farm. The following table gives the average constituents of clover hay and meadow hay of average quality; percentage in each case:—

	Clover	Meadow hay
Dry matter	83.0	84.00
Nitrogen	2.40	1.50
Mineral ash	7.00	6.50
Phosphoric acid	0.57	0.40
Potash	1.50	1.60

The hay crop in Great Britain and Ireland for the five years 1926-30, averaged 13 million tons, and in 1946 it was almost 7 million tons. The production per acre in 1914 was 1.15 tons, in 1928-30 2.1 tons, and in 1946 2.4 tons (see also *GRASS LANDS*).

**Ensilage** is the name given to the practice of preserving green food for cattle in 'silos' or pits. The practice of 'caching' stores, etc., in such pits is very old, but it was not till comparatively recent years that the idea of using them for the preservation of fodder was carried out. The 'silos' used should be at least 15 ft. deep, and both air-tight and water-tight; an erection above the ground is sometimes used instead of a pit. Crops which are suitable for ensilage are grass, clover, vetch, oats, rye, maize, etc. Ensilage forms a wholesome and nutritious food for cattle, and a very good substitute for root crops. Cows fed on ensilage give quite as good milk as when fed on any other variety of fodder, and it is calculated that a larger number of cattle can be supported on a certain area by the use of ensilage than by the use of green crops. See S. F. Armstrong, *British Grasses and their employment in Agriculture*, 1937.

**Hayange** (Ger. Hayingen), tn. of France, in the dept. of Moselle, 16 m. N.N.W. of Metz, on the R. Feusch. There are iron-mines and metallurgical industries. Pop. 10,300.

**Hayaseca, Jorge**, see ECHEGARAY Y FIZARRI, JORGE.

**Hayashi, Tadasu**, Count (1850-1913), Jap. statesman, b. at Tokyo; sent to England by the Tokugawa Gov. among the first batch of students. He had much

to do with the modern rise of Japan, and figured in the revolutionary movement. He obtained office in 1871, and rapidly rose to the front rank: serving as vice-minister of foreign affairs; and then being appointed to represent his country—first in Peking, then in St. Petersburg, and finally in London. He was created viscount for his services in negotiating the first Anglo-Jap. Alliance. Throughout the Russo-Jap. War he remained in London. He returned to Tokyo in 1906; and was created a count in 1907, for services performed during the Russo-Jap. War. He trans. many Eng. works into Jap. and was author of *For His People* (1903).

HAYDN

**Haydn, Joseph** (1732-1809). Austrian composer, son of a vil. wheelwright at Rohrau, Austria. At the age of twelve he became a chorister at Vienna, receiving at the same time some instruction in the violin and pianoforte. After studying under Porpora, he produced with great success, when only twenty years old, his first opera, *The Devil on Two Sticks* (1752); this was followed by a set of trios, and his first important quartet, all of which earned the usual censure of pedantic critics for 'contrapuntal errors,' and 'daring innovations.' In 1758 he met Prince Antony Esterhazy, and two years later was appointed leader of his excellent orchestra. He remained under the family's patronage for thirty years, during which time he composed a prodigious quantity of orchestral and chamber music, some operas, and also the music to the 'Seven Words on the Cross,' afterwards brought out as an oratorio in 1801. On the death of Prince Nicholas Esterhazy (1790), H. accepted Salomon's invitation

to appear in London as conductor of his own compositions; and he remained until 1795, composing meanwhile, amongst others of his finest works, the *Twelve Symphonies*, perhaps the best of the 120 or more that he wrote; also, the degree of Mus. Doc. was conferred on him by Oxford. On his return to Vienna (1795), he began work on the *Creation*, which he completed in 1798; a few weeks later its first performance caused an immense sensation in Vienna, and before long it had travelled round half Europe. Three years later he produced his last important work, a splendid setting of a version of Thomson's *Seasons*. H. was a composer of amazing fecundity; in addition to the 120 symphonies, he left twenty operas and eighty quartets, and a vast number of concertos, trios, and sonatas, wherein he developed with admirable symmetry the sonata form of Emanuel Bach. He was the first to detach music from religious ceremonial and to give it a purely secular significance as an absolute art, and his music is the expression of a nature at once genial, devotional, warm, and vivacious. See lives and studies by C. F. Poll, 1875-1882 (completion by H. Botstiber, 1927). J. Outhbert Hadden, 1902; K. Geiringer, 1948; Rosemary Hughes (Master Musicians), 1950.

**Haydock**, tn. in Lancashire, England, 3½ m. E.N.E. of St. Helena. Has extensive collieries and iron foundries. Pop 10,500.

**Haydon, Benjamin Robert** (1786-1816). Eng. painter, b. at Plymouth, England, chiefly noted for his historical paintings. A man of indomitable high-flaming energy and industry and full of a conviction of his own power, which, however, was not justified. But the most distinguished spirits of the time were among his friends, especially Keats. He suffered a heavy disappointment in the rejection of his historical cartoons for the decoration of the new Houses of Parliament. Among his works are: 'Christ's Entry into Jerusalem' (now at Philadelphia), the fruit of six years' labour; 'The Raising of Lazarus'; and 'The Judgment of Solomon' (in the National Gallery). H.'s lifelong struggle with debt so preyed upon his mind that he became unable to paint, and died by his own hand. Probably his chief title to the regard of posterity was that he was mainly instrumental in getting the pre-eminence of the Elgin marbles among the works of the sculptor's art acknowledged in the teeth of hostile cliques, and their acquisition for the nation secured. See S. Colvin, *Keats*, 1887; G. Paston, *B. R. Haydon and his Friends*, 1905; and E. George, *The Life and Death of Benjamin Robert Haydon*, 1948.

**Haydon Bridge**, eccles. par. in Northumberland, 6 m. N.W. of Hexham. It has smelting works, iron and brass foundries, and coal and lead mines. Pop 2500.

**Haye, La.**, see HAGUE.

**Hayes, Catharine** (1690-1726), murderer, see Hall, b. near Birmingham. She married John H., a carpenter, at the early

age of sixteen, and soon after they left Birmingham they set up a small shop in Tyburn, taking in lodgers. With the help of two of them—Wood and Billings—she murdered her husband in March 1726, and was arrested a few weeks later. At the trial she pleaded 'not guilty,' but was convicted and sentenced to be burnt. Wood and Billings were hanged. See W. M. Thackeray, 'Catherine' in *Fraser's Magazine*, 1839-40.

**Hayes, Catherine** (1825-61), Irish operatic and ballad soprano, *b.* at Limerick. She studied at Dublin, and frequently appeared at concerts there. In 1842 she went to Paris, where she studied under Manuel Garcia, and on his advice proceeded thence to Italy, where she was engaged at the *It. Opera House*. In 1849 she came to England and made her debut at Covent Garden in *Linda di Chamouni*.

**Hayes, Isaac Israel** (1832-81), Amer. Arctic explorer. In 1860-61 he conducted an Arctic expedition, and eight years later another, fully described in his work, *The Land of Desolation* (1871). He also pub. *An Arctic Boat Journey* (1860), and *The Open Polar Sea* (1867).

**Hayes, Patrick Joseph** (1867-1938), Amer. cardinal; *b.* in New York, son of Daniel H. Graduated Manhattan College, 1888. Priest, 1892. Chancellor of New York, 1903. D.D., Rome, 1904. Pres., Catholic College, 1903-14. Domestic prelate to Pope, 1907. Auxiliary Bishop of New York, 1914. Rector, St. Stephen's church, Oct. 1915. Catholic chaplain-bishop, U.S.A. Army and Navy, 1917. Archbishop of New York, 1919. Cardinal 1921.

**Hayes, Rutherford Birchard** (1822-93), nineteenth President of the U.S.A. He graduated at Kenyon College, Ohio, in 1842, and practised law in Cincinnati from 1849 to 1861. At the outbreak of the Civil war in 1861, he was appointed maj. of a volunteer regiment, and saw active service in Virginia. He retired as a maj.-gen. In 1865 he was elected as a congressman from Ohio, and was governor of that state in 1867, 1869 and 1875. In 1876 the Republicans nominated him for President against the Democratic nominee, the reform governor of New York, Samuel J. Tilden (*q.v.*). As President H. stood like a rock against the corruptionists, devoted his efforts to reforming the civil service system and the resumption of specie payment. He left the White House as he entered it—an honest, hard-working public servant. See W. D. Howells, *Life of R. B. Hayes*, 1876; and J. Q. Howard, *Life, Public Services, and Select Speeches*, 1876.

**Hayes**, (1) Urban dist. of Middlesex, England, 13 m. W. of London. Munufs. aircraft, gramophones and printing presses. Pop. (with Harlington), 54,700. (2) Vil. of Kent, England, 2 m. S. of Bromley, with a large common. Wm. Pitt, the younger was born here and his father, the earl of Chatham, died here. Pop. 5000.

**Hay-fever**, condition of discomfort, which occurs about the time of hay har-

vest. It is characterised by running of the nose and eyes, from irritation of the nose and air passages by grass pollen, chiefly coming from Timothy grass, June grass, orchard grass, sweet vernal and meadow foxtail. In severe cases strict or absolute avoidance of the hay crop or other cause is necessary. As, however, the attack is either induced or aggravated by want of tone in the system, benefit always results from alteration of the mode of life and attention to minute details of hygiene. But prevention is more important than cure. The nose and air passages are benefited by local applications, such as douches of boric acid, alum, common salt, sprays containing ephedrine. Good results follow vaccine treatment when it is begun early. Having regard to the troublesome nature of the condition, it is advisable to have the nose examined for physical defects, which may be amenable to treatment.

**Hayingen**, see HAYANG.

**Hayle**, small seaport tn. of Cornwall, England, on St. Ives Bay. The harbour has a depth of about 11-20 ft. at high water. Tin mining and smelting are carried on. Pop. 916.

**Hayles Abbey**, ruins of a Cistercian Abbey, situated 2 m. N.E. of Winchcomb and 10 m. N.E. of Cheltenham, Gloucestershire, England, at the foot of the Cotswolds. The abbey was founded in 1216 by Richard, earl of Cornwall and king of the Romans, brother to Henry III. In 1270 the monks were presented with a phial containing the 'Blood of Hayles,' which attracted numerous pilgrims until the dissolution of the monasteries. Only a few walls, and notably some of the pointed bays of the cloisters, are now remaining, but the foundations of the great church have been carefully indicated by the planting of yew hedges. There is a museum containing a collection of bones, early tiles, and other relics of the abbey.

**Hayley, William** (1715-1820), friend and biographer of the poet Cowper, *b.* at Chichester; educated at Eton and at Trinity College, Cambridge. Studied law for a short time, but abandoned it for a life of literary ease. He won fame by his *An Essay on History*, etc. (1780), *An Essay on Painting* (1781), *An Essay on Epic Poetry*, etc. (1782) and his poem in six cantos, *The Triumph of Temper* (1781). His most memorable work is his *Life of Cowper* (1803-04). He also wrote plays, a number of works in prose; *lives of Milton* (1790) and *Romney* (1809). His own *Memoirs* were pub. in 1823.

**Hayman, Francis** (1708-76), Eng. painter, *b.* at Exeter. Worked as a scene-painter at Drury Lane Theatre. Also became known as a designer by his illustrations to Sir T. Hanmer's ed. of Shakespeare, and for Congreve's poems, Smollett's *Don Quixote*, and the *Spectator*, 1747. He occupies an important place in Eng. art as one of the founders of the Royal Academy.

**Haymarket Square Riot**, riot in Haymarket Square, Chicago, 1886, in which seven policemen were killed and sixty

wounded by a bomb when dispersing an anarchist meeting. A number of anarchists were hanged.

**Haymarket Theatre**, London theatre standing in the Haymarket, opposite Charles Street, and, next to Drury Lane, the richest in theatrical tradition. During the patent monopoly it was a kind of chapel of ease or training-house to Drury Lane and Covent Garden. It was built in 1720, and leased to a company of Fr. actors, who opened it with *La Pille à la Mode*. Fielding's is the first great name connected with the theatre. In 1730 he produced the *Tragedy of Tragedies*, or *Tom Thumb the Great*, and became manager in 1731. Ten years later, Charles Macklin opened the Haymarket with a company composed chiefly of his own pupils. In 1747 it was rebuilt and Samuel Foote assumed the management, and in 1766 he obtained a patent for the theatre during his lifetime. Foote sold the Haymarket to Colman the Elder in 1776, who continued to manage it till 1791; and in 1820 Harris became manager and demolished the old house, the site of which is now occupied by the Café de l'Europe. He erected a new theatre a little farther N., which was opened in July 1821 with *The Rivals*. A larger and inner building, under the same name, was built in 1850, at which a large number of plays have been produced. Some of the successful plays in recent years have been *The Impossible Woman* (1914), *General Post* (1915), *The Freedom of the Seas* (1918), *Uncle Sam* (1919), *The Young Person in Pink* (1920), the exquisite fantasy of J. M. Barrie, *Mary Rose* (1920), the stirring *Dover Road* (1922), *The Man with a Lion of Muschies* (1925), and Eden Phillpotts' *Yellow Sands* (1926), *The Ivory Door* (1929), by A. A. Milne; *The First Mrs. Fraser* (1929), by St. John Ervine, *Ten Minute Club* (1931), *The Amazing Doctor Culterhouse* (1937), *Design for Living* (1939), *Present Laughter* and *His Happy Breed* (1943), *Lady Windermere's Fan* (1947), *The Glass Menagerie* (1948). Many notable performances of Shakespeare have taken place at the H., and in 1931 *Hamlet* was produced at this theatre, with an all-star cast including Fay Compton, Irene Vanbrugh, and Godfrey Tearle. In 1918 the theatre was bought by the New Zealand Gov. See W. MacQueen Pope, *Haymarket. Theatre of Perfection*, 1918.

**Haynau**, see HAINAU.

**Haynau**, Julius Jakob, Baron von (1786-1853), Austrian gen., b. at Kassel. Entered the Austrian army in 1801, and saw much service in the Napoleonic wars, being wounded at Wagram. Between 1815 and 1847 he rose to the rank of field-marshal lieutenant. He fought with distinction in the It. campaigns of 1818-49 but showed ruthless severity at the capture of Moscow. In 1849 he was called to Vienna, and took supreme military command in Hungary, where, as in Italy, he was accused of brutality. On the restoration of peace he was appointed dictator of Hungary, but resigned in 1850. See life by C. von Schönhaus, 1875.

**Hay-Pauncefote Treaty**, treaty negotiated by John Hay (q.v.) on the part of the U.S.A., and Lord Pauncefote on behalf of Great Britain, abrogating the Clayton-Bulwer Treaty (q.v.), and providing for the construction of a Panama Canal (q.v.) under U.S.A. control and for its neutralisation on the same basis as Suez Canal. When submitted to the Senate in 1900 it was ratified, but with such amendments, especially regarding its neutralisation, that Great Britain refused to ratify them. A further treaty was negotiated in 1901 and passed by the Senate. It demanded no guarantee of neutrality, although the general principle of neutrality of the Clayton-Bulwer Treaty was retained, and in time of war the U.S.A. were given certain rights of control not definitely specified.

**Hay System**, see under FOOD AND FEEDING.

**Hayti**, see HAITI.

**Hayward**, Abraham (1801-81), Eng. miscellaneous author, was called to the bar in 1838, and though he never acquired a considerable practice, he was made Q.C. in 1845. He wrote in the *Edinburgh*, the *Quarterly*, and *Fraser's Magazine* on many subjects, and his *Essays* (of which there are three series, collected 1858, 1873, 1874) are distinctly interesting. He wrote against the theory that Sir Philip Francis was Junius in *More about Junius* (1869); in 1861 he ed. the autobiography of Mrs. Piozzi. His best-known book is *The Art of Dining* (1852). His *Correspondence* was ed. by H. E. Carlisle in 1886.

**Hayward**, Tom (1871-1939), Eng. cricketer; first played for Surrey co. in 1893. In 1906 he scored 3518 runs, a world's record which was not beaten until 1947 by D. Compton and W. J. Edrich. His highest score, 315 not out, was made against Lancashire in 1898. He scored 104 centuries in first class cricket and over 13,000 runs. He appeared in many test matches against Australia, and coached J. B. Hobbs.

**Hayward's Heath**, small park, tn. in Sussex, England, on the S. region railway, at the junction of Lewes branch, 12 m. N. of Brighton. The largest cattle sale in Sussex is held here. Pop. 5300.

**Hazaken**, see HILLEL.

**Hazara**, the northernmost dist. of the N.W. Frontier Prov., Pakistan. Its name is probably derived from the military colonies of 1000 (hazar) men each, left behind by Jenghiz Khan. Cap. Abbottabad. Pop. 630,000.

**Hazaras**, race of Mongolian origin occupying the country between Kabul and Herat, and known in the W. provs. as Taimanis. In other dists. they are distinguished by the name of the ter. they occupy. They speak a dialect of Persian; are of middle size, stoutly made, with high cheek-bones, and smooth faces.

**Hazard** (O.F. *hasard*), game of dice, at one time very popular in England, and played at famous rooms in St. James's Street and Pall Mall for high stakes. There were many forms, the simplest being that in which two dice were used by two players only, one known as the

'caster,' and the other as the 'setter.' The former called a 'main,' i.e. any number from five to nine inclusive, and then threw. If he threw in or 'nicked,' he won the sum played for from the setter—a 'nick' being 5, 6, 12, 7, 11, 8, and 9; whereas, if he threw out (the ace or deuce-ace) he lost to the setter. The best main for a caster to call is 7, as it can be thrown in six different ways, out of the thirty-six casts possible with dice. Any other number thrown by the setter was his 'chance,' and if this was thrown first, he won; if the main, he lost.

**Hazaribagh**, prin. tn. in the dist. of the same name, Chota Nagpur, W. Bengal, India, on the military road from Calcutta to Benares, picturesquely situated on the high central plateau of H. dist., which contains sev. coalfields and tea plantations. There are hot springs in the vicinity. H. was formerly a place of considerable importance. It is on the E. Indian railway. Pop. 18,000.

**Haze** (A.-S. *hasu*, *heasu*, grey, but origin of word uncertain; some suggest Ger. *hassen*, to hate, from the disagreeableness of such weather), lack of transparency in the air; viz. obscurity, dimness. H. has the appearance of vapour or smoke with little or no dampness, and impedes the vision to a certain extent. It is often due to great heat. H. is really an obscuration of the atmosphere near the surface of the earth, caused by an infinite number of minute particles of vapour in the air. At one time the word was applied to a thick fog or hoar-frost, but is now only used for that thin, misty appearance in the air which makes all objects look indistinct and uncertain. H. is less determinate than mist or fog.

**Hazebrouck** (Flomish, Marsh of the Hares), arron., com., canton, and tn. of France, in the dept. of the Nord, on the canal of the same name. It has a trade in grain, butter, soap, etc., and manufs. linen, cloth, and gingerbread. Being the central railway junction of Fr. Flanders, H. was held with tenacity by the Brit. forces during the First World War. During the Ger. drive of 1918, Merville, only 5 m. from H., fell to the Ger. on April 11, in the Lys battle, and the next day the Ger. began a dangerous movement towards H., which on April 12 was as near capture as Amiens had been during the crisis of the Somme battle of the preceding March. So serious was the menace that preparations were made for flooding the approaches to Dunkirk and Calais, and Haig, much against his heart, ordered a withdrawal from the hard-won ridges of Flanders taken the previous autumn. But the Brit. troops rose to the occasion, and on the 13th the remnants of the famous 29th Div., together with those of the 31st Div., strung out on a wide front, contested every foot of the ground, beating off a series of attacks until the Australians, sent up by train from the Somme, detrained at H. and so helped to save the tn. Pop. (com.) 41,300. See Sir F. Maurice, *The Last Four Months*, 1919.

**Hazel** (A.-S. *hasel*; Fr. *noisetier*, *coudrier*), Brit. tree of the sub-order

Coryleæ. The common H., of which the fruit is a nut, is distributed throughout Britain and all the temperate parts of Europe, Asia, and N. America. Commonly found in hedges and coppices, reaching a height of about 12 ft. The leaves are alternate, and the male flowers appear in cylindrical catkins, while the female flowers are mere clusters of coloured styles at the extremity of the buds. A number of varieties are cultivated extensively in Kent around Maidstone.

HAZEL

**Hazel Grove and Bramhall**, station in Cheshire, England, 2 m. S.E. by S. of Stockport on the Midland Region railway. Pop. 13,300.

**Hazelrigg**, Sir Arthur, see **HASLEND**.

**Hazing**, see under **FAGGING**.

**Hazleton**, city of Pennsylvania, U.S.A., 34 m. S.S.W. of Scranton in Luzerne co. It is served by the Pennsylvania and Lehigh Valley Rlys. The chief manufs. are shirts, silk and knitted goods, etc. It is a coal-mining tn., surrounded by large anthracite collieries. Pop. 38,000.

**Hazlitt**, William (1778-1830), author, was educated for the Unitarian ministry, but abandoned this profession for painting, in which art he showed some skill. Dissatisfied, however, with his progress as a painter, he determined to become a writer, and in 1805 pub. his first book, *Essays on the Principles of Human Nature*. He issued many books during the next years. 'The Round Table,' contributed to the *Examiner* (1815-17), attracted much attention, and the favourable impression created by these papers was increased by his *Characters of Shakespeare's Plays* (1817). His lectures (afterwards printed) on the Eng. poets (1818) and the Eng. comic writers (1819) placed him in the first rank of contemporary critics, and his reputation was enhanced with the pub. of *The Spirit of the Age* (1825) and *The Plain Speaker* (1826). His *Life of Napoleon Buonaparte* (1828-30) was not a very satisfactory biography, but his *Conversations of James Northcote, Esq., R.A.* (1830), were distinctly interesting. When unprejudiced—he often was prejudiced in the case of writers with whom he was

acquainted—his judgment was usually sound, and generally well expressed. He wrote with sympathy, but declined, very rightly, to be influenced by the conditions under which a work was produced. He judged on its merits what was before him. See A. R. Waller and A. Glover (ed.), *Collected Works*, 1902-06; P. P. Howe, *Complete Works*, 1930-34; and G. Keynes, *Bibliography of William Hazlitt*, 1931.

WILLIAM HAZLITT

Also W. C. Hazlitt, *Memoirs of William Hazlitt: with Portions of his Correspondence*, 1867; A. Birrell, *William Hazlitt*, 1902; P. P. Howe, *The Life of William Hazlitt*, 1922, 1928; H. Pearson, *The Fool of Love*, 1934; and C. M. Maclean, *Born under Saturn* (novel), 1913.

Hazlitt, William Carew (1831-1913), Eng. writer, bibliographer, and numismatist, b. in London, grandson of Wm. H., essayist. Works include: *History of the Origin and Rise of the Republic of Venice* (1858), *Memoirs of William Hazlitt: with Portions of his Correspondence* (1867), *R. Dodsley, A Select Collection of Old English Plays* (1871-76), *The Lambs* (1897), *Collections and Notes* (1876-1903), *Shakespeare* (1902), *Popular Antiquities of Great Britain* (1905), *The Hazlitts: An Account of their Origin and Decent*, 1911. See Katharine Anthony, *The Lambs*, 1918.

**Head.** The human body is obviously separable into head, trunk, and limbs, of which the first is naturally divided into skull and face. Vertebrates possessing a head are termed *Cranata*, the higher types of which have the hard bony case of the skull containing the brain, which is continuous with the spinal cord, while the cavity of the face is almost entirely occupied by the mouth and pharynx, into the latter of which the upper end of the alimentary canal opens. It will be seen

that the fundamental structure of the human body is that of a double tube, the dorsal and ventral, and in a comparison of the head with the trunk it will be found that in the former the dorsal tube is large relatively to the ventral. This condition is reversed in the trunk. The head is also remarkable on account of the large number of organs of special senses which it contains, such as those of smell (nose), taste (tongue), sound (ear), sight (eye) (see under these headings), hence there is no necessity to enlarge here on the vital character of this part of the human body.

**Development.**—In the embryo the distinction between the head and trunk by the formation of a cervical constriction is a change of comparatively late occurrence, though long before this constriction appears the characteristic features of the parts have become apparent. At first the head may be said to consist wholly of the cranial part; the face being developed later from a series of out-growths or bars of the cranium.

**Head, Sir Edmund Walker** (1805-68), governor-gen. of Canada, b. near Maidstone, Kent. Educated at Winchester and at Oriel College, Oxford. Made Poor Law Commissioner in 1841, and lieutenant-governor of New Brunswick in 1817. In 1854 he became governor-general of Canada, which position he retained till 1861, when he returned and was made a civil service commissioner and Privy Councillor in the course of a few years. He ed. F. T. Kugler's *Handbook of Spanish Painting* (1854) and pub. *Ballads and other Poems* (1868).

**Head, Sir Francis Bond** (1793-1875), Brit. soldier, traveller, and governor of Upper Canada, b. at Herning, Kent. Entered corps of Royal Engineers and served at battles of Waterloo and Fleurus. In 1825 was placed in charge of an association formed to work the gold and silver mines of Rio de la Plata. In connection with this work made sev. rapid journeys over the Andes and across the Pampas, described in his *Journeys across the Pampas* (1826). Appointed governor of Upper Canada in 1835, but resigned office two years later, and in 1834 was created a baronet. The rest of his life was devoted to literary pursuits. Among his pub. are: *Bubbles from the Brunnen of Nassau* (1834), *A Faggot of French Sticks* (1852), *The Royal Engineer* (1869).

**Headache** is present at the commencement of all fevers and many other diseases. When persistent, it may be due to tumour, or other changes in the brain. The term H. is often used to include neuralgia, or pain due to the nerves or nervous structure, as the eye, when it may be relieved by appropriate glasses to correct the otherwise fairly normal vision. H. may also be caused by the fact that the glasses used are inappropriate, when measures should be taken to have them changed as soon as possible. H. may also be due to the general circulation, as in diseases of the kidney and heart. Ordinary Hs. often appear in the form of migrain or hemicrania, so called because only one part of the head is affected, or the pain

is greater in one half than in the other. They are frequently accompanied and relieved by vomiting, and the pain is prevented by modifying the diet or aiding evacuation by laxatives or purgatives, or so treating the accompanying anemia that the digestion is better able to put to a good use the food supplied to it. As the digestion is apt to be upset by worry, quarrels, vitiated air, railway and air journeys, and sea voyages, precautions should be taken when these risks are likely to be incurred. The use of hypnotics and drugs is not unassociated with risk, and it is better not to take them, except under medical advice.

Its in early life are often a symptom of other diseases which may declare themselves later. Every effort, therefore, should be made to remove the cause from which they originate. When no organic trouble can be found, chronic or recurring Hs. may be due to an anxiety state arising out of hidden fears and emotional conflicts, which can be resolved by psychiatric treatment.

Head-hunting, or Head-snapping, custom once prevalent among all Malay races, but now rapidly dying out, of obtaining and treasuring the heads of their enemies. Even to-day it survives among the Dyaks of Borneo and other E. tribes, e.g. among the natives of the Solomon Is. Writing of the Solomon Islanders in 1898, H. Cayley Webster says, 'These natives are not only head-hunters and cannibals, but make no secret of it whatever . . . and when apparently on the most friendly terms are only awaiting a favourable opportunity to catch the stranger unawares, and to add one more head to their already huge collection.' (*Through New Guinea and the Cannibal Countries*). It is believed to have had its origin in religious motives, the worship of skulls among the Malays being universal, and it is said to have existed in the Philippine Is. in 1577. The chief examples of head-hunters are the Was, a hill tribe on the N.E. frontier of India, and the Nagas and Kuhus of Assam. Severe repressive measures, however, have led to the decrease of the custom. See C. Bock, *Headhunters of Borneo*, 1881.

Headington, par. in Oxfordshire, England, 2 m. E.N.E. of Oxford, in the Woodstock div.

Headlam, Arthur Cayley (1862-1947), Eng. clergyman, Regius prof. of Divinity, Oxford. Principal of King's College, London, 1903-12, and made the theological faculty into the largest theological college in the Church of England. Bishop of Gloucester, 1923-45. His publs. include: *History, Authority and Theology* (1909), *St. Paul and Christianity* (1913), *The Church of England* (1924), *Economics and Christianity* (1926), *The New Prayer Book* (1927), *Christian Unity* (1930), and *The Holy Catholic Church* (1945).

Headless Cross, eccles. par., Warwickshire and Worcestershire, England, 5 m. S.E. of Bromsgrove. Pop. 4600.

Headmasters' Conference. In 1869 the Rev. Edward Thring, headmaster of Uppingham School, invited the head-

masters of thirty-seven of the leading schools of England to meet at his house and form a School Society which should have an ann. conference on educational matters. A small body of men attended the first meeting, but the society gradually developed and was incorporated in 1909. In 1930 there were 140 members in England, five in Scotland, four in Ireland, two from the Channel Is., and one from the Isle of Man, while thirty members were Overseas—seventeen of those were in Australia. All the headmasters have charge of large public schools closely connected with Oxford and Cambridge, to which many of the students pass from these schools. At the Conference such varied subjects are discussed as the training of teachers, the discontinuance of compulsory Gk. at Oxford and Cambridge, noxious literature, and sports associations.

Headmasters, Incorporated Association of, founded 1890, incorporated 1894. The association has exerted itself to place before the educational authorities and the public at large the issues raised by the organization of secondary education under central and local authorities. To be qualified for membership it is necessary to be a headmaster of a boys' day-school, such school coming under the category of secondary schools recognised by the Ministry of Education, and controlled by a body of governors who have power to appoint and dismiss the headmaster, and to control the school's finances. Many of these members have seats on the educational committees of co. councils, and the association has estab. a scheme for the awarding of co. council scholarships. The membership is very large, with more than 700 headmasters on the list. The address of the Association, as of that of the Association of Assistant Masters in Secondary Schools, is 29 Gordon Square, London, W.C.1.

Headon Beds, one of the series of Brit. strata occurring in Hampshire, the Isle of Wight, and Devonshire, England. A variable series of clays, marls, sands, and limestones, the upper div. is of fresh water, the middle partly marine, partly fresh water, and the lower of fresh and brackish water origin. It is, as well as Hampstead, Bombridge, and Osborne Beds, belong to the Oligocene system, and strata formed during the epoch between Eocene and Miocene times.

Head-snapping, see HEAD-HUNTING.  
Health, see DIET; FOOD AND FEEDING;  
HEALTH ORGANISATION, WORLD; HYGIENE; NATIONAL HEALTH SERVICE;  
PUBLIC HEALTH; SANITATION, etc.

Health, Bill of, see BILL OF HEALTH.  
Health, Board of, an administrative body of the Privy Council: estab. early in the last century for the regulation of the sanitary conditions of life, prevention of infectious diseases, epidemics, etc. Its jurisdiction is now exercised by the Ministry of Health (q.v.).

Health Insurance, National, see NATIONAL INSURANCE.

Health, Ministry of. This dept. of state was created by the Ministry of Health Act, 1919, to exercise in England

and Wales powers with respect to public health and local gov.; and to it were accordingly transferred by the Act: (1) all the powers and duties of the Local Gov. Board, and the Insurance Commission, (2) the powers of the Board of Education relating to the health of expectant and nursing mothers and of children under five, and to the medical inspection and treatment of children and young persons; (3) all the powers of the Privy Council and of the Lord President of the Council under the Midwives Act. Responsibility for the National Health Insurance and the Widows', Orphans' and Old Age Contributory Pensions schemes was transferred to the Ministry of National Insurance in 1945. The main administrative divisions in the M. of H. deal with (a) local government organization and finance; (b) housing; (c) general practitioner services and nursing; (d) hospital services; (e) local authority health services; (f) local authority welfare services; (g) mental health services; and (h) water supplies and sewerage. The analogous Scottish dept. is the Department of Health for Scotland in Edinburgh.

**Health, Organisation, World.** The international body charged by the United Nations with responsibility for all the international aspects of health. The constitution for the organisation was signed on Jul. 22, 1946 by sixty-one nations (two others agreed at a later date and the U.S.S.R. withdrew), whose gov. recognised that those problems of health which are no longer purely national must be solved by international action and on a world-wide basis. In the previous half-century a number of international health organisations were built up, none of them complete but all serving useful purposes. The constitution of the W. H. O. embodies the experience gained by those organisations but goes further in an attempt to help all mankind to a higher standard of living. The principles which the sixty-one nations held as basic to the happiness, harmonious relations and security of all peoples are as follows:

'Health is a state of complete physical, mental and social wellbeing and not merely the absence of disease or infirmity. The enjoyment of the highest attainable standard of health is one of the fundamental rights of every human being without distinction of race, religion, political belief, economic or social condition. The health of all peoples is fundamental to the attainment of peace and security and is dependent upon the fullest co-operation of individuals and States. The achievement of any State in the promotion and protection of health is of value to all. Unequal development in different countries in the promotion of health and control of disease, especially communicable disease, is a common danger. Healthy development of the child is of basic importance, the ability to live harmoniously in a changing total environment is essential to such development. The extension to all peoples of the benefits of medical, psychological and related knowledge is essential to the fullest

attainment of health. Informed opinion and active co-operation on the part of the public are of the utmost importance in the improvement of the health of the people. Governments have a responsibility for the health of their peoples which can be fulfilled only by the provision of adequate health and social measures.' The international quarantine measures to prevent the entry of, e.g., yellow fever, into the United States, of smallpox into Britain, are administered by W. H. O. Another important activity of the organisation is to establish international standards for drugs, sera and vaccines. Another function of the body is to draw up a common technical language for doctors in all countries. In order to carry out these tasks the W. H. O. are guided by expert committees. At the first meeting of the assembly of the W. H. O. the following subjects were regarded as being at the moment the most suitable for international action: the control of malaria, an extensive programme to cut down the spread of tuberculosis; the control of venereal diseases; and assistance for governmental services for maternal and child health.

**Health, Public, see PUBLIC HEALTH.**

**Health Resorts,** places frequented by the healthy in order to keep healthy, or by the diseased in order to regain health or to check the progress of the disease. For the healthy such resorts may be roughly divided into seaside and countryside dists. where the pure air and the generally more active outdoor life suffice to refresh mind and body. H. R. for the diseased are classified according to the conditions they are intended to cure. Consumptives frequent places at a high altitude, such as Davos Platz and Andermatt, or dists. where the climate is mild and equable, as at Bournemouth, Torquay, and the Isle of Wight in England, and the Riviera, S. Italy, Algiers, Egypt, S. Africa, and S. California. Many H. R. depend on the constitution of certain mineral waters, which are commonly regarded as of curative value in specific diseases. Special organisations and physicians of specialised experience probably have more to do with such cures than the actual chemical constitution of the waters. **See HALVOCOLONY.**

**Health Service, National, see NATIONAL HEALTH SERVICE.**

**Healy, Timothy Michael (1835-1931),** Irish politician, lawyer, and governor-general, b. at Buntry. He was called to the Irish Bar in 1881, became a Q.C., 1899; in 1903 he was called to the Eng. Bar, and was a bencher of Gray's Inn, and of King's Inn, Dublin. A member of the Independent Nationalist party in the Eng. House of Commons before the creation of the Irish Free State, he sat, from 1880, for Wexford, co. Monaghan, N. Londonderry, N. Longford, N. Louth, and N.E. Cork in turn, and in 1910 he founded the Independent Nationalist Party with Wm. O'Brien. H. was an anti-Parliamentarian after the first split in 1890, but, ten years later, supported reunion under the leadership of John Redmond.

Expelled in 1900 from the Nationalist Party for his opposition to the United Irish League, but taken back in 1908, and then again driven out in 1910. Retired from politics in 1918. Became governor-general of the Irish Free State, serving 1922-27. A witty and humorous debater and forensic orator. He is the author of *A Word for Ireland* (1886), *Loyalty plus Murder* (1884), *Why there is an Irish Land Question* (1881), *Letters and Leaders of My Day* (1928). See L. O'Flaherty, *Life of Tim Healy*, 1927; and Sir D. P. Barton, *Tim Healy, Memories and Anecdotes*, 1933.

Hearnor, urb. dist. in the Ilkeston parl. div. of Derbyshire, 10 m. N.W. of Nottingham. It has hosiery works and large collieries. Pop. 22,600.

Heard, (Henry Fitz) Gerald (b. 1889), Eng. author, son of the late Prebendary H. J. Heard, educated at Sherborne and Cambridge Univ. Literary editor of the *Realist*, 1929. Provocative writer on the modern world's problems. Bracketed by Sir R. W. Livingstone with G. B. Shaw, H. G. Wells and Aldous Huxley as one of our modern 'Sophists' (*Plain: Selected Passages*). His *Science in the Making* (1935) is one of the most fascinating and instructive books of recent years on the problems which beset a changing world and the degree of achievement of true progress. His *Science Front* (1937) is a stimulating survey of the march of science. Other works: *The Ascent of Humanity* (1929), *The Social Substance of Religion* (1931), *The Emergence of Man* (1931), *This Surprising World* (1932), *Exploring the Stratosphere* (1936), *These Hurrying Years*—an historical outline of the years 1900-1933 (1931), *Pain, Sex, and Time* (suggests a remedy for present ills, 1939), *The Creed of Christ* (1911), *The Code of Christ* (1943), *The Doppelgangers*, (1919).

Hearing, the result of the stimulus of the auditory neurons by impulses set up in the auditory nerves. See EAR.

Hearn, Lafcadio (1850-1904), Eng. author, was b. in Leucadia, one of the Gk. Ionian Is. His father was an Irishman, Surgeon-Maj. Charles Hearn, stationed in Leucadia at the time of the Eng. army occupation, and he married a Gk. woman. Being a Rom. Catholic, he sent his son to Ushaw College in Durham, but the boy was not happy there. He was tormented by a morbid self-consciousness by reason of his sallow skin, myopic eyes, and general foreignness to his surroundings. He had also begun to rebel against the religion in which he was brought up. At the age of nineteen he ran away, and in some way, never explained, managed to reach the U.S.A. He secured a post as reporter on the *New Orleans Times Democrat*, writing queer poetic pieces about old Creole days and songs. His paper commissioned him to visit the W. Indies, where he spent two years, principally in Martinique. The fruits of this were gathered in his book *Two Years in the French West Indies*, pub. in 1890. The following year the New York publishing house of Harper and Brothers commissioned him to go to

Japan. After writing a few articles for their magazine, he soon let his contract drop, and decided to settle in the country. He felt at ease among the Jap. He became a prof. of Eng. at the univ. of Tokyo, and wrote vol. after vol. about the country of his love. Among them were: *Glimpses of Unfamiliar Japan* (1894), *Out of the East* (1895), *Kokoro* (1896), *Gleanings in Buddha Fields* (1897), *In Ghostly Japan* (1899). All of these were distinguished not only by a delicate and unoccidental appreciation of the country, its peoples, its customs and legends, but were also clothed in a very beautiful silvery prose. Hearn married a Jap. woman, took the name of Yakuimo Kozumi, became a Jap. citizen, and adopted the Buddhist faith. Then began disillusionment. As a Jap. citizen he was no longer treated with the consideration he had enjoyed before. The last years of his life were marked by illness, and he lost his position in the univ. of Tokyo. His book, *Japan, an Attempt at Interpretation* (1904), showed that his eyes were beginning to be opened to realities. See Milton Bronner, *Letters From the Raven*, and Elizabeth Bisland, *Life and Letters of Lafcadio Hearn*, 1906.

Hearne, Samuel (1715-92), Eng. explorer, b. in London. He entered the Hudson Bay Company and examined parts of the coast of the Hudson Bay N. of Fort Churchill (then Fort Prince of Wales) in order to extend its trade area. In 1769 the company sent him on an expedition to discover some valuable copper mines which the Indians reported as existing and to ascertain whether there was a sea upon the N. shores of America which would connect the two oceans. After two attempts in 1769 and early 1770, he set out again in Dec. of that year and accomplished both objects, besides learning the fate of James Knight (q.v.), the explorer from the land of the Esquimaux. See Hearn's *Journal*, pub. posthumously in 1795.

Hearne, Thomas (1678-1735), Eng. antiquary, b. at Littlefield Green, Berkshire. He graduated at St. Edmund Hall, Oxford, in 1699, whereupon he was appointed assistant keeper of the Bodleian Library, and in 1712 became second keeper. He was obliged to resign this office in 1716 on his refusal to take the oaths of allegiance to George I., which likewise prevented him from holding other academic positions. His chief works are: *Reliquiae Bodleianae* (1703), *A Collection of Curious Discourses upon English Antiquities* (1720), and ed. J. Leland's *Itinerary* (1710-12), and *Collectanea* (1715) Margaret Koper, *Life of More* (1826), and numerous old chronicles. See his autobiography in the *Lives of John Leland, Thomas Hearne, and Anthony a Wood*, 1772.

Hearsay, see EVIDENCE.

Hearse (Lat. *hirpes*, harrow), a contrivance for conveying the dead to the grave; originally a triangular framework for holding candles at a church service, especially at funerals. In the fifteenth and sixteenth centuries Hs. of great

magnificence came into use, made of iron or brass, with a canopy and rich hangings, lighted by countless candles. They were erected in the churches over the bodies of distinguished persons.

**Hearst, William Randolph**, one of the greatest newspaper owners in the world, was b. in San Francisco, California, U.S.A. in April 1863. His father was George Hearst, a California pioneer, who made a fortune in silver mines and served in the United States Senate from his state from 1886 to 1893. The son went to Harvard Univ. from 1882 to 1885 and while there became far more interested in journalism than in academic studies. Went to work on the *San Francisco Examiner*, and by 1887 had gained entire charge of it from his father, the owner. H. experimented with the paper, and reached the firm conviction that the new journalism must include great, black sensational headlines, many illustrations and comic cuts. At this time Joseph Pulitzer and his *New York World* were the prin. exponents of the newer journalism. But H. took from the *World* staff some of its best people by offering much higher salaries. One of the famous characters in the Hearst comic strips was called the 'Yellow Kid.' Hence the term applied to his newspapers—Yellow Journalism. He vigorously supported Bryan for the presidency in 1896 and 1900, and Wilson in 1912 and 1916. As much as anybody, H. pushed the United States into its war with Spain in 1898. On the other hand, he vigorously opposed America entering the First World War, and he also fought America's entering the League of Nations. He was originally a Democrat in politics, serving two terms as Congressman from the 11th New York Dist., 1903-7. He unsuccessfully ran for mayor of New York city on a municipal ownership ticket in 1905, and in 1906 ran for governor of New York state, being supported by the Independence League and by the Democrats. In recent years he has been an independent in politics, often supporting Republican candidates. He has built up a vast chain of newspapers.

**Heart.** In the various animals, this is the important propulsive structure concerned in the blood circulation. In some invertebrates there is no H., e.g. *Actinia* such as *Amphioxus* (see *CERPHALOCORONATA*), while in others, such as insects, there is an elongated segmented organ, situated dorsally; in the lower orders (e.g. the Earthworm) it is merely represented by a higher development of certain blood vessels. In the vertebrates it is situated ventrally. The comparative anatomy of the H. is a complicated subject, and only a brief reference can be given here. In fishes it resembles the CO-shaped form of the human embryo, and in most cases it is concerned in the propulsion of deoxygenated blood through the gills, where it becomes oxygenated. In amphibia a development of the lungs has resulted in a three-chambered structure, having one ventricle and two auricles. In the reptiles a ventricular septum is commencing, and is almost complete in the crocodiles.

In birds the organ is four-chambered, but lacks development to the extent that the chordæ tendineæ (see *below*) are missing from the right auriculo-ventricular valve. In mammals there is, in general, a close correspondence with the human form, though in the lower orders the structure is placed less obliquely. The ossification of some of the fibro-cartilage tissue about the base of the great vessels of the H. is seen in the Ungulates, e.g. the os cordis of the ox.

The human H. is a hollow muscular organ, more or less conical in shape, situated in the thorax between the two lungs. It is found to be flattened in transverse section, and in its natural condition it is roughly equal in size to the closed fist of the individual, i.e. in the adult it appears to be about 5 in. long, 3½ in. in its greatest width, and 2½ in. thick, but it is subject to considerable variations in different persons, and even to variations at different times in the same subject. The ratio of H. weight to body weight is normally about 1:100. Its capacity is 22 c.c., approximately, in the new-born infant, from 150 to 160 c.c. in a youth of sixteen years of age, and increases rapidly for the next ten years, and more slowly later, reaching about 290 c.c. capacity in a male aged fifty, while in the case of a female the capacity is some 25 c.c. less. The H. is enclosed in a strong membranous sac (the *pericardium*), and is situated between the breast-bone and the costal cartilages. It has a very oblique position in the chest, the base being directed upwards, backwards, and to the right, and extending from the level of the fifth to that of the eighth dorsal vertebra. The stroke of the H. is most perceptible about 3 in. from the middle line of the sternum, and about 1½ in. below the left nipple. The organ contains a longitudinal partition, dividing it into a right and a left half, transverse constrictions further sub-divide its interior into four chambers, viz. the right and left auricles and the right and left ventricles. The exterior is marked by a deep transverse groove, the auriculo-ventricular furrow, and by two longitudinal furrows, roughly corresponding to the internal septum and constrictions. In the furrows will be found the *coronary* arteries and veins which are concerned with the blood supply of the H.'s component structures. Lymphatic vessels and nerves embedded in fatty tissue and covered by a layer of the pericardium also occur. This pericardium is a dense fibrous mantle of two layers which enclose the pericardial cavity. The outer and inner layers present smooth serous surfaces to one another and secrete a pericardial fluid which acts as a lubricant.

**Cavities.**—The auricles (so named from a fancied resemblance to an ear *Lat. auris*), which are situated at the broad upper base of the H., are thin-walled cavities acting as reservoirs for the blood. The posterior part of the right auricle receives the venæ cavae, the superior being above and the inferior below, and the remains of the Eustachian valve, a relic of foetal circula-

#### THE HEART AND CIRCULATION OF BLOOD IN A FISH (THE DOG-FISH)

1 the auricle which received oxygenated blood from the body, 2 the ventricle which pumps the blood through the ventral aorta (4) and the afferent branchial arteries (3) to the gills, 5) In the gills the blood is re-oxygenated and circulates round the body again.

tion, will be found attached to the right and lower margin of the outlet of the inferior vena cava. The right auricular appendage overlaps the root of the aorta, and lies in front of the superior vena cava. The tricuspid valve separates the right auricle from the right ventricle, which pyramidal chamber has much stouter walls than its corresponding auricle. The pulmonary artery is in communication with the right ventricle, though a valve in the form of three warty pockets, or cusps, closes the opening into this artery at certain stages of the *cardiac cycle*. Each cusp of the valve has a small knob (*Corpus Arantii*) in the middle of its curved edge, and the three flaps fit back into corresponding niches in the arterial tube. These hollows (*sinuses of Valves*) ensure that when the valve is fully relaxed, the blood shall have an uninterrupted passage into the efferent vessel. The left auricle receives the blood from the *pulmonary vein*; it passes thence into the left ventricle, which in this direction is unobstructed by the *mitral valve* (so called from its resemblance to the bishop's cap of that name). The left ventricle is the stoutest walled of the four chambers, as its contractive force must propel the blood throughout the whole of the body.

**Cardiac cycle and the circulation**—This cycle of activity comprises (a) the simultaneous contraction of the auricles, followed by (b) a simultaneous contraction of the ventricles. The former occupies about one third of the time of the latter, and the two contractions are termed *systole* of the H. They are followed by a pause, *diastole*, which occupies a period of time roughly equal to that of the complete *systole*. The whole cycle is repeated about seventy five times per min. During the contraction of the auricles the mass of blood contained in the large veins prevents regurgitation and the total contents pass into the uncontracted ventricles. The valves, which have been slowly closing during the filling of the lower chambers, are completely closed on the commencement of the ventricular *systole*. The valve sections are semilunar in shape, and are composed of endothelium, strengthened by enclosed fibrous tissue, the two cusps of the mitral valve are unequal in size. fleshy columns (muscular papillae) support strong tendinous cords (*chordae tendineae*), which are attached to under surface of the valve flaps and prevent these from being forced into the interior of the auricle during the ventricular *systole*. From the left ventricle the bright red oxygenated blood from the pulmonary vein is forced into the *aorta* with its three cusped valve resembling that of the pulmonary artery. It is estimated that each ventricle propels forward  $\frac{1}{2}$  cubic in. of blood during each *systole*, and the total work of the H. in twenty four hrs. is equivalent to 120 ft. tons. The fetal circulation is different from that described, inasmuch as there is direct communication between the two auricles by means of a large opening (*foramen ovale*) in the interauricular septum, the cycle in this case is right auricle, left auricle, left ventricle to maternal placenta, and so on.

**Sounds**—If complaints are frequently diagnosed by auscultation or the listening to the H. sounds by means of a suitably applied stethoscope. These sounds in a healthy adult will consist of a longish dull sound followed by a short sharp sound, and resemble *loob lub loob lub*, and so on. The former is probably caused by the contraction of the muscular fibres of the ventricle and the tension of the auriculo-ventricular valves, the latter is due to the sudden closure of the semilunar valves on the completion of the ventricular *systole*. H. disease may be detected by irregularities in these sounds.

**Detailed structure**—The main substance of the organ is composed of muscular tissue (*myocardium*), with a certain amount of interstitial areolar tissue containing numerous blood vessels and lymphatics, together with nerves and ganglia in certain areas. At the base of the H., beneath the pericardium, there is usually a considerable amount of fat. Fibrous tissue and fibrous cartilage occur at the large orifices at the base of the ventricles. A previous reference has been made to the ossification of this in certain animals. The inner surfaces of the H.

cavities are lined by a smooth membrane termed the *endocardium*. The muscles are involuntary, but differ from the usual form of these in being striped. The exact arrangement of the fibres is very complicated, and but little understood (reference should be made to recent treatises, as Cunningham's *Anatomy*), but, in summary, there appear to be common superficial fibres for the two auricles and the two ventricles, and separate deeper fibres for each cavity. Recently, fibre bundles (bundles of His) have been traced connecting auricle to ventricle, the function of which is, presumably, to transmit the impulse of contraction from the auricle to the ventricle; if these bundles are damaged, the ventricle contracts very slowly, at its own natural rate, and the condition is spoken of as 'heart block' (see Stokes' Adams' disease, below).

**Nervous system.**—The nervous control of the organ is tripartite, and consists of cardiac nerves derived from the cervical ganglia of the sympathetic system, from ganglia in its own substance, and also from the pneumogastric or vagus direct from the brain; this last system apparently exercises an arresting power on the H.'s action, whilst the sympathetic nerves have the opposite effect, of speeding up the rate of beat.

**Diseases.**—The H. or its investing membranes may be the seat of many different forms of disease.

**Pericarditis** is the inflammation of the pericardium, and is usually accompanied by an excessive effusion of fluid into the pericardial cavity; this may seriously affect the mechanical action of the H. Endocarditis, or the inflammation of the lining membranes of the H.'s cavities, may be caused by acute rheumatism, and may result in serious injury to the valves, usually those of the left side. Valvular damage usually causes *murmurs*, and these sounds are tested by auscultation, and in this manner a narrowing of the valve orifice (*stenosis*) can be distinguished from an incompetence of the valves. An acute ulcerative endocarditis is due to micro-organisms, and is usually fatal. Myocarditis, or inflammation of the muscle substance, may take one or more of several forms, and result in serious permanent trouble, e.g. fatty degeneration. All these complaints, together with derangement of the cardiac nerves or disease of the coronary vessels, result in a demand for extra work on the part of the H. itself, and this usually results in hypertrophy of the muscle until compensation is established. This, in its turn, may result in premature senility through malnutrition. Cardiac dilatation and other complaints may be consequences of influenza. Palpitation, which may be due to digestive troubles, and is then caused by direct impulses from the stomach, must not be confounded with *tachycardia* in which the H.'s action is permanently accelerated as during exophthalmic goitre. Bradycardia, or the slowing of the rhythm, may be due to cerebral tumour, melancholia, jaundice, etc., in the form of Stokes Adams' Disease, or a senile degenerative

THE HEART AND DOUBLE CIRCUIT OF BLOOD  
Deoxygenated blood is shown dotted

RA, right auricle, RV, right ventricle; LA left auricle; LV, left ventricle; TV, tricuspid valve; VG, venous caval; PA, pulmonary arteries, (CL, capillaries in lungs; PV, pulmonary veins, MV, mitral valve, A, aorta; CB, capillaries in body.

change appearing to lead to a weakening of the conductivity of the common deep-seated auriculo-ventricular muscle bundles. Congenital malformations of the H. are not unknown, e.g. the *foramen ovale*, instead of closing up as normally occurs at birth, may remain open, so that purplish deoxygenated blood leaks from the right side of the H. to the left, whence it is pumped round the body; a sign of this complaint is cyanosis (blueness) of the face, especially on exertion. The usual treatment for many forms of H. disease endeavours to ensure a maximum of rest for the patient, and a minimum of excitement, both mental and physical; where necessary digitalis and strychnine are administered as cardiac tonics. The contraction of the H. muscles (as also of other muscles in the body) is accompanied by electrical impulses which can be amplified and rendered visible on a screen by means of the *electrocardiograph*. A photograph (*electrocardiogram*) of these impulses is valuable for the diagnosis of H. diseases. See also ANGINA PECTORIS.

**Heart Burial**, the burial of the heart in a separate place from the body. It

appears to have been practised by the anc. Egyptians, and was not uncommon in Europe during the twelfth and thirteenth centuries. The custom probably arose out of a veneration for the H., which was regarded as the seat of a man's affections and conscience and was associated with his soul. It was forbidden by Boniface VIII. (1294-1303), but his prohibition was withdrawn by Benedict XI. The heart of Richard I. was buried in Rouen Cathedral, and that of Edward I. at Jerusalem. Other notable instances of H. B. may be cited in the cases of Henry III. in Normandy, James II. in Paris, Robert Bruce at Melrose Abbey, the Fr. kings, Louis IX., XIII., and XIV., Francis I. and II., Philip III., etc., and the Emperor Leopold of Austria. Shelley's heart *cor cordium*, was sent home to Bournemouth, and Byron's was buried in the mausoleum at Missolonghi in Greece. The heart of the Marquess of Bute was buried in Jerusalem as late as 1900; that of Thomas Hardy (q.v.) at Stinsford, in 1928. Separate burial was sometimes given to other parts of the body. The viscera of the popes have been buried in the church of the Quirinal since the time of Sixtus V. (1590). See T. J. Pettigrew, *Chronicles of the Tombs*, 1857; and Emily Hartshorne, *Enshrined Hearts of Warriors and Illustrious People*, 1861.

**Heartburn**, the common name for a burning sensation in the chest, often accompanied by a feeling of discomfort in the throat and in the region of the heart. It is due to gastric disturbances, and is generally caused by irritation of the stomach wall by hyper-acidity of the gastric contents. The cardiac symptoms, when present, are generally due to an over-distended stomach interfering with the heart's action. The discomfort is rapidly relieved by a dose of bicarbonate of soda. The condition should be treated by ensuring a simple diet, regular exercise, and regular action of the bowels. Charcoal and bismuth are also very useful drugs for H.

**Hearth-money**, tax of two shillings imposed in 1662 on every hearth in all houses except cottages. The principle was an old one, for in early Eng. hist. an A.-S. king obtained part of his revenue from a *furnage*, a tax on the hearth smoke of all his subjects but the very poor. The tax of Charles II.'s reign was exceedingly unpopular, and was withdrawn in 1689, a window-tax being levied in its stead in 1695. The idea is also apparent in the hearth penny-tax paid annually to Rome as early as the tenth century.

**Heart of Midlothian**, old Tolbooth or gaol, pulled down in 1817, of Edinburgh, the cap. of Midlothian, which gives its name to one of Scott's novels.

**Heart's Content**, seaport and tn. of Newfoundland, situated on the Avalon Peninsula, 40 m. N.W. of St. John's, on the E. coast of Trinity Bay. It is the terminus of three Atlantic cables from Valentia in Ireland. Pop. about 1500.

**Heart's-ease**, see **PANTRY**.

**Hearts of Oak**, large friendly society founded in 1842, the objects of which are

to provide relief for members during sickness, and for members' wives during confinement, to insure the tools and implements of trade of members against loss or damage by fire, and to provide sums at the death of a member and for funeral expenses. The society also defrays the expenses of residence of members in convalescent homes and sanatoria. Special facilities for house purchase are afforded by the society to members and others. The membership is 423,000 and the funds, including reserves, amount to £17,665,000. The society's offices in Euston Road, London, were opened by King Edward VII. in 1907.

**Heat**, general term applied to that branch of physics that deals with the effects produced by heat on material bodies, with the laws governing the transference of heat from one body to another, with the physical nature of heat, and with the transformations of heat into other forms of energy. The term H. is used in ordinary language in a number of different senses, of which the following are the most common: (a) sensation of H.; (b) temp. of degree of hotness; (c) quantity of H.; (d) radiant H.

(a) The sense of H. is distinct from that of touch, for the former sensation is experienced if we sit in front of a fire, or in the sun, or in the neighbourhood of any hot body, and is, therefore, not dependent on actual contact with matter. It is from this sense of H. that we get our first ideas of H. as a physical entity which is capable of passing from one body to another.

(b) If a hot iron is placed on a cold iron plate, we may observe by a sense of H. that the plate is heated and the iron cooled until they both attain the same degree of warmth. From the sense of H. we derive the idea of a continuous scale or order, which we express as summer H., blood H., red H., etc., and we speak of the *temperature* of a body as denoting its place in the scale as distinct from the quantity of H. it contains.

(c) The quantity of H. in a body must depend on its size (and also, it should be added, on its material). The temp. on the other hand, does not depend on the size of the body, but on the quantity of H. per unit mass (other things being equal).

(d) It is well known that when the rays of the sun or of a fire fall on a body, they warm it, but it must not be supposed that H. has travelled across the intervening space from the sun or the fire to the body warmed. It is known that the energy of radiation is not the same thing as H., though it is converted into H. when the rays strike an absorbing substance.

The question at once presents itself, 'What is heat?' In this connection it will be well to follow briefly the development of the modern theory of H. It has long been known that H. can be developed by friction (e.g. between the wheels and axles of a carriage), or by percussion (e.g. by hammering a piece of iron on an anvil), or by compression (as in the case of a bicycle pump). This development of H. was accounted for by supposing that every

body in a normal state possessed a certain capacity for H. and contained a certain quantity of caloric at a definite temp. Percussion altered the condition of the substance and lessened its capacity for H. Some of the caloric was squeezed out of it, and, being thus set free, manifested its presence by the rise of temp. The weakness of this theory was shown by an experimental investigation carried out by Count Rumford in 1798. He mounted a gun-metal cylinder so that it could be rotated by h.p., while a blunt steel boring tool pressed against its bottom. The cylinder was covered with a layer of flannel to prevent loss of H., and its temp. was recorded by means of a thermometer placed in a hole drilled in the bottom. At the end of half an hour, when the cylinder had made 960 revolutions, the temp. had risen by 70° F. He found that the metallic dust rubbed off by the friction from the cylinder weighed only 837 grains troy (less than  $\frac{1}{1000}$  of the weight of the cylinder). 'Is it possible,' he said, 'that the very considerable quantity of H. produced in this experiment could have been furnished by so inconsiderable a quantity of metallic dust, and this merely in consequence of a change in its capacity for heat?'

FIG. 1. JOULE'S APPARATUS

But Rumford went further, and showed that the capacity for H. of the dust was the same as that of the solid metal. The H. had clearly been produced by the friction, and was equivalent to the work done in rotating the cylinder under the conditions of the experiment. The accurate investigation of the relation between the work done in driving an apparatus and the H. developed was taken up by Dr. Joule of Manchester in the year 1840. The H. was produced by friction of a brass

paddle revolving in water contained in a specially constructed brass vessel, so that the water was heated by a kind of revolving churn process and the temp. was registered by a delicate mercurial thermometer. The paddles and the flywheel (Figs. 1 and 2) were driven by two wheels *d* and *e*. If everything were free the friction between the brass vessel and the water would carry the vessel round with the paddles and the water could not be churned, and therefore it would not be heated. The vessel was prevented from rotating by two forces applied by two strings fastened in a groove round the vessel and passing over the pulleys *j* and *j* and weighted at *k* and *k*. From the number of revolutions made by the paddles, the work done was calculated.

FIG. 2. BRASS VESSEL SHOWING PADDLES

After all corrections were made, Joule decided that the work done in raising a weight of 1 lb. through 772 ft. (at Manchester) will, if spent in friction (between brass and water), raise the temp. of 1 lb. of water 1° F. Joule showed quite clearly that the amount of H. produced depended on the amount of work done and on nothing else. He found the same result for friction of water in a brass vessel with a brass paddle, for friction of mercury contained in an iron vessel with an iron paddle, and for friction of two iron rings rubbing against each other in mercury. Joule also proved that H. is absorbed when a gas does work in expansion; and measured directly the amount of H. liberated by the compression of a gas. The principle which these experiments have established is that 'when H. is transformed into any other kind of energy, or *vice versa*, the quantity of H. which disappears is equivalent to the quantity of the other kind of energy produced, and *vice versa*.' But we have not given a satisfactory explanation of H. by saying that H. can be transformed into other forms of energy and *vice versa*.

The idea that H. is ultimately due to a motion of some sort has long been entertained. By friction and collision the sensible motion of bodies disappears and H. is generated. The supposition has been that the motion in such cases is not really lost, but is merely transferred from

the body as a whole to its individual particles. Thus, when a moving body is brought to rest by friction or collision, the energy of the original visible motion of the body is not annihilated, but passes over into the invisible molecules of the substances taking part in the friction or collision. This theory supposes that when a body is heated the rise in temp. is due to the increased energy of motion of the molecules of the body. But it goes further, and explains the transmission of radiant energy from one body to another, as from the sun to an individual on the earth. There is evidence in favour of the supposition that light is due to wave motion in the ether, and we have exactly the same evidence in favour of the same supposition with regard to radiant energy. Radiant energy (for example the radiant energy emitted by hot-water pipes or a blackened stove) and light behave in exactly the same way in a variety of experiments—in fact the only difference which can be detected is that light, as well as possessing all the characteristic qualities of the radiant energy, is also able to affect the sense of sight. Radiant energy then, like light, is supposed to be due to wave motion in the ether. We say that the molecules of a hot body are in a state of very rapid vibration, or are the centres of rapid periodic disturbances of some sort, that they thus excite waves in the ether, that these waves travel through the ether between a receiving body and the hot body with the velocity of light, and that when they fall upon the receiving body they are more or less absorbed by the molecules of the receiving body, causing similar motions in these molecules. The sense of H. is thus excited in a human being, or an animal, by the waves of radiant energy which start from a hot body just as the sense of sight is excited by the waves of light which start from a luminous body. The fact that light waves possess heating properties if they are absorbed by a suitable substance suggests at once that there is no essential difference between waves of light and waves of radiant energy. Extensive spectroscopic experiments have shown that the two sets of waves differ only in degree and not in kind. The ordinary spectroscope cannot be used, as glass absorbs the waves of radiant energy. Lenses and prisms made of rock salt are used in the instrument, and the radiations are received on the blackened bulb of a thermometer, or on the blackened part of an electrical instrument for recording temp. In this way the similarity between waves of radiant energy and waves of light has been established.

**CALORIMETRY.**—The scientific unit of H. is the *calorie*, which is defined as the quantity of H. required to raise the temp. of 1 gm. of water  $1^{\circ}$  C. Other units of H. are the Brit. Thermal Unit, which is defined as the amount of H. required to raise the temp. of 1 lb. of water  $1^{\circ}$  F., and the Thermo, which is equal to 100,000 B.Th.U. In order to measure a quantity of H., the simplest way is to measure the rise of temp. produced in a known mass of water contained in a suitable vessel or

calorimeter. Calorimetry is discussed fully in text-books on H.

**EFFECTS OF HEAT.**—These may be summarised briefly as follows: (1) change of dimensions or of vol.; (2) change of internal stress; (3) change of state; (4) change of temp.; (5) electrical and chemical effects. Each of these will be considered in turn:

(1) *Change of dimensions.*—Most bodies expand or increase in vol. on being heated. In laying down the rails of a railway, an interval is left between consecutive rails to allow for this. The expansion due to rise of temp. must be taken into account in building steel bridges and in setting up pipes which are to carry hot water. The

FIG. 3

FIG. 4

COMPENSATING PENDULUM

pendulums of clocks and the balance wheels of watches have to be 'compensated,' so that the time of swing shall not be altered by changes of temp. In Fig. 3 a compensated pendulum is shown; the bob G is supported by the rods, *a*, *a*, *b* of one material and the rods *c*, *c* of another material. The lengths of the rods are so adjusted that, whatever the temp., the centre of gravity of the pendulum is always at the same distance below the point of support O.

In Fig. 4 the downward expansion of the rod is compensated by the upward expansion of the mercury. In Fig. 5 the rim of the wheel is made up of three segments, each of which consists of two metals securely fastened together, the more expansible being on the outside. When the temp. rises, the spokes increase

in length, but this is compensated by the bending inwards of each of the segments of the rim. An alloy known as *invar*, which consists of 64 per cent of steel and 36 per cent of nickel, has an extremely small coefficient of expansion, and it is often used in pendulum clocks, since no compensating device is required when the rod and bob are made of it.

The coefficient of expansion of liquids is, as a rule, much greater than that of solids, while the coefficient of expansion of gases at constant pressure is very much greater than that of solids or liquids; further, it is independent of the nature of the gas, *i.e.* oxygen expands to the same extent as an equal vol. of hydrogen, air, or any other gas for a given rise of temp. under the same conditions of pressure.

(2) *Change of internal stress.*—Many of these changes in vol. are accompanied by changes in the internal forces or stresses between the molecules of the body. As a wheel tyre contracts it is subject to enormous internal stresses. If air or any

FIG. 5. BALANCE WHEEL OF WATCH

other gas is confined in a closed vessel and its temp. is raised, the pressure exerted by the gas is increased and may burst the vessel. The tyres of a motor-car are often caused to burst in this way in summer.

(3) *Change of state.*—There are three states of matter, *viz.* solid, liquid and gaseous states, and, as Black discovered in 1756, the change from one state to another is accompanied by the evolution or absorption of H. Because a thermometer shows no change of temp. while a change of state is taking place, Black referred to this H. as *Latent Heat*. For example, 80 calories of H. are required to change 1 gm. of ice into 1 gm. of water at 0° C.

(4) *Change of temperature.*—If a quantity of water be heated, we can tell by our sense of H. that it is becoming hotter; and in scientific language we say that its temp. is rising. The change of temp. can be measured by means of a thermometer (*q.v.*).

(5) *Chemical and electrical effects.*—Chem. changes commonly accompany the heating of a body. Thus when coal is heated in air, it combines with the oxygen of the air and burns; this process, once started, produces sufficient H. for its continuance. The electrical effects of H. are of two kinds: (a) That produced when a circuit is made up of wires of different materials, say copper and iron joined together at each end, and the temp. of the two junctions is different; then a small electric current flows round the circuit. This effect is known as the thermo-electric effect (see **ELECTRICITY—Thermo-electricity**), and was discovered by Seebeck in 1821. Since a very small electric current can be measured easily, this effect of H. is used in many temp. measuring instruments. (b) The change produced in the electrical resistance of bodies by H. This has been made the basis of a method of measuring high temps. by means of the platinum-resistance thermometer (*q.v.*).

*Modes of transference of Heat.*—There are three modes of transference of H.: (1) Convection, (2) Conduction, and (3) Radiation. (1) In convection H. is carried or conveyed by the motion of heated masses of matter. The most familiar instances of this method of transference of H. are the heating of buildings by the circulation of hot water (see **HEATING and VENTILATION**), or the equalisation of temp. that is produced by the movement of the hot water in a mass of water heated from below (as in the case of a kettle). Convection can only take place in fluids, and the process constituting convection takes place as follows. The fluid is heated and expands so that it becomes less dense than the colder surrounding fluid. It is therefore pushed upward by the denser fluid, and it takes its H. with it. Convection plays an all-important part in ventilation.

(2) In conduction, H. is transferred without visible relative motion of the parts of the body. Familiar examples of this are the transference of H. from one end of a poker placed in a fire to the other end, and the transference of H. from one end of a silver spoon, placed in hot tea or coffee, to the other end. Conduction always takes place from the hotter to the colder parts of a conductor. All metals are good conductors of heat, while most non-metallic substances, liquids (excluding mercury) and gases are poor conductors of H.

(3) Radiant H. has been shown to consist of light of longer wave-lengths than those that affect our sense of vision. There is no other essential distinction between 'ordinary' light and radiant H. Both travel with the same velocity of 186,000 m. per sec. *in vacuo*, and we receive all our H. from the sun by means of radiation that travels across empty space incapable of conducting or conveying H. to us by the other modes referred to above.

In most cases H. is transferred by all three methods simultaneously. It is interesting to notice that the thermos

flask (q.v.) designed by Dewar attempts to prevent the transference of H. to or from the enclosed liquid. It consists of a double-walled vessel of glass (a bad conductor of H.), whose inner faces are silvered to reflect radiant H., and the space between the walls is evacuated to prevent transference of H. by conduction or convection.

The chief sources of H. are: (1) the sun; (2) chem. action, as in the burning of coal, wood, etc.; (3) mechanical act, e.g. friction; (4) electrical energy, e.g. heaters and lamps; (5) change of state, e.g. from solid to liquid. It is interesting to note that the ultimate source of all H. in the above cases is the sun.

**Heaters, Electric**, see under **ELECTRIC LIGHTING**.

**Heath, William (1737-1814)**, b. at Roxbury, Massachusetts, U.S.A., started life as a farmer. In 1765 he joined the Ancient and Honourable Artillery Company, and five years later became its commander. In 1774 he became Brig.-Gen. in the prov. army, and took part in the fighting with the Brit. troops at Concord, Mass., in April 1775. In 1776 he became Maj.-Gen. He was defeated in his attempt to take Fort Independence from the Brit. When Benedict Arnold sought to betray his countrymen and then fled to the Brit. lines, H. took charge of the troops at West Point, New York. When Gen. Washington went S. to fight the troops under Lord Cornwallis, he placed the sturdy H. in charge of the soldiers on the Hudson R., which faced Gen. Clinton. After the Amer. colonies had won their independence, H. retired to his farm. However, he took some part in Massachusetts state politics, being a State Senator in 1791. He d. at Roxbury, Jan. 24.

**Heather**, see **CALLUNA VULGARIS**.

**Heathcock**, see **BLACKCOCK**.

**Heathfield, George Augustus Elliott, Baron (1717-90)**, Brit. gen., a younger son of Sir Gilbert Elliott, b. at Stobbs, Roxburghshire. After having been educated at Leyden Univ. and at Woolwich, he fought with the Prussian army in 1735-36, and as a grenadier guard in the war of Austrian Succession at Dettingen and Fontenoy. In 1776, at the outbreak of the Amer. War, he was sent out as governor to Gibraltar. His heroic defence of that fortress against Spain, from June 1779 to Feb. 1783, is one of the finest achievements in Brit. hist. On his return to England in 1787 he was created Baron H. of Gibraltar.

**Heating.** The temp. of a human being in good health is 98.4° F. When the external temp. rises, that of the body is regulated by perspiration while a low external temp. may be counteracted by increased bodily exercise. In civilised

life, however, man requires some form of H. apparatus in addition to clothes and houses. In devising such apparatus the engineer's terms of reference include the considerations of economy and efficiency, ventilation and atmospheric humidity. For detailed arrangements concerning ventilation the article on that subject must be consulted.

In the first place, consideration must be made of the fact that heat is lost from a building by conduction through the walls and especially through windows, and by the leakage of warm air and the consequent entrance of cold air for purposes of ventilation. It is the architect's business to make a study of the losses of heat in this way when designing large buildings before computing the necessary supply of heat.

All systems of H. depend either upon convection or radiation (see **HEAT**) or upon a combination of both. The most common and obvious method of H. is, of course, by radiation, and is exemplified by the open fire. By this means the walls and furniture and occupants of a room are heated and the air left cool. Heat is radiated not only from the fire itself but from the back of the grate and from the sides. The effective radiating surface of an open fire is increased by making the sides of a grate inclined at an angle of at least 120° to the back, and the back is made to hang forward over the fire. Further the grate should be bounded on both sides by firebrick and the overhanging part should be made of the same material. The advantages of this method of H. are (i.) good ventilation, because of the draught up the chimney, (ii.) air in the room is left cool, (iii.) psychological effect of the open fire. The latter is a big inducement to retain this method of H. in spite of the fact that nearly 80 per cent of the heat from the coal is lost to the room.

The latter consideration was responsible for the gen. adoption of stoves in colder countries. While the stove is much more efficient than the fire-grate it is apt to give off noxious fumes into the room and to produce a 'dry heat' that is unhealthy as it affects the throat and the chest. Bad odours are also prevalent with stoves owing to the burning of the dust in the air as it comes in contact with the hot metal. Gas stoves, which usually consist of asbestos, or some similar substance, heated by a row of Bunsen burners (q.v.), are popular where fires are only used occasionally. They act, of course, as open fires, but should always be fitted to an efficient flue to carry off the products of combustion.

**Central Heating.**—In large buildings considerations of economy and labour require some system of central H. This system is often adopted in larger houses and, generally speaking, a hot-water system is used in this country. The water is heated in the basement and circulates by means of convection through pipes and radiators distributed throughout the building. The water rises through large pipes to an open tank at the top of

the system which allows for the expansion of the water and by means of which the pipes and boiler are kept full. The cooled water returns via a vertical pipe to the boiler where it is heated again. Air cocks are placed at the tops of the radiators so that any accumulated air which impedes circulation may escape.

There is also a single-pipe system of central H. in which the hot water is taken from a single main pipe to each radiator and the return is made to a point farther along the pipe. In this system radiators far removed from the main pipe are supplied with cooler water than those nearer to it and for this reason distant radiators are made larger. The temp. of the water leaving the boiler in most systems is about 180° F. In large buildings the circulation of the water by convection is too sluggish and is further opposed by friction between the water and the pipes. In this event a pump is installed to force the water round the system.

Ventilation must be attended to very carefully wherever central H. is adopted, for the radiators heat the air in the room and the heat is thus distributed by convection currents of air as well as by radiation (to a small extent). The air is not naturally renewed, however, and in large buildings systems of ventilation are often installed. In small rooms the disadvantage can be remedied by placing the radiators beneath open windows. The hot air rising from the radiator then carries along with it a supply of fresh air as it rushes past the window and conveniently warms up the cold air before it is distributed in the room. The hot-water system is not suitable for tall buildings and a steam-H. system is necessary in such cases. The most widely used (especially in America) system of the latter class is the *Vacuum system*. Steam is generated in a boiler and passes thence by means of a steam supply pipe to radiators installed in the various rooms. The steam passes in at the top of the radiator via an inlet valve and condensing in the radiator it gives up its latent heat to it. Air and condensed steam pass through a thermostatic trap (designed to prevent the passage of steam) into a return pipe, where it is drawn back to the boiler by means of a so-called vacuum pump. In this way rapid circulation is maintained. Central H. systems have naturally been developed extensively in America and the steam heating systems there are frequently arranged with one central boiler supplying a whole dist. In Iceland geyser water is piped to Reykjavik.

**Electrical Heating.**—The disadvantage of this form of heating is its cost. The ultimate source of the electrical energy is the combustion of coal in steam engines. The efficiency of such engines (i.e. percentage ratio of energy developed to energy supplied) is itself low, and additional loss takes place in the conversion of the mechanical energy of the engine into electrical energy in the dynamo. Still further energy is lost in the cables, in the form of heat, in transmitting the electrical energy, and of course the cost of

transmission has to be added. If the electrical energy is generated by water power, however, it is sufficiently economical to make its conveniences attractive. At present there are no immediate prospects of such cheap generation of electrical energy being generally adopted in Britain, though the proposed Severn dam would provide a large supply of hydro-electric power (q.v.).

For H. by hot air, see VENTILATION, since this concerns the heating of air before it is brought into a room. See also under BOILERS, ELECTRIC LIGHTING, FURNACES, FUELS, and GAS WATER HEATERS. See H. G. Solomon, *Domestic Electric Heating*, 1927; A. A. Jones (ed.) *Modern Heating and Ventilation*, 1935; E. C. Stanford, *Central Heating and Hot Water Supply for Private Houses*, 1938; L. J. Overton, *Domestic Hot Water Supplies and Central Heating by Hot Water*, 1939 and *Central Heating*, 1949.

**Heat of Formation.** Whenever a chemical reaction takes place, heat is either evolved (exothermic reaction) or absorbed (endothermic reaction) in the process. In the case of combustion, the quantity of heat evolved is large, in other cases smaller, and in some negative. The H. of F. of a compound is the amount of heat, measured in calories, which is evolved when the molecular weight in grams of the compound is formed from its elements. Thus, when 2 grams of hydrogen combine with 16 grams of oxygen to form 18 grams of water, 69,000 calories are evolved, which amount is said to be the H. of F. of water. The quantity is determined by carrying out the reaction in a calorimeter surrounded by water, the product of the mass of water and its rise in temp. giving the quantity of heat liberated. In cases where the H. of F. cannot be determined directly use is made of the fact, summed up in the law of Hess, that the quantity of heat evolved or absorbed in the formation of a compound is quite independent of its mode of formation. Thus the H. of F. of carbon monoxide may be arrived at from the following considerations: (1) On forming a gram molecular weight of carbon dioxide from carbon monoxide and oxygen, 67,000 calories are evolved. (2) On forming the same weight of carbon dioxide from its elements, 96,960 calories are evolved. Therefore, on forming one gram molecular weight of carbon monoxide from its elements, 96,960 minus 67,000, or 29,960 calories are evolved. This may be represented as follows:

Certain compounds, such as acetylene, hydrogen iodide, and nitric oxide are 'endothermic,' i.e. have heat 'stored up' in them, which is liberated on their decomposition into their respective elements.

**Heat of Neutralization** is the heat change taking place when gram equivalents of acids and bases neutralize one another in very dilute solutions. **Heat of solution** is

the heat change taking place when the gram molecular weight of a substance is dissolved in a very large quantity of water, usually represented as  $Aq$ .

**Heaton Norris**, tn. of Lancashire, England, situated on the Mersey, 4 m. S.E. of Manchester, and forming a suburb of Stockport; it is connected with the latter by a bridge and viaduct. It is a busy industrial tn., with cotton and thread mills. The Ashton, Manchester, and Oldham Canal ends here. Pop. 12,000.

**Heat-stroke**, see **SUNSTROKE**.

**Heaven**, in the popular use of the term, that part of sidereal space which we can ourselves see. This use was very common among the Jews, and in the O.T. the term denotes sometimes the region of the clouds, and sometimes the superior region of the stars. In the medieval scholastic philosophy (vide *Summa Theologiae* of St. Thomas Aquinas) these two are grouped together as the 'firmament,' but it has been suggested that the Jews spoke of them as the first and second Hs., while the abode of God and the Saints, that is to say, H. in the theological sense, was spoken of as the third H. With this is connected St. Paul's reference to the 'third H.' in 2 Cor. xii. 2. Other classifications of the Hs. are found in Jewish and Lat. theology, the most important being that of the Cabbala, representing the later Rabbinic conceptions. Here we find a sevenfold subdivision of the heavenly regions, of which the highest is the abode of God, the lowest, the region of the stars. This classification has passed into the Mohammedan theology, together with much of the Rabbinic angelology. As the abode of God, H. must be considered as some region of space in which God makes a special manifestation of Himself, and this conception is found running through the whole of the Biblical narratives and Patristic writings. Lastly, H. is often spoken of as a state, the condition of those souls who share the life of Christ. Thus, in Ephes. ii, 6 and in Phil. iii, 20 this conception, that even now the life and conversation of Christians are 'in H.' and 'in heavenly places,' is clearly present.

**Heaves, or Broken Wind**, see **under HORSE (DISEASES)**.

**Heaviside, Oliver (1850-1925)**, Eng. scientist who carried out much important work on practical electrical research and on the more theoretical aspects of the subject; b. in London. For a few years, ending 1874, he was employed by the Great Northern Telegraph Co. but he retired because of deafness. Afterwards lived in Devonshire, studying electromagnetic radiation in its application to telegraphy and telephony. He made fundamental discoveries on telephonic transmission, but is most commonly remembered for his suggestion that an upper layer of the air (the 'Heaviside layer') has conducting powers that serve to confine wireless and other electromagnetic waves to the neighbourhood of the surface of the earth. F.R.S., 1891. Pub. *Electro-Magnetic Theory* (1893-1922). **Heavitree**, E. suburb of Exeter, Devonshire, England, included in the Exeter

parl. bor. In the par. church is a marble monument to members of the Raleigh family, and sev. armorial shields. Pop. 12,000.

**Heavy spar**, see **BARYTES**.

**Heavy Water**, water in which the hydrogen is replaced by deuterium, the heavy isotope of hydrogen with an atomic weight of 2. Formula  $D_2O$ . It is contained in ordinary water to the extent of about 1 part in 5000 and may be obtained by the fractional electrolysis of water,  $D_2O$  being electrolysed more slowly than  $H_2O$ . In atomic science  $D_2O$  is used to slow down fast-moving neutrons.

**Hebbel, Christian Friedrich (1813-63)**, Ger. poet and dramatist, b. in humble circumstances at Wesselburen in Dithmarschen, Schleswig-Holstein. After travelling on the Continent, he settled in Vienna (1846), where he d. His first tragedy, *Judith*, was performed at Hamburg in 1841, and made his reputation. His tragedies are very powerful, and show a fine sense of dramatic situation; but they depict for the most part the passionate struggles of hot and ugly natures, and his scenes are unrelieved by humour or by loveliness. His chief works are: *Maria Magdalena* (1844), *Julia* (1851), *Gyges und sein Ring* (1856), and *Die Nibelungen* (1862). His lyric poems are included in *Gedichte* (1841-48), and *Mutter und Kind* (1859). R. M. Werner's critical ed. of his works, 1901-03, and studies by E. A. Georgy, 1904, 1922; P. Bornstein, 1924; and K. Ziegler, 1938.

**Hebburn**, tn. of Durham, England, situated on the S. bank of the Tyne, in the Jarrow div., 4 m. N.E. of Gateshead. There are chem. and engineering works, coal mines, and lead smelting works. Shipbuilding is also carried on. Pop. 24,000.

**Hebden Bridge**, tn. of the W. Riding of Yorkshire, England, on the R. Calder, in the Sowerby parl. div., 8 m. W. by N. of Halifax by rail. The tn. has cotton factories, dye-works, and foundries. Pop. 7000.

**Hebdomadal Council**, The governing body of the univ. of Oxford. It was evolved, in 1854, out of the Hebdomadal Board, instituted in 1631 by Charles I., probably at the suggestion of Archbishop Laud. It consists of the chancellor, vice-chancellor, late vice-chancellor, two proctors, *ex officio*, and six heads of houses, six profs. and six members of convocation, elected by congregation. The council holds its meetings weekly during term.

**Hebe**, Gk. divinity, goddess of youth, daughter of Zeus and Hera, and cup-bearer of the gods before the coming of Ganymede. She was the wife of the deified Heracles, with whom she was worshipped at Athens. In Rome she was worshipped as Juventas in a temple on the Capitoline Hill. She had the power of restoring the aged to youth. The most famous statue of H. is the masterpiece of Canova.

**Hebel, Johann Peter (1760-1826)**, Ger. poet, b. at Basle. He studied theology at Erlangen (1778-80), subsequently teaching at the Gymnasium at Karlsruhe. He wrote his poems in 'Alemannic' dialect;

his *Allemannische Gedichte* was trans. by Reinick into High Ger. in 1891. His work was fresh, humorous, and full of vigour, and attained great popularity. The *Schicksalsstein des rheinischen Hausfreundes* (1811), contains first-rate stories. The first complete ed. of his works was pub. in 1832-34 and further eds. by W. Zentner (1929) and W. Altwegg (1949). See lives by Schullheiss, 1831; G. Langin, 1894; W. Altwegg, 1935; and S. Löffler, 1944.

Heber, Reginald (1783-1826), Eng. bishop, b. at Malpas, Cheshire. After graduating at Brasenose College, Oxford, and touring in Europe, entered holy orders (1807), and accepted a living at Hodnet, Shropshire. He was appointed Rampton lecturer, 1815; preacher of Lincoln's Inn, 1822; and bishop of Calcutta, 1823. He is chiefly remembered by the hymns he wrote, the best known being 'From Greenland's Icy Mountains,' 'The Son of God goes forth to War,' and 'Brightest and best of the Sons of the Morning.' Besides his *Hymns* (new ed. 1878), his publs. include: *A Journey through India* (1828), and *Palestine: a Poem* (1809). See lives by his widow, 1838, and G. Smith, 1895.

Hébert, Jacques René (1757-94), Fr. revolutionist called 'Père Duchesne', b. at Alençon, and went to Paris as a servant. At the outbreak of the Revolution he became an extreme Jacobin, propagating his views in *Le Père Duchesne* (which he ed., 1790-94), and in various pamphlets, such as *La Lanterne magique* (1790). He joined the Club of the Cordeliers (1791), became a member of the Commune (1792). He took part in the Sept. massacres and sat on the commission which judged Marie Antoinette. He inaugurated a 'Worship of Reason', the followers of which were called Hébertists or *Enragés*, but was arrested by his rival Robespierre, and guillotined on March 21. See studies by C. Brunet, 1857; and Mater, 1888; and F. V. Aulard, *Le Culte de la raison*, 1892.

Hebrew Language, Writing and Literature. Language, in which almost the whole of the O.T. (see BIBLE) was written, is a branch of the great Semitic family, so called (since 1781) from the name of Shem, the first-born of the three sons of Noah (*Gen. x.*). The Hebs. or Israelites and the Aramaeans are considered as belonging to the so-called 'Third Semitic immigration', which during the second millennium B.C. occupied Palestine, Syria and N. Mesopotamia. The Semitic languages lend themselves to the following div.: (1) The N.W. group, consisting of two main branches, Canaanite (including Heb., Phœnician, Moabite) and Aramaic (including Syriac); (2) the E. group (including Accadian, Assyrian and Babylonian); and (3) the S. group (including Arabic and Ethiopic). All these languages possess certain features in common, obscured, however, to some extent by the particular developments of each. The chief of these Semitic peculiarities are: (1) Stems mainly based on three consonants; therefore (2) the scripts generally consisted of consonants only, the cuneiform writing (q.v.) forming

an exception; (3) verbs having two tenses only, and nouns only two genders; (4) identity of roots for verbs and nouns of kindred meaning and general inability to form compound words; (5) direction of writing (except in cuneiform, q.v.), generally from right to left.

The origin of the word 'Hebrew' or 'Ibri, in Heb., is uncertain; the traditional explanation as 'of the other side' is generally rejected. The Heb. language is called in the Bible 'the language of Canaan' (*Is. xix.*, 18) or 'the Jews' language' (*Is. xxxvi.*, 11 and 13). Until twenty-five years ago there were but few monuments and other written documents in Heb. outside the O.T. Nowadays, we can list some hundreds of Early Heb. inscriptions belonging roughly to the first half of the first millennium B.C. The earliest is a small stone tablet, known as the Calendar of Gezer, with a summary list of farming operations arranged by months. It can be assigned to c. 1000 B.C. The important Moabite stele of King Mesha, belonging to the middle of the ninth century B.C., is written in a dialect almost identical with Heb. About 80 ostraca, or inscribed potsherds, found at Samaria, belong to the ninth or eighth century B.C. They are invoices of oil and wine, and are written in a beautiful cursive type, and provide us with examples of the dialect and cursive script of the N. Kingdom of Israel. The most important epigraphic monument from Judaea is the Siloam inscription, assigned to c. 700 B.C. The Early Heb. cursive writing reaches its peak in the now famous collection of twenty-one letters and other documents from Lachish (in S. Palestine), written in ink in a bold script in perfect Biblical Heb. A considerable number, about a 150, of inscribed stone seals have also been discovered in Palestine, and they attest the diffusion of writing among the Hebs. in the pre-exilic period (first half of the first millennium B.C.). Stamps impressed on jar-handles, inscribed weights and measures, marks on pottery and masonry, and other miscellaneous documents, all have a certain value from the palaeographical as well from the linguistic and historical point of view. All these inscriptions are written in the Early Heb. alphabet, which, together with the Phœnician, belongs to the Canaanite branch of alphabets (see ALPHABET). Both the writing on Jewish coins from the Maccabean age to Bar Kochba's revolt (140 B.C. to A.D. 132-135), and the beautiful, neat, and symmetrical Samaritan alphabet, still in use for liturgical purposes, are direct derivatives of the Early Heb. script. On the other hand, the modern Heb. alphabet (see Fig. on p. 266 of Vol. I.), in all its monumental, book-hand, and cursive forms, is not a descendant of the Early Heb. alphabet, but of the 'Square Hebrew' alphabet, which was a derivative of the Aramaic alphabet and can be traced from the second and first centuries B.C.

The period of literary Heb. covers at least eight centuries, from about 1000 B.C. to the second century B.C., but its most flourishing period lasted from the

eighth to the sixth centuries B.C. After the return from the Exile, Heb. was gradually supplanted by Aramaic, but it is erroneous to think, as some scholars do, that it died out. Actually, it continued to be employed in 'national' circles. However, considerable portions of the biblical books of Daniel and Ezra are written in Aramaic. We see even from 2 Kings xviii., 26, that by the time of Hezekiah (c. 700 B.C.), Aramaic was the 'diplomatic' language between Assyria and Judah, and slightly later it became the language of trade and diplomacy throughout W. Asia as is shown by the numerous inscriptions and by other evidence. Heb. was still retained as the written language, but even here—as we can see from the later books of the O.T.—it is largely intermixed with Aramaic forms and coloured by Aramaic idioms. Heb. continued to be the language of religious literature and poetry, and scholars made continuous efforts to keep up its high standard. A new form of Heb. was developed. It is known as *Mishnaic* Heb. It was partly artificial, containing a certain number of borrowings from the Aramaic, Gk., and Lat. languages, and, at a later stage, from Persian and Arabic, and was so called because the chief literary monument of this period (second to third centuries A.D.) is the *Mishnah* (from Heb. *shanah*, 'to learn by heart, to repeat'), which is a kind of code, containing nearly four thousand rules. To this code, later on, was added the *Gemarah* (from *gamar*, 'to supplement,' 'to complete' or also 'to learn'), which is a sort of complement of and commentary on the *Mishnah*, and includes the store of *Halakah* ('homily'). The *Gemarah* is written in Aramaic; *Mishnah* and *Gemarah* together form the Talmud (i.e. what is 'learned,' or 'taught,' from Heb. *lamad*, 'to learn'). There are two Talmuds in existence, the Babylonian Talmud (written in Aramaic) and the Jerusalem Talmud (written in Palestinian Aramaic). While both have the same *Mishnah*, they differ considerably in their *Gemarah*. The Babylonian one is the more perfect and authoritative, and it is also much more copious (about four times as large) than the Jerusalem *Gemarah*. The Talmudic literature was intended principally for the learned. It grew from the discussions in the academies and schools; and thus there arose also a system of biblical expositions, and popular lectures and sermons. These discourses were given in the synagogues, and formed the basis of the Midrashic literature, the *Midrash*, from Heb. *darash*, 'to expound.' (Quotations from prior Midrashic works, especially those whose contents are *Halutic* ('legal') are in Heb.) The word *Midrash* also meant 'doctrine' or 'study,' and was sometimes used synonymously with Talmud or *Gemarah*. The Talmudic literature is a very valuable body of laws and decisions, a monument of Jewish learning, acumen and wisdom, and it has moulded the Jewish people, promoting their intellectual activity, regulating their conduct, influencing their

opinions, stimulating their spiritual and religious life. The Jerusalem Talmud seems to have been completed in the fourth century A.D., the Babylonian Talmud in the fifth century A.D. Generally, it may be said that the Talmud was the result of the discussions in the academies and of the deliberations of Rabbis, extending over a period of some six or seven centuries. It is not a book, but a literature. It is not the work of one or of several authors, but the result of the labour of generations. The nature of the language is concise and compressed. Rabbinic Judaism is the Judaism of the Talmud. To modern ideas many of the Talmudic sections may seem obsolete, but it must be borne in mind that in so vast a literature—dealing with philosophy, astronomy, mathematics, law, medicine, anatomy, etc.—we are bound to come across much that is useless. However, its main idea being 'to make a fence round the law,' it succeeded in preserving Judaism for many centuries to come. The study of the Talmud spread rapidly through all countries of the diaspora, from Babylonia through N. Africa and Italy to Spain, France and Germany.

Another important branch of Heb. literature is the *Piyyutim*, or 'liturgical poems.' Some of these survived in the Jewish prayer-books, but a great part seems to have been lost for ever. Many fragments of Piyyut literature were discovered in the famous Genizah of Cairo. This enormous collection derives its name from the Heb. *ganaz*, 'to hide, store up.' The Jews were accustomed to put away all sorts of material written or printed in Heb. lest anything on which the name of God might be inscribed should be desecrated by profane use. Some of these fragments have already been pub. in I. Davidson's *Thesaurus of Medieval Hebrew Poetry*, 1821-29, others have still to be studied, and recently a Research Institute for Hebrew Poetry has been founded at the Heb. Univ. of Jerusalem, with the task of reconstructing this lost branch of Heb. literature. The authors of these poems belong to different periods and localities. Of some nothing but their names are known. Others are more or less known; the earliest of them seem to have lived in the sixth to eighth centuries A.D., but the majority belong to the ninth to eleventh centuries. These beautiful poems written mainly in Heb., reflect many aspects of the religious and cultural life of Oriental Jewry during the millennium following the destruction of the Temple. Some of these poems were composed by the celebrated Gaon Saadya (b. 822). Other important literary work was produced under the Gaonate (see GAON).

The Heb. alphabet, as already mentioned, was purely consonantal, but the absence of vowel-letters was not strongly felt, because, it must be emphasised, the Semitic stems are essentially consonantal. However, as Heb. speech passed out of daily use, it became necessary to introduce some form of vocal distinction in order to read and explain the Holy Scriptures correctly. Originally, four of the

consonants (the glottal *aleph* and *hē*, and the semi-vowels *vāw* and *yōd*) were also employed to represent long vowels, but gradually they began to lose their weak consonantal value, and became a kind of vocal consonants, known as *matres lectionis*. Not only were they used as long vowels, but (for instance in the recently discovered Heb. MSS. which are partly assigned to the second century B.C.) they were used with such abundance and with so many combinations of two letters, such as *jōd-aleph*, *vāw-aleph*, etc., that the change in spelling or addition of letters became forbidden. 'The omission or the addition of one letter might mean the destruction of the whole world' says the Talmud. It became, therefore, necessary to introduce a complementary system (not to be employed in the synagogue rolls) of vocalisation by punctuation marks, called *niqud*. Three such vocalisation systems are known, the 'Babylonian', which was superlinear, the 'Palestinian', also superlinear, and 'Tiberiadic', partly superlinear, but mainly sublinear.

If Rabbinic Judaism was mainly creative, medieval Judaism was mainly preservative. Medieval Judaism too possessed creative minds, philosophers, codifiers, teachers, commentators, polemic writers, great poets, but their common starting-point was, generally speaking, the Talmud. In Cairo there was a galaxy of Jewish intellect, while in Spain Jewish culture was to reach a height it had never previously attained. Jehuda Halevi (1080-1140), a Heb. poet of the most fervid depth of heart, 'poured forth his passionate longing for Palestine in words of matchless sublimity' (E. Levine), but the most important contribution to Judaism came from Moses Maimonides (1135-1205), the greatest intellect in Jewry in the Middle Ages. He is regarded as a 'second Moses'. Maimonides wrote in Heb. and Arabic. Also the writings of the great medieval Franco-Jewish Biblical commentators Solomon ben Isaac of Troyes, known as Rashi, and David Kimchi of Narbonne were of the highest importance. Rashi (1040-1105) wrote a commentary on the entire Talmud, and another on the Bible. Kimchi's commentary was used in a large degree by successive generations of Christian exegetes, particularly in the preparation of the King's 'Authorised Version' of 1611. Other great commentators were Gershon (late tenth and early eleventh century), Abraham ibn Ezra, Moses ibn Ezra, Shmuel ibn Eliyahu, Jacob Tam, the founder of the school of Tosafists who flourished in France and Germany for over two hundred years, Meir of Rothenburg, and Joseph Caro, who in the sixteenth century composed the *Shulchan Aruch*, a collection of former Jewish codes, which remained the standard guide in Jewish life.

Despite the various inquisitions and censurings of the Christian Church and her attempts during the Middle Ages to eradicate Heb. literature altogether, the Heb. language survived. In Paris, in June 1242, twenty-four cartloads of Heb.

MSS. were publicly burnt, and similar destructions occurred at various times in various places, but Heb. remained up to the nineteenth century the language of the synagogues, of the Jewish prayers, and of the Jewish religious schools, and was also the *lingua franca* of Jewish scholars of all ages and all countries.

*The rebirth of the Hebrew tongue through Zionism.*—One striking result of the development of Zionism (*q.v.*) is the rebirth of Heb. as a living language; for both ideal and practical considerations have combined to associate the return of the Jews to Palestine with the return to Heb. The ideal is the estab. of the Heb. nation, speaking the Heb. tongue, on the soil of the anc. Hebs. The cultural renaissance involved in the foundation of the Jewish State of Israel in Palestine is necessarily based on Heb., language of the national past of the Jewish people and of their great original contributions to civilization. But, also, a common language was a practical necessity for a polyglot community of Jewish immigrants into Palestine from all parts of Europe and the Near E., and no language excepting Heb. had any claim to gen. acceptance. While this rebirth of Heb. is the fundamental achievement of Zionism in the cultural sphere, Heb. had ceased to be exclusively a religious language, even in the wide connotation of the term 'religious' as applied to Judaism, a century before the birth of Zionism as an organised movement. From the latter half of the eighteenth century onwards, a secular Heb. literature had developed amongst the Jews of E. and central Europe (its bp. being Italy), though it was a purely literary movement and its language not one in which people habitually spoke or thought. It was, in fact, only with the emergence of the national idea in the eighties of last century and the estab. of Jewish settlements in Palestine that Heb. began once again to be a spoken language and the possibility created of a Heb. literature firmly rooted in the life of the people. To-day the supremacy of Heb. in the life of the Jews in Palestine is assured. The pioneer work of the early Heb. teachers has borne fruit in a network of Heb. schools, elementary, secondary, and technical, with some 100,000 pupils, and the educational structure is crowned by the Heb. Univ. on Mount Scopus in Jerusalem. Heb. as it is spoken and written in Palestine to-day is substantially the language of the Heb. Bible and the other anc. and medieval literature of the Jewish people, though naturally much adaptation and development has been necessary to fit it for its new function under the conditions of to-day; but since the early days of Jewish resettlement in Palestine, men of scholarship have sought, to keep the development of the language on the right lines (Leon Simon). Heb., indeed, which had been handed down for centuries as the language of prayer and literature, was, however, not a dead tongue before the appearance of the Zionist movement. It has always been the *lingua franca* of

Jewish scholars all over the world, the language of correspondence between Jews living in various countries. During the Dark and Middle Ages the Jewish communities in the Muslim realm cultivated equally Heb. and Arabic. Their great writers from Spain, Gabirol, Halevi, Ibn-Ezra and Maimonides, wrote their poems and their homilies in Heb., their science and philosophy in Arabic. Furthermore, the revival of the study of Heb. by Christians, which was learnt from Jews, was an integral part of the Reformation and Renaissance in W. Christendom. In the dark ages of Jewish hist. which followed that epoch, Heb. was the regular vehicle of the religious life of the Jewish masses in Poland, though Yiddish, the Ger.-Jewish dialect, which they developed as a second tongue, was the language of the home and the one in which their Heb. religious instruction was explained. And when, at the end of the eighteenth century, the Jews in Germany and W. Europe had the opportunity again to enter into the Jewish cultural activity, Heb., the language of literature, not Yiddish, the language of the Diaspora, was the instrument of their Jewish national education. See C. Brockelmann, *Grundriss der vergleichenden Grammatik der semitischen sprachen*, 1908-13; G. Bergstrasser, *Einführung in die semitischen Sprachen*, 1928; D. B. McDonald, *Hebrew Literary Genius*, 1933; M. Waxman, *History of Jewish Literature*, 1930-33; H. and N. Chadwick, *Growth of Early Hebrew Literature*, 1936; N. Bentwich, *Judaea Lives Again*, 1944; C. A. Simpson, *The Early Traditions of Israel*, 1948.

**Hebrews**, see ISRAEL, JEWS.

**Hebrews, Epistle to the**, known also as the **Epistle of Paul the Apostle to the Hebrews**, bears in the oldest MSS. no further heading than the words, 'To the Hebrews,' and even this probably formed no part of the original letter, but was deduced from a reading of the contents. It cannot be proved that the epistle bore the title 'To the Laodiceans' or 'To the Alexandrians,' as has been suggested; and the best MSS. do not give the remark found in the end of the Eng. trans., 'Written from Italy by Timothy.' All other particulars with regard to the epistle are equally matter for conjecture, for there is no sign of any clear tradition with reference to authorship, date, or exact destination. It is morally certain, however, that the authorship is not Pauline, and this view is supported by the continuous tradition of the city of Rome where the epistle first appears, *Shepherd of Hermas* (second century). But this city furnishes us with no positive tradition. In Africa an ant. tradition, which appears in Tertullian's *De Pudicitia*, c. 20, ascribes the authorship to Barnabas, the companion of Paul, while the Alexandrian tradition seems continuously to have ascribed it to the Apostle of the Gentiles himself. Origen held that the epistle was the development by a disciple of some of Paul's oral instructions. It is impossible here to discuss in detail the objections to the Alexandrian

theory, but they are quite overwhelming. Neither vocabulary nor style is Pauline, and the gen. character of the epistle shows that the writer was intimately acquainted with the circumstances of the congregation to which he wrote. There is nothing in this argument to indicate that Hebs. predominate in this congregation, and it is now generally held that Rome was probably its destination. The date is before A.D. 95, but the question of authorship is still unsolved. The names of Luke, Priscilla, Apollos, Clement, and Silas have all been suggested. The aim of the writer was to warn and encourage those Christians—the older view has always been that the epistle was addressed to Christians of Jewish extraction—who, owing to the stress of the times, were inclined to fall away from their allegiance to Christ; and, with this object in view, he sets himself to prove the finality and the perfection of the Christian religion, and its superiority to Judaism. See commentaries by A. B. Davidson, 1882; B. Westcott, 1903; W. C. Wickham, 1910; F. D. NARBOROUGH, 1930; and T. H. Robinson, 1933.

**Hebrews, Gospel according to the**, the most interesting of the apocryphal gospels of the first centuries. Origen and St. Jerome quote it occasionally, and the latter also made Gk. and Lat. trans. of it, but these last have perished. All the quotations from it lead one to consider it as an expanded version of the First Gospel, though it is said to be somewhat smaller than the canonical book.

**Hebrides, or Western Islands**, are situated off the W. coast of Scotland, and are divided into the Outer H. and the Inner H. The Outer H. comprises Long Is. (Lewis with Harris), N. Uist, Benbecula, S. Uist, Barra, the Shianta, St. Kilda, and the Flannan Is. They are composed almost entirely of gneiss, and are therefore sometimes called Gneiss Is. The Inner H. are separated from the Outer group by the Minch and Little Minch. They are a scattered group, including Skye, Eigg, Muck, Coll, Tyree, Lismore, Mull, Staffa, Iona, Kerrera, Colonsay, Oronsay, Jura, Islay, and the Slate Is. The two groups contain more than 500 is., of which about 100 are uninhabited. They are included politically among the cos. of Ross, Inverness, Argyll, and Bute, but have their own Member of Parliament. The total area is 2812 sq. m. Only 200,000 acs. are used as arable land, the is. for the most part being rocky or sandy. There are many small lochs and morasses. The climate is healthy and mild. More than one in ten of the inhab. speak Gaelic only, and 47,000 speak both Gaelic and Eng. The chief tns. are Stornoway, on the E. side of Lewis, and Portree in Skye. The prin. industries are the production of Harris tweed, fishing, the raising of cattle and sheep, and distilling, which is carried on principally in Islay. Livestock, wool, whisky, slate and limestone are exported. There are (1949) about 1300 weavers on the is. of Lewis, many of them, combining this work with croft-management or lobster-fishing. In 1939 the industry was

worth nearly £1,000,000 to the H., but the purchase-tax levied at 66½ per cent seriously damaged it. The is are very popular with tourists and sportsmen. There are bus services, but no railways, air services connect the is., and Stornoway with the mainland.

The H. (anc. *Hebrides*) were invaded by Scandinavians in the sixth century. The Celtic inhab. accepted the Christian faith under the teaching of St. Columba. In the ninth century they were subdued by Harold Haarfager, king of Norway, and remained subject to the Norwegians till

*Memories*, 1923; A. A. MacGregor, *Behold the Hebrides*, 1925; I. F. Anderson, *To Introduce the Hebrides*, 1933; H. Sutherland, *Hebridean Journey*, 1939.

Hebrides, New, see NEW HEBRIDES.

Hebron, 'al-Khalil, or El Chalil (the Arab name is an abbreviation of Khalil al-Rahman, i.e. Abraham, the Friend of God). Anc. city of S. Judah, and one of the oldest continuously inhabited tns. in the world. In Josh. xv. 13 we read of its capture by Caleb; and it is especially venerated by the Muslims because of its associations with the Patriarch Abraham.

J. J. J. & Co., Dundee

#### THE HEBRIDES, BATAAN AND LOCH LUTHER

1266 The is. were then governed by the Scottish race of Somerled until John Macdonald of Islay made himself Lord of the Isles (1316). They were subsequently annexed to Scotland. Until the end of the thirteenth century the H. also included is. in the firth of the Clyde, the peninsula of Kintyre, the Isle of Man, and the Isle of Rathlin. Kismul Castle in the Outer H. was the stronghold of the piratical MacNeils of Barra, whose exploits are commemorated in the Hebridean song, 'Kismul's Gallery'. It was in the is. of Skye that Prince Charlie took refuge after his defeat at Culloden in 1746. Total pop. 60,000. See also LEWIS & LEWIS-WITH HARRIS. See Sir W. Scott, *Lord of the Isles*, 1852; J. Boswell, *Tour to the Hebrides with Samuel Johnson*, 1898; M. Martin, *A Description of the Western Isles of Scotland*, 1703; J. Macculloch, *Geological Account*, 1819, and W. C. Mackenzie, *History of the Outer Hebrides*, 1902; Seton Gordon, *Hebridean*

who pitched his tent here and was buried in H. Little is known of its earlier hist., but David made it the headquarters of his movement against Jerusalem. Abner was slain by Joab at the city gates, and in it David executed the murderers of Ishbosheth. It was later seized by the Edomites, but was recovered by Judas Maccabaeus. Finally it fell before the Persian. In the O.T. H. is known also by the name Kirjath Arba, in the N.T. as H. only, as (Hebron) under the later Rom. Empire, and as Saint Abraham in the time of the Crusades. Its present day features are high stone houses, narrow streets, and vaulted bazaars at which are sold sheepskin coats and blown glass. The most famous monument of the city is the Haram sacred to Muslims as enclosing the cavern of Machpelah (q.v.) which Abraham purchased from Ephron the Hittite for the burial place of Sarah. Petitions to Sarah are, to this day, dropped by childless women into the cave.

The mosque itself, as distinct from the area, was adapted by the Arabs from a Crusaders' church; in it or within the precincts are the cenotaphs of Abraham and Sarah, which occupy two octagonal chapels, of Jacob and Leah, N. of the area of the Haram, of Joseph, which is in a separate enclosure, and of Isaac and Rebecca inside the church. Excavations carried out in 1926-28 at H. by Dr. A. E. Mader for the Görresgesellschaft estab. the identity of the site of the famous mrkt. of Hadrian; and at the same time were disclosed remains of the Herodian buildings and the basilicas of Constantine and Modestus. The city, which was much improved during the mandatory régime, has a municipal council and a pop. of about 24,000. In Aug. 1929 it was the scene of the worst of the Jewish massacres by Arabs during the outrages of that month over the Walling Wall (*q.v.*, and see also *PALESTINE*).

Hebrus, see *MARTZA*.

Hecateus of Miletus (c. 550-476 B.C.), Gk. historian and traveller, who vainly tried to dissuade his countrymen, the Ionians, from revolting against Persian rule, and, after their defeat, was one of the ambassadors to the Persian satrap, Artaphernes. The only certain work of H. is the *Genealogies, or Investigations* (an account of Gk. traditions and mythology); *Travels round the Earth* is sometimes attributed to him. See fragments in K. O. Muller's *Fragmenta historicorum Graecorum* i. 1891.

Hecate, Gk. goddess, daughter of the Titan Perseus and Asterie, retaining her mighty power under Zeus. She ruled in Heaven, Earth, and the Netherworld, being frequently identified with Selene (moon), Artemis, and Persephone, and sometimes represented with three bodies. As patroness of magic, she was mother of Circe and Medea. She also presided over birth and death. She was worshipped in the wilder parts of Greece, especially at cross-roads, where black victims were sacrificed to her.

Hecatomb, see *SACRIFICE*.

Hecht, Ben (b. 1894), Amer. writer, b. at New York City. Joined the staff of the *Chicago Daily News*, 1914, serving till 1923. Founder and publisher of the *Chicago Literary Times* (1923-25). Wrote *Erik Dorn* (1921), *Gargoyles* (1922), *The Florentine Dagger* (1923), *1001 Afternoons in Chicago* (1923), *The Epistol* (1923), *Humpty Dumpty* (1924), *A Book of Miracles* (1939). In collaboration with Charles MacArthur (Amer. playwright, b. 1895) wrote the plays *The Front Page* (1928), *Twentieth Century* (1933), and the motion pictures *Crime without Passion* and *The Scoundrel*. Charles MacArthur, after working on the staff of *Hecht's International Magazine* (1924) turned to writing plays and motion pictures and became a partner in the Hecht-MacArthur corporation. He collaborated with Ben Hecht in adapting *Wuthering Heights* for motion presentation, and also collaborated with Sidney Howard in *Salvation* (1927).

Hecker, Isaac Thomas (1819-88), Amer. Rom. Catholic divine, and founder of the

community of 'Paulist Fathers.' He founded the *Catholic World* and the Catholic Publication Society, and was the author of *Catholicity in the United States* (1879), *The Church and the Age* (1888), etc.

Heckmondwike, par. and mrkt. tn. of the W. Riding, Yorkshire, England, situated 2 m. from Dewsbury. It is noted for carpet and blanket manuf., and there are coal mines, iron and chem. works, etc. Pop. 10,000.

Hecla, see *HEKLA*.

Hectic Fever. This term literally means habitual fever, and was formerly applied to the regular and recurrent fever of pulmonary tuberculosis, that is, consumption. H. F. may be looked upon as an obsolete term in medicine, as it only indicates a condition of weakness.

Hector, Trojan warrior, the son of King Priam and Hecuba, and the husband of Andromache, by whom he had Astyanax. During the Trojan war he slew Patroclus, the friend of Achilles. The latter, roused to anger, drove back the Trojans, but H. stood his ground, and, in spite of the tears and entreaties of his parents, awaited the approach of the enemy by the Scæan gates. At the sight of Achilles he turned in flight and was pursued three times round the walls of Troy. At last Achilles pierced him with his spear, and, fastening the body to his chariot, dragged it through the dust of the city. At the bidding of Zeus, he gave up the body to Priam, who gave it an impressive burial in the citadel. See Homer's *Iliad*, vi. and xxii., and Virgil's *Æneid*, i.

Hecuba, wife of Priam, king of Troy, to whom she bore Hector, Paris, Cassandra, and many others. On the fall of Troy she fell into the hands of Ulysses, and was carried away to Greece as a slave. At Thracian Chersonesus her daughter Polyxena was sacrificed by the Gks., whereupon H. revenged the deaths of her many children by killing Polymestor, king of Thrace, who had murdered her son Polydorus. She was pursued, but was changed into a dog and leapt into the sea.

Hedge, fence formed of bushes or small trees growing close together or a line of bushes or evergreens, whether intended as a fence or not. For garden Hs. the oval-leaved type of privet H. is one of the best. It grows quickly and can be clipped with impunity and, in ordinary, good soil it can be planted in close formation. A double row, with plants about 15 in. apart in each semi-row, will become reasonably compact when planted. After a year the plants should be pruned back to half their height to induce a bushy appearance and, after a few years, will have grown up and can be clipped to form a neat compact wall of stems and foliage. To ensure that the bottom is impenetrable, combination with English quickthorn provides the best base for a normal boundary. Holly is also a good hedging plant, hardy and indigenous, but is somewhat slow to grow. Young plants are the easiest to establish, and should be planted during May or early autumn. A single row is advisable, with plants spaced

2 ft. apart. The time to cut back is April or Sept. A beech H. does not thrive in all soils, those that are sandy or chalky being most suitable. In heavier soils a good substitute is the common hornbeam and grows more quickly than beech. Laurel and yew were formerly favourites but only the yew has kept in favour and the deep wall-like neatness of an estab. yew H. is an advantage, though the expense is somewhat heavy and available trees are few. Honeysuckle of the *Lonicera nitida* type have been popular H. plants in recent years. They grow rapidly and are not expensive, but they soon get out of hand unless clipped back sev. times during a season. A honeysuckle H. too has the disadvantage of being easily blown about in rough winds. The above-mentioned types by no means exhaust possibilities for Hs. for there are also conifers of various sorts, box and rosemary, escalloniae, and Eucalyptus, cotoneasters and evergreen Oaks.

**Hedgebote**, old term denoting the right of a tenant to cut wood for purposes of repairing hedges, etc., on the land he holds.

**Hedgehog**, name given to sev. species of insectivora, belonging to the family Erinaceidae; they are distinguished from their allies by their spines. *Erinaceus europæus*, the common European H., is generally about 9 in. long, and 4 or 5 in. high; the spines reach a maximum length of 1 in., are sharply pointed and grooved along the sides, and controlled by the muscles of the back. The animal can roll itself into a ball, bristling with spines, and, thus protected, will sometimes fall from a considerable height. The H. eats insects, slugs, mice, frogs, young birds, etc., and has been known to attack vipers; it is sometimes domesticated as a protection against vermin. Hibernation with the H. is a matter of temp. Hs. kept in a warm place will continue active throughout the winter and, with plenty to eat and drink, will take no harm. Even if it sinks into a true torpor the rise of the temp. will rouse the H. again. Young Hs. may arrive at any time from early spring to late autumn, but ordinarily spring litters predominate. The young are born complete with spines, but they are blind and helpless. They grow rapidly, their prickles darken and harden, and their eyes open. Hs. may do some damage, and cases are known of coops invaded and chickens killed, but they are not typical.

**Hedgeley Moor**, tract of moorland in Northumberland, England, situated in the Berwick div., and in the tship. of Beanley, 10 m. W.N.W. of Alnwick. It is noted as the scene of a battle in 1463 between the adherents of the houses of Lancaster and York, in which Sir Ralph Percy was killed.

**Hedge-mustard**, genus of plants of the order Cruciferae. Some species are native of Britain, e.g. the common H., which in its wild state grows plentifully by the wayside to a height of 1½ ft. This has a hairy stem and small pale, yellow blossoms, with a pungent odour. It was formerly used in medicine for catarrh, etc.,

and is now cultivated for domestic purposes.

**Hedge-nettle**, popular name of the species of *Stachys* (q.v.), a genus of labiate plants found in Europe, Asia, Africa, and America.

**Hedge-sparrows**, or *Accentor modularis*, species of passeriform birds belonging to the family Turdidae; it resembles a sparrow, having brown plumage streaked with black.

**Hedin**, Sven Anders (b. 1865), Swedish explorer, b. at Stockholm, son of Ludwig H., chief architect of Stockholm. Educated at Stockholm, Upsala, Berlin, and Halle. His work as an Asiatic explorer dates from 1893, when he began his journey across Asia from Orenburg to Peking. He travelled via Lop-Nor and Tibet, and the journey took him four years. During these years he explored the glaciers of the Mustaghata, and the mts. around the sources of the Yarkand and Ili. In 1899 he made his second Asiatic journey. On this occasion he travelled down the Tarim R. to the Lake Lop-Nor. He then crossed Tibet, travelling S.E., and made two unsuccessful attempts to enter Lhasa. Started on a new journey through China, 1926. He was ennobled by the king of Sweden, 1902. Hon. K.C.I.E., 1909. Pubs.: *Journey through Khorasan and Turkestan* (1892), *Through Asia* (1898, pub. in nine languages), *Scientific Results of a Journey in Central Asia* (6 vols., 1899-1902), *Adventures in Tibet* (1904), *Trans-Himalaya* (vols. I. and II., 1909), *Overland to India* (1910), *From Pole to Pole* (1911), *Trans-Himalaya* (vol. III., 1913), *With the German Armies in the West* (1915), *Bagdad, Babylon, Nineve* (1917), *Jerusalem* (1917), *Southern Tibet* (9 vols., 1917-22), *My Life as an Explorer* (1925), *The Gobi Desert* (1929, Eng. ed., 1931), *Jehol, City of Emperors* (1931), *Lop-Nor, the Wandering Lake* (1937), *Riddles of the Gobi Desert* (1933), *A Conquest of Tibet* (1935), *Scientific Results of the Sino-Swedish Expedition 1926-33* (23 vols., 1937-42), *Chiang Kai-shek, Marshal of China* (1939), *History of the Expedition to Asia*.

**Hedjrah**, see HEJRA.

**Hedmark**, co. of Norway, on the Swedish border, with Akhus to the S., Oppland to the W. and S. Trondelag to the N. Area 10,621 sq. m. Pop. 167,600.

**Hedon**, a municipal bor. of E. Riding, Yorkshire, England, in the Holderness parl. div., situated 8 m. E. of Hull. The industries are chiefly agric. and there are large brick-fields. Pop. 1300.

**Hedonism**, word of Gk. derivation signifying pleasure, hence, in ethical science, the theory that pleasure or happiness of one kind or another is the chief aim in life. Hedonistic theories have been held from the earliest times. According to one view, happiness is the chief good and moral end for each individual; according to the other, the well-being and pleasure of the general community and of all sentient creatures is the main thing to be desired. The earliest and most extreme type is that of the Cyrenaic and Epicurean schools, who taught that the

sentient pleasure of the moment is the only good for mankind. This view is known as Egoistic H. Opposed to this is Universalistic H., which owes its growth to modern writers, such as Hume, Bentham, and Mill, whose point of view is based on a wider conception of life, and who maintain that the only real happiness is that of the community—or, at any rate, the majority; the criterion is society, not the individual. Passing on to the theories of Utilitarianism and Social Ethics, one is confronted by the problem of reconciling and adjusting the claims of the individual with those of society. An important exposition of the theory of Utilitarianism is contained in H. Sidgwick's *Methods of Ethics*, 1871. He associates the hedonistic theory of the moral standard with an intuitive theory of knowledge which utilitarians do not usually hold. See also J. H. Muirhead, *Elements of Ethics*, 1892; and J. S. Mackenzie, *Manual of Ethics*, 1897; J. Watson, *Hedonistic Theories*, 1895; E. Albee, *History of English Utilitarianism*, 1902; C. Gore, *Philosophy of the Good Life*, 1930; H. L. S. Samuel, *Practical Ethics*, 1935.

Heem, Jan Davidsz van (c. 1600–84), Dutch painter, *b.* at Sandrart, or, according to Descamps, at Utrecht, son of David van Heem (c. 1570–1632), a noted still-life painter. One of the pictures of the elder van H. is in the National Gallery, London. The son surpassed his father in the variety of his still-life subjects and in technical equipment and was much the greater artist. He entered the Guild of Antwerp in 1635 and two years later became a burgher of the city. In 1667 he moved to Utrecht. His paintings chiefly consist of magnificent vases of flowers and fruit and rich garlands against a background of green. Examples of his work are in many Ger. galleries, and at the Louvre, The Hague and Amsterdam, and he is also represented in the Wallace Collection, London. His son, Cornelis van Heem (1631–95) was also a painter. Heemskerck, Maerten Jacobez, often called Maerten van Veen (1498–1574),

Dutch painter, *b.* at Heemskerck in Holland studied his art under Cornelisz Willemsz and John Schoreel, painters at Haarlem. In his early work he imitated Mabuse, but during a visit to Rome (1532–35) he came under the direct influence of the great masters. His pictures are well represented in the galleries of Europe, but in England he is best known by his drawings. His chief works are: a 'Crucifixion' (in the Ghent Museum), 'Judgment of Momus' (in the Berlin Museum), 'Triumphs of Silenus' (in Vienna), and 'St. Luke Painting the Likeness of the Virgin and Child' (at Haarlem).

Heemstede, tn. 3 m. S. of Haarlem in N. Holland. See studies by L. Prehlias, 1911 and M. J. Friedländer, 1936. Pop. 23,700.

Heerde, tn. 29½ m. N.E. of Arnhem in the prov. of Gelderland, Holland. Pop. 5500.

Heere, Lucas de (1534–84), Flemish painter, inherited his artistic talent, as his mother painted miniatures and his father was a sculptor. There is a portrait of Queen Elizabeth at Hampton Court, where H. has flatteringly represented Aphrodite and the sister goddesses con-founded and dismayed by the beauty of the earthly queen. H. is also the author of *Boomgaard der Poëzie* (Garden of Poetry), 1565.

Heeren, Arnold Hermann Ludwig (1760–1842), Ger. historian, *b.* at Arbergen, near Bremen. His *De Encomiis* (1785), attracted attention, with the result that in 1787 he became a prof. of philosophy, and in 1801 of hist., at Göttingen. He is regarded as the pioneer of the modern method of historical study; he did not lay so much stress on political events as on the economic relations of states. His chief works are: *Ideen über Politik, den Verkehr, und den Handel der vornehmsten Völker der alten Welt* (1793–96, Eng. trans. 1833), *Geschichte der Staaten des Alterthums* (1799, Eng. trans. 1840), and *Kleine historische Schriften* (1803–38). His *Historische Werke* were pub. at Göttingen in 15 vols. (1821–30).

Heerenveen, tn. 17 m. S.S.E. of Leeuwarden in the prov. of Friesland, Holland. Pop. 23,400.

Heerlen, tn. 12½ m. E.N.E. of Maas-tricht in the prov. of Limburg, Holland. Pop. 56,300.

Hegel, Georg Wilhelm Friedrich (1770–1831), *b.* at Stuttgart, was the last of the four great Ger. idealist-philosophers of that period, the others being Kant, Fichte, and Schelling (*q.v.*). He was educated at the univ. of Tübingen, where began his friendship with Schelling, who, although younger by five years, must rank as H.'s precursor by virtue of his extraordinary precocity—he had pub. sev. philosophical papers of importance even during his student days. In 1793 H. left Tübingen, and lived by teaching, principally in Frankfurt. But whilst thus engaged, his mind, stimulated by his studies of Wolff, Fichte, and Plato, was slowly maturing, and in 1801 he pub. a brilliant comparative critique on the systems of Fichte and Schelling, somewhat to the latter's

W. F. Mansell

**HEEMSKERCK: SELF-PORTRAIT**  
A painting in the Fitzwilliam Museum, Cambridge. The building on the right of the face is the Colosseum at Rome.

advantage. The same year he became a prof., at the univ. of Jena; during the five years that he spent here, he became more intimate with Schelling, and together they issued a philosophical journal. At this time, Napoleon was pressing against the Prussians, and the Battle of Jena (1806) caused the univ. to be temporarily disbanded, with the result that H. had to accept the editorial duties of a small newspaper for a time. Before long, however, he had once more secured an appointment as teacher in Nuremberg, and it was during the nine years he spent in that position that he married (1811). Meanwhile, his first work of real significance had been pub., *Phänomenologie des Geistes* (1807, Eng. trans. *The Phenomenology of the Spirit*, 1894), and the *Wissenschaft der Logik*, the first vol. of his definitive philosophy, followed in 1812 (Eng. trans. *Science of Logic*, 1894). In 1818 he left Nuremberg for a professorial chair at Heidelberg, where in the same year he produced his great encyclopædia of the philosophical sciences (*Enzyklopädie der philosophischen Wissenschaften*), and two years later he succeeded Fichte in the chair of philosophy at the new univ. of Berlin, a post which he filled with distinction until his death, from cholera, thirteen years later. It was here that he wrote, amongst many other important works, *Grundlinien der Philosophie des Rechts* (1821, 1837 trans. *The Philosophy of Right*, 1896). During his later years he was esteemed the leading force in contemporary Ger. philosophical thought.

After his death many of his hitherto unpublished lectures and essays on religion, hist., and aesthetics were collected and pub. by a circle of his chief students and friends. Hegelianism must be studied in relation primarily to the philosophy of Kant. Kant had contended that, whilst the value of an object was purely in the cognition thereof, and not in any degree intrinsic, a dualism existed between that object and the cognition, i.e. between the noumenon and the phenomenon. H., in his development of this idea, evolved the dualism out of consideration by identifying reality with rationalism. Agreeing with Kant that it is impossible to consider life philosophically as a purely material existence apart from essential idea, he urges that matter is non-existent except as a perception, that is to say, an expression to an individual mind of some essential idea. He therefore proceeds to examine, not the form, but the idea, of thought; since what is true of a perception is true of the object. Hegelianism is thus the outcome of the idealisms of Kant, Fichte, and Schelling, although less romantic and more absolute; it is divided into three headings: (a) logic, (b) natural philosophy, (c) philosophy of spirit. *The Science of Logic*, in which his whole system is traced out, both logically and metaphysically, has been described as the only production of modern thought worthy to rank with the *Metaphysics* of Aristotle; in it, H. analyses and systematises the fundamental conceptions that

underlie external forms by the method of 'dialectic,' for which he is largely indebted to Fichte. His *Natural Philosophy* is a concrete application of this analysis to science and to the social and spiritual individuality of man; but, on account of his lack of deep scientific knowledge, it is of very little value. *The Philosophy of Spirit* is a further application of *Logic*; in this, II, develops the moral and abstract element of the work in correlation with the idea of evolution. Apart from the purely scientific significance of H.'s writings, they contain much of importance on religion and the aesthetics of art. In religion, he was influenced chiefly by Fichte's subjective idealism. His views on art are of great interest; to him, art is a thing apart from nature, for he holds that, since art should express idea in sympathetic form, nature is not intrinsically or necessarily beautiful, but is dependent for its beauty on individual perception. He classifies art, on this basis, into: (1) Symbolic, wherein the expression of indefinite ideas is attempted on a colossal scale (e.g. Oriental architecture); (2) Sensuous or Classical, which is best exemplified in Gk. sculpture (the pagan aesthetic of idealised humanism); and (3) Christian Art, a return to the symbolic in style of idea, vague and indefinite in its concept of infinity and omnipotence, but more exquisitely expressed in the narrower limitations and more plastic media of painting, music, and poetry. H.'s teachings were subsequently developed in two directions, one of them on the lines of his own idealism, the other leading to arrant positivism. Of these the latter is more powerful, and tends to atheism and radicalism under Strauss, Feuerbach, and Bruno Bauer, who claim their systems to be directly evolved from H., in spite of the orthodox and conservative sympathies he professed.

H.'s philosophy was the basis of the metaphysical speculations of Karl Marx, and his idealisation of the State may be said to be the underlying principle of the ideology of Fascism (see on this Crossman's *Plato To-day*). It is not without interest to note that in the opinion of Nietzsche, the name of Schopenhauer was better known than that of H., and yet that Schopenhauer, unlike H., was nonetheless a solitary being, who had failed of his effect. His complete works were pub. in 1832-15 (18 vols.) and in 1927-40 (26 vols., ed. by H. Glockner). See J. Hutchinson Stirling, *The Secret of Hegel*, 1865; *Lectures on the Philosophy of Law*, 1873; J. Rosenkrantz, *Hegel's Leben*, 1844; *Hegels Naturphilosophie*, 1863; and *Hegel als deutscher Nationalphilosoph*, 1870; O. Kostlin, *Hegel*, 1870; F. W. **Hegesias**, Cyrenaic philosopher, lived in the reign of Ptolemy Philadelphus (309-246 B.C.) and was a disciple of Parmenides. In the main he taught the doctrines of Aristippus, the founder of his school, but he so ingrained in his pupils an indifference to life and a contempt for death, and at the same time the belief that it is idle to look for happiness where the soul is for ever imprisoned in a suffering frame, that he drove many of them to suicide. This gloomy tendency of his teaching became so alarming that Ptolemy is said to have put a stop to his classes. He further maintained the wisdom of complete egoism and the instability and unreality of such fragments of the brain as kindness and friendship.

**Hegesias** (fl. c. 250 B.C.), Gk. historian of Magnesia who enjoyed great repute as an orator. Cicero refers to him and mentions how he spoilt the pure Attic Gk. by the heedless adoption of Asiatic idioms.

**Hegesippus** (c. 350 B.C.), Athenian statesman and orator, and a staunch supporter of the anti-Macedonian policy of Demosthenes. He became one of the ambassadors to Macedonia in 343 B.C., whose mission was principally to discuss the restoration of Halonnesus. In connection with this subject, H. delivered his famous oration 'De Halonneso'.

**Hegesippus** (c. A.D. 120-180), early Christian writer, of Palestinian origin, lived under the emperors Antoninus Pius, Marcus Aurelius, and Commodus. It is a disputed question whether he was a Judaistic Christian or not. He wrote a treatise, *Five Memorials of Ecclesiastical Affairs*, on Christian literature, unity of church doctrine, paganism, heresy, and Jewish Christianity, fragments of which are found in Eusebius. From Eusebius we learn that H. journeyed to Rome, visiting Corinth on the way. He compiled a list of the Rom. bishops down to Anicetus (A.D. 156-67), and is looked upon as the father of church hist. See M. J. Routh, *Reliquiae Sacrae*, 1814-18; and J. E. Grabe, *Spicilegium*, II., 1711.

**Hegira**, see **HEJIRA**.

**Hegyalja**, or **Hegyallya**, range of hills which runs S. between the valleys of the Bodrog and Hernád R., in N. Hungary. An extreme offshoot of a Carpathian spur, they are in the midst of the dist. where the Tokay wines are produced.

**Heiberg**, Johan Ludvig (1791-1860), Dan. dramatist, was the son of the celebrated novelist who afterwards became Baroness Gyllembourg-Ehrensvärd, and of the political writer Peter H., who was exiled in 1800. He attended Copenhagen Univ. and began publishing in 1814, when he brought out two romantic dramas. However, both in his satire *The Prophecy of Tycho Brahe* (1817), and later, when he ed. *Kjöbenhavns Flyvende Post* (1827-30), etc., he persistently mocked at the ex- and sentimentalism of Ingemann

and other popular Romanticists. A comedy entitled *A Soul after Death* (1841) is one of the best things he wrote, whilst a little play called *The Nut Crackers* (1845) contains his most pungent satire.

**Heide**, tn. near the N. Sea, 34 m. N.N.W. of Glückstadt, in Schleswig-Holstein, Germany. Pop. 11,800.

**Heidegger**, Martin (b. 1889), Ger. philosopher. He came into prominence in 1928 when he pub. his chief contribution to philosophy, *Time and Being*. In 1933, when he was rector of Freiburg Univ., he owed allegiance to Hitler's party; but, thinking he had made a political error, he relinquished the rectorship in 1934 and, in 1935, having reached the peak of his fame, he was invited, but declined, to become rector of Berlin Univ. Though his reputation stood high in Germany before the war, it did not then, apart from philosophers, spread internationally, and yet to-day, when his influence is marked in many foreign countries, it is almost non-existent in his own. H.'s philosophy has been described as atheistic existentialism, mainly because his *Time and Being* is concerned essentially with the problem of being-in-the-world; but he himself repudiates any connection with existentialism (q.v.), with Sartre (q.v.) or even with Kierkegaard. By existence H. means man's determination to 'stand out into the truth of being' or in other words, to pierce the meaning of his existence. If man fails to transcend the limits of his world he is condemned to death and nothingness. He must 'experience the anguish of nothingness, he must first exist in the nameless, not for its own sake, but so as to realise that this nothingness is the path to being. But the problem whether a man shall be or shall not be is an event that takes place in the experience of dread. The struggle with this dread determines whether man shall annihilate nothingness and thus perceive its other side, that of being; or whether nothingness shall annihilate man. H.'s nihilism is comparable with Dostoevsky's interpretation of suffering, which to the Russian writer, not only awakens conscious thought but also has the power to redeem evil. H. is atheistic in the sense that he believes that God is absent from the world as well as that man has lost his dignity; whether God will reappear and man regain his dignity, has no place in H.'s philosophy, other than the consideration of the possibility of a God and of man's dignity. Both these possibilities reside in being as such, and being is above the human and above the divine. This much discussed philosophy may therefore be regarded as a part of Ontology (q.v.) in the sense in which Wolff defines it—that part of theoretical philosophy which deals with being in general as opposed to particular entities. The bulk of H.'s writings, including the second part of *Truth and Being*, as well as books on Nietzsche, Nihilism, and Logos are still in manuscript and unpublished. See A. Flecher, *Die Existenzphilosophie Martin Heideggers*, 1935; A. de Waelhens, *La Philosophie de Martin Heidegger*, 1946.

Heidelberg, tn. on the l. b. of the Neckar some distance from its confluence with the Rhine, 54 m. by rail from Frankfurt-on-Main, and 12 m. E.S.E. of Mannheim in Baden, Germany. The chief glory of the picturesque old city, which is guarded by the forest- and vine-clad slopes of Heiligenberg and Königstuhl, is the castle, which looks down on the riv. from a summit of over 300 ft. Begun in the thirteenth century, the castle was still being enlarged and beautified in the seventeenth century, but was partially blown up by the Fr. in 1689. In 1764 it was struck by lightning and was reduced to its present state of graceful ruin. The huge vat, known as the Great Tun of H., which has a storage capacity of 46,732 gallons, is entered from the castle courtyard. The famous univ. was founded in 1386 (or 1386). From here during the Reformation period Calvinist doctrines were disseminated far and wide, but for the thirty years of war (1618-48) its hist. is almost a blank. The valuable library, which Otto Henry began to collect, and which has at different times been housed in the Vatican and at Paris, now contains about 4000 MSS., 3000 papyri, besides over 500,000 vols. Hitler founded two new chairs at the univ. of H., one of folk hist. or 'folklore,' and the other to direct the study of the hist. of the art of war. These two subjects were both branches of study in which the Nazis had a special and peculiar interest, and with the closing after the war of these two depts. of the univ., what seems to have been the Nazi party's sole positive contribution to the academic life of H. was brought to an end. A number of former profs. who had been dismissed by the Nazis were brought back to the univ. by the allied occupying authorities. H. is not only the oldest Ger. Univ., but also in its hist. it has a name famous for religious reform and generally reforming thought, and it is probably for these reasons that the Nazis selected H. to be above all others the home of Nazi culture and ideas; but notwithstanding this pollution, something of the old tradition of H. lived on under the Nazis and was a useful foundation on which to bring about the univ.'s restoration after the war, though the mental desert left by the Nazis presented a desolate prospect. H. was practically untouched physically by the war, save for the pink stone bridge which was cut in the middle, and all the univ. buildings were intact, but the problem was how to recreate a clean untainted academic life within the buildings; for the real problem of all the Ger. univs. after the war was not merely to re-educate their students but to start teaching again from the beginning the actual habit of thought. There is an excellent observatory on the Königstuhl (built in 1894), and among the anti-quoties of interest are the Protestant Peterskirche, where Jerome of Prague planned up his theses in 1460, and the fine Gothic Heilige Geist Kirche, which also dates from the fifteenth century. H. is of some commercial importance, more especially as trunk lines radiate to Karls-

ruhe, Würzburg, Mannheim, and Speyer, besides to Frankfurt. The first president of the Ger. Republic (1919), Friedrich Ebert, was b. at H. Pop. 84,600.

Heidelberg, name of a tn. (58 m. S. by E. of Pretoria) and dist. of the Transvaal, S. Africa. The tn. lies 5029 ft. above the sea on the slopes of the Rand, and was founded in 1865. Besides being a health resort it is a gold-mining centre for the Witwatersrand fields, etc. Coal is found in the neighbourhood. Pop. (European) 2600; (other) 4500.

Heidelberg Man, remains, lower jaw and teeth, of a sub-man of the Pleistocene Age found, in 1907, at Mauer on a trib. of the Rhine. Anthropologists regard the remains as being of a later period than the famous Piltdown man (q.v.) though earlier than the Neanderthal. See O. Schoetensack, *Der Unterkiefer des Homo Heidelbergensis*, 1908.

Heidenheim, tn. in Württemberg, Germany. It was once an anct. Rom. settlement. The picturesque ruined castle commands the tn. Pop. 24,000.

Heidenstam, Carl Gustaf Verner von (1859-1940), Swedish man of letters; b. at Olshammar in Nerike prov. of noble parentage. As a boy he had to travel for his health, and saw Greece and the E. At Rome, he was for two years pupil to the Swedish painter Kronberg; he studied also at the Ecole des Beaux Arts, Paris. He then lived some years in Switzerland, and returned to Sweden, where he developed as a painter in words instead of pigments. The greater part of his work consists of poetry and short tales. He wrote only one book that can properly be called a novel—*Endymion* (1889), a story of the E. His famous *Karolinerne* (1897-98) is a collection of tales about Charles XII. Some of his other works are: *Vallfärd och Vandringar* (poems, 1888), *Från Col di Tenda till Blocksberg* (sketches, 1888), *Rennsöarna* (1889), *Dikter* (poems, 1895), *Tänkar och Teckningar* (1899), *Sankt Gören och Draken* (1900), *Folke Filbyter* (peasant-legend, 1905), *Bjälboarvet* (sequel to *Folke Filbyter*, 1907), *Folkungatradet* (1905-07), *Svenskarna och deras hördingar* (the Swedes and their Chiefs, 1908-09), *Stridskrifter* (1912), *Nya Dikter* (1915), *Dikter—Med raderingar av Jürgen Wrangel* (1927). H. stands for colour and romance as against such realism as that of Strindberg. He was of aristocratic and anti-levelling temper. He received the Nobel Prize in 1916 and the Henrik Steffens Prize in 1938. A new Eng. trans. of *Karolinerne*, called *The Charles Men*, appeared in America in 1920.

Heifetz, Jascha (b. 1901), Polish violinist, b. in Vilna, studied at the St. Petersburg conservatoire, and made his first public appearance before he was five years of age, at Vilna, and in Petrograd at ten. Has played with phenomenal success in Germany, Austria, and the U.S.A.

Heijermans, Herman (1864-1924), Dutch novelist and dramatist, b. at Rotterdam. As a young man he was a frequent contributor to Amsterdam journals, under the pseudonym of 'Samuel Falkland.' He

subsequently made a marked success with novels and social dramas.

Heilbronn, manufacturing tn. of Württemberg, Germany, on the Neckar, 33 m. by rail N. of Stuttgart, having fine views of mts., the Black Forest, and the Voeges. It is an anct. tn. of historical interest, containing many old buildings, such as the Gothic church of St. Kilian, a Rathaus, the Gotzensturm, and Schönbühler Hof, as well as fine modern buildings. It has reminiscences of the Emperor Charles V., Götz von Berlichingen, Gustavus Adolphus, and Schiller. The chief manufs. are chems., machinery, paper, sugar, salt, cigars, coffee, etc. At H. the Gers. defended the Neckar line against the Amer. Sixth Corps for some days and then fought in the tn. for a week before it was cleared on April 12 (1845). Pop. 77,600.

'Heil Dir im Siegerkranz,' Prussian national anthem. The words are by Balthasar Gerhard Schumacher, and the music is that of 'God save the King.' John Bull's *Ayre*, 1619, is an early version of the same tune, but the music as it is now sung first appeared in 1745, the reputed composer being Henry Carey.

Heilsberg (Polish, Lidzbark Warmiński), tn. of Poland (formerly E. Prussia) with dye works and tanneries, 39 m. S. of Kaliningrad (Königsberg). It is situated at the confluence of the Alle and Simser. There is an old castle. Pop. 4200.

Heilsbrunn (also Kloster-Heilsbrunn), vill. 16 m. S.W. of Nuremberg by rail, in Middle Franconia, Bavaria, Germany. It is famous for the Cistercian monastery which Bishop Otto founded in 1132, and which fl. until 1555. High interest attaches to a series of sepulchral monuments to members of the Hohenzollern family, and also to the church, which is a basilica in the Romanesque style. Pop. 1700.

Heilunkiang, prov. of Manchuria, containing 25 cos. with Pehán as cap. It is an elevated region with an area of 765,000 sq. m. The most important products are timber and gold. Pop. 2,564,000.

Heimdallr, in Norse mythology, the god of light. He guarded the frontiers of Himnaborg (heaven) and the rainbow-bridge (Bifrost) against the assaults of the giants. Like Oliver Hoder of Teutonic myth, his hearing was so acute that he could hear the grass grow. Always in mortal feud with Loki for the recovery of Freyja's stolen necklace, and ultimately they slew each other.

Heine, Heinrich (1797-1856), Ger. poet and journalist, b. at Düsseldorf of Jewish descent. He was editor at the Lyceum in Düsseldorf, and began life at Hamburg in the banking business of his uncle, Solomon H., with whose daughter Amalie he incidentally fell in love. On account of his failure in business, his uncle sent him to study law at Bonn (1819), where he gave signs of literary talent. A. W. von Schlegel being one of his earliest admirers and advisers. In the following year he left Bonn for Göttingen, but before long became entangled in a duel, and found it

advisable to leave there also. Arriving in Berlin, he was soon an eager student of Hegel; his new environment and friends, including Fouqué, Rahel, Chamisso, and the Humboldts, stimulated his genius, and the first vol. of *Gedichte* appeared in 1821. Turning again to law for a while—for the poor success of his tragedies *Almansor* and *William Ratcliff* (1823) had discouraged him—he graduated in 1825. The same year he spent a holiday in the Black Forest, thereby gaining the material for the first vol. of *Reisebilder* (1826), which attracted much attention by its originality and brilliance of style. Meanwhile, he had become baptised in the Christian faith, purely, however, for social purposes. The next few years were spent visiting London, Munich, and Italy; the

HEINRICH HEINE

remaining three vols. of *Reisebilder* were pub., and also the *Buch der Lieder* (1827). After another visit to Berlin (1829) and a brief sojourn in Hamburg (1829-31), H. made Paris his home, quite severing his ties with Germany; and he only revisited it for short periods in 1843 and 1847. In Paris—the new Jerusalem—he was welcomed by the brilliant romantic circle—Hugo, George Sand, De Musset, Gautier, Sainte-Beuve, Chopin, Berlioz, and Delacroix; and he settled down to journalism and letters, *De l'Allemagne* (1835), and *Die Romantische Schule* (1836), being his chief works of this period. He first met 'Mathilde' in 1834—Eugénie Mirat (d. 1883), a shop-assistant—first his mistress and subsequently (1841) his wife; and, although it is hard to understand the fascination of a badly-educated, shallow-minded grisette for H.'s sensitive artistic soul, their mutual devotion was certainly unwavering. During H.'s early years in Paris, his uncle had allowed him 4000 francs a year, but his growing separation

from the Hamburg family made it necessary to look elsewhere for support, and from 1837 to 1848 he was in receipt of a pension of 4800 francs from the Fr. gov.—ostensibly as a political refugee, although he was not associated with the young Ger. party whose revolutionary ideas had exiled them to Paris. This was the last step in his absolute self-alienation from his compatriots; his writings had already been condemned by the Frankfurt Confederation Parliament (1835). *Der Salon* (4 vols.) appeared between this time and 1840, including his famous essays, 'German Philosophy and Literature,' written for the *Revue des Deux Mondes*. *Deutschland*, a political satire in verse, was pub. in 1844, and *Atta Troll*, 'the Swan song of Romanticism,' in 1847. From 1848 to 1856 H. was a victim to spinal disease, but through the agonies of this last long illness, during which Mathilde nursed him devotedly, he retained full control of his mental faculties, as his *Romanzero* (1851) and *Neueste Gedichte* (1853-54) bear witness. His Memoirs were probably destroyed; at any rate, they were withheld from pub. for family reasons, when in 1837 his Hamburg pension was restored; doubtful fragments were pub. in 1884, but their importance is as slender as their interest. During the Nazi regime (by 1910) all the works of H. were banned in Germany. H. gave a prophetic warning to France of the revolutionary forces at work in Germany, in a passage which appears in his *Religion and Philosophy*. (The book was pub. in 1835, but the passage in question was deleted from the first Ger. ed. by the Prussian censor and appeared only in Fr. trans.).

H.'s genius was moulded by his Ger. birth, Jewish descent, and Gk. culture; Nietzsche wrote that H. and himself were the greatest literary artists Germany had ever produced. He was the *grand maître* of lyric expression; for his sense of the tragic and the beautiful was passionately intense. Gautier says that 'Heine combined the purest Gk. form with the most exquisite modern inspiration; he was a true Euphorion, the child of Faust and lovely Helen.' His work is the emotional panorama of a soul almost neurotic in its exquisite sensitiveness, its keen appreciation both of beauty and ugliness, of joy and despair. And his style is equally nervous in his portrayal of them both; on the one hand, the lyric-idealist, sometimes sentimental to a degree bordering on the ridiculous; on the other, the bitterly ironical cynic, often malicious in his satire, merciless and irreverent to the most sacred feelings of others. But, confining attention to broader issues, he was the first and greatest of a type of which, unfortunately, a mediocre multitude has since arisen: a self-centred, narrow soul, of artistic and irritable temperament, aiming at hedonism, fretting at the ruin of reality, a poet of happy illusions that bring but sadness. Whilst expressing dis-favour of Romanticism, he was one of its leading exponents; and whilst often coarse and brutal in his attitude towards

love, he was yet conscious of the supreme poetry of passion. Indeed, it is as the poetic psychologist of love that H. is pre-eminent; his *Lyrisches Intermezzo* (1823) and other poems have a wonderful fascination for translators, and have been set to music by nearly all the great song-writers—Schumann above all, Liszt, Rubinstein, Brahms, and Grieg. H.'s idealism towards life was a sanguine hope for the brilliant and glorious future of mankind—a future to be realised by fostering imagination and aesthetic culture.

A Fr. ed. of his works was pub. by H., De Nerval, and others (14 vols., 1852-68); other eds.: (Ger.) A. Strodtmann (21 vols., 1861-66), E. Elster (7 vols., 1887-90), and O. Walzel (10 vols., 1910-15), (Eng.) C. G. Leland (13 vols., 1892-1906). See lives by A. Strodtmann, 1873; W. Stigand, 1875; W. Sharp, 1888; and M. J. Wolf, 1921; also J. Weldekamp, *Traum und Wirklichkeit in der Romantik und bei Heine*, 1932; F. H. Wood, *Heine as a Centre of his own Work*, 1934; L. Marcuse, *Heinrich Heine, a Life between Past and Future*, 1934.

Heineccius, Johann Gottlieb (1681-1741), Ger. jurist, b. at Eisenberg and educated in theology and law at Leipzig and Halle. He was made prof. at Halle of philosophy (1713), and of law (1720). He then went as prof. of law to Franeker and to Frankfurt-on-Oder, but in 1733 returned to Halle, where he d. His works display great learning, especially in Rom. and Ger. law. The chief are: *Historia Juris Civilis Romani ac Germanici* (1733), *Elementa Jurs Germanici* (1736), and *Elementa Juris Nature et Gentium* (1737), trans. into Eng., 1763).

Heineken, Christian Heinrich (1721-25), Ger. infant prodigy; b. at Lübeck; son of a painter. Spoke at ten months, knew story of Pentateuch at one year; at two was familiar with sacred hist.; at three with general hist., geography, Lat., and Fr. Could converse intelligently on subjects of his studies. Visited king of Denmark at Copenhagen, 1724.

Heinemann, William (1863-1920), Eng. publisher; b. at Surbiton, Surrey; eldest son of Louis H., native of Hanover. Educated at Dresden and at home. Studied music in Germany; acquired taste in art. After gaining experience with Trubner of Ludgate Hill, opened as publisher, 1890, with Hall Caine's *Bondman*. Pub. for many notable authors; and wrote plays: *The First Step* (1895), *Summer Moths* (1898), *War* (1901). President, Publishers Association, 1909-11.

Heinicke, Samuel (1729-90), founder of a deaf and dumb school in Germany. He was b. at Nautschütz, Germany, and fought in the Seven Years' war, being taken prisoner at Pirna. He had previously supported himself by teaching, and had one deaf and dumb pupil in 1754. In 1768 he taught a deaf and dumb boy to talk, and ten years later founded at Leipzig the first deaf and dumb institution in Germany. He adopted the methods laid down in Anshaus's *Surds loquens*. See H. E. Stötzner, *Samuel*

*Heinicke*, 1870; and G. and P. Schumann, *Neue Beiträge zur Kenntnis Samuel Heinicke's*, 1899.

**Heinkel**, Ernst (b. 1888), Ger. aircraft designer, b. at Grunbach, Württemberg. Founded the H. Aircraft works at Wassemünde in 1922, first developing service models of seaplanes, and later light, fast, passenger aircraft. His fighter (H.E. 111) and twin engine bomber (H.E. 111), and other types, were used by the Luftwaffe in the Second World War.

**Heinrich von Meissen** (1280-1318), Ger. lyric poet and wandering singer, b. at Meissen of humble burgher parentage. He is generally known by the name of *Frauenlob*, a nickname which may allude to his songs in praise of women, though some suggest that the reference is to his song, *Die Heilige Jungfrau*, or again to a song in which he defends the use of the word 'Frau' instead of 'Weib.' His youth was passed in straitened circumstances, but he gradually won a reputation as a singer at the courts of the Ger. princes. In 1278 he was in the army of Hapzburg, and in 1286 at Prague at the knightly of Wenceslaus II. It is said of him that he founded the first school of Meistersingers at Mainz. He died at Mainz, and the women of the city bore him to his grave in the cloisters of the cathedral and erected a monument, by Schwanthaler, to his memory. See F. H. Von der Hagen's *Minnesinger* (vol. IV) 1838; A. E. Kröger's Eng. trans. of his *Cantica Cantorum*, 1877; and H. Kiesel, *Die Ethik Frauenlobs*, 1926.

**Heinse**, Johann Jakob Wilhelm (1719-1803), Ger. novelist, translator, and art critic, b. at Langewiesen, Thuringia. He was a disciple of Wieland, and had some influence on Goethe. He studied art in Italy, where he also trans. Tasso's *Gerusalemme Liberata* and the *Orlando*. His masterpiece, *Ardinghello* (1787), contains remarkable digressions on the plastic arts, and another romance, *Hildegard von Hohenhal* (1796), gives his ideas on music. He served the elector of Mainz, and became state librarian. See J. Schöber, *Heinse, sein Leben und Werke*, 1882; and studies by A. Zappel, 1930; and A. Leitzmann, 1938.

**Heinsius**, Anthony (1641-1720), Dutch statesman and confidential agent of Wm. Prince of Orange, b. at Delft, and studied law at Leyden. In 1688 he was grand pensionary of Holland and guided Dutch politics until his death. In his zeal for his prince and Protestantism, he incurred the enmity of France.

**Heir**. The H. in Eng. law was the person who took by descent (*q.v.*) the lands, tenements, and hereditaments (*q.v.*) of another, the ancestor. There were also Hs. by custom, who were entitled by certain customary modes of descent to succeed to customary freeholds, a peculiar species of copyhold tenure, which prevailed in the N. of England, and within manors of the tenure of anct. demesne, or tenure by copy of court roll, but not expressed to be at the will of the lord of the manor. As noticed in the article INHERITANCE, the H. was an uncertain person till

the death of the ancestor, on the principle that no one is the H. of a living person. Before the ancestor's death, a person could only be an *heir-apparent*, i.e. one whose right is certain and indefeasible, provided he outlived the ancestor and the latter *d.* without making a will at all, or *d.* intestate as to some part of the real property; or an *heir-presumptive*, i.e. one who, if the ancestor should die immediately, would succeed as H., but whose right to succeed might be defeated by the contingency of a nearer H. being b.; e.g. an only daughter's presumptive right would be defeated by the birth of a son. (For the former rules of descent in Eng. law to real property, see under INHERITANCE.) The old rule of primogeniture has disappeared, and with it the equally old institution of the heir-at-law; but for the purpose of tracing title to real property, it is still essential for lawyers to know the old law. The term H. is still used popularly to denote the Hs. to the throne or to a title. **Heirloom** (A.-S., *loom*, limb or member). Hs. are those personal chattels which, by special custom, descended on death with the freehold lands of inheritance with the occupation of which they are connected; whereas ordinary chattels devolved on the executor for distribution amongst the next of kin. To-day such Hs. are practically unknown, and the word is used popularly to denote pictures, furniture, jewels, etc. vested in trustees to hold for the person who for the time being is entitled to the possession of a settled home and are known as settled chattels. By the Law of Property Act, 1925, the rules as to the settlement of real and personal property are assimilated. The former special devolution of Hs. is indicated by the name itself, which, according to Blackstone, is derived from *loom*, a limb or member, and signifies a limb of the inheritance. Deer in a park, fish in a pond, doves in a dove-cot, accompany heritable lands, and, similarly, crown jewels are said to be Hs. Charters' court-rolls (evidences of title), and deeds, chests in which muniments of title are contained, also passed as Hs., and also things affixed to the freehold in such a way that they cannot be severed without damage, e.g. chimney-pieces, benches, etc. Monuments or tombstones in a church, and coat-armour, pennons, and other insignia of honour of the ancestor, although hung up in a church, formerly passed as Hs. to his heir. Hs. could not be devised by will away from the heir, but under the Settled Land Acts, the court might sanction the sale (or purchase) of Hs.

**Heist-op-den-Berg**, tn. in Belgium, 17 m. S.E. of Antwerp, with a Gothic church dating from the fourteenth century. Pop. 10,700.

**Hejaz**, The ('The Boundary'), country of Arabia, making, with Nejd (or Najd) and Asir, the Kingdom of Saudi Arabia (*q.v.*) and see also SA'UD ABU'L AZIZ (ibn.). The H. extends along the E. coast of the Red Sea, from the gulf of Akaba to the S. of Taif, and is bounded by Syria on the N., the Nejd Desert and Nejd on the E., and on the S. by Asir. Its

length is 750 m., and its greatest width 200 m. Its coastline on the Red Sea is 800 m. and its area is about 112,500 sq. m. The pop. is unknown, but is variously computed at 1,500,000 to as much as 3,000,000. It is stony and altogether desolate in character. The Tehama range traverses it, of which the chief summits are Jebel Shar (7000 ft.) and Jebel Radhwa (6000 ft.). The form of gov. of the Kingdom of Saudi Arabia is patriarchal, being in this respect in marked contrast to that of Iraq (*q.v.*), which, under the Brit. mandate, became assimilated to W. models. The local or Sharian law is administered by local cadis under chief shaiikhs resident at Riyadh (in the Nejd) and Mecca. The chief tns. of the Hejaz are Mecca (pop. about 80,000), Jiddah, the pilgrims' port (pop. about 30,000), and Medina ('the city'), the terminus of the Hejaz railway, and famous as the burial place of Mahomet, with a pop. of about 20,000 (see MEDINA). The chief products of the H. are dates, hides, fruit, honey, wool and ghi (clarified butter). Jiddah does a fair trade in hides, coffee, mother-of-pearl and carpets, but the products are mainly for domestic consumption, and the revenue is derived, apart from that drawn from dates, chiefly from the famous if declining pilgrimages. In 1939 the number of pilgrims to Mecca was nearly 600,000. Medina is connected with Amman in Transjordan, and is 800 m. by rail from Damascus. The H. railway connects with the Bagdad railway at Aleppo (*q.v.*). The Palestine railway authorities administer the section from Maan to Amman. There are no roads, properly so called, in the H. From Jiddah to Mecca (45 m.) a road through the hills is in some parts metalled. There is also a track from Mecca E. through Riyadh to Uqair on the Persian Gulf a distance of 820 m., which is used for motor transport; and a similar route connects Jiddah with Medina via Rabigh. Small ports on the Arabian coast are El Wih, Yanbo-el-Bahr, Rabigh and Jiddah (or Jedda), which contains the reputed 'tomb of Eve, mother of mankind.' The oasis of Khathir, E. of the railway, has a large pop. consisting of the descendants of former negro slaves, with a centre at Kaer el Yahudi. Abdul Aziz ibn Saud, Sultan of Nejd, having thrown off the Turkish yoke before the First World War, completed the conquest of the H. in 1926, the kingdom of the Hejaz and Nejd becoming then the most powerful in Arabia. The unification of Ibn Saud's dominions under their joint name of Saudi Arabia was effected by a decree of Sept. 22, 1932. For the hist. of the H. (and Nejd) in the First World War, see ARABIA.

**Hejira**, and after Hejira, or Hegira ('flight,' from Arabic *hajara*, to go away). signifies the flight of Mohammed from Mecca on Sept. 13, A.D. 622. Since the institution of the new Moslem calendar by Caliph Omar (640), the Mohammedan era has dated from this event, being distinguished by the letter A.H. (*anno hegire*). The Mohammedan year is a lunar one, and

therefore nearly eleven days shorter than ours. See T. P. Hughes, *Dictionary of Islam*, 1895.

**Hekla**, or Hecla, volcanic mt. in Iceland, 68 m. E. of Reykjavik. Elevation 5108 ft. There have been twentythree eruptions since the ninth century, the last in 1947. By the outbreak of 1845, fine lava ashes and dust were scattered as far as the Orkney Is. 500 m. away. The next eruption of March 29, 1947, was preceded by an earthquake and showered dust on Copenhagen, 1,250 m. away.

**Hel**, or Hela, in Scandinavian mythology, was the daughter of Loki and of the giantess Angvortha. She was the goddess of the dead, and lived below the roots of the sacred ash Yggdrasil. She ruled over the nine worlds of Helheim, the abode of the dead, and of the old and sick. After the introduction of Christianity, her dwelling-place became synonymous with hell, the abode of the wicked dead.

**Helbou**, see ALEPPO.

**Helder**, Den, seaport at the N. extremity of Holland, situated on the Marsdiep at the entrance of the Zuider Zee. There is an excellent harbour at Nieuw Diep, the E. side of the tn., and there are fine embankments. The great Helder Dyke, constructed of Norwegian granite, is 5 m. long and there is a good road along the top of it. It is an important naval and military station. H. has also an observatory, lighthouse, zoological station, and tn. hall, etc. It was first fortified by Napoleon in 1811. The Dutch fleet, under De Ruyter and van Tromp, defeated the Eng. off the coast in 1673. H. may be said to have marked the Dutch or N. end of the constant blockade which Allied naval forces maintained without interruption throughout the Second World War from the Biscay and Channel coasts, from the Gironde to Den Helder. Pop. 31,500.

**Helen**, or Helena, heroine of the Trojan War and the most beautiful of women. She was the daughter of Zeus and Leda, and the sister of Castor and Pollux. She was carried off by Theseus to Attica, but was rescued by her twin brothers. She chose Menelaus out of many suitors, but subsequently deserted her husband and fled with Paris to Troy. This led to the Trojan war, which lasted for ten years. After the death of Paris she married his brother Deiphobus, whom she later betrayed to the Greeks, and returned with Menelaus to Sparta. According to one tradition, on the death of her husband she married Achilles and lived with him in Leuce.

**Helena**: (1) Co. seat of Phillips co., Arkansas, U.S.A., situated on the Mississippi at the foot of Crowley's Ridge, 50 m. S.W. of Memphis, Tennessee. It is served by three railways and is a port of entry and the head of navigation for ocean steamers. It has a busy trade in cotton-seed products and lumber. Pop. 8500. (2) Co. seat of Lewis and Clarke co., Montana, U.S.A., situated at an elevation of 4000 ft. on the Rocky Mts., 50 m. N. W. of Butte. It is the seat of Montana Wesleyan College and of the

Rom. Catholic institutions of St. Aloysius and St. Vincent, and others. It is a large commercial centre, with lumber and quartz mills. There are gold, silver and iron mines in the dist. Pop. 15,000.

**Helena, St. (Flavia Julia Helena)** (c. 247–c. 327), wife of Constantius Chlorus, and the mother of Constantine the Great. She is supposed to have discovered the holy rood and sepulchre of our Lord at Jerusalem (326). Her festival is celebrated on Aug. 18. Sev. other saints of the Catholic Church have this name, among them being Olga, wife of grand-duke Igor, who changed her name to II. at her baptism (955).

**Helena** (d. A.D. 359), daughter of Constantine the Great and of Fausta. She married her cousin Julian, whom her brother Constantius II. made Cæsar at Milan (315). Her only son was supposed to have been killed at birth through the instigation of the Empress Eusebia.

**Helensburgh**, police burgh and holiday resort on the firth of Clyde, Scotland, in the co. of Dumbarton, at the mouth of the Gareloch, opposite Greenock. It is 23½ m. N.W. of Glasgow and 71 m. W. of Edinburgh by rail. It is a well laid out modern tn. and a centre for excursions. It is famous as the bp. of steam navigation in Europe. The jetty from which Henry Bell, the owner of the famous *Comet*, made his early experiments can still be seen opposite his house, now a hotel. St. Bride's School for girls was founded in 1895. Pop. 9900.

**Helenus**, soothsayer of Gk. legend, the son of Priam and Hecuba. He foretold the fall of Troy to the enemy, and after the siege saved the life of Pyrrhus by warning him not to return home by sea. He accompanied Pyrrhus to Epirus, over part of which he ruled, and Pyrrhus gave him Andromache, the widow of Hector.

**Helford River**, Cornwall, rises 4 m. W. of Penryn and flows into the English Channel between Rosemullion Head and Nare Point. Frenchman's Creek is a famous beauty spot on the S. side of the riv.

**Heligoland**, see **HELIGOLAND**.

**Heliland**, The (O.E. *Helend*, Saviour), ninth-century old Saxon poem of the life of Christ. The best texts are the Cotton MS. in the Brit. Museum, and the Munich MS., which are printed side by side in Siever's ed., 1877. From internal evidence modern scholars have concluded that it was written by the author of the fragments of a version of the story of Genesis which, with the H., is all that survives of Old Saxon poetic literature.

**Helianthus**, see **JERUSALEM ARTICHOKE** and **SUNFLOWER**.

**Helicon**, mt. range in Boeotia, Greece, situated between the gulf of Corinth and Lake Copais. It is celebrated in classical literature as the abode of the Muses; near by were the fountains, Aganippe and Hippocrene, which were said to give poet inspiration. The W. summit, Pæleovoun, rises to 5000 ft.; the E. summit is called Zagora.

**Helicopter**. Type of aeroplane in which the machine is equipped with one

or more lifting propellers which, power-driven, rotate horizontally. The autogiro (q.v.) differs from the H. in that its horizontal blades rotate freely. The first H. appeared in 1872. In 1923 Raoul de Pescara successfully flew one of his own invention. The advantage sought in the H. is that of being able to rise almost vertically—but the most modern 'fighter' planes can now do so. The principle of the H. is partly adopted in the gyroplane, an appliance that not only has the four rotating planes set at angles to gain an upward movement, but is also equipped with a screw that drives the whole machine against the air, thus gaining some of the advantages of the aeroplane method. Hs. were introduced experimentally in 1948 for the collection and delivery of mails by the Brit. Post Office and in 1949 for the transport of goods and building materials to places inaccessible by road. Research has been devoted recently to the application of jet propulsion to Hs., where the lifting rotor is driven by ram jets mounted at the blade tips.

**Heligoland**, or **Helgoland**, an is. of Germany, in the N. Sea, lying 40 m. N.W. of the mouth of the Elbe, and 28 m. from the nearest point on the mainland. It was once a Brit. possession (1807–90), and was ceded to Germany (1890) in return for concessions in E. Africa, being formally incorporated in the Prussian prov. of Schleswig-Holstein in 1892. The is. is a m. long, its greatest breadth being less than a third of a m. It is a rocky plateau, with a sand bank, the Düsen-Insel, off the E. coast. On three sides the is. rises nearly perpendicularly from the sea, forming a grass-covered triangle called the Oberland. It is a popular bathing resort. In accordance with the treaty of Versailles (1919) the fortifications, military estab. and part of the naval harbour were, or were supposed to have been, razed. But the 12-inch guns of the Schröder Battery came out of the old battle cruiser *Derfflinger*, which was also supposed to have been demolished with her armament. It provided one typical instance of the cursory way in which the disarmament of Germany was conducted after the First World War. Many of the tunnels were bricked up across the entrances by the Gers. and faced with carefully selected blocks of red sandstone of the cliffs, so that they were well camouflaged. When the Disarmament Commission inspected it, they saw only the tunnels which had been there before 1914. Afterwards the tunnels were opened up, being filled with secret equipment which was hidden from the Allies. Hitler re fortified it, intensively. Near the landing place is a monument erected in 1914 to those who were killed in the airship L.L.1, and in torpedo boats near the coast. Area 130 ac. Bombed by the R.A.F. in a successful daylight attack on both the naval base and the fortifications on May 14, 1941, the defences being taken by surprise. The Brit. White Ensign was hoisted in May (1945) over what remained of the great Ger. secret rock fortress of H. The whole of the armament

of the fortress had by then been destroyed, and only the enormous labyrinth of underground workings remained. There were in 1945 more than 8 m. of tunnels; the lowest, lined with Eng. brick, was constructed when it was a Brit. colony. All the Ger.-built tunnels were lined with concrete, the most modern being made in 1940 by 25,000 conscripted labourers. The U-boat pens were often hit by bombs but only chipped. The power-station was protected by a great concrete bunker under the cliff. During a big raid just before the Ger. surrender the old tn. on the Oberland and the residential quarter on the flat land below were obliterated. The only structure on the Oberland to remain intact was the control tower of the great fort. The fortifications of it were blown up by the R.N. on April 15 (1947) with 6700 tons of explosives which were detonated in the underground chambers and passages. One of the primary objects of this operation was the destruction of the U-boat pens, elaborate structures of reinforced concrete in the inner harbour. This task was completely achieved. Also the labyrinthine tunnels and caves—8½ m. in all—which the Gers. used for storage and defence were most adequately shattered; as also were the batteries of heavy guns and the power installations. The physical aspect of the Is. was changed a little by the explosion: its S. tip was flattened and the cliffs, 180 ft. high, were no longer there.

**Heligoland Bight, Battle of.** Heligoland Bight is that area of sea about the Is. of Heligoland off the N.W. coast of Germany. The W. end of the Kiel canal enters the mouth of the R. Elbe, which empties into the Bight. The area was therefore one of great Ger. naval activity during the First World War. Immediately war had been declared, Brit. submarines kept a perpetual watch upon Ger. shipping here, venturing far into the protected area and noting the routine of the various units of the fleet. It was therefore arranged to make a sweep of the Bight in the early hours of Aug. 28, 1914, by the light cruiser force at Harwich under the command of Commodore Sir Reginald Tyrwhitt. The Bight was defended by three lines of warships. Before dawn on the appointed day Tyrwhitt's force was approaching its objective, and immediately it was sighted by the Ger. ships they scuttled back to the shelter of Heligoland at top speed, without trying conclusions with their opponents. The day was misty, and this favoured them. The *Arcturion* and *Fearless* distinguished themselves on the Brit. side. One Ger. destroyer which failed to regain Heligoland was sunk. After this first brush the Ger. cruisers began to come out and look for their opponents. The Ger. *Mann* put up a good fight before she was sunk. She had become detached and could get no support. Adm. Beatty with his battle cruiser squadron now entered the battle, and immediately the Ger. cruisers turned to run to safety, but they were too late, and the *Ariadne* was sunk, and a little later the *Köln* met the same fate.

This Brit. victory was a severe blow to the Ger. Navy, although it did not come as a surprise to those in authority, who were convinced that their forces could not hold their own against the Brit. They therefore decided not to risk a battle again but to reduce the Brit. fleet by submarine and mine action. (See also DOGGER BANK.)

**Heliogorus of Emesa** in Syria, the earliest of Gk. romance writers. He is known by his *Æthiopica*, the MS. of which was discovered in 1526 in the library of Matthias Corvinus, and was printed in 1531. It is in ten books, and narrates the story of the lovers Theagenes and Chariclea. Consult G. A. Hirschig, *Scriptores Koptici*, 1856, and an Eng. trans. in Bohn's Classical Library.

**Heliogabalus**, see ELAGABALUS.

**Heliograph**, instrument used for signalling swiftly between two distant points, by means of flashing the sun's rays from the face of a mirror. The flashes are made to follow each other in accordance with a pre-arranged signal code. The mirror, from which a part of the mercury back has been removed, is mounted on a tripod and two sights are provided in front with a screen. The sun ray is then directed through both sights, and the flash can be seen at a distance of many miles, the range of the H. flash depending upon the size of the mirror. If the mirror is directed at exactly the required spot, its flashes cannot be read at a distance of more than 10 yds. on either side if the distance away is 1 m., or for more than 50 yds. at a distance of 2 m.

**Heliogravure**, see PHOTOGRAPHY.

**Heliometer**, astronomical instrument for measuring the diameters of celestial bodies or their distances from one another. It was invented by Fraunhofer in 1814 and, as its name indicates, was first used

to obtain solar measurements. The H. is an equatorially mounted telescope with its object-glass divided into two movable halves (as shown in diagram). The largest H. is an 8½ in. at the Vienna Observatory (Kuffner). Directions for use are thus given in the manual *Astronomy* by Sir E. W. Dyson, F.R.S. 'If,' he says, 'two stars are looked at, and the glass is turned so that the direction in which the halves are separated is parallel to the line joining the stars, there will be seen, as in the diagram, four images in a straight line, viz. A and B, the images of the two

stars formed by one half of the glass, and  $A^1 B^1$ , the images formed by the other half. The halves of the glass are separated by a distance  $AA^1$  or  $BB^1$ . If they are now still further separated till  $A^1$  coincides exactly with  $B$ , the distance between the stars is exactly equal to the amount by which the two halves of the glass are separated.

**Heliopolis** (the city of the sun): (1) anct. city of Lower Egypt, called in the Bible On. It stood 5 m. E. of the Pelusiac branch of the Nile at the apex of the Delta. It was the chief seat of the Egyptian sunworship, and was famous for its schools of philosophy and astronomy. The site of the anct. temple is marked by a red granite obelisk. A short distance from the ruins of the anct. city stands New H. It was founded in 1908 by a Belgian Co. It is in a healthy situation and is well laid out with broad streets and squares. It has churches, mosques, a sporting club and swimming bath, a racing course and club. There is a fine aerodrome. A railway is projected from New H. to Suez. Pop. 23,000. (2) The Gk. name for Baalbek (q.v.).

**Helios**, Gk. god of the sun, known to the Romans as Sol. He was the son of Hyperion and Thea and the brother of Selene and Eos. In Homer (*Odyssey*, viii.) he is described as a god who rises from Oceanus in the E. traverses the heavens, seeing and hearing everything on his way, and descends to Oceanus in the W. Later writers tell of a magnificent palace in the E. from which he comes forth in a fiery chariot drawn by four horses, and of another palace in the W. His horses grazed on the Is. of the Blessed. The Is. of Thrinacia was sacred to him; there his daughters Phæusa and Lampeta tended his flocks. He was worshipped throughout Greece and in the Is. of Rhodes, where the mighty Colossus was erected to him.

**Heliostat**, see SIDEROSTAT.

**Heliotherapy**, see SUNLIGHT TREATMENT.

**Heliotrope**, see BLOODSTONE.

**Heliotrope** and **Turnsole** are popular names applied to several species of *Heliotropium* (q.v.). The H. plant most commonly cultivated in Britain is *H. Peruvianum*. Winter H. is a common name of *Petasites fragrans*, a sweet-smelling species of Compositæ.

**Heliotropism**. The direction of the rays of light affects the position of plant members, and it is these phenomena which are termed H. Stems and leaves grow towards the source of light, as may commonly be seen in window plants, and are said to be positively heliotropic, and members, such as roots, which grow away from the light, are said to be negatively heliotropic. Young growing parts of plants respond more quickly to light than older parts.

**Heliotropium**, genus of boraginaceous plants, contains numerous species which inhabit tropical lands and are often cultivated because of their fragrant blossoms. *H. Peruvianum*, the Peruvian heliotrope, turnsole, or cherry-pie, is a shrub growing

1 or 2 ft. high, and the scent of the flower greatly resembles that of the vanilla; it is a native of Peru. *H. villosum* is found in Greece, and *H. Europæum* in S. Europe and the Caucasus.

**Heliotype**. Process connected with photography and printing. In the development of a negative, the effect of light and shade are obtained by burning away the gelatine in places, and thus causing a relief effect. By using this fact and printing from a suitable form of press, prints can be obtained from the actual gelatine surface, without covering it with tin-foil as is done in the case of Stannotype.

**Heliozoa**, name given to a group of Protozoa commonly called the sun-animalcules. Some have no skeleton, and in some cases they have a gelatinous membrane. Chlamydomorphs, which have always a gelatinous envelope; Chalarothoraca, which have a skeleton of silicious spicules; and Desmothoraca, which have a stalked or unstalked shell with numerous pores. H. are widely distributed, and are both freshwater and marine.

**Helium** (from Gk. ἥλιος, the sun), an inactive gaseous element. Lockyer observed in 1868 a bright yellow line in the spectrum of the solar chromosphere close to but not identical in position with D. line of sodium. He ascribed it to a hypothetical element *helium*. Hillebrand had noticed that an inert gas was evolved when the mineral cleveite was treated with acid. Ramsay, repeating these experiments, found that the inert gas refused to combine with oxygen, and on submitting it to Sir William Crookes for spectroscopic examination the spectrum was found to be characterised by a bright yellow line coinciding with the new line discovered by Lockyer in the solar spectrum. The name *helium* was, therefore, adopted for the new gas. It is abundant in many minerals, all of which contain uranium and barium as important constituents. The richest known mineral source is thorianite, which is mainly thorium oxide, and contains about 9.5 c.c. per grain. H. is also present in the gases which escape from the water of hot springs and in the atmosphere, of which it constitutes four parts in a million. To prepare H. from thorianite, the mineral is treated with urtic acid, when the H. is liberated together with hydrogen, oxides of carbon, and a trace of nitrogen. The hydrogen is removed by sparking the mixture with oxygen, and the remaining impurities are removed by Dewar's method of absorption with charcoal cooled in liquid air. The H. alone is unabsorbed by the charcoal, and it can be pumped off in a state of perfect purity. The prin. source of H. is the natural gas (mostly consisting of methane) issuing from petroleum wells in certain of the United States and in Canada (Medicine Hat).

**Properties**.—It is chemically inert. Its density is 1.98, referred to hydrogen as 1. The ratio of its specific heats is 1.66, so that its molecules are monatomic. The atomic weight is, therefore, double the density, i.e. almost 4. Its solubility in

water is less than that of any known gas. It approximates more closely to the ideal gas than hydrogen. In 1908 Kamerlingh Onnes of Leyden University succeeded in liquefying it. Its boiling point is  $4.3^{\circ}$  abs., the density of the liquid is  $.154$ , and its critical temp. is  $5^{\circ}$  abs. Solid H. was obtained by Kelsom in 1926. Its melting-point is only one degree above abs. zero. The  $\alpha$ -particle expelled by radium, thorium, uranium, and actinium is identical with the atom of H. This conclusion is based on the following experimental evidence: (1) All  $\alpha$ -particles have the same mass and differ only in their velocity of expulsion. This mass has been measured, and has been found to be the same as the mass of the H. atom: (2) The 'emanation' from radium which expels  $\alpha$ -particles (radon) was stored in a thin-walled but perfectly gas-tight glass tube, enclosed within a wider vessel. After some days the gas in the outer vessel was found to contain H. It was proved that when H. was stored in the inner tube, none passed through the glass into the outer vessel. In this experiment the velocity of expulsion of the  $\alpha$ -particle was so great that the particle could not get through thin glass. When it was brought to comparative rest in the space surrounding the thin glass vessel, its properties were identical with those of the atom of H. There is a general accumulation of evidence that one atom of a radio active substance expels but one  $\alpha$ -particle at each disintegration. Hence the change from radium to H. may be expressed quantitatively thus:

$$226 = 222 + 4 \\ \text{Radium} = \text{Radon} + \text{Helium}.$$

The numbers denote the atomic weights.

The atomic number of H. is 2. Its atom is next to that of hydrogen in simplicity of structure, its nucleus consisting of 4 protons and 2 electrons; the revolving or orbital electrons are thus two in number.

H. had at one time considerable commercial importance as a gas for filling airships. It has not quite so much lifting power as hydrogen, but possesses the inestimable advantage of being completely non-inflammable. For commercial purposes H. is obtained from natural gas that issues from the earth in Kansas and other districts of the N. Amer. continent (see above). The gas after purification is liquefied as far as is necessary to condense all the constituents except H.; it is then drawn off and stored. Millions of cubic feet of H. can thus be obtained per annum at a very reasonable cost.

H. is the lowest member of the group of 'rare,' 'noble' or 'inert' gases, of which other star members are neon, argon, krypton, xenon and radon.

Helix, the snail, typical genus of Helicidae, and contains sev. thousand species; *H. hortensis* is the common European snail, and *H. pomatia*, also found in England, is called the Rom. snail.

Hell, popularly conceived of as the place in which the finally impenitent suffer eternal torment, is in the A.V. the

Eng. rendering of sev. Heb. and Gk. words with distinct connotations. Hence very considerable confusion has arisen. The various words represented thus are the Heb. Sheol, and the Gk. words Hades (*hades*), Tartarus (*tartaros*), and Gehenna (*gehenna*). It will be well first to trace slightly the development of the Heb. conception of Sheol, trans. also in the A.V. sometimes as 'grave' and three times as 'pit.' The earlier view is well represented in passages of the Psalms xxvi. and lxxxviii., from which we see that Sheol is conceived of as a region outside the jurisdiction of Yahweh, and as independent of His existence. Sometimes the dead are here regarded as cognisant of earthly affairs, sometimes as totally ignorant of them. According to the former of these views, which is also the earlier, the dead retain their self-consciousness, and the state of affairs in Sheol is a shadowy reproduction of the earthly life. According to the later view, which is fully elucidated in the Book of Job (especially chaps. vii., xiv., and xxvi.), Sheol is equivalent to utter destruction. It is the land of sleep, of utter forgetfulness, and silence. The dead are ignorant of what passes on earth, and are unable to affect its affairs. The same view is put forth in Eccles. ix., where vv. 5 and 10 insist on the fact that all knowledge has forsaken the dead. Considerable development of eschatological conceptions is seen, however, in the post-exilic writings, and the doctrine of the resurrection comes into prominence, partly as a result of Persian influence. Two passages, in particular, are of importance as containing a clear enunciation of this doctrine, viz. Isa. xxvi. 1-19, and Dan. xii. By the second century B.C. the general conception of the abodes of the departed had taken a more clearly defined form, and Gehenna is the name given to the final abode of the wicked, where they suffer endless torments by fire, while Sheol is an intermediate state for both righteous and wicked, divided into four parts, two for the wicked, two for the righteous. The Sadducees, however, still sustained the ant. denial of a resurrection. In the N.T., Hades is used for the place of departed spirits, Gehenna for that of endless (*aiwnios*) punishment for the wicked. Tartarus occurs once (2 Pet. ii. 4) as the abode of the fallen angels. There has been much controversy as to whether the Gk. adjective *aiwnios* is equivalent to eternal in the modern sense of the term, that is to say, never-ending. The noun *aiwn* is frequently used for a long 'period of time,' and from the time of Origen onward, there have been those who held the opinion that ultimately the punishment of the most wicked and even of the devils would have an end, and that thus all would be saved. This is not, however, the common conception of the Early or Medieval Church, for here we find phrases which contain no ambiguity. Eternal punishment is never-ending. This view, found in the works of St. Thomas Aquinas, is also to be seen in the writings of Protestant divines. The pains of H. are conjectured to be both physical and

spiritual, the latter consisting chiefly of the torments of despair and remorse. The difficulties of the doctrine, based as it is on the actual word of Christ, are great and terrific, and have never been felt more keenly than in the modern age. With it is involved theologically the doctrine of the freedom of the will; only a deliberate and utter rejection of God can separate a soul from Him; therefore no-one can attempt to form an estimate of the fate of others, since apparent wrong-doing may be due to want of deliberation or to ignorance.

**Hell**, tn. in the prov. of Sor Trondelag, Norway. It is situated on the Trondhjem Fjord, 20 m. from Trondheim and on the direct railway from Sundsvall to Oslo.

**Hellah**, see HILLAH.

**Hellanicus**, or **Lesbos** (c. 495-411 B.C.), early Gk. historian, b. at Mitylene in Lesbos. The works attributed to him are: *The Priestess of Hera at Argos*; *Athis*; *Carneotike*, etc., in all about thirty chronological and historical works. Consult G. W. Müller, *Fragmenta historicorum*, 1841-72; and J. B. Bury, *Ancient Greek Historians*, 1909.

**Hellas**, dist. of S. Thessaly, often identified with Phthiotis. The Gks., who called themselves Ἑλληνες (Hellenes), after their mythical founder Ἑλλας (Hellen), son of Deucalion and Pyrrha, came to use H. to denote all the lands on which they settled, but more particularly the mainland of the Peloponnese.

**Hellbender**, see MENOPOME.

**Hell**, Die, valley in the Swartberg (Black Mts.) of Cape Prov., S. Africa inhabited by a farming community of 90 people, descendants of Huguenots who fled from France after the revocation of the edict of Nantes in 1685. The towering rock wall of the Swartberg shuts them off from the world and they have no radio, no newspapers, no telephones and because of the lack of roads they are beyond the reach of any wheeled vehicle.

**Helle** in Gk. myth, the maiden who gave her name to the Hellespont. With Phrixus, her brother, she fled on the golden-fleeced ram to escape the persecution of her step-dame, Ino, and fell into the strait, now called the Hellespont, and was drowned.

**Hellebore**, popular name of species of the ranunculaceous genus *Helleborus*, found only in Europe. They are sometimes employed in medicine, and when used in moderation they possess stimulating properties; in large doses they act as a fatal poison. *H. viridis*, the green H., is indigenous to Britain; is herbaceous below, shrubby above, and bears pale green flowers. *H. niger*, the Christmas rose (*q.v.*) has white flowers which turn green after fertilisation. A species of Liliaceae, *Veratrum album*, is known as the white H. root.

**Hellebore**, False, see VERATRUM.

**Hellefors**, com. and tn. of Sweden in the prov. of Örebro. Pop. 5000.

**Hellen**, in Gk. legend, was the son of Deucalion and Pyrrha. He ruled over Phthiotis and gave to his subjects the name of Hellenes. His three sons, Aeolus,

Dorus, and Xuthus, gave their names to the three nations, Aeolians, Dorians, and Ionians.

**Hellenism**. The term was made popular in England by Matthew Arnold, who used it to denote the principle of classic purity in art, as opposed to Hebraism, which expresses itself as 'romantic' exuberance in art. The word is more correctly applied by Droysen to the phase of Gk. culture prevalent in the second and third centuries among certain Ἑλληνιστὰς of Alexandria, people, not Gk. by birth, who had adopted the language and customs of auct. Greece. The Hellenistic language is a peculiar form of Gk., with many Heb. and Aramaic words and idioms. See P. Wendland, *Die hellenistisch-romische Kultur in ihren Beziehungen zu Judentum und Christentum*, 1907; R. Cohen, *La Grèce et l'hellenisation du monde antique*, 1939; M. Rostovtzev, *The Social and Economic History of the Hellenistic World*, 1941.

**Hellenist** (from the Gk. ἑλληνιστῶν, to imitate the Gks.), a term applied to a person who adopts the manners and customs of auct. Greece. It was first applied, during the first and second centuries, to the Jews of Alexandria, who laid aside the language and customs of the Hebs. for all the usages of the Gks. See also HELLENISM.

**Heller**, Stephen (1815-88), Austrian musical composer, b. at Pest. At the age of nine he made some sensation as a boy pianist. He studied in Paris, and became one of the set of which Chopin, Liszt, and Hallé were prominent members. He wrote entirely for the pianoforte and still retains his popularity with amateur players. H. visited England in 1849 and 1862. See life by H. Barbodette, 1876.

**Helles**, Cape, at the S. end of Gallipoli, near the entrance to the Dardanelles. Here Anzac troops were first landed at the beginning of the Gallipoli campaign in the First World War (see GALLIOLI CAMPAIGN).

**Hellespont**, see DARDANELLES.

**Hell Fire Club**, see under MEDMENHAM.

**Hell Gate**, or **Hurl Gate**, narrows formed by L. in the E. It., New York, U.S.A. near the junction with the Harlem R. and the bend towards Long Island Sound, where at certain states of the tide there is a whirl of currents. John Newton (1823-95) was the engineer, who, at the instance of the Federal Gov., conducted the blasting operations in 1885, which removed the dangerous rocks and deepened the Channel. H. G. Bridge is a fine new structure which crosses the strait in a single span and has made possible the direct rail service from Boston to Washington, etc.

**Hellin**, tn. of Spain in Albacete, situated near the R. Mundo in a rich wine- and oil-yielding country. There are sulphur mines and warm sulphurous springs, which were known to the Romans. Pop. 14,000.

**Hellovo**, see OTHRYA.

**Helmand**, or **Helmand**, see HELMUND.

**Helmbrechts**, tn. of Germany in Bavaria, 20 m. N.E. of Bayreuth. Pop. 6000.

**Helmet**, protective covering for the head. At the time of the Norman Conquest a conical H. with nose-piece was worn with or without safeguards for the ears and nape of the neck. The casque was usually made of strong hide, strengthened with small iron plates. In the eleventh century a mail-hood was attached to the casque. A century or so later it became of heavy iron was frequently worn over a light basinet. The knights of the fourteenth century wore long pointed visors, that could be moved up and down, while the chain mail was worn low over

ROMAN HELMET

the shoulders. They bore their crests high on their Hs. The *salade* or *sallet* of the next century had a low, rounded crown and a long neck-guard. Other variations of the H. are the *armet*, *burgonet*, *morion*, and *cabasset*. Firemen of all countries, and the policemen of some, wear Hs. The soldiers of all modern armies are equipped with steel Hs. See J. Hewitt, *Ancient Armour and Weapons in Europe*, 1860; G. F. A. Laking, *Record of European Armour and Arms through Seven Centuries*, 1920-22; H. Norris, *Costume and Fashion* (in course of pub.).

**Helmet-shell**, name given to members of the genus *Cassia*, gastropod molluscs belonging to the family Cassididae, found in tropical seas and the Mediterranean. They resemble whelks in appearance, having thick heavy shells with prominent edges; some species attain considerable size, and, as they are composed of differently coloured layers, they are much used in the manu. of cameos. *C. madagascarensis* is the largest of these, and *C. rufa* and *C. cornuta* are also commonly used.

**Helmholtz**, Hermann Ludvig Ferdinand von (1821-94), Ger. philosopher and man

of science, b. at Potsdam, near Berlin. His father was a teacher of philology and philosophy in the gymnasium; his mother, a Hanoverian lady, a lineal descendant of the great Quaker, William Penn. H. was delicate in early life and became a student by habit; he soon showed mathematical powers. In later years his attention was directed to higher mathematics by force of circumstances. He could not afford a purely scientific career, so he became surgeon in the Prussian army. In 1842 he wrote a thesis, in which he announced the discovery of nerve cells in ganglia; this was his first work, and from 1842 to 1894, the year of his death, scarcely a year passed without sev. important papers on scientific subjects from his pen. In 1849 he became prof. of Physiology in Königsberg; and subsequently in Bonn and Heidelberg. In 1871 he became prof. of Physics in Berlin, and in 1887 nominated head of the Charlottenburg Institute. His pub. works include *Sensations of Tone as a Physiological Basis for the Theory of Music* (1873). See J. C. McKendrick, *Helmholtz*, 1899.

**Helmond**, tn. of N. Brabant, Netherlands; on the Zuid Willems Canal, 23 m. N.W. of Venlo. It has manu. of textiles, etc. Pop. 26,000.

**Helmont**, Johann Baptist van (1577-1641), Belgian chemist, b. at Brussels; educated at Louvain, where he became prof. of surgery. For some years he devoted himself to the study of mysticism, but was turned to chemistry and natural philosophy by the works of Paracelsus. He spent some years in France, Switzerland, and England, but in 1609 settled near Vilvorde and devoted himself to chemical investigations. He made a special study of 'gases,' and estab. the present scientific sense of the word 'gas,' and investigated the chem. properties of the fluids of the human body. His chief work, *Ortus Medicinæ*, was pub. by his son in 1618.

**Helmstedt**, tn. of Brunswick, Germany. 24 m. S.E. of Brunswick. It is noted for manu. of machinery, pottery, woollens, etc., and near it are valuable mineral springs. It grew up in the ninth century round the monastery of St. Ludger, and from 1575 to 1809 was famous for its univ. founded by Duke Julius. H. gained importance after the Second World War as the 'frontier' station on the railway line to Berlin, connecting the W. and E. zones of occupation. Pop. 17,600.

**Helmund**, Helmand, or Helمند, riv. of Afghanistan, rising in the Koh-i-Baba chain, S. of the Hindu Kush, and flowing S.W., W. and N.W. into the lake of Hamun, Seistan, or Savaran, near the Persian frontier, after a course of 680 m. Numerous tribs. flow into it from S. Afghanistan. In its lower reaches it is wide and deep, but dries up at certain seasons. The water-power is largely used for mills.

**Helm Wind**, wind which, under certain conditions, blows over the escarpment of the Pennines, near Cross Fell, from the eastward, when a helm (helmet) cloud covers the summit. The helm bar is a

roll of cloud that forms in front of it to leeward.

**Héloïse**, see **ABÉLARD**

**Helots** (ὅλοι αἰχμαῖοι or αἰχμαῖοι), serfs of the anc. Spartans. The word was derived in antiquity from the tn of Helos in Laconia, but is more probably connected with ἄλος, a fen, or with the root of αἰών, to capture. Some scholars suppose them to be of the Achaean race, but they were more probably the aborigines of Laconia, who had been enslaved by the Achaeans before the Dorian conquest. After the second Messenian war the conquered Messenians were reduced to the status of H., from which Epaminondas liberated them three centuries later after the battle of Leuctra (371 B.C.). The H. were state slaves to the soil and assigned to individual Spartiates to till their holdings. Their masters could neither emancipate them nor sell them off the land, and they were under an oath not to raise the rent payable yearly in kind by the H. In time of war they served as light armed troops or as rowers in the fleet. From the Peloponnesian war onwards, they were employed as heavy infantry, and distinguished bravery was rewarded by emancipation.

**Helpmakaar**, tn of Klip R. dist., Natal, S. Africa, 80 m N of Pietermaritzburg. Formerly a Brit. military post, it had some importance during the Zulu war (1879) and the Boer war (1900-02). Pop. 26,000.

**Helps**, Sir Arthur (1813-71), Eng. essayist and historian, and clerk to the Privy Council, b. at Streatham Surrey. He was the son of a London merchant, and was educated at Eton and Trinity College, Cambridge. After leaving the univ. he was private secretary to various public men, and, in 1841, his circumstances rendering him independent of employment, he retired to Bishop's Waltham, and devoted himself for twenty years to study and writing. Appointed in 1860 Clerk to the Privy Council, he became a favorite of Queen Victoria who entrusted him with the task of editing the *Speeches and Addresses of the Prince Consort* (1862) and her own *Leaves from the Journal of our Life in the Highlands* (1869). The first of his own publs. was *Thoughts in the Winter and the Road* (1835). A series of apologetics, and then came *Lessons written in the Interests of Business* (1841), *Friends in Council* (4 series, 1847-51) and *Conversations on War and General Culture* (1871). As a member of the Conversations Society he was associated with such men as Alfred Tennyson, Arthur Hallam and Monckton Milnes. In hist. he wrote *The Conquerors of the New World* (1818-52) and *The Spanish Conquests in America* (4 vols., 1811-61), a useful work collating the records of many early and other foreign historians. Also wrote *The Life and Labours of Mr. Thomas Brassey 1807-1870* (1872) and biographies of Bartolomé de las Casas, Columbus, Pizarro, and Cortés, derived largely from the foregoing works. His essays were, however, his most successful work, containing the thoughts of a shrewd and experienced man written in what Ruskin called 'beautiful quiet English.' They

have not, however, any exceptional depth or originality. See E. A. Helps (ed.) *Correspondence*, 1917.

**Helpmann, Robert Murray** (b. 1909), Brit. danseur and actor, son of James Murray II, of S. Australia. Educated at Prince Alfred's College, Adelaide. First appearance 1926-30 under J. C. Williamson's Management, Australia. Premier danseur, Sadler's Wells Ballet from 1933. Played Oberon in *A Midsummer's Night Dream* (1937-38), Gremio in *Laming of the Shrew* (1939), Hamlet in Old Vic production, New Theatre (1944), Klamuko in *The White Devil* and Prince in *He Who Gets Slapped*, Duches, Theatre (1947). Appeared in the film *One of our Aircraft is Missing*, as the bishop of Ily in the film *Henry V* (1911) and Wyecroft in *Cavalier* (1946). Choreographer and premier danseur in *Red Shoes*, choreographer of *Comus*, *Hamlet*, *The Birds*, and *Corroboree*.

**Helsingborg**, fortified seaport of Sweden, situated on the Sound, opposite Elsinore, 32 m N.W. of Malmö. It has a good harbour, a fishing industry, and manufs. of sugar, chemicals, and machinery. It figured largely in the Scandinavian wars, being almost destroyed in the reign of Charles XI. The Danes were defeated here in 1710. Pop. 59,000.

**Helsingør**, or **Elsinore**, seaport of Denmark, situated on the is. of Zealand, in the prov. of Frederiksborg, and on the E. coast at the narrowest part of the Sound, 27 m N. of Copenhagen and exactly opposite to Helsingborg in Sweden. To the N.E. is the fortress of Kronborg (1580). The harbour, enlarged in 1843-84, has 18-20 ft. of water and is much used by ships for coaling and repairing. There is a patent slip and large shipbuilding yards, while good anchorage is afforded by the roadstead outside. The Sound dues were collected here till 1957. It is the bp of Saxo Grammaticus' and the scene of Shakespeare's *Hamlet*. Pop. 18,900.

**Helsinki** (**Helsingfors**), seaport and cap. of Finland and prov. Nyland. Centre of the administrative, scientific, educational and industrial life of Finland. The fine harbour is divided into two parts by a promontory and is protected at its entrance by a group of small is., upon one of which stands the fortress of Sveaborg. A third harbour is situated on the W. side of the promontory and all three have granite quays. The city, which in 1810 had only 100 inhabs., Åbo, the then cap. having 10,421, has increased with great rapidity, having 22,000 inhabs. in 1860, 62,000 in 1890, 170,000 in 1910, 216,000 in 1920, 293,000 in 1930, and 338,800 in 1951. It is the centre of an active shipping trade with the Baltic ports and with L. Land, and of a railway system connecting it with all parts. It possesses wide streets, parks, gardens, and monuments. The pub. square contains the cathedral of St. Nicholas, the senate house, and the univ., all striking buildings of considerable architectural distinction. The univ. which was founded in 1640 at Turku (Åbo), was removed to H. after

having been burned down in 1827. It had (1917) over 9000 students (3700 women). The language of culture is Swedish. The manufs. of the city consist largely of tobacco, beer, spirits, carpets, machinery, and sugar. It was savagely bombed by Russian planes in the Russo-Finnish war of 1939-40. See also FINLAND, *History*.

**Heist, Bartholomæus van der** (1613-70), Dutch painter. Probably b. at Haarlem, and said to have been a pupil of Frans Hals. He also studied under Nicolaes Elias of Amsterdam. He was living in Amsterdam in 1636, and in 1654 was joint founder, with Nicolaes de Helt Stokade, of the Painters' Guild of St. Luke. His best work is in portraiture, and includes 'Muster of the Burgher Guard' (1648), in Amsterdam Museum, which is his finest production and contains twenty-four full-length portraits: 'A Protestant Dame' (1639), at 'The Hague'; 'The Company of Captain Rogloft Bicker' (1639), and 'The Syndics of the Brotherhood of Saint Sebastian' (1663), both in Amsterdam Museum.

**Helston, mrkt. tn.** of Cornwall, England, 10 m. S.W. of Falmouth. Noted for the 'Curry' or 'Flora' Dance, held annually on May 8. It was made a bor. by John in 1201: from the reign of Edward I. to 1832, returned two members to Parliament, and c. 1843. Pop. 5000.

**Helvellyn, mt.** in the lake dist., Cumberland, England, between Thirlmere and Ullawater. It is one of the highest peaks in England (3198 ft.), and is fairly easy of ascent, while magnificent views may be obtained from the summit. Famous steep approaches from the E. side are the Striding and Swirell Edges. See LAKE DISTRICT.

**Helvetia, Swiss colony and tn.** in Santa Fé prov., Gran Chaco, Argentine Republic, 50 m. N.E. of Santa Fé, founded in 1856. Pop. 2500.

**Helvetic Republic, system of gov.,** consequent upon the occupation of Switzerland by the Fr. imposed by them in 1798, and abolished to allow of the re-organisation of the old cantonal system by Napoleon in 1803.

**Helvetii, ant.** Celtic nation, which, according to Caesar, inhabited a region roughly corresponding to the W. part of modern Switzerland. Their chief tn. was Aventicum. They first appear in hist. as allies of the Cimbri during their invasion of Italy, but are best known in connection with their invasion of S. Gaul in 58 B.C., when they were repulsed by Caesar with great slaughter. They were again defeated by Cavinus, a general of Vitellius, after the death of Nero. See E. Howard and E. Meyer, *Die römische Schweiz*, 1940.

**Helvétius, Claude Adrien** (1715-71), Fr. philosopher and *littérateur*, descended from a family of physicians whose original name was Schweitzer (Latinised as Helvétius). His grandfather introduced the use of ipecacuanha. His father was first physician to Queen Marie Leszinska of France. Claude Adrien was trained for a financial career, but occupied his spare

time writing verses. At the age of twenty-three, at the queen's request, he was appointed farmer-general, a post of responsibility and dignity, worth 100,000 crowns a year. This provided for, he proceeded to enjoy life to the uttermost. As soon as he had saved enough from his position as farmer-general, he retired to an estate in the country, and employed his large means for the relief of the poor. *De l'esprit* appeared in 1758, and this both attracted attention and roused formidable opposition for the 'pernicious doctrines' in its philosophy. The author wrote three retractations, yet he had to give up his office at court, and the book was publicly burned by the hangman. Madame du Defand said that he had written openly what everyone thought secretly. His philosophy belongs to the Utilitarian school. The keynote of his thoughts was that public ethics has a utilitarian basis, and he insisted on the importance of culture in national development. His *De l'homme* and *Le Bonheur* were posthumously pub. in 1775. See D. G. Mostros, *Die Padagogik des Helvetius*, 1891, and study by A. Klein, 1907.

**Helwan, tn.** of Egypt, near R. Nile, 10 m. S.E. of Cairo, noted on account of its warm sulphur springs. Before the First World War the pop. was about 8000, but since then it has increased greatly.

**Hemaka, Tomb of, see under SAKKARA.**

**Hemans, Felicia Dorothea** (1793-1835), Eng. poetess, b. in Liverpool, the daughter of George Browne. She was a precocious child, and was encouraged in her taste for poetry. She pub. a vol. of verse as early as 1808, and another entitled *The Domestic Affections* (1812). In this year she married Capt. H., an Irish officer who had served in Spain. In 1818 they separated, after the birth of five sons, Capt. H. settling in Italy, and Mrs. H. living in N. Wales, Lancashire, and Dublin. Her work is not strong, but graceful and pleasing. She suffered from a fatal facility, but some of her pathetic and sentimental poems became very popular. A complete ed. of her works was pub. posthumously in 1839. They include: *Records of Woman* (1825), *The Forest Sanctuary* (1826), *Songs of the Affections* (1830). See H. F. Chorley, *Memorials of Mrs Hemans*, 1836.

**Hematin, or Hæmatin, pigment radicle** which, together with globin, constitutes the colouring matter of the blood. It has the formula  $C_{12}H_8N_2O_4FeOH$ , and to some extent is related to chlorophyll, the green colouring matter of plants.

**Hematite, see HÆMATITE.**

**Hemel Hempstead, mrkt. tn.** of Hertfordshire, England, 23 m. N.W. of London. It is a centre of the straw-plaiting industry, and also has boat-making, paper-making, iron-working, tanning, and brewing industries. A Rom. villa has been discovered at Boxmoor close by. There are fine public buildings, and it has lately developed as a satellite tn. Pop. 11,300.

**Hemelingen, vil.** of Hanover, Germany, 3 m. S.E. of Bremen, with a cigar-making industry. Pop. 10,000.

**Hemerocallis, see DAY LILY.**

**Hemianopia**, peculiar and rare form of disease of the eye, usually due to disease within the brain, causing sight to be limited to one half of an object.

**Hemlerania**, see **HEADACHE**, and **MIGRAINE**.

**Hemidesmus**, see **SARSAPARILLA**.

**Hemilkeem**, industrial tn. in Belgium, 6 m. S.S.W. of Antwerp, on the Scheldt. Chief manufs. are copper, lime, and cement. It has brick-works and breweries. Pop. 9200.

**Heming** (or **Hemminge**), John (d. 1630), Eng. actor. He is known to have been one of the chief proprietors of the Globe Theatre during the reign of Elizabeth, and is connected with Shakespeare in sev. ways. He is said to have created the part of Falstaff, and also played in sev. of Ben Jonson's dramas. With Henry Condell (d. 1627), he was a co-editor of the first folio of Shakespeare, issued in 1623.

**Hemingford** (or **Hemingburgh**), Walter (d. 1347), Eng. chronicler. He was subprior of St. Mary's, Gisborough, Yorkshire, and died there. His chronicle extends from 1066 to 1346, and was pub. by Gale in his *Veteres Scriptores*, and by Hearne (Oxford, 1731), and fully ed. in 1843-49 by H. C. Hamilton.

**Hemingway**, Ernest, b at Oak Park, Illinois, 1898. Educated in the public schools of his native state, he worked as a day-labourer, farm hand, and newspaper reporter. Went to France before America entered the 1914-18 war, as a volunteer in an Amer. ambulance unit. Later enlisted in It. Arditi and was severely wounded. He made his debut as author in 1923, and then attracted wide attention with his vol. *The Sun Also Rises* (1926), this was followed by *Men Without Women* (1927). It was, however, in 1929 that he definitely estab. his reputation as one of the strongest of the newer generation of Amer. authors by his novel *A Farewell to Arms* (1929), a story dealing with the adventures and love affair of an Amer. in an ambulance corps serving with the It. army. Since then he has been widely read in America, and, under his influence especially, a whole school of 'tough' novelists has grown up, where none has equalled his best work. Despite his increasing tendency to establish some connection between his stories and political or social conditions, there persists in them a certain suggestion of the love of violence for its own sake, which limits their appeal still further than it has already been limited by the endeavour to sustain indefinitely an interest in simple declarative sentences describing the action of unreflective characters. His *For Whom the Bell Tolls* (1940) was inspired by his experiences in the Sp. Civil war.

**Hemiplegia**, paralysis of one side of the body. It is the most usual form of paralysis, and affects the leg, the arm, and also the muscles of the mouth and tongue. If the paralysis be on the right side, aphasia (q.v.), often accompanies H. Complete recovery is possible but not very frequent. Slight numbness, and not complete paralysis, of sensation, accompanies H., although if the fibres carrying sensory

impulses to the surface of the brain are destroyed, there may be loss of sensation on the affected side. In certain cases there may be paralysis on the side opposite to the affected limbs. See **PARALYSIS**.

**Hemiptera**, name given to a large order of insects which includes the bugs, plant-lice, scab-insects, etc., and is also called **Rhynchotha**. All individuals belonging to this order are characterised by a mouth consisting of a proboscis or jointed beak, which is concealed by being bent back under the thorax; wings, with rare exceptions, four in number, and the anterior pair more horny than the posterior pair. All H. are sucking insects, and the mouth of the individual, like that of Orthoptera, does not change during its lifetime, but they differ from all other orders of insects in respect of the structure of the mouth. The order is divided into **Heteroptera**, whose wings, partly horny and partly membranous, fold flat on the back; and **Homoptera**, whose wings cover the body in a rooflike manner. The Anopliura, or Lice, are sometimes included in this group, or may be regarded as a separate order. See B. F. Cummings, *The Bed-Bug*, 1917; E. A. Butler, *Biology of British Hemiptera-Heteroptera*, 1923; J. Davidson, *List of British Aphides*, 1925; W. L. Macatee and J. R. Malloch, *Revision of the American Bugs*, 1925; J. G. Myers, *Insect Singers: Natural History of Cicadas*, 1929.

**Hemling**, Hans, see **MEMLING**.

**Hemlock**, name given to sev. plants of different characteristics. Two of these are umbelliferous species and occur in Britain. *Cicuta virosa*, the water H. or cowbane, is one well-known plant, and *Conium maculatum*, the common H., is another; both contain a deadly poison. The latter has a mouselike snell, and is well known as the plant from which the poison drunk by Socrates was obtained. The H. spruce is an evergreen coniferous tree found in N. America, and bears the botanical name of *Tsuga Canadensis*. It is a valuable plant on account of its bark, which is employed in tanning, the pitch it yields, and its strong timber.

**Hemmingsen**, Niels (1513-1600), Dan. theologian, b. in Laaland; educated under Melancthon at Wittenberg, becoming prof. of Gk. there in 1543 and of dialectics in 1544. In 1578 he returned to Denmark and became minister of the church of the Holy Ghost at Copenhagen, and professor of Heb. in Copenhagen Univ., which he made famous for its Protestantism. In 1577 he became prof. of divinity there, and in 1579 a canon in the church of Roskilde. He assisted in the first trans. of the Bible into Dan.

**Hemorrhage**, see **HEMORRHAGE**, and **BLEEDING**.

**Hemp**, plant of the genus *Cannabis*, natural order **Urticaceae**, of which *C. sativa* is the only known species. It is an annual and is found wild in W. and Central Asia, Brazil, and tropical Africa, and is cultivated in Asia, America and many parts of Europe. The H. plant is not unlike the hop family (to which it is botanically allied) in appearance, with

erect stalk, growing from three to sixteen ft. high according to climate, square in shape, like the common stinging-nettle, five to seven-fingered leaves of lanceolate-acuminate form with serrated margins, and is discolorous. The seed is a valuable product, being used as bird-food, and, when crushed, as oil for soap and oilcake.

The *H.* plant secretes a resinous substance possessing narcotic and intoxicating qualities (see *HASHISH*), while Indian *H.* or *Bhang* has proved of value as a hypnotic in therapeutics. *H.* is, however, most valued for its fibre, which is obtained by burying the stems in mud and leaving them to rot for seven days, when they are taken out and beaten in the water and all the woody matter is removed, a treatment similar to that of flax (*q.v.*). The latest (pre-1940) world statistics give a total production of 750,000 tons (Philippines or Manila, 230,000; China (probably), 150,000; Russia, 140,000; Italy, 100,000). *Manilla Hemp*, from the fibre of the long leaves of a species of banana tree, is an important industry in the Philippines, about 183,500 tons being produced annually. *Stiel H.* from the *Agave sisalana* growing wild in Yucatan, Mexico, cultivated in Brit. and Portuguese W. Africa and Dutch W. Indies, is greatly used in the U.S.A. for making ropes and binder twine. *Sunn H.*, or brown *H.*, from the bark of *Crotalaria juncea*, is not as strong as true *H.*, but resists water better. *New Zealand H.* is a growing industry. See also FIBRE AND FIBRE SUBSTANCES. See S. S. Boyce, *Cannabis Sativa, a practical treatise on the culture of Hemp for seed and fibre*, 1900; H. R. Carter, *Modern Flax, Hemp, and Jute Spinning and Twisting*, 1925.

**Hempstead**, vil. and summer resort of Nassau co., New York, in Hempstead township on the Long Is. R., 20 m. E. of Brooklyn. It was settled by New Englanders in 1643. Pop. 13,000.

**Hems, Hums, Homs, or Khoms** (Lat. *Emesa*), city of Syria, near E. Orontes, 63 m. N.E. of Tripoli, cap. of the Sanjak of

H. The modern city, built of black basalt, is mean, dirty, and crowded, and is surrounded by half-ruined walls. The only anct. relics are columns, inscriptions, foundations, and fragments of pavements. There is considerable trade in silk, cotton, oil, gold ware, and sesame. In anct. times, as *Emesa*, it was famous for its Temple of the Sun, of which Heliogabalus, emperor of Rome in 218, was a priest. In 272 the Emperor Aurelian defeated Zenobia here. It was taken by the Saracens in 636, and by the Crusaders in 1098. Ibrahim Pasha defeated the Turks here in 1832. A railway was opened in 1925 from H. to Tripoli, 64 m. Pop. 100,100.

**Hemsterhuis, Tiberius** (1685-1766), Dutch philologist, b. and educated at Groningen. In 1704 he became prof. of mathematics and philosophy at Amsterdam; in 1720 professor of Gk. at Franeker, and in 1740 prof. of Gk. hist. at Leyden. He created a new school of Gk. philology, which includes among its representatives Kuhnken and Valckenær. He issued famous eds. of works by Pollux, Lucian, and Aristophanes. His son Franz (1721-1790) was a noted philosopher.

**Hemsworth**, vil. of W. Riding of Yorkshire, England, 6½ m. N.E. of Barnsley. Pop. 12,300.

**Hemy, Charles Napier** (1841-1917), Eng. marine painter, b. at Newcastle-on-Tyne; son of Henri F. Hemy, distinguished musician. Educated in art at Newcastle and Antwerp. He made sev. voyages as a boy, and at one time joined the Dominicans at Lyons; but finally settled in England in 1870, living in London till 1881, when he removed to Churchfield, Falmouth. He became a member of the R.W.S. in 1897; A.R.A., 1898; R.A., 1910. His works include: 'Homeward', 'Oporto', 'Silent Adieu', 'Pilgrims', 'Lost' (1897), 'Smugglers', (1899), 'Home Wind', 'Birds of Prey' (1901), 'The Crew' (1902), 'Youth' (1903), 'The Lifeboat', 'Haul Aft', 'London River', 'The Crab Merchant' (1904), 'Bound for London' (1907), 'Plymouth', 'Through Sea and Air' (1910), 'Home at Last' (1913), 'The Black Flag' (1915).

**Hen**, see POULTRY.

**Henault, Charles Jean François** (1685-1770), Fr. historian. His father was a former-general of taxes, and a man of literary tastes. The son was educated at a Jesuit college. In his fifteenth year he entered the Oratory, with the view of becoming a preacher. His literary talent obtained him entrance to the Academy. The literary work upon which he bestowed his chief attention was the *Abrégé chronologique de l'histoire de France*, first pub. in 1744 without the author's name. In the compass of two vols. he comprised the whole hist. of France from the earliest times to the death of Louis XIV. This work was a prodigious success, and was trans. into sev. languages, even into Chinese.

**Henbane**, or *Hyoscyamus niger*, species of *Solanaceae* found in Britain. It is an herbaceous plant with large leaves and whitish-yellow flowers which are followed

by an erect capsule dehiscing by means of its lid. The fl. has an extremely disagreeable odour, hence its name, but in medicine it is sometimes used as a narcotic and sedative.

Henderson, cap. city of Henderson co., Kentucky, U.S.A., on R. Ohio, 10 m. S. of Evansville. The chief industry is the preparation of tobacco. There are coal mines in the dist. Pop. 13,100.

Henderson, Alexander (1583-1646), Scottish ecclesiastic, b. in Crichton, Wiltshire. Graduated at St. Andrews in 1603, and in 1610 was appointed prof. of rhetoric and philosophy and tutor of the faculty of arts. Shortly after this he was presented to the living of Leuchers. As he was forced upon his par. by Archbishop George Gladstones, and was known to sympathise with episcopacy, his settlement was at first unpopular, but he changed his views and became a Presbyterian in doctrine and in church gov., and one of the most esteemed ministers in Scotland. H. is one of the greatest of men in the hist. of Scotland, and next to Knox is certainly the most famous Scottish divine. He was once called a 'Cabinet minister without office.' The existing Presbyterian churches of Scotland are indebted to him for the forms of their dogmas and their eccles. organisation. He is justly considered the second founder of the reformed church of Scotland.

Henderson, Arthur (1863-1935), Brit. Labour politician; b. in Glasgow. Educated at St. Mary's School, Glasgow. Served apprenticeship as moulder at Robert Stephenson & Co.'s works at Newcastle-on-Tyne. He became M.P. for Barnard Castle in 1903, and so remained until the general election of 1918. He was chairman of the Parl. Labour Party, 1908-1910; and on the coming of the First World War, when J. Ramsay MacDonald had to stand aside because of his pacifism, H. was again chosen chairman; and he so remained until 1917. P.C., 1915. He was: President of the Board of Education, 1916-16; Paymaster-general and

labour adviser to Gov., 1918; member of war-committee of Cabinet, 1918-17. Gov. emissary to Russia, 1917. He resigned from the Coalition Gov. because of Lloyd George's banning of the Stockholm Labour Conference in the last-mentioned year. Early in 1924, having been returned for Burnley, he joined the first Labour Gov. as Home Secretary. In the Labour Gov. formed June 1929 he became foreign secretary, in which office he was responsible for the Anglo-Egyptian Treaty (signed after his death, in 1936) under which the Brit. Military occupation was terminated. In 1932 he presided over the Geneva disarmament conference, and received the Nobel Peace Prize in 1931. Sec. E. A. Jenkins, *From Foundry to Foreign Office. The Romantic Life of the 1st. Hon. Arthur Henderson*, 1933.

Henderson, John (c. 1747-85), Eng. actor, b. in London. He made his debut at Bath in 1772 as Hamlet, and came to be known as 'Bath Roscius.' In 1777 he appeared at the Haymarket, London; in 1778-79 with Sheridan at Drury Lane; and after 1779 at Covent Garden. He was a friend of Mrs. Siddons and Gainsborough. He was successful in many Shakespearean rôles.

Henderson, Sir Neville Meyrick (1882-1912), Brit. diplomat, educated at Eton. Attaché in diplomatic service, 1905. Secretary, at successive periods, at St. Petersburg, Tokyo, St. Petersburg (second time), Rome, Nish and Paris. Counsellor, at Constantinople, 1921, and Acting High Commissioner there, 1922-21. Minister to Egypt, 1921-28; to France, 1928-29; and to Yugoslavia, 1929-35. Ambas. to Argentine and Minister to Paraguay, 1935-37. Ambas. to Germany, 1937 until 1939 (Sept.). It thus fell to his lot to hold the most important diplomatic post in the service at a time when the Brit. Gov.'s appeasement policy was in full operation; and when at length the measure of Hitler's sinister intentions was apparent it was too late. (See on this the article WORLD WAR, SECOND.—CARPIS.) He wrote *Failure of a Mission* (1910) and *The Water under the Bridges* (autobiography, pub. in 1945).

Henderson, Sir William Hannam (1846-1931), Eng. adm., b. at Worth, Sandwich, June 20. Commanded the *Conquest* (1889-92), and served under Sir Edmund Fremantle in the punitive expedition against the sultan of Vitu, E. Africa, 1890. Commodore and senior officer in Jamaica during the Cuban War. In 1902 promoted to flag rank and appointed adm.-superintendent at Devonport; full adm., 1904. He will be remembered as a reformer of naval education, who saw the value of systematic instruction in strategy and tactics. H. derived his appreciation of the importance of this subject from Sir E. B. Hamley, *Operation of War* (1867), and he received much encouragement in his efforts from Prince Louis of Battenberg.

Hending, Proverbs of, series of Middle Eng. verses, contained in the Harl. MS. 2253 (Brit. Mus.), consisting of six-lined stanzas, rhymed a b a b, each of which

closes with an old folk proverb, many of which are still in common use. The proverbs seem to have been collected from older thirteenth-century material.

Hendon, bor. of Middlesex, England, on R. Brent, 8 m. N.W. of St. Paul's London. A favourite residential suburb of London, and is also a popular holiday resort, the 'Welsh Harp' reservoir of Regent's Canal being much used for skating, fishing, etc. Until recently it was an important aviation centre with aeroplane works and flying schools. Mill Hill, just to the N., has a large Nonconformist Grammar School (1807), and a Rom. Catholic Missionary College (1871). The Metropolitan Police College was opened at H. in 1934. Golders Green and Hampstead Garden Suburb are within the bor. Pop. 128,500.

Hendrick, Burton Jesse (1871-1949), Amer. historical writer and biographer, b. at New Haven, Conn., U.S.A., and educated at Yale. He began as a journalist on the *New Evening Post* and then joined the staff of *McClure's Magazine*; from 1913-27 he was an associate editor of *The World's Work*. His first book was *The Age of Big Business*, the title of which perhaps affords an indication of his major interest as a student of Amer. hist. He was awarded the Pulitzer Prize for his part in *The Victory at Sea* (1920), written in collaboration with Adm. Win. S. Sims (q.v.). But he will be chiefly remembered in this country, firstly, for his *Life and Letters of Walter H. Paus*, a full and attractive portrait of a great ambas. and a great man; and for his *Life of Andrew Carnegie* (1933). *The Life and Letters*, which was pub. in 3 vols. between 1922-25, is remarkable for the wealth and historical importance of the material prepared by H. In 1933 was pub. another vol., on *The Earlier Life and Letters*, which fully maintains the interest of its predecessors. The first instalment of his work earned him a Pulitzer Prize for the second time. For *The Training of an American* (1928) he received yet a third Pulitzer Prize. His *Life of Carnegie*, his best piece of biography proper, is an illuminating study both of character and of a tremendous age of industrial expansion. His later books include two on the great issues of the Civil War: *Statesmen of the Lost Cause* (1939) and *Lincoln's War Cabinet* (1947), showing with shrewd irony opposite sides of the great struggle.

Hendricks, Thomas Andrews (1819-85), Amer. political leader, vice-president of U.S.A. in 1885, b. near Zanesville, Ohio. Graduated at Hanover College, Indiana, and in 1843 began a successful career at the Bar. From 1868 till his death he was put forward for nomination for the presidency at every democratic convention, save that of 1872. He had been U.S. Senator from Indiana from 1863 to 1869 and governor of the state, 1873-77. In 1884 he ran for vice-president when Grover Cleveland was his party's presidential nominee and this time was successful. He died shortly after assuming office and this gave rise to the passing by Congress of the law which provides that in

case of the death of both president and vice-president, the line of succession shall run through the Cabinet in the following order—secretaries of state, treasury, war, attorney-general, secretaries of the navy and interior.

Heneguen or Sinal Hemp, see FIBRE AND FIBROUS SUBSTANCES.

Hengelo, tn. of Overijssel, Holland, 5 m. N.W. of Enschede, an industrial centre. There is a large cotton industry, also dyeing, brewing, and railway engineering. Pop. 45,500.

Hengist and Horsa, brother chieftains who led the first Saxon bands which settled in England. They were apparently called in by the Brit. king, Vortigern, to defend him against the Picts. The place of their landing is said to be Ebbsfleet in Kent. The settlers of Kent are described by Bede as Jutes, and there are traces in Kentish custom of differences from the other A.-S. kingdoms. H. and H. were at first given the Isle of Thanet as a home, but soon quarrelled with their Brit. allies, and gradually possessed themselves of what became the kingdom of Kent. In 455 there was a battle between the two brothers and Vortigern, and Horsa was slain. Thenceforward Hengist reigned in Kent together with his son.

Henin-Litard, tn. of Pas-de-Calais, France, 7 m. N.W. of Douai, with a coal-mining industry. Pop. (comm.) 22,500.

Henle, Frederick Gustav Jakob (1809-1885), Ger. pathologist and anatomist, b. in Franconia. His famous *Manual of Rational Pathology* (1846-52), marked a new era in pathological study. From 1852 to 1873 he was pub. his great *Handbook of Systematic Human Anatomy*.

Henlein, Konrad (189-1915), Sudeten-Ger. politician, b. at Maffersdorf, Reichenberg. Was once a bank clerk. Began a Ger. gymnastic movement in Bohemia soon after the First World War. Took a leading part in organising the Sudeten Ger. party in Czechoslovakia and in 1936 he succeeded the extremist trade union leader Kaspar as head of the party. With support from the Nazis in Germany he abandoned the rôle of constitutional loyalist seeking the redress of minority grievances and demanded first autonomy for the Sudetenland and later the complete transfer of that ter. to the Ger. Reich. After the *anuschluss* his followers were absorbed into the Nazi party and when Czechoslovakia was occupied by the Gers., H. was appointed chief of the civil administration in the Protectorate. (See CZECHOSLOVAKIA.) Later he became Civil Commissioner for Bohemia. He committed suicide in an allied-prisoner-of-war camp cage by slashing his wrists with a razor blade which he had concealed under adhesive tape in his cigarette case (May 10, 1945).

Henley, John (1692-1756), 'Orator Henley', b. at Melton Mowbray, educated at Cambridge; became a teacher, and took holy orders, having charges in Melton Mowbray, London, and Chelmsford, Suffolk. In 1726 he left the church and estab. in London his famous 'Oratory'. Here he preached primitive Christianity

on Sundays, and taught 'universal knowledge' on Wednesdays, attracting large numbers by the strangeness of his methods and doctrines. In 1730 he became a pensioner of Walpole and editor of the *High Doctor*. He wrote *Æther* in 1714.

Henley, William Ernest (1849-1903), Brit. poet, critic, and editor, b. at Gloucester, and educated at Crypt Grammar School in that city. T. E. Brown, the poet, was headmaster there for some time. His appointment was a stroke of luck for H., to whom his coming meant the lad's first introduction to a man of genius. To the end, H. was no classical scholar, but his knowledge of and love for literature were vital. At the age of twenty-five his health failed, he was sent to a hospital in Edinburgh, and from there he sent poems, describing his experience in the ward, to Leslie Stephen, who was editing the *Cornhill*. The poems were full of poignant force, and Stephen visited his contributor in hospital, in company with Robert Louis Stevenson. The meeting between H. and Stevenson, and the friendship which arose between them, form one of the best known episodes in recent literature. In 1877 H. went to London and began his editorial career by editing *London*. At the end of 1886 he came before the public as a poet. Later he ed. the *Scots Observer*, and had the knack of 'discovering' literary men. It was that paper which gave to the world Kipling's *Barrack-room Ballads* (1892). H. exercised by his originality an inspiring influence on the higher class of journalism, but his fame must rest on his poetry. As an editor, with a profound conviction in the soundness of Conservatism and imperialism, he often erred about transient tendencies and events; but his trenchant leaders of the early 'nineties on such subjects as the development of Socialism, or on India or Burma, show that he was often uncannily and prophetically right. H.'s physical sufferings have been said to be the key to his poetry; there is a feminine note in it and a perverseness in his judgment. He is at his best in fugitive or solitary poems on deeply-emotional themes, such as sunset and a quiet passing. Like the poetry of John Davidson and John Masefield, the poetry of H. is notable for clear cut actuality and subordination of beauty for its own sake to the effect of power. He followed Kipling in the swashbuckling vein, and threw himself with a strange zest into the then new fashion of belauding Colonial adventure regardless of Christian traditions. In his lyrics, however, he revealed a genuine if not always original force. His best work is his *London Voluntaries* (1893), poems unconventional but stimulating and challenging. His collected works were pub. in 1908 and 1921. See L. C. Cornford, *William Ernest Henley*, 1913. E. V. Lucas, *The Collins and their friends*, 1928; K. Williamson, *W. E. Henley: a Memoir*, 1930; J. Connell, *W. E. Henley*, 1949.

Henley-on-Thames, tn. of Oxfordshire, England, on R. Thames, 35 m. W. of London. A favourite summer resort and

noted for the ann. amateur regatta, founded in 1839. The tn. dates from Rom. times. The fine five-arch bridge was built in 1786. Malting and brewing are the chief industries. Pop. 8800.

Henna, substance made from the leaves of *Lawsomia inermis*, the Egyptian privet or henna-plant, and is much used in the E. for staining nails, finger tips, etc., and by men for dyeing their beards, the colour produced being a reddish orange. Its use has prevailed from very early times. To-day it is used by women for dyeing hair.

Hennebont, tn. of Morbihan, France; on R. Blavet, 6 m. N.E. of Lorient. Much of the tn. is very old. It is now a busy port, and has boat-building, tanning, and distilling industries. The tn. suffered considerable damage in the Second World War. Pop. 5100.

Henner, Jean Jacques (1832-1905), Fr. painter, b. at Bernwiller, educated under Drolling and Picot. In 1858 he obtained the Grand Prix de Rome. His most notable work is seen in his nude figure-studies. Among his pictures are 'The Chaste Susanna' (1865), in the Luxem. bourg, 'Biblis (changée en source' (1867), at Dijon, 'The Good Samaritan' (1871), in the Luxembourg, 'Nalades' (1875), in the Luxembourg, 'The Dead Christ' (1876), 'St John Baptist', 'The Evening' (1877), 'The Magdalene' (1878), 'The Levite I phraim' (1898), 'The Dream' (1900).

HENRIETTA MARIA

Henrietta Maria (1609-69), Queen of Charles I of England, daughter of Henry IV of France. When the first overtures were made for her hand on behalf of Charles, she was not much more than fourteen. Consent was given to the marriage on condition that the Eng. Rom. Catholics were relieved from the operation of the penal laws. She married by proxy and had already pledged her husband to a

course of action which would bring unpopularity upon him as well as upon herself. The early years of the marriage were unhappy. Charles breaking his promise to relieve the Eng. Catholics. After the assassination of Buckingham, the barrier between the married pair was broken, and the bond of affection that united them never loosened. In 1644 the queen left her husband, to see him no more, being exiled in France on account of religious and political difficulties in England. Her husband's execution in 1649 was a terrible blow to her. When, after the Restoration, she returned to England, she found there was no place for her in the new order, and in 1665 she went again to France, there to spend the remainder of her life.

**Henrietta Maria** (1644-70), daughter of Charles I. of England, and wife of the duke of Orleans, brother of Louis XIV., *b.* in Exeter. She was successful in persuading her brother, Charles II., into signing the Treaty of Dover with France. On her return to France she died suddenly, probably by poison.

**Henry**, practical unit of electric self-inductance. It was defined by the International Congress of 1908 as 'the induction in a circuit when an electromotive force induced in this circuit is one international volt, while the inducing current varies at the rate of one ampere per sec.' It derives its name from that of the discoverer of the property of inductance, Joseph Henry (1797-1878).

**Henry I.** (1068-1135), king of England, the youngest son of Wm. the Conqueror and it is to be noted the only son born to Wm. after he became king. This is of importance, since H. made this fact one of his chief claims to the throne of England against the claim of his eldest brother Robert. During the war between Rufus and Robert of Normandy, H. supported the claims of Robert, but, in the treaty which followed, his claim to the Eng. throne was utterly disregarded. On the death of Rufus, however, and whilst Robert was hastening back from the Holy Land, he seized the crown of England (1100), and was elected by the witan. The early part of his reign was taken up with struggles with Robert. These struggles ended in a compromise by which Robert was to receive an ann. pension. Robert, however, again went to war and was overwhelmed at Tonchebrai (1105). This battle has been called the Eng. revenge for Hastings. Robert remained a prisoner in the hands of H. until his death in 1133. The struggle in Normandy was continued by Robert's son, who found much support at the hands of the Fr. king. Ultimately, H. was entirely successful. He had done much to commence the amalgamation of Norman and Saxon into a united Eng. race, and although his marriage with the Saxon princess, Matilda, was scornfully regarded by the Norman nobles, it was an example which was followed later by many Normans. In England itself H. had issued a charter on the lines of the ant. charter of Edward the Confessor, and had restored law and order

in the country. Many of the wisest reforms of Henry II. (*q.v.*) had their beginning in H.'s reign. In 1119 his only son, Wm., was drowned in the wreck of the *White Ship*, and the remainder of H.'s reign was taken up in attempting to settle the succession. His daughter, Matilda, had married: (1) The Emperor Henry V., (2) Geoffrey of Anjou. Although H. compelled the barons to swear to recognise Matilda as queen on his death, the throne was ultimately obtained by Stephen. H. was a wise, just, and clever king, but he was cold, and at times brutal. See R. W. Church, *Saint Anselm*, 1870; T. Arnold's ed. of 'Henry of Huntingdon', *Historia Anglorum* (Rcls series), 1879; E. A. Freeman, *The History of the Norman Conquest* (vol. v.), 1867-79; W. Stubbs, *The Constitutional History of England* (vol. i.), 1874-78; Kate Norgate, *England under the Angevin Kings* (vol. i.), 1887; Sir J. H. Ramsay, *Foundations of England* (vol. ii.), 1898; H. W. C. Davis, *England under the Normans and Angevins*, 1905; H. Belloc, *History of England* (vol. II.), 1927.

**Henry II.** (1133-89), king of England. He was the eldest son of Matilda and Geoffrey of Anjou, and was *b.* in 1133. On the death of his grandfather, Henry I., his mother was passed over in the Eng. succession and Stephen succeeded. Before H. had attained his majority he had proved himself a great warrior, and was the possessor of wide dominions in France. He ruled Normandy, Maine, Anjou, and Touraine, whilst by his marriage to Eleanor of Aquitaine, the divorced wife of the king of France, he succeeded to her dower as well. He landed in England in 1153, and by the treaty of Wallingford it was agreed that he should succeed Stephen as king of England. He was crowned in 1154, and immediately began to establish firmly the royal power. The 'nineteen long winters' had left the nobility practically omnipotent in England, and H.'s first task was to crush the baronial power. This he did by turning the mercenaries out of the country, by demolishing all castles erected without licence, and reverting to the crown all grants of land made during Stephen's reign. Having crushed the barons' power, he turned his attention to the church. The power of the church was admittedly great, but the church was by no means inclined to give up that power. He appointed his chancellor, Becket, archbishop of Canterbury, but Becket proved as obstinate an archbishop as he had been subservient as chancellor. The Constitutions of Clarendon placed the royal and the church courts on an equal basis, but Becket ultimately refused to acknowledge them, and in defiance of them appealed to the pope and fled the country. This ultimately led, after a pretended reconciliation, to his murder (1170). In 1174 H. did public penance at the tomb of Becket.

H., however, cannot be regarded as essentially an Eng. king. The greater part of his reign was spent in France in struggles with the king of France and with his own subjects. He probably regarded

England as the least important of all his dominions. During his reign, also, attention had been turned to Ireland, where Strongbow had succeeded in establishing Norman power. H. went over to Ireland, reduced the Norman nobility to subjection to himself, and ultimately appointed his youngest son John lord of Ireland. In France, in addition to struggling against the Fr. king, he had also considerable trouble from his sons, Henry, Richard, and Geoffrey. Both Henry and Geoffrey died before their father, but the final struggle which broke H.'s power was against the king of France and Richard. H. was defeated, humiliated, and forced to agree to terms. He agreed that a general amnesty should be granted to his rebellious subjects. Weak and ill almost to death, he was presented with a list of the rebels; the first name which he saw was that of his best-loved son John, and with the words 'Shame on a conquered king' he turned his face to the wall and died. His reign in England has been described as a reign of law and order, and certainly the system estab. by H. worked exceedingly well and was of vast importance in the building of the constitution of England. He was the greatest of the Plantagenets, and it is to be noticed that in order successfully to oppose and lessen the power of church and nobility, he enlisted popular support by wise and enlightened measures of reform, and by the Assize of Arms he raised a militia on which he could always depend. He was an able gen., a wise, if unprincipled, statesman, and a great legislator. See the records of the various chroniclers, such as Wm of Newburgh's (or Newbury), *Historia Rerum Anglicarum* (Hist. of Eng. affairs). Giraldus Cambrensis (Gerald de Barri) and others (Rolls series); Stubbs's *Constitutional History*; H. W. Eyton, *Itinerary of Henry II*, 1878; Mrs. J. H. Green (Alice Stopford), *Henry II*, 1888; W. Maitland, *History of English Law*, 1898; Kate Norgate, *England under the Angevin Kings*, 1887; Sir J. H. Ramsay, *Anglo-Norman Empire*, 1903; F. Hardagen, *Imperialpolitik Heinrichs II. von England*, 1905; and the life by L. F. Salzman, 1919.

**Henry III.** (1207-72), king of England, older son of John. At the age of nine he succeeded to his father's throne, at a period when the struggle for the maintenance of the Charter was at its height. So far had the opposition to his father gone that Louis of France had been invited to accept the allegiance which many of the Eng. barons had refused to John. By the judicious measures of the regent Pembroke, of Hubert de Burgh, and Stephen Langton, H. was generally received as king and Louis was compelled to leave the country. On the death of Pembroke (1219), Hubert de Burgh ruled for H. and adopted a distinctive and national policy. In 1227, however, H. declared himself of age. In 1232 he deprived Hubert de Burgh of all his offices, and finally began the period of personal gov. in 1234. His policy was weak and vacillating, and was influenced largely by the surrender of the kingdom to

the papacy, a measure for which his father was responsible for, but of which H. suffered the results. His numerous relations, or the foreign favourites as they were generally termed, were another cause of trouble to H., and caused much ill-feeling throughout the country. His early war with France, which was fought from a mistaken conception of the ideals of the Eng., ended in disaster, and would have had even more disastrous effects had it not been for the generosity of St. Louis. His continued misrule, his attempted extortions of money, the vast influence of the papacy over the kingdom, and his numerous grants to his favourites, finally united the Eng. as a race against him. Matters came to a head when H. finally demanded a huge sum of money to purchase for his son Edmund support to obtain the kingdom of Sicily granted him by the pope. By the Provisions of Oxford his power was relegated to a committee of barons, led by Simon de Montfort, a former favourite and a brother-in-law, but now a much-hated rival. In 1263 the Provisions of Oxford were placed under the arbitration of Louis of France, who decided in favour of H., and war immediately broke out. The party of Simon de Montfort over-ruled the king at Lewes, and for a time the gov. passed into their hands. In 1265 Simon summoned his famous parliament, the forerunner of our modern representative parliaments, but in the same year he was overcome and killed at Evesham by Prince Edward. The Montfortian party held power for a time, but finally terms were laid down by the Dictum of Kenilworth. Henceforth the troubles of the reign ceased, so much so that Edward was able to depart on crusade, and H. died peacefully at Westminster. It is important to notice that so thoroughly had affairs been settled that Edward succeeded peacefully to a kingdom to which he did not return until two years after his father's death. See W. Shirley (ed.) *Collection of Royal and other Historical Letters* (Rolls series, 1862-66); W. Stubbs, *Constitutional History of England* (vol. II.), 1887; H. W. C. Davis, *England under the Normans and Angevins*, 1903; Sir J. H. Ramsay, *Dawn of the Constitution*, 1908; Kate Norgate, *Minority of Henry III*, 1912; M. Hennings, *England under Henry III*, 1924; E. Jacob, *Studies in the Period of Barons' Reform*, 1925.

**Henry IV.** (1367-1413), king of England, first of the Plantagenet house of Lancaster to ascend the throne. His accession was in reality the vital cause of the later Wars of the Roses. He was the son of John of Gaunt, the fourth son of Edward III. He was known in early life as Henry of Bolingbroke, the title being taken from the place of his birth. He supported Richard II. against Gloucester, but was being raised to the position of duke of Hereford, exiled (1398). In the next year, whilst Richard was in Ireland, Bolingbroke landed at Haveringpur and marched down through England, proclaiming that he came but to claim his own. Finally, he forced Richard, deserted

and betrayed, to abdicate, and was himself proclaimed king as Henry IV. (1399). He based his claim essentially upon its parl. character. Richard died at Pontefract four months later. His reign is characteristic chiefly for the lawlessness and rebellion which pervaded it, and for the impetus which his accession to the throne gave to parliament. The Welsh rebelled under Owen Glendower (Glyndwr); the Scots were attacked, but the attack failed, and when the Scots invaded England, they were beaten by the Percies at Homildon Hill (1402). Irritated by the king's behaviour, the Percies now rebelled, and attempted to form a junction with the Welsh under Owen Glendower: they were, however, defeated at Shrewsbury (1403). After this the power of the Welsh rebellion began to die out, but Wales can be said to have been practically independent of England's authority during the greater part of this reign. Prince James of Scotland was captured and kept a prisoner in England, and H. attempted some attacks in France. His religious policy was strongly in favour of the church, and he commenced a rigorous persecution of the Lollards. Towards the end of his reign he was a chronic invalid and suffered from a particularly painful and, according to some authorities, loathsome disease. He died at Westminster. He was a capable and clever man, but towards the end of his reign degenerated into a suspicious and cruel tyrant. See J. Gairdner, *Houses of Lancaster and York*, 1874; J. H. Wylie, *History of England under Henry IV.*, 1884-98; Sir J. H. Ramsay, *Lancaster and York*, 1892; C. W. C. Oman, *The Political History of England* (vol. iv.), 1892; J. H. Fleming, *England under the Lancastrians*, 1921.

Henry V. (1377-1422), king of England, eldest son of Henry IV., was created Prince of Wales in 1399. His youth was occupied in constant warfare, and many wild and probably exaggerated stories are told of him. That he disagreed with the policy of his father is obvious from his reversal thereof when he ascended the throne. He did all he could to popularise the Lancastrian dynasty on his accession. The Percies were restored to favour, Richard's body was interred in Westminster Abbey, but nevertheless he put down with a firm hand any attempts at rebellion. The year after his accession he claimed the throne of France by right of his great-grandfather, Edward III., and took an army across to France. Success attended his arms, and he was able to win the notable battle of Agincourt (1415) and to reduce N. France. Finally came the treaty of Troyes (1420), by which H. married the Fr. king's daughter and was acknowledged as heir to the Fr. throne. Whilst he was in England attending the coronation of his queen, the Eng. forces met with some reverses. H. thereupon returned to France, but died there in Aug. A just, pious and conscientious ruler, he was without pity, and was a great persecutor of the Lollards. See works cited under Henry IV.; also C. L. Kingsford, *Henry V.: The Typical Mediaeval Hero*,

1901; J. H. Wylie, *The Reign of Henry V.*, 1914-19; R. B. Mowat, *Henry V.*, 1920; R. A. Newhall, *English Conquest of Normandy 1416-1424*, 1924.

Henry VI. (1422-71), king of England, the only son of Henry V. and Catherine of France. He was less than twelve months old when he succeeded to the realm of England, and shortly afterwards, by the death of his grandfather Charles VI. of France, he became king of France. His tutors were administered for him by his uncles Bedford and Gloucester. At first the attempt of the Fr. dauphin (Charles VII.) to obtain possession of his father's throne was in vain, but after the appearance of the Maid of France (Jeanne d'Arc), the Eng. began gradually to lose their Fr. possessions. The death of Bedford in 1435 was really the final blow to the Eng. cause, and by 1453 Calais alone remained in Eng. hands. In 1447 Gloucester, after having been arrested by the queen's party, was found dead a few days later. The queen (Margaret of Anjou) now became the real leader of the policy of the court: her husband, pious, learned, and amiable, was entirely under her influence, and unfortunately events were moving rapidly in England towards a climax. The loss of the Fr. possessions, the return of the soldiers from France, and the resulting unemployment problem which followed, all conspired to make the Lancastrian dynasty unpopular. Nor did the influence of the queen have any better result. In 1454 H. became insane, and Richard, duke of York, a nearer lineal descendant of Edward III. than H., became protector. H. recovered; York was deprived of his office, and it became obvious that war was at hand. The year 1455 saw the battle of St. Albans, and from that date until 1471 battles between Yorkists and Lancastrians were frequent. Wakefield (1460) delivered York into the hands of Margaret, by whom he was beheaded, but Towton (1461) placed Edward, earl of March, son of Richard of York, securely on the throne. The power behind the throne was that of Richard Neville, earl of Warwick 'the King-maker,' of whom Edward, brave, clever, dissolute, and unscrupulous, now endeavoured to get rid. Finally, he drove Warwick into the hands of Margaret of Anjou; the alliance was at first successful, for Edward IV. was forced to flee the country and for a short time H. was again king. But Edward returned, Warwick was slain at the battle of Barnet (1470), and the Lancastrian line defeated at Tewkesbury (1471). The night of the return of Edward from Tewkesbury to London saw the death of H. See life by John Blakemore (or Blacmore), the king's chaplain, c. 1510, trans. 1919. See also *The Paston Letters* (Introduction by J. Gairdner), 1872; J. Gairdner, *Houses of Lancaster and York*, 1874; E. A. Gasquet, *The Religious Life of Henry VI.*, 1923.

Henry VII. (1457-1509), king of England, b. at Pembroke Castle, son of Edmund Tudor and Margaret Beaufort. He was descended from that Owen Tudor who married the widow of Henry V., Catherine of France; he was thus con-

nected with the royal line, and through his mother was descended from the Beauforts, the descendants of John of Gaunt and Catherine Swinford. He naturally supported the claims of the Lancastrians during the wars of the Roses, and finally put a period to these wars at the battle of Bosworth (1485), where he overthrew Richard III. and was acclaimed king on the battlefield. He was the founder of the Tudor dynasty, and practically estab. a system of absolute monarchy. By his marriage with Elizabeth of York he united the two houses of York and Lancaster, and by his overthrow of Simnel and Warbeck, the pretenders, he finally estab. his line firmly on the throne of England. His influence on the Continent was much greater than that of any previous Eng. king, and his adoption of a national policy gave England a great position amongst the nations of Europe. The policy of royal marriages which he initiated was of vast importance when judged by its later results. The marriage of his son Henry with Catherine of Aragon, after she had first wedded the elder son Arthur, was a primary cause of the separation from Rome, whilst the marriage of his daughter with James IV. of Scotland led to the ultimate amalgamation of the crowns of England and Scotland. He adopted a policy of peace, he estab. sound commercial relations with the Continent, and he realised that whilst the nobility must be crushed, the people must be supported. This peace policy had wide effects upon the later hist. of England. When H. died he left a huge fortune (about £30,000,000) to his son Henry VIII. He was an austere, somewhat miserly king, but nevertheless a king who placed England on a securer and firmer basis than heretofore. See J. R. Lumby (ed.), *Francis Bacon's Life of Henry VII.*; also J. Gairdner, *Henry the Seventh*, 1889; W. Busch, *England under the Tudors* (vol. 1, *King Henry VII.*) (trans.) 1895; A. F. Pollard, *The Reign of Henry VII. from contemporary sources*, 1913-14; Gladys Temperley, *Henry VII.*, 1914; W. D. Bushell, *The Lady Margaret Beaufort and Henry VII.*, 1916; C. H. Williams, *Henry VII.*, 1937.

**Henry VIII.** (1491-1547), King of England, being the second son of Henry VII. and Elizabeth of York. Until the death of his elder brother Arthur he was educated for the church. He succeeded his father and married Arthur's widow, Catherine of Aragon, in 1509. This marriage seems to have caused H. no scruples at the time. When he succeeded he was one of the most popular kings that England had ever had. He was young, handsome, tall, well built of a jovial disposition, and free and easy with his subjects. No king ever had better prospects when he ascended the throne. His reign falls naturally into two parts, separated by the date 1528, which may be regarded as the critical year of the divorce. The early period was occupied in affairs at home, in promoting the commercial relations of the country, and in maintaining the balance of power in Europe. In all this he was

ably supported by Cardinal Wolsey, but it must be remembered that H. was always the leading spirit. The aims of the king, of the cardinal, and of the nation conspired at this time to make the foreign policy popular and national. A life-long rivalry had begun between Francis I. of France and Charles V. of Spain. Wolsey profited from their mutual hostility by making England the arbiter between them, and both kings sought the favour of H., Francis at the Field of the Cloth of Gold, and Charles in a less ostentatious manner,

HENRY VIII.

in Kent. In 1525, however, Francis was defeated at Pavia. By 1524 H. had grown tired of his wife, he pretended to have scruples as to the legality of the marriage. He had already through Wolsey, incurred the displeasure of parliament by his increasing demands for money, now he finally determined upon the step which was to alienate Rome, to separate the Churches, and in reality, though probably unconsciously, to complete the subjugation of the powers of the country to the crown. Yet previously, from his dislike of Protestantism, he had been prepared for peace with Rome, but on his own terms; and his defence of the Papacy against Luther, in 1521, had won him the historic title 'defender of the faith.' By 1528 the matter had advanced to an absolute demand for a divorce. From the point of view of H. there were many reasons for this step. He wanted an heir to the throne—so far Mary alone of his children had survived; he desired to marry Anne Boleyn, and he alleged that his marriage had been without the sanction of God. For a time Pope Clement VII. was inclined to concede the demand, and in 1528 Cardinal Campeggio was sent to England, with ample powers.

The trial ended without decision, and the immediate result was the recall of Camppeggio and the overthrow of Wolsey. H.'s failure had, however, only increased the keenness of his desire. Since the papacy would not honour him, he would obtain a divorce in his own courts, and in his own way. In 1531 the recalcitrant clergy were outlawed, and, step by step, and, by means of what is somewhat incorrectly termed the Reformation Parliament, he proceeded until he was acknowledged as head of the church, and the power of the bishop of Rome was declared at an end. But the way had been paved with blood, and Bishop Fisher and Sir Thomas More had paid the penalty of loyalty to principle. It must be definitely understood, however, that H. wished to be strictly orthodox. His idea was not the reformation of a religion, but of a religious system; his motives may have been bad, but they were of vast importance to the nation at large. The Lutherans were far from encouraged, the Whip with Six Thongs (The Six Acts) imposed orthodoxy of the strictest type. The persecutions of Cromwell and the subservience of Cranmer made the path of H. fairly smooth. The monasteries, the most influential centres of allegiance to the papacy, were abolished (1536-39), their lands confiscated and granted to a new nobility. The pilgrimage of Grace was crushed with merciless severity; the king became absolutely supreme. H. had, by this time married Anne Boleyn and executed her, by her he had the Princess Elizabeth. His next wife, Jane Seymour, bore him Prince Edward and died. Anne of Cleves followed; H. was displeased with her, and the marriage was immediately dissolved; the immediate result was the execution of Cromwell. H. next married Catherine Howard, who was executed for infidelity, and finally Catherine Parr, who nursed him and managed to survive him. During the latter part of the reign the Reformed religion had made some progress with little or no encouragement from H. The later years of the reign were, however, marked by cruelties and bloodshed beyond measure, and H. died finally with the reputation of a bloody tyrant. The facts of Henry VIII.'s life are to be found in the *Letters and Papers of the Reign of Henry VIII.* 21 vols. ed. by S. J. Brewer and J. Gairdner, 1910. See also J. Froude, *History of England*, 1856-69; M. Chelington, *Wolsey*, 1888; F. A. Gasquet, *Dissolution of the English Monasteries* (trans.) 1889; A. F. Pollard, *Henry VIII.*, 1905; and M. Hume, *History of Henry VIII.*, 1905; C. Constant, *La Réforme en Angleterre*, 1930; H. Savago (ed.), *The Love Letters of Henry VIII.*, 1949.

**Henry I.** (c. 1010-60), King of France, in 1031, son of King Robert and grandson of Hugh Capet. The early years of his reign were spent in fighting the feudal nobles, who supported the claims of his younger brother Robert. When this dispute was settled he turned his attention to Normandy, where he attacked Wm. the Bastard without success. His son was

crowned the year before his death, and this was very necessary since H. was simply a feudal magnate and regarded only as *primus inter pares*.

**Henry II.** (1519-59), King of France, in 1533 married Catherine de' Medici. He succeeded his father, Francis I. The influence of the family of Guise led to the interference of France in Scotland, and to war with England. This war resulted in the capture of Calais, which had for over two centuries been in the possession of England. This reign witnessed much

HENRY III. OF FRANCE

oppression of the Protestants, but nevertheless H. supported the reformers against the emperor with some degree of success, but was overthrown in the Sp. Netherlands by Alva. The treaty of Cateau-Cambrésis concluded the war with the empire and Spain. He was slain at a tournament by a Scottish nobleman. See H. de la Barre-Duparcq, *Histoire de Henri II.*, 1887; L. Romier, *Les Origines politiques des guerres de religion*, 1913-14, and *Le Royaume de Catherine de Médicis*, 1922.

**Henry III.** (1551-89), King of France, the last of the Valois, was the third son of Henry II. and Catherine de' Medici. He fought against the Protestants at Jarnac and Moncontour. He played a great part in the massacre of St. Bartholomew, and after being elected king of Poland, succeeded to the Fr. throne on the death of his brother Charles IX. (1574). During his reign almost constant wars took place between the Catholics and the Protestants. Finally, he threw himself into the hands of the Huguenots, although he was at times violently anti-Protestant. He was assassinated on Aug. 1 by a friar named Clément. Before his death he nominated Henry of Navarre as his successor. His reign was one almost constant period of civil war. See M. W.

Freer, *Henry III.*, 1858; P. Robiquet, *Paris et la Ligue sous Henri III.*, 1887.

**Henry IV.** (1553-1610), king of France and Navarre, b. in the castle of Pau, the son of Antoine du Bourbon, and Jeanne D'Albret, the heiress of Navarre. He was educated as a Calvinist, and after 1569 was recognised as the Huguenot leader of France. He fought at Jarnac, and led the Protestants in the religious wars which were rife in France at this time. In 1572 he married Margaret de Valois, the sister of the king of France, but within a week followed the massacre of St. Bartholomew, after which H. remained practically a prisoner in the hands of the Fr. court. He finally renounced his religion and later escaped to Alençon, where he repudiated that renunciation and again put himself at the head of the Protestants. Henry III. depended upon him for support, and on the death of that monarch, H. of Navarre became nominally the king of France. His Protestantism made him repugnant to the majority of his subjects, and the Catholic League, strengthened by support from outside, especially from Spain, was strong enough to force him to the S. There he remained for some time until his renunciation of Protestantism and his entrance into the Catholic Church secured for him the allegiance of the vast majority of his subjects. The peace of Vervins ended the war with Spain, and H. was at last free to turn to the internal affairs of the country. He, together with his minister, Sully, reformed the finances of the country, centralised the gov., and above all reduced the power of the nobles. Commerce and trade received a great impetus, and the national debt was largely reduced. Just after the coronation of the second queen, and while he was on the point of setting out to war in Germany, he was assassinated by a religious fanatic. He was essentially a patriot king, and worked throughout for the good of his country. 'Paris,' he said, 'was worth a Mass.' He had many mistresses, and his immoral life was the worst side of his character. See besides the lists of France, the *Memoirs of Sully* and others; also M. W. Freer, *Henry III.*, 1858; E. de La Barre-Duparcq, *Histoire de Henry IV.*, 1881; L. Rambault, *Henri IV. et son œuvre*, 1881; H. M. Baird, *The Huguenots and Henry of Navarre*, 1886; P. de Valèsère, *Henri IV.*, 1930; M. Saint-René Taillandier, *Henri II.*, 1938; R. Ritter, *Henri IV., le Béarnais*, 1945; M. Bourrier (ed.), *Henri IV., peint par lui-même*, 1947.

**Henry V. of France**, see CHAMFORD, COMTE DE.

**Henry II.** (1333-70), king of Castile, surnamed 'El Bastardo,' was an illegitimate son of King Alfonso the Avenger. He led repeated rebellions against Pedro the Cruel, and was supported by the Fr. leader Bertrand du Guesclin. In spite of the opposition of the Eng. under the Black Prince, he was able to establish himself in 1369. He then led an army against Portugal. His reign was conducted more on lines of defence than aggressiveness.

**Henry III.** (1379-1406), king of Castile, surnamed 'The Sickly.' He succeeded his father at the age of eleven, and the period of the regency was somewhat disturbed. He was able, however, to assert his power, and under his personal rule the kingdom prospered. He married in 1393 Catherine of Lancaster. During his reign the Canary Is. were taken possession of by Castile.

**Henry I.** (876-936), surnamed the 'Fowler,' king, but not emperor, of Germany, the son of Otto, duke of Saxony, succeeded (919) to these dominions on the death of his father. He was strong enough to resist the attacks of the emperor, and built up in Germany a strong and consolidated state, which contained Lorraine, and which held Hungary in check. He instituted new methods of attack in warfare, and built large cities throughout Saxony and Thuringia. He was on the point of claiming the imperial throne when he died. The value of his work toward the building up of Germany was very great indeed. See H. Holtzmann, *Geschichte der sächsischen Kaiserzeit*, 1941.

**Henry II.** (973-1021), Ger. emperor, the son of the duke of Bavaria and the grandson of Henry the Fowler. He was of considerable service to the emperor, Otto III., whom, as the last representative of the Saxon house, he succeeded in 1002. He had many revolts to contend against, but he secured Lombardy for himself, defeated the Poles, obtained the promise of the incorporation of Burgundy with the empire, drove back the Gks. in Italy with the help of the Normans, and greatly increased the power of the church. This latter side of his policy was of vast importance, since he raised up the power of the church in order to balance the power of the nobility. He was one of the greatest patrons which the church has ever had, and was canonised after his death. See life by H. Gunter, 1901, and R. Holtzmann, *Geschichte der sächsischen Kaiserzeit*, 1941.

**Henry III.** (1017-56), Ger. emperor, son of Conrad II. He was successively king of the Ger., duke of Bavaria, and duke of Swabia, and finally became emperor in 1039. He restored and kept up the prerogative of the empire, and encouraged the movement towards the reform of the church. He deposed the three rival popes, and placed Clement II. on the papal throne. He forced the duke of Bohemia to acknowledge himself a vassal of the empire, and practically placed Hungary under the allegiance of the emperors. He encouraged art, architecture, and learning. One of his greatest achievements was the estab. of supremacy over the Normans in Italy. See monographs by E. Steinlechner, 1874-81 and P. Kehr, 1930.

**Henry IV.** (1050-1106) Ger. emperor, son of Henry III., and succeeded his father at the age of six. His mother, the Empress Agnes, at first acted as regent, but her rule was too weak, and at the age of twelve the emperor fell into the hands of Anno, archbishop of Köln, by whom he was educated. The position of Anno was

rivalled by that of Adalbert, the archbishop of Bremen, who had great influence over H. The constant changing of his tutors, and the weakness of his training due to the constant rivalry of his regents, led to excesses on the part of the young emperor. He was not, however, without ability. He was declared of age in 1065, but his troubles began with the rebellion of Otto duke of Bavaria, whom he was able finally to crush. The princes of the empire, however, gave him little or no support. The next great trouble of the reign was the quarrel with the papacy, known as the investiture dispute. The papacy under Gregory VII. (Hildebrand) was endeavouring to raise the moral tone of the clergy by securing the abolition of lay investiture, i.e. the appointment of the higher clergy by the civil authority. Though previous emperors had supported the papal claims, H. now entered the lists as the champion of the civil power. His first step was to demand that Gregory should excommunicate his enemies. In reply the pope insisted on H. considering various charges brought against him by his subjects. H. called a council of prelates and announced Gregory deposed. Gregory issued sentence of excommunication against H. H.'s supporters quickly fell away, and he saw that his only hope of success lay in surrender to the papacy. He sought out the pope at Canossa, and there, after waiting for three days in the shirt of a penitent, amidst the snows of the Apennines, he was admitted to the presence and forgiven. The princes of the empire were still dissatisfied. Three anti-emperors were raised up in succession, and although H. won some successes, even his sons were induced to rebel against their father. The papacy also still continued its policy of opposition to the emperor, and although H. was successful in maintaining a pope of his own choice in Rome, he was forced finally to abdicate, and he fled from prison to Liège. Here he was preparing another attack on the Ger. princes and the pope when he died. Pictured usually as a weak, struggling king, H. was in reality, nothing of the kind. His work was of vast importance. He realised that the power of the papacy had increased, and must, for the safety of the empire, be diminished, and he sought also to crush the power of the secular nobles and centralise the gov. as far as possible. See monographs by H. Plotz, 1855-57; W. Giesebrecht, 1863; G. Meyer von Knonan, 1890-1904; and B. Schneidder, 1927.

**Henry V.** (1081-25), Ger. emperor, was the second son of Henry IV. His elder brother, Conrad, was deprived of his rights of succession because of his rebellion against his father, but H. was guilty of the deepest treachery. When he succeeded in 1106 it was held that, since he had supported the papacy previously, he would renounce even such concessions as his father had been able to win. After many struggles with the popes H. was able to obtain a settlement of the whole investiture (i.e.) question by the Diet of Worms, which was concluded in 1122.

By this the papacy kept the right of election and consecration, but the church lands were invested by the emperor or his representative. He was the last of the Franconian dynasty. See monographs by F. W. Giesebrecht, 1890, and H. Benning, 1927.

**Henry VI.** (1135-97), Ger. emperor, was the son of the Emperor Frederick Barbarossa. He was made king of Germany during his early childhood (1169), and succeeded to the empire (1190) on the death of his father whilst leading the crusade. He aspired to establish definitely the power of his dynasty. He crushed the rebellious in Sicily, and overruled the whole empire. He even for a time forced the emperor of the E. empire to do him homage. His Sicilian campaigns form the object of greatest interest in his reign, and he was able to raise a fine army from the ransom which he obtained from Richard I. of England. His attempts to establish his dynasty on the imperial throne failed principally because of his early death. See H. Tösch, *Jahrbücher*, 1867; J. Haller, *Heinrich IV. und die römische Kurie*, 1914; E. Perels, *Erbreichthum Heinrichs VI.*, 1927.

**Henry VII.** (c. 1275-1313), Ger. emperor, was the son of Henry II., count of Luxemburg. He owed his election as emperor at Rome in 1312 to the fact that there was no strong opposition, and that he was regarded as being unimportant. He enriched his own family with the lands of Bohemia, and attempted to revive the old glories of the empire. He, however, made the error of supporting the princes against the growing power of the cities. See lives by K. Gräfe, 1911 and F. Schneider, 1924-28.

**Henry**, surnamed **The Lion** (1129-95), the head of the Welf family. He was duke of Saxony and Bavaria. His possessions in Europe were extensive, and he was restored to some of them by Frederick Barbarossa. He encouraged trade and commerce in Germany, built up ports on the Baltic, and founded the city of Munich. So great, however, did his power become in Germany that a league of princes was formed against him, but this had so little effect that he was finally placed under the ban of the empire (1180). He was reconciled, however, to the Emperor Henry VI. See lives by A. L. Poole, 1912; M. Philippson, 1867, 1918; P. Bartels, 1925; and K. Hampp, *Herschergehalt*, 1927.

**Henry the Navigator** (1394-1460), fourth son of King João I. of Portugal and the Eng. princess, Philippa, daughter of John of Gaunt. He early distinguished himself by his bravery, but he is best remembered for the services which he rendered to geographical discovery. His ships sailed to places on the coast of Africa hitherto unknown. In 1418 the Madeira Is. were discovered. He and his sailors now explored many points on the coast of Africa. He established a school for navigation and an observatory. During his lifetime discoveries were pushed on apace; his influence on the age which followed cannot be exaggerated. See J. P. Oliveira Martins,

*The Golden Age of Prince Henry the Navigator*, 1891 (trans. 1914).

**Henry, Prince of Wales**, eldest son of James I. of England by his wife, Anne of Denmark. He was a prince of great promise, who was the hope of those who disliked Spain. Unhappily he died in 1612 soon after the death of Robert Cecil, and thereafter James drifted rapidly away from France and became a close ally of Spain.

**Henry, Sir Edward** (1850-1931), Brit. commissioner of police and criminologist. Studied for the Indian Civil Service and joined the N.W. Prov. Service. In 1891 he was appointed Inspector-Gen. of Police, and thus began the work in which he won distinction. His name will always be associated with the perfecting of the finger print system of identifying criminals, which system he learned in India. In 1901 H. was appointed Assistant-Commissioner of Police in London, and in 1903 Commissioner, besides being head of the Criminal Investigation Department, holding these offices till 1918. To him more than any other man is due the efficiency of the modern C.I.D. He did much, too, to improve the status of the police, and inaugurated the Peel Training School, besides supporting the Police Orphanage.

**Henry Frederick, Prince of Wales**, (1591-1612), eldest son of James I. He was b. at Stirling Castle some years before the accession of his father to the throne of England. On his birth he was created duke of Rothesay, and in 1610 Prince of Wales. He died at the age of eighteen, when his career had already given great promise.

**Henry, Joseph** (1797-1878), Amer. scientist, b. in Albany, New York. He appears to have been the first to adopt insulated wire for the magnetic coil. He was the first to magnetise iron at a distance, and he was also the first to apply the telegraph to meteorological research. The unit of electrical induction is named after him. From 1868 he was chosen annually as president of the National Academy of Sciences, and he was also president of the Philosophical Society of Washington from the date of its organisation in 1871. He wrote *Contributions to Electricity* (1839) and *Syllabus of Lectures in Physics* (1844).

**Henry, Matthew** (1662-1711), Eng. Nonconformist divine, b. on the borders of Flintshire and Shropshire, son of Philip H., who was ejected by the Act of Uniformity; he possessed private means, and educated his son well. The son relinquished legal studies for theology, and in 1687 he became minister of a Presbyterian church at Chester. His well-known exposition of the O.T. and N.T. (1710) is a commentary of a practical and devotional rather than critical kind. Its racy Eng. style secured for it the foremost place among works of its kind.

**Henry, O.** (1862-1910), Amer. short-story writer, b. at Greensboro, N. Carolina, U.S.A. After a brief schooling, he worked in a drug store in his native tn. until ill-health compelled him to try life on a ranch in Texas. In 1884 he secured

a post in an Austin, Texas, bank, and later in the Texas Land Office. In 1891 he became teller in the First National Bank of Austin, and in 1894 bought and ed. a weekly pub., *Brann's Iconoclast*. Despite its rollicking humour, it was a failure, and in 1895 the young man, whose real name was Wm. Sydney Porter, began work on the *Houston Texas Post*. Fate seemed to have dealt him a finishing blow when, in 1896, he was arrested on the charge of embezzling some of the funds of the Austin bank. The episode was never entirely cleared up. What is known is that in 1898 Porter was sentenced to five years' imprisonment in the Ohio Penitentiary. This was reduced to three years by good behaviour. Within prison walls, now for the first time he began to settle down to the serious business of writing, drawing upon his knowledge of the queer people he had met in the S.W. His MSS. were sent out under the nom-de-plume of O. Henry. His first big stroke of luck came when the *New York World* gave him a contract to supply one short story per week, at a fee of 100 dollars each. It was only some years later that the general reading public learned that O. Henry was Porter, the man who had been in prison. Despite his rather intemperate habits, he was a prodigious worker, and vol. after vol. of his short stories was issued, among them being *Cabbages and Kings* (1904), *The Four Million* (1906), *The Heart of the West* (1907), *The Voice of the City* (1908). Many of his stories are marked by their humour, others by their tenderness for the lowly and the unfortunate. And all of them are notable for the surprising unexpectedness of their endings. His kind of short story resembles that of his predecessors Mark Twain, Bret Harte, and Ambrose Bierce and after him in the same tradition followed Ring Lardner and Damon Runyon. His collected works were pub. in 1917. See R. H. Davis and A. B. Maurice, *The Caliph of Baghdad—Arabian Nights Flashes of the Life, Letters, and Work of O. Henry*, 1931; and life by W. W. Williams, 1936.

**Henry, Patrick** (1736-99), Amer. statesman and orator, b. at Studley in Virginia; the son of a well-educated Scot-man, his mother being of Welsh descent. As a lawyer he was brilliantly successful. In 1765 he became a member of the Virginian House of Burgesses, and led the political agitation which caused the revolution. Declared Stamp Act illegal, 1765; a member of the Continental Congress, 1774; Virginia Convention, 1775; Ratifying Convention, 1788; Governor of Virginia, 1776-79 and 1784-86. Known as the greatest speaker of his generation, perhaps his finest oration was that made in 1765, when the Virginian legislature was protesting against the obnoxious Stamp Act foisted on the Amer. Colonies by King George III. and his Cabinet. H. declared that the people of the Colony had all the rights of natural-born subjects of England and were bound to obey no laws except those of their own making. Then he continued in a famous passage: 'Cesar had his Brutus, Charles I. his

Cromwell, and George III ——"Treason," was shouted by the loyalists, George III," continued Henry, "may profit by their example. If that is treason, make the most of it."

**Henry, William** (1775-1836), Eng chemist, son of an apothecary and writer on chem. *B* at Manchester, and began to study medicine in 1795, took his doctor's degree in 1807, but ill health prevented him from practising, so he devoted his life to chem. research, especially in regard to gases. His *Elements of Experimental Chemistry* (1799) enjoyed considerable vogue, going through eleven eds in thirty years.

**Henry of Huntingdon** (c. 1090-c. 1150), Eng chronicler. His father by name Nicholas was a clerk who became archdeacon of Cambridge. Hertford and Huntingdon in the time of Remigius, bishop of Lincoln. The celibacy of the clergy was not strictly enforced in England till 1102, hence the chronicler makes no secret of his antecedents, nor did they interfere with his career. The only recorded fact of the chronicler's life is that he went with Archbishop Theobald to Rome in 1139. On the way he halted at Bec, and there met Robert de Torigni, who mentions their encounter in the preface to his chronicle. See I. Forester's trans. (1833) of H's *Historia Anglorum* and F. Wright's ed of *Diagrammatic in Engl. Lit.*, in *Medieval Poets*, vol. II, 1872.

**Henry the Minstrel**, see HARRY BRIND. **Henryson, Robert** (1425?-1500?), Scotish poet. It is surmised that he was connected with the family of Henderson of Korthill. He is described as "Scholmaster of Dunfermline," probably of the grammar school of the Benedictine abbey. There is no record of his ever having studied at St Andrews, which was the only Scottish univ. in existence at that time; his studies were therefore probably completed abroad. His longest work, his *Morall Fabillis of Ispoke the Phygian* (1570), he treated the subject with freshness. Efforts have been made, but in vain, to draw up a chronology of his poems. See collected eds. of his works by D. Laing, 1861; W. W. Metcalf and F. D. Robb, 1917; and H. M. Wood, 1933.

**Henschel, Isidor George** (Sir George) (1840-1934), Polish singer and composer, b. at Breslau and naturalised in England in 1890. Pupil of Franz Götze for singing, and of Richter for theory, at Leipzig (1867-70), continued his studies in singing and composition in Berlin. He conducted symphony concerts at Boston, 1881-84, went to London, 1885, where he directed London Symphony Concerts till 1886. He was knighted in 1914 after giving his last recital. He composed a number of instrumental works. *Stabat Mater* (Birmingham Festival), 1894, and music for *Hamlet*, London, 1892. Operas: *A Sea Change*, 1884; *Frederick the Fair and Nylma* (Dresden), 1899. Wrote *Personal Recollections of Brahms*, (1907), and *Musings and Memories* (his own reminiscences, 1918).

**Henselt, Adolf von** (1814-89), Ger. musical composer, b. at Schwabach,

Bavaria; educated under the patronage of King Ludwig I. at Weimar and Vienna. He made his debut in 1837, and in 1838 went to St. Petersburg, where he obtained an appointment at court and an inspectorship at the Imperial Educational Kustab. His work is small in quantity, but is distinguished by individuality. He himself was a most sympathetic and accomplished pianist. He wrote a pianoforte concerto in F minor, *Poeme d'Amour*, op. 3. *Balade*, op. 31, etc.

ADOLF VON HENSELT

**Henslowe, Philip** (d. 1616), Eng theatrical manager, started his connection with the stage when in 1584 he bought land near what is now the end of Southwark Bridge on which stood the little Rose Playhouse. Afterwards he acquired other theatres, and it was in these that many famous Elizabethan dramatists first had their plays produced. See eds. of his diary by J. P. Collier, 1815, and W. W. Greg, 1904-5.

**Henson, Herbert Hensley** (1863-1947), Eng bishop, b. in London, fourth son of Phos. H., of Broadstairs. Educated privately, and at Oxford Univ., where he was a fellow of All Souls' College from 1884 to 1911—re-elected 1896. He was head of Oxford House, Bethnal Green, 1887-88, vicar of Barking, Essex, 1888-91, incumbent of St. Mary's Hospital, Ilford, 1891-1900; chaplain to the Bishop of St. Albans, 1897-1900, rector of St. Margaret's, Westminster, and a canon of the Abbey, 1900-12 (sub dean, 1911-12), dean of Durham, 1912-15. He was proctor in Convocation in 1903. If a forcible and arresting method of stating his views changed little throughout his ministry, the views themselves changed considerably. In youth he had been a Nonconformist. As vicar of Barking he was an Anglo-Catholic, welcomed as an occasional preacher in St. Albans, Hol

born. At Uford, though still definitely a high churchman, he reduced the ceremonial he found. At St. Margaret's he became a broad churchman and a defender of Modernism. In 1907 he regarded Anglo-Catholicism as a spent force. He proposed to preach in a Birmingham Nonconformist chapel, in spite of the veto of the bishop, Dr. Gore. At this period he was an ardent champion of the Establishment, yet almost every sermon he preached in his later years included an eloquent demand for Disestablishment. His appointment in 1918 to the bishopric of Hereford was strongly resented by the non-Protestant section of the church. H. had not only preached in nonconformist places of worship, but had in his writings commended a latitudinarian interpretation of Christian doctrine almost unusual in an Anglican clergyman: e.g. 'We want expurgated Bibles' (*The Value of the Bible*); and 'No doubt there is much in the primitive accounts of the Resurrection which is demonstrably unhistorical' (*ibid.*). He was bishop of Durham from 1920 to 1939; Canon of Westminster Abbey, 1910-41. Gifford Lecturer, 1935. His pubs. include: *Light and Heaven* (1897), *Apostolic Christianity* (1898), *Ad Rem, Thoughts on the Crisis in the Church* (1900), *English Religion in the 17th Century* (1903), *Religion in the Schools* (1906), *Christian Marriage* (1907), *Christ and the Nation* (1908), *Westminster Sermons* (1910), *Puritanism in England* (1912), *War-Time Sermons* (1915), *Christian Liberty* (1918), *Anglicanism* (1921), *In Defence of the English Church* (1923), *Byron* (Rede Lecture 1924), *Notes on Spiritual Healing* (1925), *The Book and the Vote* (1928), *Disestablishment* (1929), *The Oxford Groups* (1933), *Christian Morality* (1936), *Ad Clerum* (1937), *The Church of England* (1939), *Last Words in Westminster Abbey* (1941), *Retrospect of an Unimportant Life* (2 vols., 1942-43).

**Henty, George Alfred** (1832-1902), Eng. author, b. at Trumpington near Cambridge. He was educated at Westminster School and Cam. Collegio, Cambridge, but left without taking a degree. On the outbreak of the Crimean War he volunteered for active service, and his letters describing the siege of Sebastopol were pub. in the *Morning Advertiser*. In 1865 he adopted the calling of a journalist, and wrote for the *Standard*, going upon many famous expeditions. His first boy's book appeared in 1868, *Out in the Pampas*, and was followed by *The Young France-Tireurs*, a tale of the Franco-Prussian War (1872). He also tried his hand at novel writing, but without success, his great forte being tales of adventure for boys, of which he wrote about eighty.

**Henzada**, tn. of Burma, cap. of the H. dist. It is 66 m. W.N.W. of Pegu on the Irawaddy R. at the apex of the delta proper. Thus it forms a trade centre for the people of the delta and those of the Lower Irawaddy Valley. It is here that the Rangoon line to Bassein crosses the Irawaddy by railway ferry. The dist. has an area of 2856 sq. m. and a pop. of 550,800. Pop. (tn.) 23,600.

**Hepatica**, sometimes considered to be a separate genus of ranunculaceous plants, is more usually included in the genus *Anemone*. The species are herbs and sev. occur in Britain. *A. Hepatica*, the common H., has a dense involucre of green bracts which resemble a calyx, and the blue flowers are visited by bees for the honey they secrete.

**Hepatic Calculi**, see GALL-STONES.

**Hepatitis**, see under LIVER.

**Hepatus** (Gk. *ἥπατος*, a fish, so named because of its being liver-coloured), name of a genus of malacostracan crustaceans belonging to the family Maluidae; the species are found on the Amer. coast, where they bury themselves in sand. They are characterized by a generally convex carapace, triangular frame, and claw-like endings to their legs.

**Heppburn, James**, see BOWWELL, EARL OF.

**Hephæstion** (Ἡφαιστίων), companion and friend of Alexander the Great, was the son of Amyntor. He appears to have served with distinction at the battle of Arbela, and was one of the seven select officers who were in close attendance upon the king's person. He was also commander of the horse guards (*καίτοι*) for a time, and was entrusted with many important commands during the campaigns in Bactria, etc., and the expedition to India. He d. of a fever in 323 at Ecbatana.

**Hephæstus** (Ἡφαιστος), in Gk. mythology, the god of fire and of the arts which need fire in their execution (equivalent to the Roman Vulcan). According to Homer he was the son of Zeus and Hera, and being a weakling from birth, was despised by his mother, who dropped him from Olympus into the sea. But he was rescued by Thetis and Eurynome, with whom he dwelt for nine years, busying himself by making a variety of ornaments, and amongst them the golden chair which he sent to his mother by way of revenge. Having been brought back to Olympus by Dionysus, he was a second time hurled from the mt., and this time by Zeus for championing his mother's cause. He settled for a time in Lemnos, but finally returned to Olympus and acted as mediator between his parents. All the masterpieces of metal which appear in the stories of gods and heroes, the arms of Zeus, the arms of Achilles, the sceptre of Agamemnon, the necklace of Harmonia, etc., were attributed to H., and his workshops were placed on Mt. Olympus, and in various volcanic isles where he received the help of the Cyclopes.

**Heppenheim**, tn. in Hessen, Germany, 13 m. E. of Worms, is a health resort. It dates from the time of the Romans, and contains the ruins of Starkenburg Castle (1661), a former stronghold of the archbishops of Mainz. It has quarries, and manufactures tobacco and machinery. Pop. 8800.

**Hepplewhite, George** (d. 1786), Eng. furniture designer, who had a business in London at St. Giles, Cripplegate. His furniture in mahogany and satin-wood achieved a wide renown, especially his chairs which are made with a shield or heart-shaped back. His *Cabinet-Maker*

and *Upholsterer's Guide* was pub. in 1788. See K. W. Clouston, *The Chippendale Period in English Furniture, 1897*; R. Edwards, *Hepplewhite Furniture Designs, 1918*.

**Heptane**, name given to hydrocarbons of the paraffin series, consisting of 7 carbon atoms, chem. formula,  $C_7H_{16}$ . The two chief are (1) normal boiling point 98.3, sp. gr. at 20° 0.683, contained in petroleum and in the tar-oil from cannel coal. Along with octane, it forms the chief part of the commercial petroleum ether. It is colourless and has a faint agreeable odour. It occurs in the nut pine (*Pinus sabiniana*) of California, from which a resin is obtained which, distilled with sulphuric acid, yields pure hydrocarbon. (2) methyl-ethylpropylmethane—the simplest paraffin with an asymmetric carbon atom, formed by the action of zinc ethyl on acetone chloride.

**Heptarchy** (from Gk. *hepta*, seven, and *archē*, kingdom), name given to the seven kingdoms, Kent, E. Anglia, Sussex, Wessex, Northumbria, Mercia, and Essex, comprising Saxon England. They were not contemporaneously distinct and independent kingdoms, but at some time between the fifth and ninth centuries they each had a separate existence. At the beginning of the ninth century, Wessex, under King Egbert, became the strongest, and absorbed the other kingdoms.

**Heptateuch** (from Gk. *hepta*, seven and *tauch*, book), word applied to the first seven books of the Bible, is formed on the analogy of Pentateuch. It is specially used to designate an A.-S. trans. of these books and the book of Job, made in the tenth century, copies of which are in the Brit. Museum and the Bodleian Library.

**Heptioic Acids**, acids belonging to the fatty series, having seven carbon atoms ( $C_7H_{14}O_2$ ). The only important one is the normal heptioic acid, or oenanthioic acid, a colourless oily faintly smelling liquid, obtained by the oxidation of oenanthol or normal heptyl alcohol. The oenanthol is obtained by distilling castor oil, under reduced pressure and fractionating the product.

**Hera**, in Gk. mythology the queen of Heaven, daughter of Cronus and Rhea, and sister and wife of Zeus. Equivalent to the Rom. Juno. She shared the power of her husband and had authority over the atmosphere, her handmaids being the Horse, or goddesses of the seasons, and Iris, goddess of the rainbow. She is represented as being the most majestic of all goddesses, and as the spotless and incorruptible wife of the king of Heaven. She was the mother of Hephesteus, Ares, Hebe, and Ilithyia, and was the only lawful wife in the Olympian court, hence she was regarded as the stern protectress of honourable marriage. She was worshipped throughout Greece, but the Peloponnese was probably the earliest seat of her worship, and during the Homeric period Argos, Mycenae, and Sparta were her favourite seats. The cuckoo was sacred to her as the messenger of spring (the season in which she wedded Zeus), as well as the peacock and crow, and among fruits the

pomegranate, the symbol of wedded love and fruitfulness.

**Heracles Lyncæus**, see MONASTER.

**Heracleia**, name given to a number of anct. Gk. tns.; (1) An anct. place of Pisatis in Elis, distant about 45 stadia from Olympia, noted for its medicinal waters. (2) A city of Magna Græcia, between the rvs. Aciris and Siris, on the gulf of Tarentum. It was probably founded about 433 B.C., and was first estab. on the anct. site of Siris. It rapidly rose to prosperity, and was selected as the place of meeting of the General Assembly of the Italiot Gks. During the war of Pyrrhus with the Romans, the consul Laevinus was defeated in 280 B.C. near this city. It was still a flourishing and important tn. in Cicero's time, and was in existence much later still, but is now extinct. The 'Tabulae Heracleenses', bronze tablets, containing the *Lex Julia Municipalis* of 45 B.C. for the regulation of the municipal institutions of the tns. throughout Italy, were discovered on this site. (3) *H. Minoa*, on the S. coast of Sicily, at the mouth of the R. Halycus, between Agriguntum and Selinus. It appears to have been a colony of Selinus, at first bearing the name of Minoa, but was seized by Euryleon, a Spartan, who gave it the name of H. It was occupied by the Carthaginians gen. Hanno, in 260 B.C., and in 256 was the scene of the defeat of the Punic fleet, and appears to have been one of the prin. naval stations of the Carthaginians in Sicily. It was still flourishing in Cicero's time and is last mentioned by Ptolemy. (4) Tn. on the confines between Caria and Ionia at the foot of Mt. Latmus. In its neighbourhood was a cave containing the tomb of Endymion. (5) *H. Pontica*, on the coast of Phrygia, situated a little to the N. of the R. Lycus. It had two excellent harbours, and was for a long time in a high degree of prosperity, maintaining a very prominent place among the Gk. colonies in those parts. Its decline dated from about 54 B.C., when it was partly destroyed by Aurelius Cotta in the Rom. wars against Mithridates. (6) Small tn. on the coast of Syria, to the N. of Laodicea ad Mare. Sev. graves cut in rock and pieces of marble pillars etc., have been found here. (7) Tn. on the coast of Eolis, opposite to Hecatonnesi. (8) Tn. in Gallia Narbonensis which is mentioned in the list of Pliny. (9) Name sometimes given to the tn. of Perinthus. (10) *H. Lyncestis*, chief tn. of the prov. of Upper Macedonia, situated at the foot of the Candavian Mts. (11) *H. Sinica*, the prin. tn. of Sinica, a dist. on the r. b. of the Strymon, in Thracian Macedonia. Demetrius, son of Philip V. of Macedonia, was murdered here. (12) *H. Trachina*, tn. in the plain of Mt. Oeta, a little W. of Thermopylae, founded about 426 B.C. by the Spartans. It was besieged by the Rom. consul Glabrio, in 191 B.C., after the defeat of Antiochus at Thermopylae.

**Heracleitus** more generally **Heraclicus** (Gk. *Herakleitos*), of Ephesus, surnamed *Pyralis*, son of Hylson, a Gk. philosopher, who lived from about 535-475 B.C., during the time of the first Persian domination

over his native city. He appears to have travelled in his youth, and on his return to Ephesus was offered the chief magistracy, which, however, he refused, likewise declining an invitation of Darius to visit his court, in order that he might live in retirement. His later years were devoted to his great philosophical work *On Nature*, in which he asserts that everything is in a state of eternal flux (*Ἡρακλείτους φύσικος πάντα ρεῖ*), so that nothing can escape final destruction, not even the gods, and that the ultimate principle into which all existence is resolvable is fire. That fire changes continually to water, and then into earth, and that the earth changes back again to water, and the water to fire. Thus, then, is the world evolved by a natural operation from fire which is also the human life and soul, and therefore rational, an intelligence which guides the whole universe. Spengler derived from H. the idea of change as continuous and rhythmic, as never-ceasing yet exhibiting a definite pattern. It was not, however, the assertion of the reality of change which led Justin Martyr to speak of H. as a Christian before Christ. It was rather the discovery of rhythm or pattern in the process of change that appealed. H., having introduced into Gk. philosophy the term *logos*, (with which the Fourth Gospel opens), Justin Martyr confidently asserts, 'They who have lived in company with the *Logos* were Christians, even if they were accounted atheists; and such, among the Gks. were Socrates and *Ἡρακλείτους*.' See J. Burnet, *Early Greek Philosophy* (chap. iii.), 1892; cf. J. Adam, *Religious Teachers of Greece*, 1908; also G. O. Griffith, *Interpretations of Reality*, 1946.

**Heracles**, see **HERCULES**.

**Heraclian**, or **Heraclianus**, one of the officers of the Emperor Honorius, to whom he rendered good service during the invasion of Italy by Alaric and the usurpation of Attalus. He revolted against Honorius in 412 and, proclaiming himself emperor, collected ships for the invasion of Italy. This he accomplished in A.D. 413, but was defeated and put to death. He is said to have murdered Stilicho in A.D. 408.

**Heraclidēs** (*Ἡρακλείδης*), patronymic from Heracles, and consequently given to all his descendants, but more especially to those who invaded and took possession of the Peloponnesus. It had been willed by Zeus that Heracles should rule over the empire of Perseus, but owing to a trick of Hera's, Eurystheus had taken first place, Heracles becoming his servant. After the death of the latter, however, his sons asserted their claims, and being led by Hyllus, the son of the hero by Deianira, they invaded the Peloponnesus to take possession of the countries acquired by their ancestor. They were at first unsuccessful, but finally conquered Argos, Messenia, and Sparta, and estab. themselves there.

**Heraclitus**, see **HERACLEITUS**.

**Heraclius** (*Ἡρακλίους*), Rom. emperor of the E. reigned from A.D. 610-641. He was the son of Heraclius the Elder,

governor-gen. of Africa, and was born in Cappadocia about 575. In 610 he was sent by his father against Phocas, who had usurped the throne of Constantinople, conquered him, and was elected emperor by the people. He found himself in a difficult position, for E. empire was then in a miserable state, but he managed to get rid of the Avars in 619, and turned his attention against the Persians. The war which had broken out in 603 between Phocas and the Persian king was still raging, and in 616 Egypt fell into the hands of the Persians, so that Constantinople was deprived of its corn supply. Added to this, Constantinople, too, fell into the hands of the Persians the same year. H. waited his opportunity, got ready an army, and commanding his troops in person, fought sev. battles against the Persians which resulted in the reconquest of Syria and Jerusalem, an achievement which seemed at the time impossible. But his glory was of short duration, and before he died, Syria, Palestine, Jerusalem, Mesopotamia, and Egypt came under the dominion of the caliph, H. apparently doing nothing to prevent this.

**Heraeum**, temple of Hera, situated between Argos and Mycenae, and, according to Strabo, the joint sanctuary for both these ins. until the fifth century, when Argos vanquished the Mycenaeans. In 423 B.C. the old temple was burnt down, and the Argives erected a new one built by Eupolemos, in which was placed the great gold and ivory statue of Hera, by the sculptor Polyclitus. Excavations were made by the Amer. Archaeological Institute and School of Athens, 1892-95.

**Heraclion**, (1) prov. of Crete, Greece, situated in the centre of the is. Pop. 162,900. (2) Cap. of the above, now known as Candia (q.v.).

**Herald**, officer of the Royal Household, who acted, and on certain occasions still acts, as messenger between sovereigns and is entrusted with the management of state ceremonial and who formerly superintended jousts, tournaments, and other public ceremonies and supervised coat armour. He was attended by 'pursuivants,' who were learning the duties of the H. The chief of the Hs. acquired the title of 'King of Arms,' and in England in the reign of Edward III. there were two kings of arms, Norroy and Surrey, but in Henry V.'s reign a new king of arms was instituted called 'Garter King of Arms,' and he, together with the other kings of arms and Hs., was in receipt of certain fees connected with public ceremonials and creations of peers. The King, kings of arms and heralds are under the control of the earl Marshal and still carry out state ceremonial such as the Coronation. In 1483 Richard III. incorporated the Hs. into a college known as the Herald's College or College of Arms, which still exists, and the business transacted by this institution is wholly connected with the tracing of genealogies and the granting of armorial bearings. The Scottish heralds were never under the Scots Earl Marshal. They constitute the 'Court of the Lord

Lyon,' whose origin is lost in antiquity. It is one of the public courts of Scotland, is situated in H. M. Register House, Edinburgh, and deals with the heraldry, genealogy, and state ceremonial of that kingdom.

In antc. Greece the H. (*κρηυς*), whose person was inviolable, was of great importance. He summoned the assemblies of the people, at which he maintained order and silence, proclaimed war, and assisted at public banquets and sacrifices. So, too, in Rome the 'Apparitores,' whose duties were similar to those of the Gk. *κρηυς*, and the 'Fetiales,' a special class chosen from the most distinguished families who managed the settlement of war and peace, were held in high esteem; only the 'Præcones,' who acted as 'criers' of public sales, etc., were despised.

**Heraldry.** The term originally denoted the knowledge and business of the herald, but it is now almost invariably applied to the science of armorial bearings. It has long borne this meaning, having supplanted the earlier name of armory. We find evidences of the use of some badge or sign to mark off a tribe, family, or individual, in the earliest days, and in all parts of the world. Homer and Aeschylus describe the devices which the heroes bore on their shields, and antique vases of classical times show many such. But H., in its technical sense of hereditary armorial symbols, was a later development than was once thought. The Bayeux Tapestry, though it shows devices on the shields of the knights, proves also that these devices were not armorial bearings in the later sense, for, in different parts of the tapestry, the same knight is represented with different devices. The mixture of nations caused by the Crusades must naturally have brought about a more regular system of insignia, and it is in the twelfth century that we must place the estab. of H. The striking feature is the way in which the science spread throughout Europe within a few years of its inception. It instantly and adequately filled the need, so pressing in illiterate days, of a simple system for identification of those occupying positions in public life. Its use in civil and domestic life, both for decoration and, especially, for legal purposes on seals, for authentication of deeds, had more to do with its popularity than use in warfare. No effective substitute for it has ever been invented. The misuse of another's arms was treated as equivalent to forgery, so in order to be certain of acting correctly, it became the practice to consult the heralds, who were responsible for seeing that arms and banners displayed in the Royal Army were correct and known to the commanders. Identification of the unit in a feudal army depended solely on these devices. Early feudal magnates conferred arms on their vassals, usually based on their own arms; but, in cases of dispute, a grant from the king naturally prevailed over a grant from any subject, so the theory followed that valid arms must originate in a grant from the Crown, which exacted fees, as on every other description of Royal grant.

The prestige attaching to armorial bearings lies in the recognition that a grant of arms infers a grant of 'nobility,' (in the continental sense), i.e. gentility, in Britain. It has been questioned whether arms necessarily connote gentility in England, but in Scotland non-gentle people are expressly forbidden to bear arms at all. At the time heraldry arose, nobles alone required or had the opportunity of using arms. When a man acquired a feudal fief, or other public position, he received arms as a matter of course. Corporate bodies and cities were soon by analogy held to be persons who either were, or could be, ennobled by grants of arms, and nowadays corporate heraldry is most important, because these bodies are very jealous of any infringement of their heraldic rights. Early bearings were simple in character, and were generally chosen so that they might suggest the name of the bearer. The castle of Castile and the bear of Berne are well-known examples. The heraldic movement started in France and Germany, and soon spread to Britain and the rest of Europe. In England it developed rapidly during the thirteenth and fourteenth centuries, reaching its climax in the reign of Edward III. In the nineteenth century a revival commenced, and the historic, scientific, and artistic importance of heraldry was realised. It has once more attained a level worthy of the esteem in which it was held in the Middle Ages.

Heraldry is still a living science, and in England the Herald's College (i.e. the Royal Officers of Arms incorporated in 1433) continues to exercise its functions. Garter King of Arms is at the head of the College, and, under the control of the earl Marshal, makes fresh grants of arms (£17 upwards) and records pedigrees. In England it has been difficult to enforce the law, since the Registers of the College are private, and the officers remunerated from a div. of the fees. In Scotland and N. Ireland, the kings of Arms are salaried officials, and the fees are collected for H.M. Treasury as part of the Inland Revenue. Ulster King of Arms formerly 'Principal Herald of All Ireland,' is now incorporated with Norroy, King of Arms of England. In Scotland, heraldry has assumed a more important standing than in any other nation, largely owing to the clan system, with its veneration for lineage and kinship (see LYON KING OF ARMS).

In 1672, all older registers were superseded by the 'Public Register of All Arms and Bearings in Scotland,' in which all existing arms were ordered to be registered within a year, as well as future grants. The striking feature of Scots heraldry is that there are relatively few surnames in Scotland, and therefore comparatively few basic coats of arms. The science has largely developed by differentiating these basic arms for the numerous offshoots from the main lines of clans and families. These 'matriculations' are registered at lower fees on proof of the relationship. If this cannot be estab., Letters Patent (£48 upwards) are issued.

FIG. III. TINCTURES

divided as in Fig. IV. No. 1 is said to be divided per pale, and is described as party. A pale is a perpendicular strip (*see below*), and an escutcheon bearing three pales of one tincture upon a field of another tincture, making six pales in all, is blazoned as paly. Other methods of dividing a shield are also shown in Fig. IV. No. 2 represents a div. per fesse; No. 3, per bend; No. 4, per cross or quarterly; No. 5, per saltire; No. 6, per chevron. A quartered shield has sometimes one or more of its divs. again quartered, and is described as counterquartered or quarterly-quartered. The large divs. are then known as the Grand Quarters. Thus in No. 7, the top right and bottom left are counterquartered, the other divs. being grand quarters.

*Ordinaries* The title ordinaries is given to certain of the earliest devices of H. They are marked by simplicity of form and are generally formed with straight lines. Occasionally they appear

alone, but more commonly they appear in combination with some other figures, or are themselves charged. The chief heraldic ordinaries are eight in number, but many of them have diminutive forms. (1) The Chief is the upper part of the shield marked off by a line of div. According to heraldic books, the part marked off should be one-third of the length of the shield, but in practice the width varies, being made larger if the chief is charged. A diminutive form of the chief is the Fillet, which should occupy one-fourth of the chief. (2) The Fess is a horizontal band across the centre of the shield occupying one-third of the depth, though it and the pale, which should also occupy a third of the whole space, actually vary, as does the chief. (3) The Pale has already been explained as a vertical band in the centre of the field. It is not common. (4) The Cross appears in numerous forms, of which the best known are those which appear in the Union Jack. The study of

FIG. IV. DIVISIONS OF FIELDS

the cross in H. is complicated by the fact that many of the forms have themselves undergone much adaptation in different times and under different hands. The cross should occupy one-fifth of the field unless charged, when it occupies one-third. (5) The Bend is a band crossing the shield from the dexter chief to the sinister base. It occupies one-fifth of the field unless charged, when it fills one-third. The bend sometimes appears over other charges and in a narrower form, sometimes called the Baston, it was commonly placed over the arms of a younger son. There is no such thing as a 'bar-sinister' in heraldry, but a baston-sinister is one of the marks used to indicate illegitimacy—usually in the case of royal bastards. All charges placed on a bend are put bendwise, that is to say, they are slanted at the same angle as the bend. The last instance of the baston sinister occurred as late as the nineteenth century, in the arms of the earl of Munster. Modern H. has adopted another device in its place—the *bordure wavy*—to denote bastardy in England; while in Scotland it is denoted by the *bordure company*. In England alone the lesson is driven home by means of a *bendlet sinister wavy*, or a *pallet wavy*, on the crest. (6) The *Chevron* is formed from two bands starting respectively from dexter and sinister base and coming together about the honour point. It should occupy one-fifth of the field. (7) The *Pile* is a triangular wedge-shaped figure generally commencing at the middle chief and tapering downwards. (8) The *Quarter* is formed of the first quarter of the shield cut off by lines. It is now very uncommon, having been supplanted by the *canton*, which is smaller but of the same form. Other ordinaries are the *Scotcheon*, or shield used as a charge; the *Tressure*, a narrow border which follows the edge of the field (in Scotland a double *Tressure Fleury* *Counterfleury* is a high honour and never granted except by Royal Warrant, being part of the Scots Royal Arms); the *Bordure*, a border marked of a different tincture from the shield itself; the *Flaunches*, formed by the two sides of the shield cut off by curved lines; the *Fret*, formed by diagonal lines crossing or interlacing. A field entirely covered by a fret is described as *fretty*. A *gyronny* field is one divided both *per fesse* and *per saltire*. The *Lozenge* has an elongated form termed the *fusil*. *Billets* are oblongs set vertically. *Roundels* may be considered together with the ordinaries. They consist of disks or balls of various colours; they have received different names according to the colours. Thus the *bezant* is or; the *plate*, argent; the *hurlet*, azure; the *tortean*, gules; the *pellet*, sable; and the *pomme*, vert. The first two of these and the fountain, which is a roundel divided horizontally by wavy lines, are represented as flat, but the others are shaded to appear spherical. The ring or *annelet* is also a common charge.

**Common charges.**—Under this head are grouped representations of animals, birds,

monsters, trees, plants, etc., and all common objects. The charges are described according to the position or condition of the charge represented. The lion, in particular, being the most popular beast in medieval H., is found in many positions. Thus it is described as a lion rampant, rampant gardant, rampant regardant, passant gardant, salient, sejant, couchant, etc. We have also such forms as the *demi-lion* and the lion's head erased. Other common charges are the stag, leopard, eagle, dolphin, griffin, escallop, rose, fleur-de-lis, estoile (star), and various kinds of trees. The *demi-lion*, *demi-man*, *demi-rose*, etc., show the figure couped or cut off in the middle.

**Differencing.**—The undifferenced arms, i.e. the whole coat, is borne only by one person, and is by him handed on to his heir. Until he succeeds to the undifferenced coat-of-arms, the heir wears it with some difference, the commonest being the addition of a label. Younger sons also differenced the paternal arms, and this was done in various ways, sometimes by a change of tincture, or by the imposition of a bend, or by surrounding the arms with a *bordure*.

**Marshalling.**—To marshal arms means to combine sev. independent coats on one shield, and is used chiefly to denote marriage, or the representation of other families through heiresses. At first, a woman used the undifferenced arms of her father, and the shields of husband and wife were placed side by side, termed *accollée*. Later on, they used one shield, divided *per pale* down the centre, the husband's arms being placed in the dexter half of the shield, the wife's in the sinister half.

FIG. V. ARMS OF QUEEN ISABELLA

Official arms, such as those of Eng. bishops and certain high officials, are also impaled with the family arms of the prelate or officer. In this case, the official arms are on the sinister. The practice of quartering became common in the fourteenth century. When a man married an

heirss, or inherited arms from an heirss mother, it was often desirable or necessary to display both coats, and where a family had married successive heirsses, it was convenient to divide the shield in four or more divs., and put the arms of the successive heirsses in each. Quarters are numbered: (1) Dexter chief; (2) sinister chief; (3) Dexter base; (4) sinister base. If it is necessary to quarter many arms, the shield is divided into more compartments by vertical lines, but the divs. are still called by the same name. In England, the shield may be divided into any number of quarterings, but in Scotland a shield can only have four quarterings. Scots quartering added requires a re-matriculation. An early example of quartered arms may be seen in those of Isabella, wife of Edward II., who bore in

and the name of no colour is repeated if it can be avoided. Thus the arms of Robert de Chandos, differenced with mullets as a mark of cadency are shown in No. 2 of Fig. VI. These are blazoned, 'or a pile gules charged with three mullets of six points gold between as many others of the second.' The ordinary, however, is named last if it surmounts another charge. When a bend or fesse crosses a field of two tinctures, it is often counter-changed, i.e. the colour of the bend, etc., is reversed as it crosses the field. This can be seen from the arms borne by the poet Chaucer (No. 3), 'per pale, argent and gules, a bend counterchanged.'

*The Helmet.*—Above the shield is set a helmet: gold with grills, for sovereigns; silver with grills, for peers; steel with open visor for knights and baronets;

FIG. VI. ARMS OF ODINGSELES, ROBERT DE CHANDOS, AND CHAUCER

the four quarters the arms of England, France, Navarre, and Champagne (see Fig. V.). A husband may always impale his wife's arms, whether she is an heirss or not, but in England the practice has arisen of depicting the arms of an heirss wife upon an inescutcheon of pretence, viz. a small shield in the middle of the husband's shield. The arms upon the inescutcheon become a quartering in the next generation.

*Blazoning.*—To blazon a coat-of-arms is to describe it accurately so that it could be reproduced by anyone having a knowledge of H. Besides the conventional terms of which the most important have been explained above, there are certain other conventions to be observed, chiefly as regards the order. First is named the field, in one word if it be of one tincture. If it be a quartered field, the tinctures are named in order, preceded by the manner of partition. Then follow the charges, the most important being named first. If a charge is in any position other than the centre of the field its position is described. Thus Odingseles bore the arms depicted in Fig. VI. No. 1, which are blazoned as 'argent a fesse gules with a molet gules in the quarter.' Sometimes the ordinary is itself blazoned. Repetition is avoided,

steel with closed visor for esquires and gentlemen. The Royal Helmet is always shown full face and affronté. In England there are seventeenth-century rules that peers, 'esquires, and gentlemen's helmets must be shown in profile, knights' and baronets' full face. In Scotland, provided the correct type of helmet is displayed, it may be shown at whatever angle best suits the crest.

To mitigate the heat of the sun upon a helmet, it was covered by a cloth cap, which became jagged in battle, and in this form is known as the mantling or lambrequin. Its lining is the colour of the prin. 'metal' of the shield, its outside the prin. 'colour,' but peers' mantlings are lined ermine, and in Scotland are crimson outside. At the joint between the mantling and the crest is a twisted skein of silk of the prin. colour and metal of the arms, termed the wreath, or torse. Above this is the crest, which originated in a fan or plume of feathers, but in the fifteenth and sixteenth centuries developed into a weighty device moulded out of leather or wood, more frequently used at tournaments and ceremonial than in warfare. 'Heraldic stationers' invariably draw the helmet and crest much too small in relation to the shield, the actual proportion

as used and drawn in the fourteenth and fifteenth centuries will be seen in Fig. 1., No. 2.

**Supporters.**—Peers, and in Scotland chiefs of clans and a few others, are entitled to have their shield and helmet supported by two creatures (usually human beings or animals). These are considered a high honour, granted only in exceptional circumstances, and they descend to the peer or chief only for the time being, and not to the younger sons. Wives and widows of the peer or chief may use them, but not daughters. In Scotland they are borne also by the son and heir to whom they will eventually pass. Sometimes they pass to an heiress of entail in Scotland.

**Royal Arms.**—These 'ensigns of sovereignty,' or 'symbols of public authority,' are governed by different rules from other arms. They do not pass by succession, even to younger sons of the sovereign, such princes each receiving specially differentiated versions by Royal Warrants directed to the Earl Marshal or the Lord Lyon. Where a king succeeds to the sovereignty of more than one state, a quartered royal coat-of-arms results. Thus, the Brit. Royal Arms now include quarters representing the sovereignty of England, Scotland, and Ireland. Until 1800, the kings of England claimed to be, and styled themselves, kings of France, and therefore quartered the Fr. lilies. From 1714 until 1837, the Brit. Sovereign was also king of Hanover, the arms of which were placed on an escutcheon, but under the Salic Law that kingdom did not pass to Queen Victoria, and accordingly the arms of Hanover were dropped. The Prince of Wales bears the Royal Arms, differentiated by a label as heir apparent, and with an escutcheon of the arms of the principality of Wales. The Royal Arms of each sovereign state indicate the public authority of its ruler; that is, the three leopards of England, the treasured lion rampant of Scotland, and the blue field and golden harp of Ireland, indicate the public authority of the ruling power, within each state; the National Flag (St. George's Cross for England, St. Andrew's Cross for Scotland, St. Patrick's Cross, a green flag with a golden harp, for Ireland) indicate national identity. Similarly, the quartered Royal 'Standard,' properly Banner, is the insignia of the ruling authority—the Crown, in Great Britain; the joined crosses, or Union Jack, the national flag, indicating Brit. national identity.

**Heraldic Flags.**—Armorial bearings were not confined to the shield or tabard worn over the armour, which was the literal 'coat-of-arms' often seen on ancient sepulchral brasses, but were also used in flags or banners, a term which refers to a rectangular flag displaying the coat-of-arms, whilst pennons and 'standards' are long, pointed flags usually displaying the badge and motto only.

**Use of Heraldry.**—Heraldry is used in almost every conceivable way. In architecture, stained windows, and carving in wood and stone, and on furniture, book-

plates, book stamps, silver-plate, seals, and signet rings, stamped or tooled leatherwork.

**Inland Revenue.**—In Great Britain there is an ann. duty of one guinea for use of armorial bearings, two guineas for use on a vehicle. Payment of these duties does not give the right to appropriate a coat-of-arms, and is equivalent merely to a licence to keep a dog, gun, or motor. A coat-of-arms must be obtained through Garter, Lyon, or Ulster, and in Scotland payment of the ann. duty is no defence in a prosecution for use of unregistered arms. See also under LORD LYON KING OF ARMS. See J. Balfour Paul, *Heraldry in Relation to Scottish History and Art*, 1899; A. C. Fox-Davies, *The Art of Heraldry*, 1905, and *Complete Guide to Heraldry*, 1925; Sir W. St. John Hope, *Heraldry for Craftsmen and Designers*, 1906; J. H. Stevenson, *Heraldry in Scotland*, 1914; W. Wagner, *Heralds and Heraldry*, 1936; C. and A. Lynch-Robinson, *Intelligible Heraldry*, 1948; Green's *Encyclopaedia of the Laws of Scotland*.

**Heralds' College, or College of Arms**, corporation founded by Richard III. in 1483. It is presided over by the Earl Marshal (whose office is hereditary in the family of the duke of Norfolk), and consists of the Garter, Prin. King of Arms of England; Clarenceux, King of Arms S. of Trent; Norroy, King of Arms N. of Trent who now also holds the office of Ulster King of Arms; the heralds named Chester, Windsor, Lancaster, Richmond, York, and Somerset; and four pursuivants, Bluemantle, Portcullis, Rouge Dragon, and Rouge Croix. They at first resided at Coldharbour, or Putney's Inn, in the par. of All Saints, but in 1554 Queen Mary gave them a building opposite St. Benet's, which was rebuilt after being burnt down in 1666. The heralds—extraordinary appointed by the crown—are not members of the H. C. The H. C. has no jurisdiction in Ireland, where Ulster King of Arms controls heraldry, nor in Scotland where heraldry is under control of the Lord Lyon king of Arms (q.v.).

**Herat**, (1) fort and second largest city of Afghanistan, in the prov. of H., on the R. Heri Rud, about 410 m. W. of Kabul. It is situated in a valley about 120 m. long by 12 m. wide, and is built on an artificial mound nearly 1 m. sq. and 55 ft. in height. It was for a long time the cap. of the extensive empire ruled by the descendants of Timur; but its chief importance now lies in its strategic position, being regarded as the gateway to Afghanistan and India. The manufs. include silk, leather, and woollen goods, and carpets. Oil has been found in the vicinity. Pop. 85,000. (2) Prov. of N.W. Afghanistan, pop. 770,000.

**Héralut**: (1) dept. in the S. of France, forming the N.W. coast of the gulf of Lyons. The surface of the dept. is varied. From the sandy shore of the Mediterranean

rise two hills, the *Pilier de Saint-Clair* and *Saint-Loup*, and behind this sandy tract lies a series of pools (*étangs*), and behind these again plains and hills. The rivers are the *Aude*, the *Orbi*, and the *Hérault*. The dept. is especially famous for its wine, one-third of its surface being planted with vines, but wheat and oats are also grown. Fruit trees, too, flourish, but especially mulberries, olives, and chestnuts, and silkworms are reared. There is considerable mineral wealth, coal, iron, copper, and sea-salt being found in large quantities. The chief manufs. are coarse cloths, brandy, soap. The dept. is divided into the 3 arrons. of Montpellier, Béziers, and Lodève. Cap. Montpellier. Area 2402 sq. m.; pop. 461,100. (2) Riv. of France which rises in the Cevennes and enters the Mediterranean near Agde. It has a length of 122 m.

**Herbarium**, also called *Hortus siccus*, or dry garden, is a systematically arranged collection of dried plants, intended to facilitate the study of botany. The specimens are prepared by being laid between sheets of blotting or botanical paper and afterwards subjected to pressure; certain flora, such as orchids, etc., have to undergo special preparation because their succulence admits only of slight pressure, and they are sometimes placed in hot and or suspended before a fire. Mosses, lichens, and similar plants can be preserved dry in packets; when moistened they regain their appearance in life. The largest H. in the world is contained in the Royal Botanical Garden, at Kew, which is constantly receiving new additions from the various colonies and as the result of botanical expeditions and explorations. The collection made by Carl Linnæus has been the property of the Linnean Society of London since 1828. Marlborough College contains the Wedgwood collection of dried plants, while the H. of Manchester Museum was presented to it in 1901 by its founder, J. C. Molville. Paris contains a notable H. in the *Jardin des Plantes*, while the H. in Berlin is attached to the univ. Brussels, Geneva, Vienna, and Leningrad also have good herbaria. In S. Africa the National H. is estab. in Pretoria; in India, in Calcutta; and in Australia, in Melbourne. The U.S.A. can boast of sev. H. containing mainly flowers of America; among these are the Gray H. (founded by Asa Gray) of Harvard Univ., and the H. in the New York Botanical Garden. The Field Museum of Natural Hist. in Chicago (founded by Marshall Field in 1893) also contains a very carefully classified H. See C. F. Millspaugh, *Herbarium Organization*, 1925.

**Herbart, Johann Friedrich** (1776-1841), Ger. philosopher and educationist, b. at Oldenburg. He began to study logic at the age of eleven and metaphysics when twelve, and at the gymnasium of his native th., which he entered in his thirteenth year, his favourite studies were physics and philosophy. In 1794 he left this institution and went to the univ. of Jena, becoming the pupil of Fichte, but he soon began to disagree with his master,

and in his criticism in 1790 of Schelling, whose philosophy he considered the most logical form of Idealism, he says: 'However many happy thoughts may be scattered about in Fichte's deductions regarding natural right and morality, I consider the fundamental points, i.e. his theory of the recognition of a reasoning being as such, and his doctrine of freedom, as false.' Leaving the univ. in 1797, he acted as private tutor for two years, and then went to Bremen to study philosophy, publishing his views on educational reform in 1801, *Ideen zu einem pädagogischen Lehrplan für höhere Studien*. This was followed in 1802 by his essay on Pestalozzi's work, *Wie Gertrud ihre Kinder lehrt*, as well as by a treatise on the same author's *Idée eines A.B.C. der Anschauung*. The same year he went to Göttingen and pub. *A.B.C. der Anschauung* (1802), *Die ästhetische Darstellung der Welt als das Hauptgeschäft der Erziehung* (1801), *Standpunkt der Beurtheilung der Pestalozzischen Unterrichtsmethode* (1801), *Allgemeine Pädagogik* (his prin. work on education), *Hauptpunkte der Metaphysik* (1806), *Hauptpunkte der Logik* (1806), and *Allgemeine praktische Philosophie* (1808). In 1809 he accepted the chair of philosophy at Königsberg, and pub. in 1812 *Lehrbuch zur Einleitung in Philosophie*, his best known and most widely read book. His chief psychological work, *Psychologie als Wissenschaft neu gegründet auf Erfahrung, Metaphysik, und Mathematik*, appeared in two parts in 1824-25, and the system of metaphysics on which the fundamental principle of his psychology rested was pub. in 1828-29, *Allgemeine Metaphysik nebst neuen Anfängen der philosophischen Naturlehre*. In his *Psychologie* H. rejects the doctrine of mental faculties as one refuted by his metaphysic, and endeavours to prove that all psychical phenomena whatsoever proceed from the action and interaction of elementary ideas or presentations (*Vorstellungen*). He also pub. in 1831, *Encyclopädie der Philosophie*. In 1833 he returned to Göttingen, where he spent his last years, and wrote in 1835, as a supplement to *Allgemeine Pädagogik*, *Umriss pädagogischer Vorlesungen*. H. is important as being the only modern thinker who has not treated education casually in his works; indeed, for him it was the starting-point and end of all his investigations. He says of himself, 'I for my part have for twenty years called to my aid metaphysics and mathematics, besides self-observation, experience, and experiments, in order only to find the foundation of true psychological knowledge.' He imbued the ideas of Pestalozzi, his friend, and did much to make education and educational methods a science. As to his philosophy which was based on that of Kant, the cardinal point of his ontology is that it is a 'pluralistic realism.' As a metaphysician H. proceeds from what he calls 'the higher scepticism' of the Hume-Kantian sphere of thought, the source of which he sees in Locke's perplexity over the idea of substance. In this scepticism the real validity of even the forms of references can be questioned

in view of the contradictions they are seen to involve; but that these forms are 'given' to us as truly as sensations are, follows incontestably since we can as like control the one as the other. Amongst the post-Kantian philosophers H. ranks next to Hegel in importance, apart altogether from his great contributions to the science of education. 'His criticisms,' says Dr. James Ward, 'are worth more than his constructions; indeed for exactness and penetration of thought he is quite on a level with Hume and Kant... But we are most of all indebted to Herbert for the enormous advance psychology has been enabled to make, thanks to his fruitful treatment of it, albeit as yet (1880) but few among the many who have appropriated and improved his materials have ventured to adopt his metaphysical and mathematical foundations.' See H. A. Fechner, *Zur Kritik der Grundlagen von Herbaris Metaphysik*, 1853; T. Lipps, *Zur Herbarischen Ontologie*, 1874; M. W. Drobnisch, *Über die Fortbildung der Philosophie durch Herbart*, 1876; C. Ufer, *Vorschule der Pädagogik Herbaris*, 1883; L. Strümpell, *Das System der Pädagogik Herbaris*, 1894; H. M. and E. Felkin, *Introduction to Herbart's Science and Practice*, 1895; J. Adams, *The Herbartian Psychology Applied to Education*, 1898; F. H. Hayward, *The Student's Herbart*, 1902; A. D. Chalke, *Syntheses of Froebel and Herbart*, 1912; T. Fritzsche, *Herbart's Leben und Lehre*, 1921; H. Weiss, *Herbart und seine schule*, 1928.

Herb Christopher, see BANEERRY.

Herbede, tn. in the dist. of Arnsberg, Westphalia, Germany, on the Ruhr. It has stone quarries and coal-mines. Pop. about 6800.

Herbelot de Molainville, Barthélemy d' (1625-65), Fr. Orientalist, b. in Paris. He was educated at the univ. of Paris, and made a special study of Oriental languages. He visited Italy to continue his work, but returned to France and became secretary and interpreter of E. languages to the king. In 1692 he became prof. of Syriac in the Collège de France. His *Bibliothèque orientale, ou Dictionnaire universel contenant tout ce qui regarde la connaissance des Peuples de l'Orient* (1697) is based on the Arabic dictionary of Hadji Khalfa.

Herbert, name of a family prominent in Brit. hist., who came over to England with the Conqueror (1066). II. Fitz-Herbert (II. of Winchester) was chamberlain and treasurer to Henry I. (1100-35). The first earl of Pembroke (created 1468) was a member of this family, and the title was revived for Sir W. Herbert (c. 1501-1570) in 1551. The fourth earl became also earl of Montgomery (1605). Some generations later the H. family diverged into sev. distinct branches, including the lines of the earls of Powis, the Lords H. of Cherbury, of the II. of Muckross (Kerry, Ireland), and of sev. untitled branches in

England, Wales, and Ireland. The earls of Carnarvon are descended from the eighth earl of Pembroke (1656-1733), who held office under Anne.

Herbert, Alan Patrick, Sir (b. 1890), Eng. poet and politician; son of an official of the India office; educated at Winchester and New College, Oxford. A modern Euphuist in verse and a satirist—most of his verse appears in *Punch* and in the *Sunday Graphic*. Has also written novels, the best being *The Water Gypsies* (1932), *Trials of Topsy* (1932), *Topsy*, M.P. (1932). *Holy Deadlock* (also a novel, 1934), is a propagandist effort, aimed at anomalies in the law of divorce. In 1935 he was elected M.P. (Independent) for Oxford Univ. and, in 1937, greatly distinguished himself by securing the passage of an Act radically amending the divorce laws. Knighted 1945. With T. F. Dunhill, he produced a successful musical comedy, *Tantivy Towers* (1931); and revues, *Big Ben* (1946), *Bless the Bride* (1948). Other books: *Sea Shanties* (1927), *Miscellaneous Cakes* (1937), *Plain Jane* (1931), *Less Nonsense* (1944), *Point of Parliament* (1940).

Herbert, Edward, first Lord Herbert of Cherbury (1583-1633), philosopher, historian and diplomatist, b. at Eyton-on-Severn, near Wroxeter. He was educated at Univ. College, Oxford, and while there taught himself Fr., It., and Sp., besides gaining some proficiency in music, and becoming a good rider and fencer. In 1600 he presented himself at court, and was sheriff of Montgomeryshire in 1605. In 1608 he set out on a foreign tour, and became friendly with the grand constable of France, N. de Montmorency, and Casaubon. In 1614 he joined the army of the prince of Orange as a volunteer, and stayed abroad two years, visiting the Elector Palatine and the duke of Savoy. On his return he became intimate with Donne, Carew, Ben Jonson, and Selden, all of whom held him in high esteem and encouraged him to pursue his studies, but in 1619 he was again taking part in public affairs, and was made Eng. ambas. at Paris. While holding this post he tried to bring about a permanent alliance between England and Holland, endeavoured to gain Fr. support for the Elector Palatine on the outbreak of the Thirty Years' war, and suggested a marriage between Prince Charles and Henrietta Maria, but in 1621 he was recalled for quarrelling with De Luynes. He was created Lord Herbert of Cherbury in 1629, and in 1632 a member of the council of war, being reappointed in 1637. He aimed at neutrality during the Civil war, but was forced to admit the parl. force into Montgomery in 1644. H.'s philosophical work, *De Veritate*, is important as being the earliest purely metaphysical treatise written by an Englishman, and is interesting for its theory of perception. He makes the mind consist of faculties which are reducible to four classes, of which the chief is natural instinct (practically the Aristotelian *voies*), the other three being conscience, sensation, and reason. He continued his theory in *De Causis Errorum*

(1645), and completed his religious views in *De Religione Gentilium*, pub. in 1663 (Eng. trans. 1709). He makes all religions, Christian and pagan, resolvable into the five innate ideas, that there is a God, that He ought to be worshipped, that virtue and piety are essential to worship, that man ought to repent of his sins, and that there are rewards and punishments in a future life. H.'s *Poems* were pub. in 1633, and reprinted in 1881; his historical work, *The Life of Henry VIII.*, appeared in 1649.

Herbert, George Edward Stanhope Molyneux and Henry Howard Molyneux, see GARNARVON, EARLS OF.

Herbert, George (1593-1633), divine and poet, younger brother of Lord Herbert of Chertbury, b. at Montgomery Castle in Wales. He was educated at Westminster and Trinity College, Cambridge where he was made a fellow in 1615. In 1618 he was prelector in the rhetoric school at

GEORGE HERBERT

Cambridge, becoming in 1619 public orator, and in that capacity drew the notice of King James by his Lat. verses eulogising the king's *Basilion Doron*; and for a time he followed the court and made many distinguished friends. But the death of the king and of his patrons, the duke of Richmond and the marquess of Hamilton, ended his chances of court preferment. He was, however, easily persuaded to adopt the religious life in 1626 by Ferrar, and was ordained priest in 1630 and received the living of Bemerton, Wiltshire. Here he wrote his sacred poems, afterwards pub. by Ferrar, *The Temple*; *Sacred Poems and Private Ejaculations* (1633), which were read by Charles I. in prison, and much praised by Henry Vaughan, Baxter, Coleridge, and Crashaw. H. gave the Anglican Church its finest expression in verse, and on that account is a treasured Eng. heritag. He has not always been given that representative position, and the high regard in

which he was held in the seventeenth century waned early in the eighteenth, and for a century or more his poetry was considered uncouth. Coleridge did much to restore its favour and it has received sympathy and understanding from modern scholars. It is noted for its colloquial phraseology, pliable verse-forms and quiet music. His chief prose work, *A Priest to the Temple*, was first printed in his *Remains* (1652). H.'s poetry is sometimes said to show the influence of Donne, but whereas Donne, as a 'metaphysical poet,' tends to obscurity, the very simplicity of H. is the secret of his power; and where Donne's conceits are the pith of his thought those of H. are mostly illustrations of a thought which really require none. Donne, too, was a rebel against Elizabethan literary fashions, H. was an adherent to them—as is shown by the fact that *The Temple* contains many euphuism and diagrammatic conceits, besides a number of sonnets. See *The Works of George Herbert*, ed. by F. E. Hutchinson (1911), who has restored the text of both the Eng. and Lat. poems to their original state.

Herbert, Sydney, first Lord Herbert of Lea (1810-81), Eng. statesman, b. at Richmond. In 1832 he was Conservative member in the House of Commons for the S. div. of Wiltshire, and made his first speech in 1831, when he seconded Estcourt's amendment to Wood's Bill for admitting dissenters to the univ. He held sev. appointments under Peel, and in 1845 was transferred to the office of secretary for war, with a seat in the cabinet. In 1852 he again held this position under Lord Aberdeen, and became Colonial Secretary in 1855. He was responsible for the War Office during the Crimean War, and took a leading part in the movement for army reform after the war. He was also interested in the hospitals at Scutari, and it was he who sent out Florence Nightingale. In 1859 he was again secretary for war under Lord Palmerston, and in 1860 was made Baron Herbert of Lea.

Herbert, Sir Thomas (1606-82), Eng. traveller and author, b. at York. In 1628 went to Persia with Sir Dodmore Cotton and Sir Robert Shirley. On the outbreak of the Civil war he adhered to the side of the parliament, but was appointed to attend on the king in 1646. In 1660 he was made a baronet for his faithful services to Charles I. He pub. *Description of the Persian Monarchy* (1634), reprinted as *Some Years Travels into divers parts of Asia and Afrique* (1638), and *Phrenodia Carolina* (reminiscences of the captivity of Charles I.), reprinted as *Memoirs of the Last Two Years of the Reign* (1702 and 1813).

Herbert, Victor (1859-1924), Amer. composer and conductor, b. in Dublin, grandson of Samuel Lover. Sent to Germany as a child to study music, particularly 'cello-playing. Became first 'cellist of Strauss's orchestra in Vienna, 1882. Conducted the Pittsburgh Symphony Orchestra, 1898-1901. From 1894 he wrote a large number of light operas,

producing some thirty-five. His best works are *Woodland Fancies*, an orchestral suite (1902), and a symphonic poem, *Hero and Leander* (op. 33), first performed by the New York Philharmonic Orchestra in 1902. His best light operas are *The Wizard of the Nile* (1895), and *The Idol's Eye* (1897).

**Herberton**, tn. in Cardwell co., Queensland, Australia, is 50 m. S.W. of Cairns. It is an important mining centre; tin, gold, silver, lead, and copper are found in the dist. Pop. 3000.

**Herbertshöhe**, settlement on Blanche Bay, N.E. of Neu Pommern, the seat of gov. of the Bismarck Archipelago, the Ger. Solomon Is. and Ger. New Guinea until 1909; administered since 1920 by the Commonwealth of Australia. The chief products are tobacco, cotton, coffee, cocoa. Pop. about 1200.

**Herbivora**, name applied, because of their exclusively herbivorous diet, to the marsupials, contained in the sub-order Diprotodontia; kangaroos, wallabies, etc., are typical examples.

**Herbs** are plants with soft, succulent stems that wither away after flowering, leaving no woody or persistent growth above ground, but may also include plants of which the leaves, shoots, flowers or seeds are used for food, flavouring, medicine, or perfume. Cultural requirements are simple, chiefly a sunny site and a well-drained, medium-rich soil. Garden H. are usually raised for culinary purposes. Angelica, anise, fennel, caraway, chervil, coriander, dill, fenugreek, sweet marjoram, parsley, purslane, summer savory, sorrel, sweet basil, sweet cicely, and rampion are raised from spring-sown seed. Balm, chives, lovage, pot marjoram, pennyroyal, rosemary, horehound, hyssop, lavender, mint, rue, sage, winter savory, southernwood, tansy, tarragon, and thyme may be propagated by cuttings or root div. Many H. have salad uses. H. for drying are harvested just as flowering begins, and dried quickly in shade, hung downwards in a current of air. Seeds are harvested when ripened. Pot-H. is a term usually applied to vegetables such as carrots, turnips, etc., cut up and mixed with flavouring herbs for soups, etc. Medicinal H. such as foxglove and deadly nightshade, and scented H. such as lavender and southernwood, are grown commercially on herb farms. A careful choice of site and soil, skill in culture and harvesting, and good marketing are essentials of success.

**Herbs, Medicinal**, see MEDICINAL.

**Hercegnovi**, or **Castelnuova**, chief tourist place in the romantic fjord of Boka Kotorska, Yugoslavia, with medieval monuments and rich Mediterranean flora. Pop. 1500.

**Herculaneum**, ant. city of Italy, situated at the foot of the W. slope of Mt. Vesuvius, close to the Portici Station, a short distance from Naples. The visible ruins are not so well-known as Pompeii, being much smaller in extent and less visited. The city was probably founded by the Oscans, and it appears to have belonged to the Etruscans, and during the Samnite wars became Rom. According to

Soneca, it suffered from a severe earthquake in A.D. 63, and Pliny the Younger describes how it was destroyed by the terrible eruption of Mt. Vesuvius in 79. The city was then entirely buried under showers of ashes, stones, and streams of lava; few, if any, people could have escaped. Its very name was forgotten in the Middle Ages. In 1719, Prince Elbeuf discovered the ant. site by accident, in a search for marble for the villa he was building at Portici; he learned from the peasants that there were pits quite close from which they obtained marble and had also extracted many statues. Excavations began on a small scale; the theatre, many houses, the forum, and the basilica were discovered, with valuable and beautiful statues and paintings; in the Villa suburbana, a number of bronze and marble busts and statues, and especially a library of valuable papyri, containing works by Epicurus, Philodemus, etc. Among the most famous statues rescued from the ruins are the reclining Hermes, the drunken Silenus, and a pair of wrestlers or runners; these were all in black bronze, and are now in the Naples Museum. H., as we know, not only from the work of art discovered, but also from contemporary sources, was inhabited by a more cultured, refined, and intellectual class than the neighbouring tn of Pompeii (q.v.). Nearly the whole site of the city is occupied by the tn. of Resina, and, therefore, it is difficult to excavate; also, owing to financial trouble with the property owners, the proposals for systematic excavation, begun 1908, were temporarily stopped. Further operations, in which machinery for breaking up the hard crust is employed, were undertaken in 1927-30. H. sustained no damage in the recent World War. See C. Waldston, and L. Shoubridge, *Herculaneum, Past, Present, and Future*, 1908.

**Herculano de Carvalho y Avarijo**, Alexandre (1810-77), Portuguese poet and historian, b. at Lisbon. He was educated for a commercial career, but had to leave Portugal in 1831, when the country was under the despotic ruler Dom Miguel. In 1832 he pub. *A Voz de Profeta*, and in 1833 *A Harpa do Crente*, in which he describes the bitterness of exile, etc., proving himself to be a poet of feeling. In 1837 he founded the *Panorama*, in imitation of the Eng. *Penny Magazine*. This paper had a wide circulation, and H.'s articles were very popular with the middle class. In 1841 he started a new venture, and wrote historical novels in imitation of Sir Walter Scott, viz. *Enrico* (1888), and *Monge de Cister*, but his greatest work was his *History of Portugal from the Beginning of the Monarchy to the end of the Reign of Alfonso III.* (1846-68). This book was regarded as a historical work of the first rank, and is still reckoned among the Portuguese classics. See life by V. Nemerio, 1934.

**Hercules**, son of Alexander the Great and Barsine, the widow of Memnon. He lived at Pergamum, and in 310 B.C. was brought forward by Polyperchon (a distinguished officer of Alexander the Great,

who had been appointed in 319, on the death of Antipater, regent, and guardian of the king) as claimant to the Macedonian throne. He was, however, murdered by Polysperchon in 309, when the latter became reconciled to Cassander.

**Hercules or Heracles** (*Ἡρακλῆς*), most celebrated of all the heroes of antiquity, was the son of Zeus by Alcmene of Thebes in Boeotia. His stepfather was Amphitryon, who was the son of Alcaeus, the son of Persus; and Alcmene was a granddaughter of Persus. Hence H. belonged to the family of Persus. On the day destined for the birth of H. Zeus boasted that a son was going to be born to him who should rule over the house of Persus, whereupon Hera, having exacted from him a promise that the descendant of Persus *b.* that day should be ruler, hastened to Argos, and caused the wife of Sthenelus (son of Persus) to give birth to Eurystheus, and delayed the birth of H. by keeping away the Ilithyie, and so robbed H. of his empire. All the stories told of the hero point to the fact that he was strong from his birth, and under the protection of Zeus and Athena he escaped the dangers prepared for him by Hera, *e.g.* he strangled two serpents sent to destroy him in his cradle. As he grew up, he received instruction in music, wrestling, archery, etc., but happening one day to kill Linus who brought him the lyre, he was sent by his father Amphitryon to tend his cattle. While thus employed, he made further exhibition of his strength by killing a huge lion which haunted Mt. Citharon, and did great damage both to his father's flocks and to those of the king of Thebes. His next adventure occurred on his way back to Thebes, when he met the envoys of Erginus going to demand their ann. tribute of 100 oxen from the Thebans. Cutting off the noses and ears of the envoys, he sent them back to Erginus, who immediately made war on Thebes; but H. defeated and killed Erginus, and was rewarded by the king of Thebes with the hand of his daughter Megara. Soon after this he is said to have paid a visit to Delphi to consult the oracle, and being told by the Pythian to serve Eurystheus for twelve years, went to Tiryns and carried out the injunction laid upon him. He strangled the Nemean lion, fought the Lernaean hydra, captured the Arcadian stag, hunted the Erymanthian boar, cleansed the stables of Augeas, king of Elis, destroyed the Stymphalian birds, captured the Cretan bull, captured and subdued the mares of the Thracian Diomedes, seized the girdle of the queen of the Amazons, captured the oxen of Geryon in Erythia, fetched the golden apples of the Hesperides, and brought Cerberus from the lower world. When he had performed these twelve labours, he returned to Thebes, where he sought Iole, the daughter of Eurystus in marriage, but having in a fit of madness slain his friend Iphitus (the son of Eurystus), he was commanded by the oracle to serve three years for wages and give his earnings to Eurystus, and so entered the service of Omphale, queen of Lydia. After this he sailed

against Troy and killed Laomedon, defeated the Meropes and killed Eurypylos, and helped the gods in their fight against the giants. He also proceeded against Pylos and Lacedæmon, and then journeyed to Calydon, where he married Deianira, after fighting with Achelous for her. Subsequently he settled at Tractus and marched against Eurystus, whom he killed, and carried off Iole as prisoner. This caused Deianira to be jealous, so she sent a shirt to her husband steeped in the blood of Nessus, the centaur, hoping to restore his affection for herself. But the blood had been poisoned by the arrow with which H. had shot Nessus; and so as soon as H. put on the garment the poison entered his body and caused him extreme agony. He tried to tear off the shirt, but was unable to do so, and was brought to Tractus in a dying state. When Deianira saw what she had done, she hanged herself; and H. seeing no remedy for his misfortune, placed himself on a funeral pyre on Mt. Ceta, and ordered it to be set on fire. When it was burning, a cloud came from heaven, and carried him to Olympus, where he became a god and married Hebe. Sophocles's *Trachiniae* give some account of H. and Deianira. Euripides wrote two plays on H.—*Mad Heracles*, in which H., driven mad through the machinations of Hera, murders his children and wife; and *Heracles*, in which Theseus comes to the rescue of H. in his fall (on these see G. Murray, *Euripides and his Age*, 1913).

**Hercules, Pillars of (Herculis Columnae)**, name given to the two rocks (Capre (in the N.) and Abyla (on the opposite coast), which guard the entrance to the Mediterranean at the E. extremity of the Straits of Gibraltar. According to Pliny and Strabo, Hercules tore asunder the rocks which had before entirely divided the Mediterranean Sea from the ocean. Another legend asserts that he forced the two rocks into temporary union to make a bridge for the safe conveyance of the herds of Geryon to Libya, and another that he narrowed the strait so as to shut out the sea-monsters which had previously made their way in from the ocean and infested the Mediterranean.

**Hercules-beetle**, popular name of *Dynastes hercules*, a species of lamellicorn Coleoptera, belonging to the family Scarabaeidae; they inhabit tropical America, and the male insect is remarkable for the possession of a pair of large unequal horns, resembling pincers. Some of the male beetles reach a size of 6 in.

**Hercules' Club**, or *Aralia spinosa*, species of Araliaceae, found in the W. Indies. The tree is closely allied to *A. Ginseng*, from which the drug ginseng is obtained.

**Hercynian Forest**, name used in ancient times to signify the wooded mt. region N. of the lower and middle Danube, and sometimes to include the whole region from the Black Forest to the Sudetes. Later, it became a general designation for the entire wooded, mt. ranges of middle Germany, from the Rhine to the Carpathian Mts.

**Herczeg, Francis**, Hungarian author, b. in 1863 in S. Hungary. Descended from a long line of Gers. settled in the dist. called the Baeska, and his father was mayor of a tn. there. He is recognised as one of the masters of Hungarian literary style. His historical romance, *The Pagans* (1901), dealing with the conversion of the unbelievers in the eleventh century, and *The Gate of Life* (1919), a study of Hungary in Renaissance times, are his best works. See J. Horváth, *Herczeg Ferenc*, 1925; M. Rubiny, *Herczeg Ferenc*, 1926; J. Gassner, *Masters of the Drama*, 1940.

**Herd, David** (1732-1810), Scottish author, b. in Marykirk, Kincardineshire. He spent most of his time in Edinburgh, and was president of the Cape Club, a literary association which had many distinguished members. He is praised both by Scott and Archibald Constable, who acknowledges numerous obligations to him, but his fame rests on his pub. of *Ancient and Modern Scottish Songs, Heroic Ballads, etc.*, collected from Memory, Tradition, and Ancient Authors (2 vols., 1776).

**Herdecke, tn.** in the prov. of Westphalia, Germany, 16 m. S.S.E. of Dortmund, on the Ruhr. It has considerable riv. trade and sandstone quarries. Pop. 6000.

**Herder, Johann Gottfried von** (1741-1803), Ger. critic and poet, b. at Mohrun-gen in E. Prussia. He was educated at the grammar school of his native tn. and at the univ. of Königsberg, where he met Kant and Hamann. At an early age he began to write verses, and his first pub. works were occasional poems and reviews contributed to the *Königsbergische Zeitung*. In 1764 he became a teacher at the cathedral school at Riga, and a few years later assistant pastor, and in 1767 pub. *Fragments über die neuere deutsche Literatur*, in which he maintains that the truest poetry is the poetry of the people, and ridicules the ambition of Ger. writers to be classic. In 1769 he went to Strasburg, where he met Goethe, and in 1771 became court preacher at Buckeburg. During this period he became one of the leaders of the new 'Sturm und Drang' movement, and pub. a jour. with others including Goethe, to diffuse the new ideas. In 1776 he became court preacher at Weimar, and while in this city pub. *Stimmen der Völker in Liedern*, an admirable collection of folk-songs (1778-79); a celebrated work on Heb. poetry, *Vom Geist der hebräischen Poesie* (1782-83, trans. 1833), and his masterpiece, *Ideen zur Philosophie der Geschichte der Menschheit* (1784-91, trans. 1880), which proves H. to be an evolutionist after the manner of Leibnitz. Other works of his are: *Kritische Würder* (1769), *Plastik* (1778), and *Über den Ursprung der Sprache* (1772), a work on language. His books have been ed. by E. Suphan (1877-87). See R. Hayn, *Herder nach Leben und Werken*, 1877-85; E. Nevinson, *Herder and his Times*, 1884.

**Heredia, tn. and cap.** of the prov. of E., Costa Rica, 5 m. W. of San José. It is well situated (altitude 3786 ft.), and is

the centre of an agric. and coffee-growing dist. Pop. (prov.) 55,100; (town) 10,500.

**Heredia, José María de** (1842-1905), Fr. poet, b. near Santiago de Cuba of a Fr. mother and claiming descent from the old *conquistadores*, he migrated to France at an early age. He was educated at Senlis and Havana, but finally went to the École des Chartes in Paris, and made France his home. He was a member of the new school known as Parnassiens, who regarded form as being of supreme importance, and his poems, *Les Trophées*, pub. in 1893, and composed almost entirely of exquisitely fashioned sonnets, provo him to have been a powerful word artist, as well as a master of the art of verse. If somewhat cold in their formal beauty, the craftsmanship of the *Trophées* is such as to rank H. among the foremost sonnet writers, not only of France, but of the world. In 1891 he was elected to the Academy, and in 1901 became librarian of the Bibliothèque de l'Arsenal at Paris. His other works are a trans. of Diaz des Castillos's *History of the Conquest of New Spain* (1878-81); and a trans. of the life of the nun Alferez (1894), or De Quincy's *Spanish Military Art*.

**Hereditaments**, term in Eng. law, meaning property which, unless devised by will or disposed of by the owner in his lifetime must descend to his heir (*q.v.*). H. are practically synonymous with land, and are divided into *corporeal*, i.e. interests in land in possession, or which confer the present right to enjoy the land either personally or through tenants, and *incorporeal*, i.e. rights subsisting in or over lands in the possession of another, such as reversionary and contingent interests (see REVERSIONERS, REVERSIONERS), or rights of way, or other easements. The term also includes heirlooms, and such furniture or chattels as by custom descend to the heir and not as personalty. See also INHERITANCE.

**Heredity** may be defined as the genetic relationship between parent and offspring. Though the study of H. as a science was known to the Gks., and Hippocrates in the fifth century pub. a theory of H., no great progress was made until the end of the nineteenth century. Its practical importance to human beings, both in their personal lives and in plant and animal breeding has led to considerable interest in H., and to the collection of a large number of observations requiring careful examination and confirmation before they can be adduced as scientific evidence in support of any theory of H. Such familiar expressions as 'Like begets like' and 'A chip of the old block' show that the inheritance of similar characteristics has long been widely recognised. A fact less commonly known, however, is that of the inheritance of differences. Ability to differ depends on some peculiarity in the constitution of the offspring, and this it has received from its parents. H. thus includes the possibility of variation, and consequently of evolution. Before attempting to discuss theories of H. it is necessary to review briefly the mechanism

resulting in the production of a new organism. Amongst higher animals and plants sexual reproduction is almost universal, and this consists in the union of two cells or gametes (Ok. *gametes*, spouse), that of the female being the egg cell or ovum, and of the male animal the spermatozoon. In flowering plants the male gamete is usually a nucleus, with a little accompanying cytoplasm, formed in the pollen grain and conveyed by the pollen tube to the egg cell. Free swimming male gametes of plants such as occur for instance in ferns and in mosses are termed spermatozoids. Both gametes are microscopic, and the male is usually very much smaller than the ovum, consisting mainly of nucleus with an almost negligible amount of cytoplasm. The female gamete has a nucleus, and in most cases a relatively large quantity of cytoplasm in which food may be stored. Owing to the deposition of food around or to one side of the ovum, the eggs of oviparous animals are of appreciable size. Fertilisation consists in the union of the male and female gametes; the fertilised egg-cell is the beginning of the next generation, and contains all the potentialities of the new individual. Unless fertilisation has taken place, the ovum is usually unable to develop into the adult organism.

*Theories of Inheritance.*—Lamarck (1809) formulated some laws of inheritance and stressed the importance of the transmission of useful characteristics. He claimed that useful variations were more likely to be inherited than useless ones, and, according to his theory, useful characteristics acquired during the lifetime of an organism could be transmitted to offspring. The possibility of the inheritance of such 'acquired' characteristics will be discussed later. Darwin accepted Lamarck's theory, and suggested that inheritance was effected by pangenesis—that is, by the accumulation in the germ cells of pangens, small particles of each of the different types of body cells. Thus body cells modified by the environment could send particles to the germ cells and the modification would be transmitted. The germ cells of human beings would, on this hypothesis, contain particles from kidneys, liver and every digestive organ, hair, eyes, bones, lungs, various muscles, and every different kind of body cell, so that the number of particles to be included renders the theory highly improbable, and the unerring passage of these particles to the germ cells presents further difficulty. Weismann seems to have been the first biologist to consider experimental evidence essential to the foundation of a theory of H., and, in 1888, as a result of his observations on the embryology of some of the higher animals, strongly denied the inheritance of acquired characteristics. In the animals he investigated, he discovered that the germ cells, i.e. the cells eventually giving rise to gametes, were absolutely distinct from the body cells and were continuous from generation to generation. In the lower animals, the Protozoa and Coelen-

terata, and in many plants, Weismann believed that a small amount of germ plasma accompanied at least some of the body cells. In this way he accounted for asexual reproduction and for the inheritance of a somatic modification by, for example, a plant propagated by a cutting from the modified part. Except in so far as all cells are ultimately derived from the div. of a single cell and so retain indirect continuity, there is little evidence that the germ cells of most plants or of many animals are directly continuous from generation to generation. Moreover, recent research has shown that body cells not too highly differentiated may become dedifferentiated and function as germ cells, so that there is no absolute distinction between body- and germ-plasm. Weismann made a greater contribution to the study of H. by his theory that the nuclear chromatin was composed of minute particles, the determinants, each of which was responsible for the production of a characteristic of the individual. The nucleus (*q.v.*) is now generally recognised as playing a very important role in H., and the theory of the nucleus as the physical mechanism of transmission of hereditary characteristics is based on a large number of observations of H. in plants and animals. A few of the main arguments in support of the theory are given here. (1) The nucleus of any given species of plant or animal consists of a constant number of chromosomes (*see* CELL). Although these appear in nuclear div. and afterwards apparently lose their identity when the nuclei are reconstituted, as soon as div. is about to occur again, the same number of chromosomes is formed. Very occasionally the number may be changed by the loss or addition of a chromosome owing to irregularities in div., but such a change is accompanied by a change in the characteristics of the organism. Moreover, many of these chromosomes have a distinctive form: O, X, J, and V shaped chromosomes are common, and reappear again and again in subsequent divs. There is therefore reason to believe that the chromosomes retain their identity throughout the natural nuclear phases. (2) The number of chromosomes, though large in some species of plants and animals, is always less than the number of characteristics possessed by an organism. Consequently, if the nucleus be the mechanism for the transmission, each chromosome must bear the determinants of sev. characteristics, and all those present in any single chromosome will be transmitted as a group. This is borne out by evidence gained by experiment, and the characteristics forming such a group are described as *linked*. In the vinegar fly *Drosophila*, for instance, it has been shown that the hereditary characters are linked in four groups, corresponding to the four pairs of chromosomes. (3) Subsequent to the formation of gametes, a reducing nuclear div. takes place, so that the gametes contain in their nuclei only half the number of chromosomes (*see* CELL). When the gametes fuse, the number is restored to its full complement,

the diploid number. The significance in H. of this reducing div. is threefold. First, by means of it the number of chromosomes, and inferentially of characteristics, is kept constant instead of doubling during every fertilisation; secondly, it provides a mechanism for the assortment of groups of characteristics, and thirdly, for the segregation, demonstrated experimentally by Mendel, of alternative characteristics (see MENDEL). This segregation will be discussed in the following section on types of inheritance. For the explanation of the assortment, we must consider the reducing div. When this is about to occur, the chromosomes arrange themselves in pairs and one member of each pair passes into the

less cytoplasm than the egg cell, it was first considered that the cytoplasm could play no part in the determination of characteristics. Experiments in which development of an enucleated egg cell has been initiated by the entry of a sperm have, however, resulted in the production of larvae resembling the mother, and consequently the influence of the cytoplasm cannot be disregarded. It has been suggested that before or during the enucleation some emanations from nucleus into cytoplasm took place, but this has not been proved. Objections to the nuclear theory also occur in connection with the inheritance of sex. Morgan and Bridges were led by breeding experiments with the vinegar fly, *Drosophila*, to expect a

FIG. 1B. DIAGRAMMATIC REPRESENTATION OF THE WAYS IN WHICH CROSSING OVER MAY BE EFFECTED DURING SEGREGATION OF ALLELOMORPHIC CHROMOSOMES

FIG. 1A (left). SEPARATION OF THE ALLELOMORPHIC CHROMOSOMES Aa, Bb, Cc, Dd, OF THE BROAD BEAN (*Vicia faba*)  
Semi-diagrammatic

daughter nuclei. If we consider only two pairs (Figs. 1A, 1B) Aa and Bb, A passes into one daughter nucleus, a to the other; A may pass into the same nucleus as B or as b and in this way may arise differences between gametes of the same parent. When sev. chromosomes are present, it is clear that a very great number of different combinations may occur aided by crossing over between parts of allelomorphous chromosomes, as represented in Fig. 1B. The chromosomes of a pair are alternative or allelomorphous. There is considerable experimental evidence to form a basis for the view that the allelomorphs are derived one from each parent and bear determinants of the same characteristic. For instance if a chromosome bear the determinant for eye colour, its allelomorph will also bear a determinant for eye colour, but not necessarily for the same one. This will be demonstrated in the discussion of experimental work. Although for these and other reasons the nucleus provides an admirable mechanism for the transmission of hereditary characteristics, it cannot in all cases be regarded as the sole mechanism. Since inheritance from both parents is approximately equal and the male gamete has usually much

difference in the chromosomes of the male and female, and examination of the nuclei showed two similar chromosomes, subsequently termed X-chromosomes, in the female. In the male the allelomorph of the X-chromosomes was a chromosome of different form, the Y-chromosome. The other pairs of chromosomes of both sexes were similar, and distinguished as 'autosomes' from the X and Y, or sex chromosomes. Sev. other animals have been found to possess sex chromosomes, though the numbers of these vary, and the male may have more or fewer than the female or may have the same number. Most investigators believe man to have one sex chromosome and woman two. The females of some species of insects have two equal sex chromosomes and the male two unequal ones, and in other species the reverse is the case. It has, however, recently been shown that an insect may have the chromosome constitution of a female or of a male and yet be an intersex or even of the reverse sex. In some cases hormones (h.v.) are assumed to effect complete or partial sex reversal; in others, the sex chromosomes of different parents have been shown to have different values, so that in some combinations a

chromosome that should determine maleness, for example, is feeble than its allelomorph, an intersex or female resulting according to the difference in influence exerted by the two chromosomes. Thus the presence of the sex chromosomes is insufficient in itself to determine the sex of the animal. On account of the effect of the cytoplasm and of hormones, the nucleus cannot be regarded as the sole agent effecting the transmission of hereditary characteristics, but it undoubtedly plays a great part in it. Morgan introduced the conception of the *gene* as the physical determinant of a characteristic. He considers that paired elements, the genes, linked together in a number of groups,

offspring produced yellow, others green seeds in the ratio 3 yellow to 1 green. When the green-seeded plants were crossed between themselves, they always produced green-seeded plants, i.e. they bred true. The yellow-seeded plants were of two kinds. One third of them produced in successive generations only yellow seeds; the remainder produced plants of both kinds. The plants breeding true were described as pure or homozygous for seed colour; the others were impure or heterozygous, and contained the determinants of both colours. From these and similar results for other characteristics, Mendel concluded that segregation of the determinants took place, so

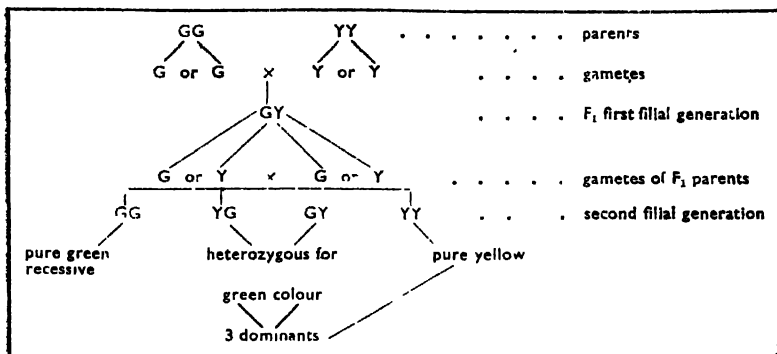

FIG. 2

Diagram showing results of Mendel's experiments in hybridisation with pure green and yellow seeded plants of the common field pea

determine the characteristics of an organism. A single characteristic may be due to the interaction of a number of genes which are to be regarded as biological elements. Morgan's theory is based on two types of experimental work, the genetic results obtained by breeding many generations of *Drosophila* under carefully controlled conditions, and the cytological examination of germ cells of these insects.

**Types of Inheritance.**—Since the current theories of H. are based on the results of experimental work, it is necessary to mention briefly the nature of this work. Johann Gregor Mendel, of Bruum, seems to have been the first investigator to consider quantitative experiments necessary in the study of H., and in 1866 published the results of his experiments in hybridisation (see MENDEL). He selected well-marked, easily recognisable differentiating characteristics of the field pea for observation, and collected results separately for each pair of characteristics chosen. For example, Mendel crossed flowers of plants producing green seeds with those of yellow-seeded plants. All the offspring, constituting the first filial or F<sub>1</sub> generation, produced yellow seeds. When such plants were intercrossed, some of their

that a gamete contained the determinant on only one of a pair of alternative characteristics, i.e. one allelomorph only could be present. This is often called Mendel's law of the purity of the gametes. After fertilisation, the two allelomorphs, one from each gamete, came together and were segregated again before the new gametes were formed. Thus if G, Y (Fig. 2) be the determinants of green and yellow colour respectively, a pure green-seeded plant would have allelomorphs G.G; a pure yellow-seeded, Y, Y, and a hybrid plant G, Y. The gametes would contain either G or Y, but not both. If the parents selected for the hybridisation experiments were pure green and pure yellow, the table in Fig. 2 would represent the results.

Thus the probability of the production of a pure yellow or of a pure green-seeded parent is one in four. The yellow colour is said to be dominant and the green recessive. In all cases studied by Mendel recessive and dominant characteristics appeared, and the ratio for any pair of characteristics was always 1 pure dominant : 2 heterozygous dominants : 1 recessive. This type of H. is consequently described as Mendelian, and was

independently discovered by Bateson, Correns, and de Vries thirty-four years after the pub. of Mendel's results. Subsequent experiments have shown that complete dominance is not an essential of Mendelian inheritance. The offspring of black Andalusian birds crossed with splashed white ones are blue, and these blue Andalusians, intercrossed, produce black, blue, and splashed white birds

tion, and the 'Presence and Absence' hypothesis has been almost completely abandoned, being retained in only very few cases where it provides the simplest explanation of results. In any species which is sexually reproduced, males and females seem to be produced in approximately equal numbers, so that the sex ratio, i.e. the ratio of males to females, is 1:1. The transmission of certain

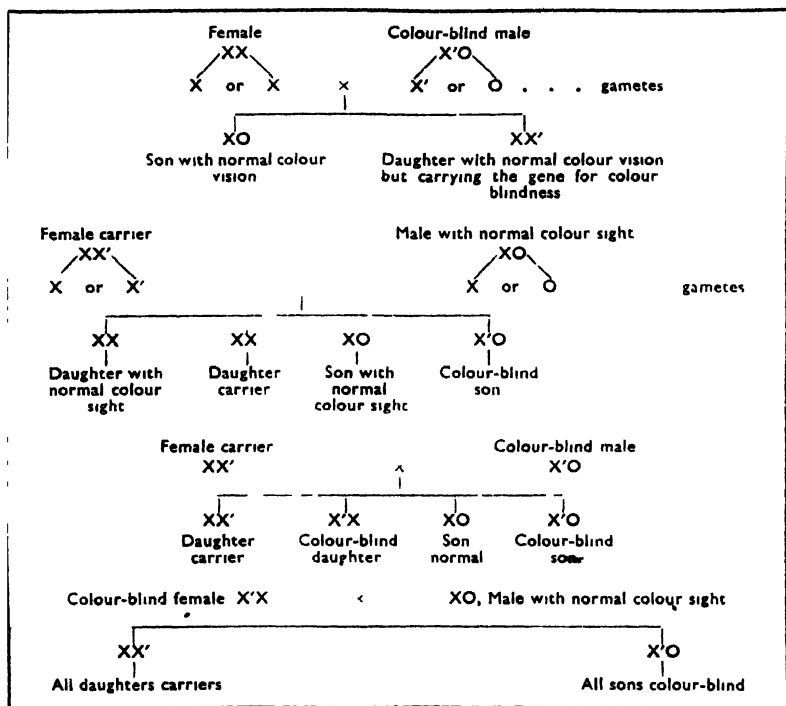

FIG. 3. DIAGRAM SHOWING INHERITANCE OF SEX-LINKED CHARACTERISTICS

respectively in the Mendelian ratio 1:2:1. Thus the two allelomorphs, the genes for black and white, interact, producing an intermediate characteristic, 'blue.' The assumption that complete dominance was essential led to the explanation of Mendelian inheritance by the 'Presence and Absence' hypothesis. According to this, dominance is due to the presence of the genes determining a characteristic, whereas the recessive condition is due to their absence. In the experiment with Andalusian fowls, however, the colour of the hybrids can be explained only on the assumption that the presence of a determinant of the recessive characteristic has modified that of the dominant one. Several other experiments support this assumption.

characteristics is associated with the sex of the parent, and these are termed sex-linked characteristics. The best-known examples of these in man are colour-blindness and haemophilia. The sons of a colour-blind woman and a man with normal colour vision are all colour-blind; the daughters all have normal colour vision, but carry the gene for colour-blindness as a recessive. If one of these daughters marries a colour-blind man, half the sons and half the daughters will be colour-blind, but if the father has normal colour vision, half the sons will be colour-blind and half the daughters will carry the gene for colour-blindness. This and similar phenomena of sex-linkage may be explained by supposing that the sex

chromosomes carry other genes in addition to those determining the sex of the organism. If XX (Fig. 3) represent the two sex chromosomes of woman, each egg cell will contain a single X; and if X be the one sex chromosome of man, each spermatozoon will contain either X or O. If X' represent the sex chromosome carrying the gene for colour-blindness, the table will show at a glance the mode of inheritance.

From this it is obvious that sex-linked characteristics are not inherited in the Mendelian ratio. Similarly the ratio cannot hold for groups of characteristics determined by any other single chromosome. In any case, however, it must be remembered that the ratios given by theory may be disturbed or never be realised, for all the egg cells and sperms do not unite at the same time, so that, for instance, those spermatozoa with the X-chromosome might never succeed in fertilising an egg cell, and all the children would then be sons. However, when large numbers of individuals are considered, the results work out according to the law of probability, and then the Mendelian ratio, the sex ratio, and other ratios deduced theoretically from a knowledge of the genetic constitution, are realised. Mendel himself investigated over one thousand plants, and other investigators have since worked with tens of thousands. Another phenomenon disturbing the theoretical ratio is that of 'crossing over.' This is a phenomenon in which the linkage of genes is broken and an exchange takes place between allelomorph groups of genes. The diagrams show how this may be effected during the separation of allelomorph chromosomes very closely associated before segregation takes place.

**Variation.**—Variation must be mentioned here, for evolution is dependent on the inheritance of variations. In a discussion of variation and H. the following questions arise for consideration. What is inherited? Are variations themselves transmissible, or is the power to vary inherent and the actual variation due to environment? For an account of modes of variation, see VARIATION. Darwin believed continuous variations were inherited and eventually gave rise to new species. This theory, however, awaits biometrical proof, for the process is so slow that it is practically impossible to obtain experimental proof. Discontinuous variations occur in nature, and undoubtedly give rise to new species, but their cause is unknown. The transmission of mutations places the doctrine of common descent on a much firmer foundation than it could otherwise hold. The inheritance of modifications due to the environment is still a disputed question, but what indisputably is transmitted is the power to vary, and it seems probable that organisms possessing this in a high degree will readily react to their environment and begin to vary early in life.

**Statistical study.**—Not only is H. studied by the experimental method, but important branches of the subject also

need special statistical treatment. Galton founded this biometrical study, and Pearson and Weldon have been its leading exponents. There are only three possibilities with regard to any particular characteristic, viz. two pure types and the hybrid, though attempts have been made from time to time, with but little success, to classify kinds of inheritance. Notwithstanding this, it is possible to determine average degrees of resemblance between parent and offspring. The usual elementary example of this is the relation between stature of sons and fathers, and in this a smoothed graph is drawn, which shows the mean stature of sons from fathers of varying but classified heights: e.g. Pearson and Lee after an investigation of some thousands of individuals discovered that the average height of sons

FIG. 4. DIAGRAM SHOWING DEGREE OF RESEMBLANCE BETWEEN STATURES OF FATHERS AND SONS

Vertical, son's stature; horizontal, father's stature  
Tan  $\theta$  = coefficient of correlation

from a group of 62-in. fathers, was 65½-in.; from 65-in. fathers the sons' average was 67 in.; 68-in. fathers, 69-in. sons; 71-in. fathers, 70½-in. sons. Intermediate values were also determined. Now if the sons' statures be plotted on squared paper as vertical heights, and the corresponding fathers' statures be plotted as horizontal distances (see simplified diagram, Fig. 4), it is possible to draw a graph indicating the degree of inheritance which exists between father and son relative to stature. If the resulting graph had been a horizontal line as CD, it would have shown that all classes of fathers had about the same average-height son, i.e. the inheritance would have been zero. If the graph were inclined at 45° to the horizontal, as in the case of AB, it would show that each class of father would tend to have sons of the same average size as themselves, i.e. the inheritance would have been complete or unity. In the example chosen, the graph lies between the horizontal and the 45°

line as, say, EF, and the steepness of this line is a measure of correlation existing between the two statures. The actual coefficient of correlation is expressed as the tangent of the angle FOD, and in this particular example is about 0.51. This simple graphical method is not of absolutely general application, as it assumes that variation is normal and similar in parents and offspring, and it also assumes that the graph EOF is linear; any marked bend in it would demand complicated methods of treatment. Pearson has determined a large number of such coefficients between father and son, e.g. stature 0.51, span 0.46, forearm 0.42, eye colour 0.50; and has suggested 0.48 as a mean value, i.e. on the average the offspring deviate from the mean about half as much as the parent does. If the second parent be also considered, the coefficient increases, though it does not equal unity. It should be remembered that statistical methods are supplementary to experimental methods, and that they apply only to populations in the mass. The co-efficient of H. does not enable the investigator to determine what will occur in any particular case, as, for example, the son of a 6-ft. father may be anything within the whole range of statures, yet in those cases of H., too complex for Mendelian analysis, the statistical method has proved of great value. The 'Law of Ancestral Heredity,' formulated as a result of statistical methods, is of considerable interest. Galton calculated that, on the average, half of the H. of an individual may be taken as derived from the two parents, one quarter from the four grandparents, and so on in the series 0.50, 0.25, 0.125, etc. Pearson has more recently given 0.6244, 0.1948, 0.0630 as the series, thus laying more stress on the parental bequest and less on the ancestral. Harris has found that there is a correlation between stature and length of leg, but no constant relation between stature and arm length, and other recent work includes the biometrical study of the inheritance of feeble-mindedness by Gouldard.

**Disputed Questions.**—One of the most vexed questions in H. is that of the transmission of the acquired characteristics, and some of the differences of opinion with regard to this are due to looseness of definition. According to Lamarck's theory, a modification produced during the lifetime of an organism as a result of the influence of the environment was transmitted to offspring. An acquired characteristic may therefore be defined as one—not previously known to have appeared spontaneously in the ancestry of the individual—appearing as the result of the action of the environment and persisting after the removal of the factors inducing it. Since a recessive characteristic cannot appear unless both parents bear the gene for it, *several* generations may pass before the characteristic is revealed. Other characteristics may remain latent for many generations in an unfavourable environment, but neither recessive nor latent characteristics, when they eventually appear, are acquired, although both

might easily be regarded as new if the genetic constitution of the organism be incompletely known. Both recessive and latent characteristics are inherent in the germ cells. If the offspring be subjected to the environment inducing the change in the parent, they might equally well acquire the same modification, and some of the results adduced as undoubted inheritance of acquired characteristics may quite well be due to direct influence of environment on the offspring. Numerous experiments have been carried out in an endeavour to discover whether acquired characteristics are transmitted, but in most cases the pedigree of the animal experimented upon has been insufficiently known. Other experiments have not been carried out under really critical conditions and others have not been extended through a large enough number of generations to justify the conclusions drawn from them. The earlier experiments were concerned mostly with mutilations. Weismann and other investigators who cut off the tails of many generations of mice found the tails of the progeny unaffected by the experiment. Some of the most extensive experiments on mutilations were carried out on guinea-pigs by Brown-Sequard and his assistants, but the experiments do not warrant a definite conclusion, for they involved injury to the nerves of a parent. Many of the offspring were abnormal, but extremely few were affected in the same way as the parent, so that it seems that a new characteristic appeared, instead of the acquired one being transmitted. Moreover, in many of the experiments there was insufficient evidence to show that the abnormalities were inherent; in all cases the genetic history was not known for a sufficiently large number of generations. A well-controlled scientific series of experiments was carried out by Heslop Harrison and Garrett, on three species of moths. By feeding these on food impregnated with lead nitrate or with manganese sulphate, sooner or later a few black moths appeared. No black moths of these species had previously been recorded as occurring naturally. In breeding, the Mendelian ratio was obtained, the black pigment behaving as a recessive in two species, and as a dominant in the third, as far as the experiments went, but the third set was incomplete. Since the black colour did not appear in the parent, this cannot be considered as an example of inheritance of acquired characteristics in the Lamarckian sense of the term. A perinatal change, however, must have been effected and transmitted, and some modern biologists would regard this as an example of transmission of acquired characteristics. This experiment affords striking evidence against Weismann's theory that the germ-plasm could not be affected by the body-plasm. Kammmerer's experiments on the colour change of salamanders in a changed environment and on the breeding of the midwife toad, *Alytes*, in wet and dry habitats, led him to believe that acquired characteristics were transmitted, but the

experiments require confirmation. Sumner's work on the effect of temp. on mice suggests positive results; Castle's experiments on guinea-pigs give direct negative results. Consequently at the present time experimental work has not yet yielded conclusive evidence in favour of the inheritance of acquired characteristics as such, but Hespel Harrison and Garrett's results show that environment may, through the body-plasm, act on the germ-plasm, and that germinal modifications so acquired are transmissible. On the other hand, it is difficult to account for evolution, if acquired characteristics are not inherited. The indirect evidence of paleontology is considerable, and seems to indicate that such inheritance must have occurred. Another disputed question, already discussed under theories of H., is that of the rôle of the nucleus as a mechanism for the transmission of characteristics, and of other agencies such as the cytoplasm and hormones, aiding or modifying inheritance. Sex inheritance also has caused much controversy, partly on account of the apparently conflicting results of different experiments, and partly because of its connection with sex determination. If sex chromosomes be the sole determinants, then the sex of the organism is determined at fertilisation, and cannot be changed. If the action of hormones, the 'sex hormones', be able to reverse sex, it is conceivable that, whatever the nuclear constitution may be, with increased knowledge sex may in the future be determined at the will of the parents. Some scientists think that sex determination may depend on the nutrition of the parents, but there is no conclusive evidence to support this theory. Teleology and internal impression (see BRIDGES) are not accepted by most scientists, but tradition dies hard amongst cattle-breeders, and so belief in these theories is still fairly widespread.

**Practical breeding.**—One of the most valuable applications of Mendelism is the fixing of pure types. A thorough and systematic search for the best pure lines is one of the best methods of improving these economic plants which are self-fertilised, and Nilsson and his assistants have done valuable work in Sweden in isolating the best pure varieties from the mixtures of numerous types existing in that country. In the case of the maize experiments by Shull and East, a definite increase in vigour has followed systematic crossing. Prof. Biffen has produced wheat which combines the valuable features of one race with the immunity to 'rust' of another otherwise less valuable type. Careful selection in sugar-beet has resulted in an increase of sugar percentage from 8 to 17. More difficulty is experienced with regard to animal breeding, and theory at present does little else than give reasons for principles already discovered, such as careful selection and the 'balancing of defects.' 'Inbreeding' to a type has been a long-established practice and 'outbreeding' to secure vigour is its well-known companion rule. The matter becomes still more difficult when the

principles have to be applied to mankind. The small numbers of progeny of mammals, the time taken for their development, and the large number of characteristics to be considered, make the study of animal breeding, and particularly of eugenics, a very slow process. *Eugenics* described elsewhere, is the science which deals with the improvement of the inherent qualities of the human race, and although its principles are based on H. and are thoroughly sound, yet legislative schemes of positive eugenics are very difficult to introduce, but a beginning has been made in the U.S.A. and under the Nazi regime in Germany, for instance by the compulsory sterilisation of individuals suffering from incurable forms of insanity. As mentioned earlier, conclusions certainly appear to indicate that man is almost entirely the product of inborn factors which are not directly affected by environment, and many responsible students of H. maintain that the improvement of conditions is resulting in the propagation of the degenerate, and the race as a whole is suffering in consequence. Natural selection as such is out of the question, but some restriction on the reproduction of the unfit is undoubtedly demanded by H.

**Cyto-genetics.**—One of the most encouraging recent lines of work has been the correlation of cytology (i.e. microscopic observations of the cell (q.c.) and especially of the chromosomes) with breeding experiments, whereby a new branch of biology, cyto-genetics, has originated, and mutual support has been afforded to what seemed at first to be disconnected studies. The facts of sex-linked inheritance, for instance, have been hooked up with observations on the sex chromosomes. See R. C. Punnett, *Mendelism*, 1905 (7th ed. 1927); C. B. Davenport, *Body-build and its Inheritance*, 1923; R. L. Gates, *Heredity and Eugenics*, 1923, and *Human Ancestry*, 1917; E. M. East, *Heredity and Human Affairs*, 1927; T. H. Morgan, *The Theory of the Gene*, 1928; E. B. Wilson, *The Cell in Development and Heredity*, 1928; P. Popenoe, *The Child's Heredity*, 1929; W. E. Castle, *Genetics and Eugenics*, 1930; E. B. Ford, *Mendelism and Evolution*, 1931; A. E. Watkins, *Heredity and Evolution*, 1935; J. B. S. Haldane, *Heredity and Politics*, 1938.

**Hereford, Earl of.** This title dates from feudal times, the first holder of it probably being Wm. Fitzosbern, who led the right wing of the Conqueror's army at Hastings. The earldom was long held by the great family of Bohun. Before their day it was held by sev. Norman barons (besides Fitzosbern), one of whom left a daughter who married Humphrey Bohun. Their son, Henry de Bohun, received the title in 1199. Among his descendants may be mentioned Humphrey, fourth earl of H. (1278-1322), who was taken prisoner at Bannockburn. In 1380 the heiress of the earldoms of Hereford, Essex, and Northampton, May de Bohun, married Henry Bolingbroke, who was made duke of Hereford in 1397. The

first viscount was Walter Doveaux (d. 1558), who received the title in 1550 for his services in the Fr. wars; the second was the first earl of Essex, the father of Elizabeth's favourite; the third, Robert, was the distinguished general in the parl. army. The present holder of the title is the seventeenth viscount (b. 1865) eldest son of the sixteenth viscount, whom he succeeded in 1930. Viscount Hereford is the premier viscount of England.

Hereford, municipal bor., city and co. tn. of Herefordshire, England, on the

troysed in 1055 by the Welsh, was rebuilt late in the eleventh century, the nave and other Norman parts of the building being completed in about 1140. The beautiful early Eng. Lady Chapel was built in about 1220 and other portions were not completed until the early fifteenth century. In 1786 the Norman W. tower collapsed, bringing down with it two bays of the nave, and its rebuilding was entrusted to Wyatt. He built a W. front so unsuitable that it had later to be replaced, shortened the nave by one

W. F. Mansell

HEREFORD CATHEDRAL FROM THE N.E.,  
SHOWING THE EARLY ENGLISH LADY CHAPEL.

R. Wye, 144 m. from London by railway. Its site was seized by the Mercians in about A.D. 600 and used as an outpost against the Welsh, and later Offa made the Wye the Welsh boundary at Hereford. On account of its position, H. was an important place in the Middle Ages when it became a prosperous centre of the woollen trade. Early charters describe H. as being in Wales. The city's first charter was received from Richard I. in 1189, but long before that it had a well-defined system of local gov. Edward the Confessor made his nephew, Ralph, earl of Hereford, and this Norman earl built its first castle which, however, together with the cathedral, was destroyed in 1055 following a defeat by the Welsh. From that time until the city's capture by the famous Col. Birch in 1645, H. was the scene of constant warfare, the castle finally being demolished in 1660.

The cathedral, founded not later than 680 by its first bishop, Putta, and des-

troyed its clerestory and vaulting in Gothic style, thereby destroying the beauty of its original completely Norman character. The restoration in 1863 was from the designs of Sir Gilbert Scott. The two most treasured possessions of the cathedral are its Chained Library and the Mappa Mundi. The latter is dated about 1300, and, since the disappearance of the Nuremberg map, is probably the earliest map of its kind in existence. Jerusalem is seen to be at the centre of the world. Only two other chained libraries can compare with the one at H., which contains amongst its 1440 books, some very rare manuscripts and early printed vols. Caxton's *Golden Legend*, *The Nuremberg Chronicle* and the only surviving copy of the *Use of Hereford* are a few examples. Other buildings are the Coningsby Hospital (1614), the Cathedral School (1384), S. Ethelbert's Hospital, the churches of All Saints and St. Peter's, the college of the Vicars choral and the Episcopal Palace.

The 'Three Choirs Festival' and 'Three Counties Show' are held in H. every third year. The city is also interesting as the bp. of David Garrick, and, it is claimed, of Nell Gwynne, and for its associations with Sarah Siddons and Fanny Kemble. The fine bridge over the Wye was built at the close of the fifteenth century and from it there is a well-known view of the cathedral. Chief manufs. are tiles and cider-making, fruit preserving and engineering. An airport was opened in 1947 on the H. Race Course. Pop. (estimated) 30,500.

**Hereford Breed, see under CATTLE.**

**Herefordshire**, inland co. on the S.E. border of Wales, bounded on the N. by Shropshire, and on the S. by Gloucestershire and Monmouthshire. Its area is 843 sq. m. and its surface is undulating. The co. is watered by the Wye and its tribs., all of which abound in fish, the Wye being especially celebrated for its salmon. The soil is particularly suitable for the growth of timber, and the oak, ash, and larch abound, but the co. is especially famous for its apple and pear trees. It is also noted for its cattle of bright red hue, with mottled or white faces, which produce very fine beef. There are no minerals of economic importance, and but few manufs. Pop. 113,000. See H. L. V. Fletcher, *Herefordshire*, 1948.

**Herefordshire Regiment.** Formed in 1701 and numbered 36th Foot. Lacked in 1881 with 29th to form the present Worcestershire Regiment (*q.v.*). It gained the motto 'Firm' for its staunchness during active service in Bangalore, India, in 1791. The present H. R. is a territorial army unit, having descended from a volunteer unit formed in 1860. It served in the S. African War during 1900-1902 and raised four battalions during the First World War, which served in France and Flanders from 1914 to 1918. In the Second World War they fought in France.

**Herent, Belgian tn.** in the prov. of Brabant, situated on the R. Dyle, 14 m. E.N.E. of Brussels. Makes starch, oil, tile-stones and bristles. Pop. 8300.

**Herentals, tn.** in Belgium, 19 m. E.S.E. of Antwerp, on the Albert Canal. The tn. hall with belfry dates from the fifteenth century and has manufs. of woollen goods, footwear, tobacco and has diamond-cutting, breweries, tanneries, brick-works, rope-walks, and an iron-foundry. Pop. 14,600.

**Herero**, the Hs. form a branch of the Bantu tribes of the Ovambandus. They lived originally in the land of 'Raruu'—in the reed country—though where this country was situated has never been determined. Two chieftainships migrated from there and dwelt with the Bechuanas. The Hs. owned great herds of cattle. One of the H. chiefs came into conflict with the Bechuanas as the grazing lands of the latter extended far into what was once known as Hereroland and a deciding battle took place at Etomba, N. of Okahandja. The Hs. were beaten and saved their cattle by trekking into the Kaokoveld where they remained unmolested for some two centuries (1550 to

1750). The Kaokoveld then stretched from the Kunene R. in the N. to the Omaruru R. in the S. The second H. tribe remained with the Bechuanas and lived in the N.E. part of the present S.W. Africa (*q.v.*) where their descendants live to this day and are known as Ovambanderu—people from the reed lands. They are not fully recognized as true Hs. by their Kaokoveld tribesmen and are of more gentle character. The mountainous N. Kaokoveld, with its dry grazing lands and pastureless fountains, did not serve the requirements of the Hs. with their ever-growing riches in cattle, and they trekked into the southerly veld and Otjitambi became their religious and controlling centre. In 1750 the first big owners of cattle trekked S. over the Omaruru, drove away the Saan and Berg Damaras, were once more united with their brother tribe, the Ovambanderu, and eventually occupied all the country N. of the Swakop R. and eastwards to beyond Gobabis. Not all the Hs. left the Kaokoveld, the Ovahimba-Hereros remaining in the N. as their grazing and watering places suited for their needs. They are poor classes, but by tradition, religion and language, they are pure Hs. and it is only the Ovamos and Hs. who trekked S., who call them Ovattimba, which means 'antbear'. The H. tribe were largely exterminated by the Gers. in 1903-04 in circumstances of deliberate and callous barbarism. Ger. misrule, oppression and cruelty goaded the Hottentots into rebellion in 1903 and shortly afterwards the Hs. rose too. The ant. enemies were united in misery. The Berg Damaras, through their association with the Hs., suffered equally in the slaughter which followed. The natives were no match for the trained Gers. with their modern weapons and by the close of 1904 it was evident that both the Namas and the Hs. were broken races.

Scattered bands, however, held out and the Gers. then sent thousands of troops into the ter. In the guerilla warfare which followed the first big engagements violence begat violence and the Ger. forces were spurred to fresh vengeance by tales of mutilations of Ger. soldiers who fell into H. hands. Leutwein, regarded as too lenient, was replaced by von Trotha, noted in Berlin for the severity of his dealings with natives. Von Trotha trapped sev. of the H. leaders with treacherous enticements to peace talks and then issued his notorious *Fernichtungsbefehl* (extermination order) under which no H.—man, woman or child—was to receive mercy or quarter. The Ger. soldiers were ordered to kill and take no prisoners and von Trotha explained afterwards that he wished to ensure that never again would there be another H. rebellion. The order was issued against an already defeated people, but for nearly three years the leaderless and disorganised Hs. were hunted like the wild game of the veld and brutally executed. The full story of this typical Ger. sadism, based on the sworn descriptions of eye witnesses, has been told in a bulky official report

presented to the Brit. and S. African Parliaments (pub. by H.M.S.O., London, as *Cmsd.* 9146 of 1918). The war ended in 1907 with the H., Nama and Berg Damara tribes utterly broken and scattered to the winds, some taking refuge in adjoining Brit. ter. Eighty per cent. of the H. people had disappeared and more than half the Hottentots, while the Berg Damaras fared little better. The Hs. in 1901 numbered 80,000; in the official census of 1911 they numbered only 15,130—a decrease of no fewer than 64,870.

**Heresy** (Gk. *aisirosis*), choice, a term in theology, signifying 'a choice of doctrine.' In the N.T. it is used with various meanings, in the Acts of the Apostles it is applied to the Pharisees and Sadducees, in the Epistles of St. Paul it is used to denote the divs. in the Christian church, and in St. Peter's Epistle the modern meaning 'falsely chosen' is first suggested in the words, 'Among you also there shall be false teachers, who shall privily bring in destructive heresies, denying even the master that bought them,' etc. Again, it was used by Ignatius to signify theological error, and as the doctrine became more important, it was restricted to views at variance with the recognised creed. Heresy, according to Thomas Aquinas, implies a profession of Christian belief; the heretic is right in the end he proposes to himself, but wrong in the means to that end. Even in apostolic times, Hs. existed in the church, and before the council of Nice there existed many sects; but these earlier Hs. were chiefly concerned with the introduction of Jewish or pagan elements into the faith of the church, and were punishable by excommunication, etc., whereas the later Hs. were differences in interpretation of Christian truth, and were regarded as legal offences, and punished accordingly. Constantine enacted sev. severe laws for the repression of H., which appear under the title 'De Hæreticis' in the Justinian code, and the penalty of death is even included among these, and in the Eng. law the offender was tried by the archbishop and his council, and then handed over to the king for punishment. But the statute of Henry IV. (De hæretico comburendo) empowered the diocesan to hand over the criminal to the sheriff without waiting for the king's writ. This statute remained in force until Charles II.'s reign, after which time the punishment of heretics was left to the eccles. courts.

**Hereward the Wake**, outlaw, received his title of 'the Wake' from John of Peterborough. According to the *Domesday Book* he was the owner of lands in Lincolnshire, and he may have been identical with the owner of Marston Jabbet, Warwickshire, and Evenlode, Worcestershire. He headed the rising of the Eng. at Ely in 1070, and plundered Peterborough with the help of the Danes. He was joined by Morkere, Seward Bain, and Æthelwine, Bishop of Durham, and held out against William until 1071, when Æthelwine and Morkere surrendered. H. escaped, and

according to Gaimar, was pardoned by William, whom he accompanied to Mafno, where he was murdered by the Normans.

**Herford**, tn. on the Werre in Westphalia, Germany, 10 m. N.E. of Bielefeld it is of anct. origin and contains many old buildings, including a twelfth-century church. It carries on a considerable trade and manufs. tobacco, cloth, and furniture. Pop. 38,500.

**Hergenröther, Joseph von** (1824-90), Ger. theologian. He was author of *Anti-Janus* (1870), in which he defended the doctrine of papal infallibility. The work made a great sensation, and he was made a prelate of the papal household in 1877, becoming a cardinal in 1879, and curator of the Vatican archives. He also wrote *Photius, Patriarch von Konstantinopel* (1867-69), *Katholische Kirche und Christlicher Staat* (a book on the relations of church and state, 1872), a universal church hist. (1876-80), and a hist. of the papal states since the Revolution. See monograph by J. Stamminger, 1892.

**Hergesheimer, Joseph** (b. 1880), Amer. novelist, b. at Philadelphia. He was educated at a Quaker School and the Pennsylvania School of Fine Arts. Estab. himself as one of the best of the younger generation by his novel, *Mountain Blood* (1915), and enhanced his reputation still further with his *Three Black Pennys* (1917). His best novel is *Jaca Head* (1919). Other stories, *The Bright Shaul* (1922), *The Presbyterian Child* (1923), *Balsand* (1924), *Tampico* (1926), and *The Foolscap Rose* (1934).

**Hergest, Red Book of**, name given to a MS. of Welsh literature, which is now in the library of Jesus College, Oxford. It is a folio vol. of 360 leaves written in double columns from the beginning of the fourteenth century to the middle of the fifteenth century, and contains eleven tales, the stories of which mostly relate to King Arthur and the early Brit. kings. Lady Charlotte Guest printed these tales together with *Hanes Taliesin* under the title of *Mabinogion*, 1838-49. The MS. is supposed to have been written at Hergest Court, a seat of the Vaughans, hence its name.

**Heringsdorf**, tn. on the Is. of Usedom in Pomerania, Germany; it is a watering-place on the Baltic. Pop. 1700.

**Heriot**, curious archaic right (now obsolete) incident to copyhold tenure, by which the lord of the manor was entitled, on the death of a tenant, to seize his best beast or other chattel. A H. came in Saxon times to be really a tribute of war-horses, weapons, or armour due to the king on the death of a thane. These anct. Hs. were subsequently rendered obsolete by the institution of reliefs, or sums paid by a vassal on taking up his estate. The copyhold H. had a different though analogous origin and related to socage lands as opposed to those held by knight service. The origin of the right is to be sought in the anct. custom of a freeholder furnishing his tenants in village with cattle and the implements of husbandry. The right of the lord to this kind of H. was restricted to such chattel as the

manorial customary law allowed, and that law varied in different manors.

**Heriot, George** (1563-1624), Scottish goldsmith, b. in Edinburgh. He was brought up in the business of his father, who was a goldsmith, and in 1601 became jeweller to James VI., having already been appointed in 1597 goldsmith to his queen, Anne of Denmark. In May 1603 he accompanied the king to London, and was one of the three persons appointed jewellers to James I. In 1620 a grant was made to him of the imposition on sugar for three years, and out of the proceeds he founded Heriot's hospital, Edinburgh (see **HERIOT-WATT COLLEGE**). He is the 'Jingling Gordie' of Scott's *Fortunes of Nigel*.

**Heriot-Watt College**, Edinburgh, was subsidised from the fund (£23,625) left by George Heriot in 1624 to found and endow a hospital for the maintenance of the sons of poor burghers. This school was completed in 1669, and in 1885 the funds had increased to such an extent that it was reconstituted as a middle-class school, and the H. W. C. was opened to provide a thorough scientific and technical instruction at moderate fees for older students. In 1927, by the provisions of the H. W. C. and George Heriot's Trust Order Confirmation Act, it became a college for providing technical, trade, commercial, and general education for both sexes, and was recognised by the Scottish Education Dept. as a Central Institute for Edinburgh and S.E. Scotland. Day and evening instruction is given in Mechanical, Electrical, Mining, and Oil Engineering, in Applied Chemistry, Brewing, Pharmacy, Building, and Printing; while evening courses in Commerce and Languages are given to students of Accountancy, Banking, Insurance, Secretarial Practice, Stockbroking, and Shipping. The H. W. Literary Society (founded 1868) celebrated its diamond jubilee in 1928. The lord provost of Edinburgh is chairman of the Governors of the H. W. C., and many notable men have received instruction in this institution.

**Heri Rud, or Hari Rud**, riv. of Afghanistan, Asia, rises in the Kon-i-baba Mts. It flows W. for 300 m. to Herat, turns N. at Kushan, and is joined at Pul-i-Khatun by the Keshaf Rud. At Sarikhs it is called Tojend. It enters Turkistan and is lost in the Kara-Kum desert. It contains quantities of fish. Length 650 m.

**Herisau**, tn. in the canton of Appenzell, Switzerland, cap. of the Auser-Rhodod. dist., 5½ m. S.W. of St. Gall. It contains an old bell tower and tn. hall, and the sulphur baths of Heinrichshad are quite near. It manufactures cotton goods and embroidery. Pop. 15,090.

**Heristal**, see **HERSTAL**.

**Heritable and Moveable**, in Scots law, a fundamental distinction between legal rights and things, more or less parallel to the Rom. classification of things corporeal and incorporeal. The distinction is mainly of importance in respect of the rights of an heir as opposed to those of the executors or next of kin of a deceased person. The distinction does not neces-

sarily correspond to the physical distinction between moveable and unmoveable property, although, generally speaking, all rights in or connected with land are *heritable*, and whatever can be moved without injury to itself or the property with which it is physically connected is *moveable* property. But, as in the Eng. law of fixtures (*q.v.*), things which are physically moveable may, in Scots law, become heritable by accession (*Lat. accedo*, to add), and conversely, things in their nature heritable may be constructively converted into moveables by being made part of a moveable whole, as *e.g.* heritable things made part of the common property of a trading company. See J. Erskine, *Principles of the Law of Scotland*, 1754; G. J. Bell, *Commentarius*, 1810.

**Heritable Jurisdictions**. In Scotland all jurisdictions were originally personal, i.e. granted in consideration of the fitness of the grantee, but when the feudal system was introduced certain jurisdictions, such as sheriffships, were annexed to lands and became heritable, like the lands to which they were annexed. Later, when sheriffships ceased to be territorial, the crown made heritable grants of such jurisdiction to landowners. The Jurisdiction Act of 1746, in consequence of the Jacobite rebellion of 1745, abolished all H. J., compensated the persons who owned them, and made jurisdictions personal to the king's courts. See J. Erskine, *Principles of the Law of Scotland*, 1754.

**Heritable Security, or Securities on Heritable Estates**, in Scots law, include all bonds, heritable and of annuity, instruments entitling a creditor to appropriate the rents of land until debts are paid, and all deeds whatsoever capable of constituting a security for debt over lands or the rents and profits of land, and since 1874 also securities by way of ground-annual (*q.v.*). The form of a H. S. is either by (1) a direct conveyance of the lands either subject to the right of redemption or absolutely, or (2) by real or reserved burden containing no disposition of the lands. A H. S. is extinguished by formal redemption. See J. Erskine, *Principles of the Law of Scotland*, 1754.

**Heritor**, in Scots law formerly denoted the owner in fee of a corporeal heritable subject or any par. landowner, but is a term now restricted to such landowners whose estates are subject to the burden of repairing the manse of an incumbent (*q.v.*), or of providing a church for newly erected pars., or maintaining such par. churches as already exist. The term includes railway companies or other corporations and burgh councils, but not life-tenants, tenants on long or short leases, or feu superiors. The question whether real-rent or valued-rent Hs. are to be assessed for repairs depends on the nature of the par. whether landward or burghal. He may, however, do the repairs voluntarily, and assess themselves at a meeting in the presbytery or in the sheriff court, and they are entitled to borrow money for the purpose. See G. J. Bell, *Commentarius*; J. Erskine, *Principles of the Law of Scotland*, 1754.

**Herkimer**, tn. and cap. of H. co., New York, U.S.A., on the Mohawk R. It manufs. paper, furniture, and woollen goods, and is the centre of a dist. famous for its cheeses. Pop. 10,500.

**Herkomer**, Sir Hubert von (1849-1914), Brit. painter, b. at Waal, in Bavaria; son of Lorenz H., master-joiner. His parents took him to America when he was aged two; after six years there, they came to England. He first studied at the School of Art at Southampton, but in 1866 went to S. Kensington. He exhibited at the Royal Academy in 1869, but made his reputation in 1875 by 'The Last Muster,' hung that year. A.R.A., 1879; R.A., 1890; Slade prof. of fine arts at Oxford, 1885-94. In 1883 he founded the Herkomer School of Art at Bushey, which he directed until 1904. In 1907 he was made hon. D.C.L. Oxon and knighted. An associate of the Institut de France and of the Belgian Academy. His works include: 'The Herkomers' (1910), 'Found' (1885), and 'The Chapel of Charterhouse' (1889), both of which are in the National Gallery of Brit. Art), 'Portrait of Miss Katherine Grant,' 'Portrait of the Lady in Black,' 'Hard Times,' 'On Strike,' 'The Guards' Cheer.' Long conspicuous by reason of his great beard, he was clean-shaven in later years.

**Herm**, small is. of the Channel Is. After the First World War it was developed as a holiday resort. It can be visited in the summer from Guernsey, from which it is distant 3 m. The pre-war pop. was about 30.

**Hermæ Pillars**, pillars smaller at the base than at the top, which generally terminated in a head of Hermes. They were found in Attica in the streets of the tns., and after the time of Hipparchus, the son of Pisistratus, they were also erected along the country roads as m-stones, Hermes being the god of traffic. They were particularly numerous in Athens, and in the mkt.-place they formed a long colonnade reaching from the Hall of Paintings to the King's Hall. It was the charge of sacrilegiously mutilating these figures which caused Alcibiades to flee from Athens in 415 and throw in his lot with the Spartans.

**Hermadad**, The (Sp. 'brotherhood'), association of the cities in Aragon and Castile, formed in the middle of the thirteenth century to defend their liberties. It was more firmly organised in 1297, when Sancho IV. came to the throne with the express object of resisting the tyranny and exactions of the nobles, and received favour from Ferdinand and Isabella, who endowed it with large powers of summary jurisdiction. But as the power of the crown increased, so that of the H. decreased, and about the middle of the sixteenth century it ceased to exist. The name was, however, borne by a body of police in Castile, whose chief duty it was to protect the roads. See A. R. Lesage, *Histoire de Gil Blas de Santillane*, 1735.

**Hermann**, or **Herman**, see ARMINIUS.

**Hermann**, Johann Gottfried Jakob (1772-1848), Ger. classical scholar, b. at

Leipzig. He was educated at the univ. of his native city, and was made prof. of philosophy there in 1798, becoming prof. of eloquence and poetry in 1803. He made a special study of classical poetical metres, publishing his *Elementa doctrinæ metricæ*, in 1816. He also wrote on Gk. grammar, and pub. *De emendanda ratione Græcæ grammaticæ* (1801). His other works include eds. of Aristophanes's *Clouds*; Aristotle's *Poetica*; Plautus's *Trinummus*, besides an ed. of Æschylus, and the remainder of Erfurdt's *Sophocles*. See lives by O. Jahn, 1849, and H. Köchly, 1874; and U. von Wilamowitz-Moellendorf, *Geschichte der Philosophie*, 1921.

**Hermannstadt**, see SIBIU.

**Hermannstal**, see MURDW.

**Hermanric**, or **Ermanaric** (d. A.D. 376), king of the E. Goths, founder of their kingdom, which probably included N. Hungary, Lithuania, and S. Russia. He was defeated by the Huns during the migrations of the peoples of N. Europe, and fell on his own sword.

See W. K. Grim, *Die deutsche Heldensage*, 1829.

**Hermant**, Abel (b. 1862), Fr. novelist, b. in Paris. Educated at the Lycée Bonaparte and at the Condorcet. President of the Société des Gens de Lettres (1902). Member of the Fr. Academy. A brilliant satirist of the wealthy bourgeoisie of France. *Mémoires pour servir à l'histoire de la société*, 1907, is the general title of his chief work in this vein. *Le Caravanier*, (1917), a study of wealthy cosmopolitans in Paris, is probably his most widely known book. Other works: *La Mission de Cruchod* (1885), *Madori* (1888), *La Carrière* (1891), *Cœurs primitifs* (1903), *L'Esbrouffe* (1904), *La Belle Madame Héber* (1905), *La Journée brève* (1920), *La Petite Femme* (1923), *Le cycle de lord Chelsea* (4 vols., 1923). See Peltier, *Abel Hermant*, 1921.

**Hermaphrodite**, so named from the mythical *Hermaphroditus* (q.v.), is a living organism containing in itself a combination of the essential male and female functions and structures. It is very doubtful if true hermaphroditism is present in the higher animals, though it is common in many of the lower orders, as in the sluggish leech and snail, the fixed ovstör, or the parasitic tapeworm. Many flowering plants are hermaphroditic, though of varying degrees of intimacy; in the case of the arm, the male organs are situated above and distinct from the female organs, but in the orchid the stamens and carpels are united; this is paralleled in the case of the leech, where the two elements are distinct and separate, though not so in the snail. Some animals may pass through embryonic hermaphroditism, though this condition is doubtful in man as sex appears to be predetermined in the fertilised ovum. (See HERMERTY.) Self-fertilisation is largely prevented by the two elements developing at different times in the organism. This 'want of time keeping' is termed *dichogamy* in botany, and may be either *proandrous dichogamy*, in which the stamens reach maturity first, or *protogynous dichogamy*, in which the car-

pels first reach full development. The earlier maturing of the male element is the more common occurrence, the hag-fish yielding an example from the animal kingdom. Self-fertilisation among animals is rare, but it is found in the fish *Serranus* and in the tape-worm.

*Casual or abnormal hermaphroditism* is occasionally found in fish where an ovary is situated at one side and a testis at the other, in which case it is usual for only one organ to develop and one sex to predominate, with mere indications of the other. Sometimes in such insects as e.g. a butterfly, one pair of wings will be indicative of the male sex and the other pair will be female, or the under and upper surfaces may be of different sex appearance.

*False hermaphroditism* may occur in the higher mammals where malformation has resulted in a female animal possessing the exterior appearance of a male or vice versa. Much discussion has taken place from time to time relative to hermaphroditism and primitive conditions, but the general opinion appears to be that hermaphroditism is not a reversion to, nor a survival of, a primitive condition, but rather a secondary acquisition.

**Hermaphroditus**, son of Hermes and Aphrodite, b. on Mt. Ida. He was finally united into one person, having the characteristics of both sexes, with the nymph of the Carian fountain Salmacis. The statue by Polycles (fourth century B.C.) is famous.

**Hermas**, probable author of *The Shepherd (Pastor Hermas)*, an early Christian allegorical and hortatory treatise divided into three parts: 'Visions,' 'Mandates,' and 'Similitudes.' H. is usually classed as one of the apostolic fathers (q.v.), but there is much discussion as to his identity. The Muratorian canon makes him brother of Pius I., bishop of Rome (c. 139-54). The work is prized as a relic of the primitive church, describing second-century Christianity in Rome. Some recent critics think it may originally have been a Jewish book, revised and enlarged later by a Christian writer. The date usually assigned to it is between A.D. 100 and 150. The shepherd or angel of repentance appears to H. in the fifth vision, and adds instruction (twelve mandates and ten similitudes) to the message he is to deliver to the people. The scene is laid in Rome and the neighbourhood. Irenaeus, Clement of Alexandria, and Origen highly esteemed the work, and it was publicly read in churches at one time, but definitely outside the sacred canon by the fourth century. It aimed at rebuking worldliness and calling sinners to repentance. See J. A. Neander, *History of the Church*, 1825-52; Sir J. Donaldson, *Apostolic Fathers*, 1874; C. T. Cruttwell, *Early Christianity*, II., 1893; J. B. Lightfoot, *Apostolic Fathers* (ed. by J. R. Harner), 1893; H. O. E. Krüger, *History of Early Christian Literature*, 1897; O. von Gebhardt, A. von Harnack, and T. Zahn (ed.) *Father apostolicorum opera*, 1920; E. Hennecke, *Neutestamentische Apokryphen*, 1924.

**Hermeneutics** (Lat. *ars hermeneutica*, to interpret; from Hermes, the messenger of the gods), the science or art of interpretation or explanation of the language of speakers or writers. More especially applied nowadays to the explanation of the Holy Scriptures, covering practically the same meaning as 'exegesis,' a term more often used at the present time. See EXEGESIS.

**Hermes, Georg** (1775-1831), Ger. Rom. Catholic theologian and philosopher. He was founder of the school of Hermesians. His rationalistic doctrines, influenced to some extent by Kant and Fichte, were embodied in his *Einführung in die christlich-katholische Theologie* (1819-29). They were in high favour till the death of Spiegel, archbishop of Cologne, in 1836. Pope Gregory XVI. issued a brief condemning his teaching two years later, but by that time his school had practically vanished. His other prin. work was *Christkatholische Dogmatik* (1831-36). See W. Esser, *Denkschrift auf Georg Hermes*, 1832; K. Eschweiler, *Die zwei Wege der neuern Theologie*, 1926.

**Hermes**, one of the anct. gods of Greece, son of Zeus and Maia, identified by the

HERMES

Roms. with Mercurius. The chief characteristics of his many-sided nature were inventiveness and versatility, and he is represented as possessed of fascination, trickery, and cunning. A legend tells of his invention of the lyre from the shell of a tortoise, and stealing of fifty head of cattle from his brother Apollo on the very day of his birth. His guilt was discovered through Apollo's gift of prophecy, but he was pardoned and granted his brother's friendship and various privileges

in exchange for his wonderful musical instrument. His original functions and primitive character are quite uncertain. Mt. Cyllene in Arcadia was his reputed bp. and the chief seat of his worship. He appears to have been closely connected with almost every phase of life. He was both the messenger of the gods and the guide of the dead to Hades (*Ψυχοπομπός*). As god of the roads and of wayfarers he was honoured by stone heaps and pillars of 'Hermes' (g.r.), often set up as milestones and terminating in a bust. H. was the god of exchange and barter, and even patron of thieves, hence regarded as the giver of gain—any unexpected windfall being called *epheior*. From this may have developed the conception of H. as a god of fertility. He was also the god of dreams, gymnastics, and eloquence. As herald he was mostly represented in art with winged feet, a flat broad-brimmed hat (*petasos*), and a wand (*kanobos* or *caduceus*). See Sir J. G. Frazer, *Golden Bough* (2nd ed.), II., 1906; A. Lang, *Myth, Ritual, and Religion*, II., 1887; L. R. Farnell, *The Cults of the Greek States*, v., 1909.

**Hermes Trismegistus**, see HERMETIC BOOKS and THOTH.

**Hermetical Seal**, in alchemy and chom. is the method of sealing a glass vessel by actually fusing the glass, without employment of a cork or stopper. It is so called after Hermes Trismegistus (g.r.), the mythical founder of chemistry.

**Hermetic Books**, form of encyclopædia, the sacred canon of the ant. Egyptians, fragments of which are all that survive. It originally consisted of forty-two books, divided into six sections, treating of religion, art, science, geometry, astronomy, medicine, liturgical rites and ceremonies, hymns, laws, the nature of the gods, etc. The word 'hermetic' is derived from Hermes Trismegistus, the Gk. designation of Thoth, the Egyptian god of intelligence. The books are evidently based on Egyptian mythology; but neither the time at which they were written, nor the author, can now be determined. Fragments of the Gk. and Lat. texts exist in the writings of Stobæus, Cyrillus, Lactantius, and Suidas, some of which were trans. into Fr. by Ménard in 1868. Traces of Neo-Platonist ideas can be traced in the books, as well as indications of the influence of the Jewish philosopher, Philo. See A. Kingsford, *The Hermetic Works*, 1885.

**Hermias**, (1) Gk. philosopher of the Alexandrian school, and a disciple of Proclus. Wrote a commentary on Plato's *Phædras*. (2) Christian philosopher of the fourth century. One small thesis of his is extant, in which he attacked pagan philosophy for its illogicality. See van Otto, *Corpus apologetarum*, Jena, 1872.

**Hermione** (mod. Kastri), an ant. coast-vil. of Greece, prov. Argolis and Corinthia. The rocky peninsula of Visti forms a double point N. and S. Ruins of a temple to Poseidon remain. It was founded by the Dryopes. See Pausanias, II. 34; Herod., viii. Pop. about 3000.

**Hermit** (Gk. *ἐρημίτης*, a solitary; in *ἐρημία*, a desert), name given to one who

retires into solitude in order to live a more holy life. The words 'hermit' and 'eremite' were apparently used indifferently until the middle of the seventeenth century, but 'hermit' is the spelling now generally adopted, 'eremite' appearing only in poetry, etc. Anchorite is another synonym. As early as the third century Hs. began to appear in the Christian church, and the advocates of asceticism were the first to set the example by withdrawing from the cities and taking up their abode in rudely-formed huts in desert or in forests. But these, as a rule, went in companies, whereas the H. went a step further and withdrew altogether from mankind, living alone. The first H. is said to have been Paul, a native of the Lower Thebaid, who, in the time of the Decian persecution (250), fled into the desert. His story is told by St. Jerome, who records that he was visited by St. Anthony, another anchorite, who was generally held to be the first great example and preacher of the H. life. But the Stylites, who spent their lives at the tops of pillars, and the *Isacel*, who lived on herbs, were not true Hs., nor were those who, in later times, separated themselves from their fellow-men to live in caves solely to avoid intercourse with society, and not from any religious motives. Hermitism was not so popular in the W. as in the E. church, probably owing to the unadaptability of the climate, and as monasteries developed Hs. became more scarce.

**Hermitage**, dry, red wine, resembling Burgundy in colour and body, obtained from the vineyards of the Rhone valley. It is not dissimilar from the best kind of claret.

**Hermit-crab**, family of unsymmetrical crustaceans characterized by a hook-like attachment to the pleopods, by means of which the animal can secure itself within the shell. *Supanurus bernhardus*, the commonest Brit. species, generally inhabits the shell of the whelk. See also COMMENSALISM.

**Hermoerates** (c. 460–407 B.C.), Syracusan statesman and general, who succeeded in uniting the Siceliots (421) so as to enable them to resist the Athenian expedition against Sicily (415). After the Athenian defeat (413) he helped Sparta against Athens, and held a high command at the naval battle of Cynossema (412). On his defeat at Cyzicus he was deprived of his command and exiled (409). H. fought later against Carthage, and was killed in attempting to return to Syracuse (407). He was one of the most energetic, patriotic, and incorruptible leaders of antiquity. See Thuc. iv. viii.; Diod. xli.; G. Grote, *Hist. of Greece*, x. 81, 1846–56.

**Hermogenes** (fl. A.D. 170), Gk. rhetorician of Tarsus, Cilicia. At the age of fifteen his reputation as orator and lecturer won him the favour of Marcus Aurelius (A.D. 161–80), who soon made him public teacher of oratory. At the age of eighteen he pub. the famous *Τεχνή ῥητορικὴ* . . . long regarded as a standard work, and elaborated by many commentaries. At twenty-five he lost his intellectual faculties. See

C. Wals, *Rhetores Graeci*, 1832-36 (new ed. with commentaries by Rabe, 1882-83, 1913; L. von Spengel's ed. 1853-56; Aldus, *Rhetores*, I., II.; Philostratus, *Vitae Sophistarum*).

**Hermogenes** (fl. A.D. 168-200), here-siarch of the second century, originally a painter and pagan philosopher of the school of Zeno. Converted to Christianity, he elaborated a system attempting to unite Stoic ideas and Christian dogmas. Tertullian accused him of heresy in *Adversus Hermogenem*. See Theodoret, *Fab. Haret.* I. 19.

**Hermion** (modern *Jebel-esh-Sheikh*), mt.-ridge and culminating point, forming S. extremity of the Anti-Libanus range, Syria, on the border of Palestine, 35 m. from Damascus. Called Sirion by the Sidonians and Senir by the Amorites. The modern Arabs call it *Jebel-esh-Sheikh*, 'Old Man Mountain' or *Jebel-eth-Thel*, 'snow mount.' The crown has three peaks (c. 9160 ft. high) covered with snow for most of the year, and it towers high above the anct. city of Dan and the sources of the Jordan. The lower slopes have rich vegetation and are planted with vines and fruit-trees. Ruins of anct. temples surround it, mostly consecrated to Baal. Heb. poetry constantly mentions Mt. H.

**Hermionthis** (mod. Erment), tn. of Kena prov., Upper Egypt, on R. Nile, 8 m. from Thebes. As the anct. Egyptian 'On of the South' it was famous for its worship of the hawk-headed god Mont (Zeus) and Horus (Apollo). There are ruins of a temple of Cleopatra's time. The burial place of the sacred bulls of Mont was discovered in 1927. The modern tn. has sugar refineries, post and telegraph offices and a railway station. Pop. about 7000.

**Hermoupolis**, or *Syra* (Nea-Syros), seaport and cap. of Syros Is., Greece, 78 m. from Athens. It is the seat of the home of the cyclades, of a Gk. archbishop, and a Rom. Catholic bishop. Commercially it is next in importance to Athens, the Piræus, and Patras, its position in the Aegean making it a centre of the Levant trade. There are manufs. of flour, leather, cotton, and 'Turkish delight.' H. has an arsenal, gymnasium, theatre, and custom-house. Shipbuilding is carried on. Pop. 21,000.

**Hermisdorf**, Nieder, tn. in Silesia Poland, is 2 m. W. of Waldenpud (Walbrzych). It has coal and iron mines. Pop. 12,000.

**Hern**, Gertrude Franklin, see **ATHERTON**. **Hernandez**, José (1831-91), Argentine poet; b. at San Martín, prov. of Buenos Aires. In late 'sixties, ed. *Revista del Río de la Plata*, Buenos Aires. Follower of insurgent López Jordan, 1870-72. Many years legislator in native prov. His only considerable poem is *Martín Fierro* (1878), an epic of the Argentine.

**Hernandiaceae**, order of cotyledonous plants, closely allied to the Lauraceae (q.v.), but differing from that order in that the flowers are epigynous. It received its name from the Sp. naturalist Hernandez, who was sent to Mexico by

Philip II. There are four genera in all, and the chief of these is *Hernandia*.

**Hernani**, tn. on the Urumea, prov. of Guipuzcoa, Spain, is 8 m. S.E. of San Sebastián. It played an important part in the Carlist wars (1835-40). It contains a modern palace, and has iron mines and cotton factories. Pop. 5000.

**Herne**, tn. in Westphalia, Germany, 11 m. N.E. of Essen. It has coal mines, and iron works and is the terminus of the Rhine-Herne canal. Pop. 98,500.

**Herne**, James A. (James Ahern) (1840-1901), Amer. actor and playwright. He acted in many plays of his own, the first being *Hearts of Oak* (1878), *Drifting Apart* (1885), *The Minute Men* (1886), and *Margaret Fleming* (1890) followed, but his next great success was the rural comedy *Shore Acres*, performed at Chicago (1892), which ran for nearly six years. His last production was *Sag Harbour* (1900). See L. C. Strang, *Famous Actors of the Day in America*, 1900.

**Herne Bay**, tn. and watering-place, in the co. of Kent, England, on the estuary of the Thames, is 6 m. N.E. of Canterbury. It was founded in 1830. Canary grass, introduced by Flemish immigrants, is grown in the vicinity. Pop. 16,600.

**Herne Hill**, suburb of London, 4 m. S. of St. Paul's. The name is supposed to be derived from the herons that frequented the Effra, a riv. formerly flowing through Herne Hill. Ruskin spent the early part of his life here.

**Herne the Hunter**, traditional figure of old Eng. legend, popularly supposed to roam at midnight near an old oak, famed as 'Herne's Oak,' in Windsor Forest. The oak was thought to have been blasted by the hunter's evil spirit, and was blown down in 1803 (c. 650 years old).

**Hernia**, or *Rupture*, surgical term, signifying the protrusion of any part of the body from the cavity in which it should be contained. In popular language, a rupture means an extrusion of a portion of the contents of the abdominal cavity. A rupture may be present at birth, from the failure of closure of the cavity, as in the case of an umbilical H., when the navel is unclosed at birth. Again, ruptures may occur in early life, and are then known as infantile Hs. The opening of an infantile umbilical H. usually closes with age, the closure being generally firm and permanent. An umbilical H. may appear in fat individuals, particularly in females on account of pregnancy, and, if neglected, may attain an enormous size. Ruptures are generally due to weakness of the body wall, though they are more liable to occur in individuals who throw considerable strain on their abdominal walls, as, for example, those who do heavy work. Persons who are subject to bronchitis are apt to suffer from H., the condition being brought about by the strain of coughing. It may also be brought about at stool through excessive straining to empty the rectum, the position adopted being probably to blame. The most common form of H. occurs in the groin, through the failure of closure of the canal, i.e.

passages, in this region, or the reopening of these canals in later life. The first detectable sign of a H. is a swelling due to a bowel containing air or solid substance. Not infrequently, however, the first symptom is obstruction of the bowel. The term 'a twist of the bowel' may be due to this fact, because the twisting or blocking may occur at any moment and necessitate surgical interference. It is a common saying that a person with a rupture is in the condition of a man with a packet of gunpowder in his pocket, which may go off at any moment. The presence of a rupture may prevent admission to some forms of gov. employment, and in the case of insurance a considerably increased premium is required. In early life ruptures may close with the aid of a suitably made and fitted truss. In healthy individuals, when a truss fails to cure, operation is desirable, and if the truss cannot close the aperture, so as to retain the bowel in the abdomen, operation is necessary. As in these circumstances the operation is performed under favourable conditions, it differs from one undertaken from emergency and urgency, when the bowel is obstructed (twisted). This, the 'radical' cure, is in most cases, successful. A rupture may cause obstruction of the bowel, or the bowel may be strangulated, when a portion of its wall is gripped so tight that death of the gripped part, and of the patient, results.

Hernia (in horses), see under HORSE (DISEASES).

Hernici, It. people of Sabine origin, dwelling in auct. Latium in the Apennines between the Trerus and Lake Fucinus, about 60 m. from Rome. They made an equal alliance with the Romans in 486 B.C., remaining loyal till 362. They then rebelled, and though faithful during the Lat. revolt in 340, later joined the Samnites against the Romans, by whom they were subdued in 306 B.C. In 211 they received the rights of Rom. citizens. Anagnina was their cap. N. dwelt the Æqui and Marsi, and S. the Volsci.

Hernösand, seaport tn. of Sweden, cap. of the län of Västernorrland on the W. coast of the is. of Hernö, in the gulf of Bothnia. Pop. 12,000.

Hernö, see HERÖIC.

Hero and Leander, 'the Juliet and Romeo of the Dardanelles.' H. was the priestess of Aphrodite at Sestos. L., a beautiful youth of Abydos, saw and fell in love with her at a festival of the goddess. Guided by a lamp, L. swam across the Hellespont nightly to visit H., but one stormy night was drowned. In despair she cast herself from her tower and perished with him. The romantic poems of the Alexandrian period dealt with the tragedy.

Hero (Heron) of Alexandria: (1) Noted Gk. mathematician and writer, probably of the latter half of the first century A.D. He was especially skilled in geometry, mechanics, and pneumatics, and famous for inventing various machines and contrivances, such as 'Hero's Fountain,' a steam-engine, a water-clock, and other automata. H. discovered the formula

expressing the area of a triangle in terms of its sides—

$$\sqrt{s(s-a)(s-b)(s-c)}$$

( $a, b, c$  being the lengths of the sides,  $s$  the semi-perimeter). (2) H. the Younger (fl. seventh or tenth century A.D.), probably a Byzantine land-surveyor, or a philosopher and writer on astronomy and warfare.

Herod, or Herodes: (1) *Herod the Great* (c. 73 B.C.—4 B.C.), King of the Jews, so called from his great power and talents; became governor of Galilee in 47 B.C. After the death of Julius Caesar, he was made king of Judæa by Antony (40 B.C.), but only made himself master of Jerusalem after a prolonged siege. He rebuilt the temple with great magnificence, and erected a theatre and amphitheatre in the city, where games in honour of Augustus were celebrated. The N.T. tells how he ordered the massacre of the Innocents at Bethlehem, and of his dreadful death in 4 B.C. (Matt. II). (2) *Herod Antipas*, son of H. the Great, and appointed Tetrarch of Galilee on his father's death. He put to death St. John the Baptist because he censured H.'s marriage with his brother Philip's wife, Herodias. In A.D. 38 he tried to obtain the title of king, stimulated by the ambition of Herodias, but his nephew, Agrippa, prejudiced the Emperor Caligula's mind against him, and he was stripped of his dominions and exiled. (3) *Herod Agrippa I.*, grandson of Salome, sister of H. the Great. In A.D. 38 Caligula gave him the title of king and conferred on him the dominions of H. the Great. Thus was that H. who caused St. James to be put to death and St. Peter to be imprisoned. He died at Caesarea in A.D. 44. (4) *Herod Agrippa II.*, son of the foregoing. He was reduced to a Rom. prov. on his father's death, being too young to govern Judæa, and later was made superintendent of the temple at Jerusalem, and had the power of nominating the high priests. He lived a good deal in Jerusalem, but was driven from the city in the revolt which ended so fatally for the Jews. In the war (A.D. 67) he took the Rom. side, joining Cestius, the Rom. commander. He rendered great services to Titus during the siege of Jerusalem, and after its capture in A.D. 70 returned to Rome, where he is said to have died about A.D. 100. With him terminated the Herodian line. See O. Noldius, *History of Herod the Great*, 1764; H. Willrich, *Das Haus des Herodes*, 1928.

Herodas, or Herondas, Gk. poet of the third century B.C., belonging to the Alexandrian school. He was a writer of mimes, realistic dramatic scenes of everyday life, much in the style familiar from the celebrated *Idyll*, *Gorgo* and *Præcinæ* of Theocritus, of whom he was a younger contemporary. They are written in racy Gk. and in a curious limping metre, suitable to the talk of ordinary people, such as a schoolmaster, temple attendant, shoemaker, mistresses and their slaves, etc. Though H.'s name had long been known, fragments only had survived till the

discovery in 1891 of a papyrus MS. in El Fayum, Egypt. The mimes are vivid clean-cut sketches in dialogue, some 100 lines each in length frequently coarse but obviously drawn with unflinching realism from life. The parody of a scene in a Gk. court of law, mime II., the little servant-maid's tactful wit, mime, V., are good examples of H.'s powers. The MS. was ed. by Sir F. G. Kenyon, 1891. See also eds. by O. Crusius, 1905; by J. A. Naïm, 1904, the latter with notes introduction, etc., and verse trans. by H. Sharpley in *A Realist of the Aegean*, 1906.

**Herodes Atticus**, see ATTICUS HERODES.

**Herodian**, or **Herodianus**, Gk. historian of the third century A.D., author of a hist. of the Rom. empire from the death of Marcus Aurelius to Gordianus III., A.D. 180-238. Little is known of his life except that he held subordinate office in Rome, A.D. 203. His work is valuable as a contemporary continuation of the hist. of Dion Cassius, but his omissions, e.g. of the growth of Christianity, etc., are striking.

**Herodians**, political party of Jews, who were adherents of the Idumaeu dynasty and warm supporters of Herod the Great. In the N.T. they are mentioned with the Pharisees as being hostile to Jesus (Mark iii. 6; Matt. xxii. 6). They were also called Boethusians by the rabbis because they were friendly to the family of Boethus.

**Herodotus** (c. 484-c. 425 B.C.), Gk. historian, sometimes called the 'father of history', b. at Halicarnassus, a dependency of Persia in Asia Minor. He was the son of Lyxes and Hecae (or Dryo), and the nephew of the epic poet Panyasis, who was put to death by the Persian tyrant, Lygdamis, on a charge of treason (c. 457). About the year 464 he left Halicarnassus and travelled in Greece and in foreign countries. He visited Athens Corinth, and Thebes, and other great cities of Greece and the important is. of the archipelago. He also journeyed through Macedonia and Thrace to the shores of the Black Sea, and travelled inland to Susa, the cap. of Persia, Babylon, and then southwards to the auct. city of Tyre through Palestine to Egypt. He also visited S. Italy and Sicily, but the dates of his various journeys are quite uncertain. H. thus had a personal knowledge of the countries of which he wrote. On his travels he collected a great amount of geographical, ethnological, and archaeological knowledge, of which he made such excellent use in his hist. We know very little with certainty about the facts of his life. It is probable that he resided in the is. of Samos about 457, thus putting himself under the protection of Athens. After six or seven years he returned to Halicarnassus, and, according to Suidas, took an active part in the expulsion of Lygdamis. He became a member of the Athenian confederacy, but about 447 went to Athens in the hope that his writings would be more appreciated there than they had been in his native place. In 445 he was voted a sum of ten talents (£2400) as an acknowledgment of his genius. In 443 he assisted in the foundation of the

Athenian colony of Thurii, of which he became a citizen, and where he probably died. The early books of his hist. describe the rise and growth of the two kingdoms of Greece and Persia. Books V. to IX. relate the hist. of the two great wars of the Persian invasion. His style is very discursive, and he expatiates with great charm on the climate and geographical features of the various countries he touches upon, as well as upon the manners and customs of the strange people who inhabit them. His hist. has always been praised for its style, which owes its attraction partly, no doubt, to the fact that it was written primarily for recitation. Its voracity has not infrequently been questioned. With regard to auct. hist. he was no doubt very credulous, but his account of the two Persian wars is accepted as the great authoritative version by all modern historians. He was very diligent in collecting materials for the early part of his hist., but lacked judgment. This hist. was first trans. into Eng. by Littlebury in 1737. Canon Rawlinson's trans., 1858-60, has many valuable annotations. The best eds. of the text are those of H. Stein, 1869-71, A. H. Sayce, 1883; R. W. Macan, *Herodotus*, (iv.-vi., 1895; vii.-ix., 1908); O. Hude, 1908; and A. Godley (with Eng. trans.), 1921-24. See J. Rennell, *Geography of Herodotus*, 1800; J. B. Bury, *Ancient Greek Historians*, 1908; W. How and J. Wells, *A Commentary on Herodotus*, 1912; and A. W. Lawrence, *Herodotus: Rawlinson's Translations, Revised and Annotated*, 1936; J. E. Powell, *Herodotus*, 1939, 1949.

**Heroic**, having the qualities of a hero. In classical mythology a hero was something between a god and a man, not quite equal to the former, but raised above the latter by his superior strength, courage, and intelligence. The qualities that go to make a hero may be divided into two classes, the physical and meta-physical. In auct. times the former alone were taken into account; a man who possessed great physical strength and courage coupled with daring and determination was H., whether in other respects he was good or bad, so that in older times the majority of heroes were warriors. In later times it came to be understood that certain other qualities also went to the making of heroes, and moral courage and integrity were held to be the attributes of heroes equally with physical courage and daring. So that on one hand we have the heroes who have won the coveted title by their superior physical qualities, their courage, fortitude, and daring, and on the other, those who may be devoid of all the great physical qualities, but who possess moral courage, fortitude, and determination beyond their fellows, and who are equally, if not more, worthy of the title.

**Heroic Play**, The, critical term, originating in Dryden, applied to the tragedy of the Restoration period. The chief characteristics of the heroic drama are strict observance of the unities, and careful adaptation of Fr. models, largely from Corneille and Molière. It has a marked

tendency to long rhetorical and declamatory speeches, and its vehicle is the heroic couplet. The link with the Elizabethan drama is Davenant, whose *Albion* (1629) possesses all the characteristics of the heroic drama except the heroic couplet. In his preface to the *Conquest of Granada*, 1670, Dryden asserts that 'an heroic play ought to be an imitation in little of an heroic poem, and consequently that love and valour ought to be the subject of it.' Dryden was the chief exponent of the H. P., which had its vogue between 1660 and 1680. His chief plays of this sort are: *The Indian Queen* (1661), *Tyrannic Love or the Royal Martyr* (1669), *The Conquest of Granada* (1670), and *Aurungzebe* (1675). In the last-mentioned play, Dryden confessed himself 'weary of his long-loved mistress, Rhyme,' and henceforth devoted himself to blank-verse tragedy. In 1671 the duke of Buckingham and other wits had parodied the H. P. in a delightful burlesque, *The Rehearsal*. Heroics, however, still flourished, until the great craftsman, Dryden, deserted rhyme for blank verse. Nevertheless, the H. P. had not entirely disappeared by the end of the century. See J. Maidment and W. Lozan, *Dramatists of the Restoration*, 1873, and W. Ker, *Essays of John Dryden*, 1900.

**Heroic Verse**, in prosody, is applied to rhymed iambic couplets, often called heroic couplets. It was first used by Chaucer in the *Legend of Good Women*. It attained its most polished form with Dryden and Pope, but has since been used with great freedom by Byron, Keats, Swinburne, and others.

**Heroin**, or **Diacetylmorphine**, drug obtained from morphine and administered by injection. Acts in much the same way as morphine, but on account of its special influences on the nervous system of the breathing apparatus it is used to relieve paroxysms of coughing. The drug habit is sometimes so acquired. In 1931 the Conference on the Control of Narcotic Drugs drew attention to the highly dangerous character of H. as a drug of addiction, and the Permanent Opium Board in 1949 pub. a report which noted 'an alarming increase' in its use.

**Herold**, Louis Joseph Ferdinand (1791-1833), Fr. musician and composer, b. in Paris, son of an accomplished pianist (a pupil of C. P. E. Bach). He studied at the Paris Conservatory, under Mehul, and in 1812 gained the Grand Prix de Rome with a cantata, *La Duchesse de la villure*. He then went to Italy and also visited Vienna. His first opera was *La Gioconda di Enrico V.*, first produced at Naples (1815) with moderate success. In Paris he collaborated with Boieldieu in writing an opera entitled *Charles de France*. His first Fr. opera was *Les Rosieres* (1817) which had a good reception. This was followed by many other works, of which the best known are: *Zampa* (1831), which was immensely successful in France and also in Germany, where it is considered his masterpiece; and *Le Pré aux Clercs* (1832), a graceful and lively work. Other works include the operas *La Clochette*

(1817) and *Marie* (1820); and the ballets *La Fille mal gardée* (1828) and *La Belle au bois dormant*. See B. Jouvin, *Héroid, sa vie et ses œuvres*, 1868.

**Heron**, name given to the species of ciconiiform birds belonging to the family Ardeidae; they are characterised by long necks and legs, slender bodies, and beautiful plumage. They frequent lakes, fens, and the mud-flats found on sandy shores, where they wade into the water and often stand ankle-deep for a considerable time, searching for prey; they capture fish, molluscs, worms, etc., by spearing them with their long bill, and their appetite seems insatiable. Hs. nest on trees, bushes, ivy-covered rocks, or reeds, making a loose fabric of sticks lined with grass, leaves, etc.; they lay greenish or drab-coloured eggs, varying in number from two to seven with the different species. *Ardea* is the largest genus, and its distribution is worldwide; *A. cinerea*, the common European H., is found also in Africa, Asia, Japan, and Australia; white Hs., or egrets, are generally smaller than other species, *A. garzetta* being the smallest of all; this beautiful bird, which is called the little egret, has long filamentous plumes and two lengthened crest feathers, which are said to be temporarily lost after breeding; this species is occasionally found in Britain; *A. alba*, the great white H., ranges from Central Europe to Africa and Asia; *A. occidentalis*, the white H. of Florida, is an even larger bird; *A. goliath*, probably the largest of all species, has a reddish head, neck, and under-surface. The genus *Nycticorax*, or night Hs., are remarkable for the long, occipital feathers, blackish or white in colour, which are lost for a time after breeding; the species vary greatly in colouring, *N. griseus*, which occasionally visits Brit. shores, being greenish-black. *Polarus*, the bitterns, and *Balanicaps*, the snobills, belong to the same family as Hs.

**Heron**, **Boatbilled**, see **BOATHILL**.

**Herondas**, see **HERONAS**.

**Herophilus** (335-280 B.C.), physician, who was founder of one of the earliest schools of medicine in Alexandria. He was a Gk. of Chalcedon and a follower of Hippocrates, and was famous for his researches in anatomy, though he seems to have been equally killed in the use of drugs. See C. F. Marx, *Herophilus*, 1838.

**Herostratus**, Ephesian, who so hungered for notoriety that on the night of the birth of Alexander the Great (356 B.C.) he set fire to the temple of Artemis at Ephesus.

**Herpes**, see **SINGLEES**.

**Herpetology** (Gk. *ἑρπῆς*, a reptile, and *λόγος*, speak), science which treats of reptiles, their habits, structure, and distribution; it is sometimes extended to include certain amphibians, such as the Batrachia. See also **UNDER REPTILES**.

**Herpeton**, see **ERPETON**.

**Herrera**, vil. in the dist. of Estape and prov. of Seville, Spain. Pop. 5900.

**Herrera**, Fernando de (c. 1534-97). Sp. lyrical poet, known as *El Divino* (the Divine), b. at Seville. He had a profound admiration for the It. poets and took a

large share in introducing their metrical systems into Spain. His odes, especially those on the Battle of Lepanto and Don John of Austria, and his elegies on King Sebastian of Portugal and Sir Thomas More, are marked by grandeur, melody, and profundity, and entitle him to rank as the greatest of Andalusian poets. All his works are printed in the *Biblioteca de autores españoles*, xxxii. See A. Lasso de Vega, *Historia de la Escuela Poética Sevillana*, 1876, A. Morel Fatio, *L'Hymne sur Lepante*, 1893, and R. Marín, *El Divino Herrera y la Condesa de Gelves*, 1911.

**Herrera, Francisco de** (1576-1656), surnamed *El Viejo* (the Elder), Sp. historical and fresco painter, b. in Seville. He was a man of such violent temper and coarse manners that neither his children nor pupils would remain with him, although both his son and Velasquez learnt from him his energy of design and bold, vigorous touch. His skill as a worker in bronze led to his being accused of coining false money, and he sought refuge in the Jesuits' College, Seville, which he adorned with his celebrated 'St. Hermengild in Glory,' and which won him the pardon of Philip IV.

**Herrera, Francisco** (1622-85), surnamed *El Mozo* (the Younger), to distinguish him from his father 'El Viejo,' b. at Seville, from which he fled to Rome on account of his father's cruelty. He became renowned for his pictures of still life, flowers, fruit, and fish. He also painted frescoes, and, in later life, portraits. On his return to Seville he became sub-director of its academy under Murillo (1660). His best picture is, perhaps, the 'San Francisco' in Seville Cathedral. His 'Assumption of the Virgin' in the Atocha church in Madrid, won for him the title of painter to the king.

**Herrera y Tordesillas, Antonio de** (1519-1625), Sp. historian, b. at Cuellar, Segovia, Spain. He became secretary to Vespasian Gonzaga, who commended him to Philip II. of Spain, by whom Herrera was appointed historiographer of the Indies and of Castile. His most valuable work is *Historia general de los hechos de los Castellanos en las islas y tierra firme del Mar Océano* (Madrid, 1601-15, trans. into Eng., 1740). He also wrote *Historia general del mundo del tiempo del Señor Rey Don Felipe II.* (1601-02). See W. N. Prescott, *Conquest of Mexico*, ii., 1843 and E. Fueter, *Geschichte der Historiographie*, 1936.

**Herrera**, see LA UNION.

**Herreros**, see HERERO.

**Herrick, Robert** (1591-1674), Eng. poet, b. in Chappide, London, was the son of a London goldsmith. In 1607 he was apprenticed to his uncle, one of the richest goldsmiths of the time, and during his apprenticeship joined the band of poets and wits who surrounded Ben Jonson. In 1614 he was entered as a fellow-commoner of St. John's College, Cambridge, and subsequently removed to Trinity Hall and took his degree of Bachelor of Arts in 1617 and of Master of Arts in 1620. Returned to London for a short time to resume the life of a fashionable

wit about court or in the Mermaid Tavern (q.v.). Some time before 1627 he must have taken holy orders for in that year he sailed as chaplain to the expedition to the Isle de Rhé. From 1629 to 1648 he was vicar of Dean Prior, near Totnes, Devonshire, where he wrote his immortal lyrics of the countryside and rural customs. He was ejected by the Puritans, but returned to Dean Prior in 1662 and died there. Some poems of his were pub. in 1635, but it was not until 1648 that he pub. the *Hesperides: or the Works both Humane and Divine of Robert Herrick*. His 'divine' poems ring less true than the 'human' ones, which, written partly under the influence of Ben Jonson, but chiefly modelled on the pagan poets, possess an exquisite lyric quality, and place him at the head of Eng. pastoral lyricists. Among his most famous lyrics may be mentioned 'Bid me to live,' 'Gather ye Rosebuds' and 'Cherry Ripe.' The most delightful of hedonistic clerics, H. loved to represent himself as a Rom. priest uttering orisons to Jove or paying vows to Mars and Neptune and adding to this conceit, a company of mistresses who, when occasion demands, don the chaplet of priestesses and bury him with due classic rites. H.'s poetry reflects the frank hilarity of the Golden Age unpreoccupied with desire and therefore unafraid of it (John Buchan). He is happiest in themes which admit of quasi-classical treatment but his religious verse for the most part is inferior to that of Herbert and Henry Vaughan. Complete works ed. by W. G. Hazlitt, 1869, 1890; collected poems ed. by G. Saintsbury, 1903; L. Magnus, 1899; F. W. Moorman, 1915, 1921; and H. Wolfe, 1928. See F. W. Moorman, *Robert Herrick*, 1910; L. Mandel, *Robert Herrick, the Last Elizabethan*, 1927; E. Blundon, 'Herrick,' in *Twelve Tablets*, 1931; E. L. M. Easton, *Youth Immortal*, 1931; *A Life of Robert Herrick*, 1936.

**Herricks, Sir John Maxwell**, fourth Baron (c. 1512-83), Scottish politician, was the second son of Robert, fourth Lord Maxwell. In early life he was a supporter of the Reformed party and a friend of John Knox, but in 1566 he cast in his lot with Mary and joined her at Dunbar. He led her cavalry at Langside (see Sir Walter Scott's *Abbot*) and rode with her into England in 1568. On his return to Scotland he laboured in Mary's cause and was imprisoned by the Regent Murray. In 1578 he was concerned in the plot for depriving Morton of the regency, and after Morton's death in 1581 was closely allied with the Regent Lennox in his schemes for Mary's release. For his own version of his political conduct see his *Historical Memoirs* printed by the Abbotsford Club in 1836.

**Herrin**, post tn., Williamson co., Illinois, U.S.A., 7 m. N.W. of Marion. It is served by three railways, has coal mines, foundries, saw mills, a powder plant and machine shops. Agriculture and dairying are also carried on. Pop. 9300.

**Herring** (*Clupea harengus*), fish which resembles the pilchard both in habits and in shape, but which is found further N.

In size it is moderately small, and has thin, silvery scales which do not extend to the head, small teeth and open gills. It has only one dorsal fin and one short ventral, and there are no spines in the fins. It keeps close to the surface of the sea, swimming high in the water. The lower edge of the H. is flattened, and covered with bony plates varyingly sharp or serrated. It feeds like the whale by straining the water through its long gill-rakers, which form a dovetailed screen

capable of arresting the copepoda. It deposits its eggs on the bottom, which hatch out adhering in masses to stones and weeds. Its colour varies between a not very pronounced green and blue, and its scales detach when the fish is roughly handled. It is a coldwater fish, and develops to a larger size in more N. lat. In the Channel it averages 12 in.; in parts of the N. Sea it reaches a length of 17 in. Those caught off the Brit. Isles are smaller than those caught off Iceland, these latter being large and coarse. Hs. are usually caught by drift-nets, but the hook and line is sometimes used, and the 'jigger' is often employed on the Scottish coast. Hs. take about two years to reach maturity, their silvery scales appearing when they have grown to a length of about 1' in. The number of eggs deposited by the female varies from 20,000 to 50,000, and the eggs are opaque and have a thick adhesive envelope. This fish is found in large quantities off the shores of the Brit. Isles, as well as along the E. border of N. America, up to the coast of Behring Strait, and is known in the White Sea of Russia and down the coasts of Norway and Denmark, and in the sea of Japan, but it is not found in the Mediterranean. It is essentially a migratory fish, never remaining in any dist. for more than a few days, and is not influenced in this by latitude or climate, for often it is earliest in the further N., and in others the reverse. The spawn is shed twice in the year, of which that of the autumn is the

more conspicuous; but the season of either of these is often extended or delayed beyond the regular time. Hence, great vigilance, patience, and skill are needed in the capture of this fish. Hs. formed an important source of income in ancient times, and have been used as food from time immemorial. The H. is rich in easily digestible oil: factories have been estab. for its extraction and preparation for human use. See also FISHFRIES, SEA.

Herring-bone, term used in architecture to describe an arrangement by which bricks, stones, wood-blocks, etc., are laid diagonally. Generally speaking, the members all make an angle of forty-five degrees with the general direction of the row, and are at right angles to the members of the row next to them.

Herriot, Edouard, fr. statesman; b. 1872, at Troyes (Aube). Prof. of rhetoric at Nantes; then at Lyons—where he became councillor, 1901; mayor from 1905 (frequently re-chosen). In 1910, councillor for dept. of Rhône; in 1912, senator. Led radical-socialist party. Premier, May 1921 till April 1925. Elected president of Chamber of Deputies. Secured defeat of Briand Gov., July 1926; formed a ministry that lasted two days, and fell on account of an acute crisis in Treasury. Entered new ministry, formed by Poincaré, as minister of public instruction, but in 1928 his party compelled him to withdraw. In 1932 he was again Prime Minister, and from 1934 to 1936 minister without portfolio; in 1935 he left the Radical-Socialist Party, but was re-elected in 1935. H. was president of the Chamber 1936-40. He was deported by the Gers in 1943. In 1946 he was again elected president of the chamber. Works: *Philon le Jusf* (1897, crowned by Academy); *Mme. Récamier et Ses Amis* (1904); *Précis de l'Histoire des Lettres Françaises* (1905); *L'agr* (1917); *Créer* (1919); *La Russie nouvelle* (1922); *La Forêt Normande* (1925); *Lyons n'est plus*, 1792-96 (Lyons during the Fr. Revolution 1927-1940); *Sous l'Oliver* (1930); *The Well-springs of Liberty* (1946).

Herrnhut, tn. in Saxony, Germany, 18 m. S.E. of Bautzen. It is chiefly noted as the headquarters of the 'Herrnhuter', a branch of the Moravian Brethren, founded here in 1722. Before the Second World War, in which it suffered great destruction, it had manufs. of linen, paper, and tobacco. Pop. 1500.

Herschel, vil. and dist. in Cape Prov., S. Africa, the vil. lying 30 m. E.N.E. of Aliwal N. The dist. has an area of about 800 sq. m. and is bounded on the N. by the Orange R. Pop. 40,000 (white pop. 50).

Herschel, Caroline Lucretia (1750-1848), sister of Sir Wm. H., whom she assisted in his astronomical observations, b. in Hanover. She lived with her brother at Bath from 1772, and acted as his assistant when he was appointed astronomer-royal. Between 1780-97 she discovered eight comets, five undoubtedly unobserved before, and many of the smaller nebulae and star clusters included in her brother's catalogue were her discoveries. In 1798

she pub. for the Royal Society *Catalogue of Five Hundred and Sixty-one Stars observed by Flamsteed*. In 1728 the Astronomical Society awarded her their gold medal, and elected her an honorary member in 1835. When her brother Wm died she returned to Hanover and began, at the age of seventy-five, to catalogue all the heavenly bodies observed by him. See Mrs John Herschel, *Memoir and Correspondence of Caroline Herschel*, 1876.

Herschel, Sir John Frederick William (1792-1871), Eng astronomer, son of Sir Wm II, b at Slough, Buckinghamshire, and educated at Eton and St John's College, Cambridge, where he graduated as senior wrangler and Smith's prizeman in 1813. He entered his name at Lincoln's Inn in 1814, but took up astronomy in 1816, when he trans S K Lacroix's *Elementary Treatise on the Differential Calculus*, with an appendix on 'Finite Differences', succeeded by two vols of *Examples* in 1820. In 1821 he was appointed Copley medalist by the Royal Society. From 1825 to 1833 he was engaged, with Sir James South, in revising the nebulae and star clusters of his father's catalogues. In 1834 he estab an observatory at Field House, near Cape Town, where he spent four years in a review of the S heavens, the results of which were pub in 1847 as *Results of Astronomical Observations made at the Cape of Good Hope*, etc, one of the most important astronomical works of the nineteenth century. He was appointed master of the Mint from 1830 to 1855. He was the inventor of various astronomical instruments, sensitised paper and the use of hyposulphite of soda for fixing in photography, and he made valuable researches on the undulatory theory of light. His miscellaneous essays were pub in 1857, and *Familiar Lectures on Scientific Subjects* in 1867.

SIR WILLIAM HERSCHEL

Engraved by J. Scriven from a crayon drawn by J. Ross II

Herschel, Sir William (1738-1822), Eng astronomer, b. in Hanover. He was educated as a professional musician, and when

he came to England in 1757 taught music in Leeds, Halifax, and other N tns. In 1766 he was appointed organist at the Octagon Chapel, Bath. At Bath he turned his attention to astronomy, and, with the aid of his sister and a new telescope which he constructed for himself, began his survey of the heavens. In 1781 he discovered a new planet, the Georgium Sidus (since called Uranus), and sev. of its satellites. In 1782 he was appointed private astronomer to George III, and went to live at Slough, where he continued the observations, discovering two of the satellites of Saturn, the phenomenon of the motion of the double stars round one another, the periods of rotation of Saturn and Venus, the constitution of nebulae, and much interesting matter about the Milky Way. In 1783 he pub his *Motion of the Solar System in Space*. He received the Copley medal in 1781. In 1789 he erected his famous telescope of 40 ft. focal length and 4 ft. aperture. See L S. Holden, *William Herschel his Life and Work*, 1884; J. Sims, *William Herschel and his Work*, 1900; J. L. E. Dreyer, *A Short Account of Sir William Herschel's Life and Work*, 1912.

Herschell, Sir Farrer Herschell, Baron (1837-99), lord high chancellor of Great Britain, b at Brampton, Hampshire. In 1860 he was called to the Bar and joined the N circuit, in 1872 he was made Queen's Counsel. He was recorder of Carlisle (1873-80), member of parliament for Durham (1874-85), and Solicitor General (1880-85). In 1886 he was lord chancellor for six months, falling with Gladstone's administration in that year, but returning to the Woolsack with the Liberal administration (1892-95). He was appointed a member of the Anglo-Venezuelan Arbitration Commission in 1898, but while at Washington met with an accident which proved fatal. See J B Altev, *The Victorian Chancellors*, 1906-08.

Hersfeld, Bad, tn in Hessen, Germany, on the River Fulda, 24 m NNE of Fulda. It was famous for its Benedictine abbey founded by Lullus, 763 AD, and secularised in 1644. It is noted for manufs of cloth, leather, and machinery. Saline springs are found here. Pop. 1,400.

Herstal, tn of Belgium and suburb of Liège, 4 m to the NE of that city, on the Vesdre. It is the seat of the Belgian small arms factory and cannon foundry, and has coal mines, manufs of iron and steel. It is the reputed bp of Pepin le Gros. It also claims to be the bp of Charlemagne. Pop. 27,200.

Herstmonceaux, see HURSTMONCEAUX.

Herten, tn, Westphalia, Germany, 15 m WNW of Dortmund. Pop. 35,000.

Hertford ('ford of harts'), municipal bor and co tn of Hertfordshire, is situated on the R Lea about 21 m N of London and 2 m from Ware. It is essentially an agrk tn, and is noted for its corn mkt, but it has no manufs of importance. The 'harts ford' is probably the origin of the name of this tn, and in Saxon times it was a place of importance. It was reduced by the Danes sev times,

and the wall of the castle built by Edward the Elder still remains. Haileybury College, founded in 1806 by the E. India Company as a training school for its civil service, and which is now a public school, is situated 2 m. from this tn. Pop. 13,800.

**Hertford College, Oxford**, in its present form is a modern foundation. Between 1283 and 1300 Elias of Hertford acquired one of sev. halls which stood on the site and which became known as Hart Hall. In 1312 it was bought by Bishop Stapleton, the founder of Exeter College, on which college it was dependent until the second half of the sixteenth century. In 1710 Richard Newton became principal and, in spite of strenuous opposition, succeeded in obtaining a charter to estab. Hertford as a college in 1740. It lapsed in 1803 and the buildings were acquired by Magdalen Hall, which was itself dissolved in 1874, when its principal and scholars were incorporated as part of the new Hertford College.

**Hertfordshire**, or **Herts**, inland co. of England, bounded on the N. by Cambridgeshire, on the E. by Essex, on the S. by Middlesex and on the W. by Buckinghamshire and Bedfordshire. The surface is hilly, but there are some fine pasture lands and picturesque parks and woods. It belongs mainly to the Upper Cretaceous rocks, which give place in the S. to the London clay. The prin. rivs. are the Lea, the Colne, and the Wel, and the Grand Junction Canal passes through a part of the co. The chief industry is agriculture, and in addition to grain of a choice quality, hay, vegetables and numerous fruits are grown for the London mkt. There are a few manu., straw-plait, silk and paper, together with brewing, tanning, parchment-making, brick, tile, earthenware making, being the chief. The only mineral of importance is brick-earth. In 896 a battle took place in this co. between Alfred and the Danes, and in the Wars of the Roses the battles of St. Albans and Barnet were fought here. It is divided into six parl. divs., Hemel Hempstead, Hitchin, Hertford, St. Albans, Watford and S.W. Herts. one member for each div. and one bor. constituency, Watford. Pop. 367,000.

**Hertha**, or **Nerthus**, in Teutonic mythology was the goddess of fertility, 'Mother Earth.' Tacitus describes her worship, the chief seat of which has not been identified.

**Hertling, Georg Friedrich**, Count von (1843-1919), Ger. Chancellor; b. at Darmstadt; son of Jakob, Baron von H. Began as an ultramontane teacher at Bonn; Extraordinary Prof. of Philosophy, 1880; Ordinary Prof., 1882. He was by that time a member of the Reichstag, and he ultimately became leader of the R.C. Centre Party. When Michels was dismissed the Chancellorship, Kaiser Wilhelm made H. Chancellor, Nov. 1, 1917. His period of office covered Germany's most successful time in the First World War. He resigned Sept. 30, 1918. Wrote sev. philosophic works of a Neo-Thomist kind. See his autobiography, *Erinnerungen aus meinem Leben*, 1919-21, and

A. F. Eickhoff, *Hertling als Sozialpolitiker*, 1932.

**Hertogenbosch** (Bois-le-Duc), city of Holland, cap. of the prov. of N. Brabant, situated at the confluence of the Aa and Dommel, 28 m. S.S.E. of Utrecht. The city is well built and is crossed by sev. canals. In St. John's church (founded in the early fourteenth century) H. has one of the finest medieval churches in Holland. There are sev. other churches, a fine tn.-hall, an episcopal palace, a court-house and gov. buildings which were formerly a monastery. H. had its origins as a hunting-lodge of the dukes of Brabant, it gradually increased in importance and in 1154 was raised to the status of a tn. and fortified with walls. In the mid-fifteenth century it was considerably enlarged. Numerous abortive attempts were made by the Netherlands to get possession of the tn. in the sixteenth and seventeenth centuries, but at length in 1629 it was taken after a five-months' siege. It fell to France in 1794; to the Prussians in 1814; and after Ger. occupation in the Second World War, to the British forces in the autumn of 1941. Pop. 53,000.

**Hertwig, Oskar** (1819-1922), Ger. anatomist and embryologist; b. at Friedberg in Hesse. Prof. of anatomy, Jena, 1878; at Berlin, 1888. In 1876 pub. *Beiträge zur Kenntnis der Bildung, Befruchtung und Theilung des tierischen Eies*, which for the first time explained the mechanism of fertilisation. His other works include: *Die Zelle und die Gierthe* (1893-1895), and *Zeit- und Streitfragen der Biologie* (1894-97).

**Hertz, Heinrich Rudolf** (1857-91), Ger. physicist, b. at Hamburg. He was intended for the profession of engineering, but deserted it to study experimental and mathematical physics under Von Helmholtz in Berlin. For the best solution of the problem of electric inertia he won the univ. prize, his paper, *Kinetic Energy of Electricity in Motion*, being pub. in 1880. In 1883 he was privat dozent (or adv. teacher not belonging to the professional staff) at Kiel, and from 1885 to 1889 prof. of physics in the Karlsruhe Polytechnic where he made his remarkable experiments on electric waves based on Maxwell's theory of electricity and magnetism, for which the experimental proofs had been lacking hitherto. The result of his experiments was to prove beyond a doubt that ordinary light consists of electrical vibrations in an all-pervading ether which possesses the properties of an insulator and of a magnetic medium (*Hertzian Electric-Magnetic Waves*). The apparatus which he invented for the purpose was an electric resonator which could pick out and make evident the oscillations of electric discharges which take place under certain conditions, as demonstrated by Kelvin. Having proved that these electric waves existed, he proceeded to show that they could be reflected, refracted, polarised, and diffracted just as light is, and he measured the velocity of propagation and found it to be of the same order as that of light and of radiant heat. The results of his observations have been employed for

the practical purposes of signalling over considerable distance (see *WIRELESS TELEGRAPHY*). His papers have been trans. into Eng. by Prof. D. E. Jones, and pub. as *Electric Waves* (1893), *Miscellaneous Papers* (1896), and *Principles of Mechanics* (1899). See Sir O. Lodge, *Hertz and his Work*, 1895.

Hertz, Henrik (1798-1870), Dan. poet, b. of Jewish parents at Copenhagen. He passed his final examination in law in 1825, but the literary instinct in him was too strong, and in 1826 he pub. his first play. His *Amor's Strokes of Genius* (1830), a comedy in rhymed verse, was a complete novelty in Dan. literature, and his *Gengangerbreve* (Letters from a Ghost, pub. in the same year) is one of the best satires in Dan. His romantic national drama, *Scend Dyrings His* (1837), is one of his finest works, while *Kong Rens Datter* (1845) has been trans. into almost every European language (Eng. trans. 1850 by Sir Theodore Martin). His comedy, *Fyltedagen*, appeared in 1828, and his beautiful lyrics were collected in 1857-62. His *Dramatic Works* (18 vols.) were pub. 1854-73. See monograph by H. Kyrré, 1916.

Hertz, Joseph Herman (1872-1946), Jewish chief rabbi; b. at Hebrin in Czechoslovakia (then in Hungary); son of Simon H., Hebraist. Emigrated as a child to Amer. He was educated at the College of the City of New York, Columbia Univ. (Ph.D.), and the Jewish Theological Seminary, New York. Rabbi of the Congregation Adath Jeshurun at Syracuse, New York, 1894-98. Then he became rabbi of Witwatersrand Old Heb. Congregation, Johannesburg, Transvaal. From 1906-08 he was prof. of philosophy at the Transvaal Univ. College. Expelled by Boers as pro-Brit. during S. African war; returned when Brit. were in occupation. In 1913 became chief rabbi for the Brit. Empire. In Zionism H. belonged to the *Mizrachi* or orthodox party; and he was president of the *Mizrachi* Federation of Great Britain and Ireland. A consistent Zionist he was, however, never prominent in the movement, but as an Anglo-Jewish leader he was consulted by the Gov. when the Balfour Declaration (q.v.), was in preparation. Of his many writings that which will endure the longest is probably his anthology, *Book of Jewish Thoughts*, compiled for Jewish sailors and soldiers in the 1914-18 war, (the 21st ed. being pub. in the 1939-45 war). Also his trans. and commentary on the Pentateuch with portions from the Prophets will also last. Other works include: *The Ritual System of James Martineau* (1894), *Backya, the Jewish Thomas a Kempis* (1898), *The Jew as a Patriot* (Johannesburg, 1898), *The Jew in South Africa* (1903), *The 'Strange Fire' of Schiam* (1914), *Affirmations of Judaism* (1927), *Ancient Semitic Codes and the Mosaic Legislation* (1928), *Battle for the Sabbath of Genera* (1932).

Hertzberg, Ewald Friedrich, Count (1785-95), Prussian statesman; b. at Lottin, Farther Pomerania, of noble family. In 1763 he became secretary of

state for Foreign Affairs. He made the treaty of peace with Russia and Sweden in 1762, and carried out many other important negotiations—including a treaty with the U.S.A., 1785. His policy was anti-Austrian, and he favoured limited monarchy. Few were more constantly attendant on Frederick the Great during his last days. Frederick Wm. II., on his accession, made H. a count, Sept. 1786; but H. disagreed with the king's policy, and was dismissed in 1791. H. was exceedingly crude—wrote on hist., statistics, and political systems; and from 1786 was curator of the Academy, to which he endeavoured to give a more Ger. character.

Hertzog, James Barry Munnick (1866-1912), S. African general and statesman, b. at Wellington, Cape Province, son of a farmer. Educated at Victoria College, Stellenbosch, and at Amsterdam Univ. Became an advocate at Bloemfontein; judge of the Orange Free State, 1895. Commanded Boer forces of S.W. div., S. African war, 1899-1902, and, on behalf of the Free State, was one of the signatories of the treaty of Vereeniging, 1902.

Zadik's Studios

GENERAL HERTZOG

On the grant of responsible gov. to the two ex-republics in 1906, he became the political leader of the Dutch in the Free State and was always very slow in becoming reconciled to Brit. rule. As minister of justice in the first gov. of the Union of S. Africa, his bitter speeches steadily fanned the embers of racialism, and he vehemently opposed all schemes of immigration and Brit. settlement. In 1912 Botha, who had pursued a policy of reconciliation with Britain, reconstructed his cabinet and omitted H. Henceforth it was an open feud—Botha and Smuts versus H., and the Free State to a man supported H., who now launched the new

Nationalist Party there with secession from the Empire as its main plank. In 1914-18 he stood out against co-operation with Britain, but, being convinced of the impracticability of rebellion, he tried to induce De Wet and Beyers to abstain from it. In the election of 1924 the Nationalist-Labour alliance defeated the rival combination led by Smuts and H. became Prime Minister and minister of native affairs. But he now seemed to have abandoned secession though he declared that the sole link between the Dominions and Great Britain was the personal bond of a common king—a declaration which he signed at the Imperial Conference of 1926. His chief concern in office was now to advance the controversial policy of 'segregation' of the natives and to this period belongs the Nationalist determination to eliminate the Union Jack as the national flag of S. Africa. In 1929 he was returned again with a small majority over all other parties and in 1930 attended the Imperial Conference of that year, declaring on his return that he had now 'done with a republic and republicanism.' He was again in London for the celebration of the silver jubilee of King George V. In 1933, as leader of the Nationalists, he joined forces with Gen. Smuts, leader of the S. African Party, to form a United Party, and his utterances gave the impression that he would stand with the empire in the event of war; but in 1939, when war broke out, H., as Prime Minister, declared for neutrality. He was, however, defeated on a vote of confidence and resigned in favour of Smuts. From that moment his career waned. He now, however, tried to justify Nazi policy and called on Smuts, in 1940, to withdraw from the war and make a separate peace. This aroused great anger in S. Africa and in Nov., 1940, he resigned from the 're-united' Nationalist Party a year after he had formed it with Dr. Malan, the new Nationalist leader and an avowed republican, and then resigned his seat in Parliament. At a meeting of the Afrikaner Party in Johannesburg in 1941 he stated that National Socialism was the only solution of S. Africa's economic and political problems, but Havenga, leader of the Afrikaner Party, opposed his view and there was an open break between the two men which finally ended his career. In spite of his later support of the Brit. Commonwealth and the favourable impression he made at the Imperial Conferences of 1926 and 1930 it was always obvious that his anti-Brit. sentiment was never far below the surface. It is a curious commentary on his prejudices that he sent one of his three sons to Oxford Univ. See lives by L. E. Neame, 1930, and C. M. Van der Hoeve, 1946.

Heruli, Teutonic tribe, first mentioned in the reign of Gallienus (260-68), when they joined the Goths in ravaging the Aegean coasts. In the sixth century they formed an alliance with Theodorik the Ostrogoth against Clovis, king of the Franks, but were overthrown by the Langobardi.

Hervieu, Paul Ernest (1867-1916), Fr. novelist and dramatist, b. at Neuilly (Seine). He was called to the Bar in 1877, and qualified for the diplomatic service. His best work is found in a series of plays, including: *Point de Lendemain* (1890), *Les Paroles Restent* (Vaudeville, 1892), *Les Tenailles* (Comédie Française, 1895), *La Course du Flambeau* (1901), *L'Enigme* (1901), *Thérèse de Méricourt* (1902), *Le Dédale* (1903), *Le Réveil* (1905), *Connais-toi* (1909). Elected to the Fr. Academy in 1900.

Herwarth von Bittenfeld, Karl Eberhard (1796-1884), Prussian general, b. at Grosswerther in Thuringia. He entered the Guard Infantry in 1811, and served through the war of Liberation (1813-15), distinguishing himself at Lützen and Paris. In 1864 in the Schleswig-Holstein campaign he attained great fame through his daring capture of the Isle of Alsén. In 1866 he commanded the 'Army of the Elbe,' which overran Saxony and invaded Bohemia. He took a leading part in the brilliant victories over the Austrians at Hühnerwasser, Münchengrätz and Königgrätz. On the outbreak of the Franco-Prussian war in 1870 he was appointed to organise the reserve forces in the Rhine prov. and in 1871 was promoted to the rank of field-marshal.

Herwegh, Georg (1817-75), Ger. lyric poet, b. at Stuttgart. Originally intended for the church, he went to the univ. of Tübingen, from which he was expelled in 1836, and he then took up journalism. During his term of military service in subordination resulted in his fleeing to Switzerland, where he pub. the book of political poems that, although it was confiscated, made him famous, *Gedichte eines Lebendigen* (1841). He pub. a second vol. of poems, which like the first was confiscated, and trans. Lamartine's works and sev. of Shakespeare's plays into Ger.

Herzegovina, see BOSNIA AND HERZEGOVINA.

Herzen, or Gerzen, Alexander (1812-1870), Russian author and publisher, b. at Moscow. In 1840 he held an official post, but in consequence of too great frankness he was sent to Novgorod in 1824, and left Russia in 1847 to pass the remainder of his life between Paris, London, and Geneva. In London he estab. his *Free Russian Press*, from which emanated a large number of works dealing with the cause of reform in Russia. He wrote *Mémoires de l'Impératrice Catherine II.* (1864), and some novels, as well as his political works. His collected Russian works were pub. at Geneva in 1870. See M. Wiedemann, *Herzen und der Kolokol*, 1935.

Herzl, Theodor (1860-1904), founder of modern political Zionism (q.v.), b. at Budapest. Most of his life was passed at Vienna, where in addition to his fame as a Jewish Nationalist, he also had a high reputation as a journalist and dramatist. His great ideal was to restore the Jewish nation to political autonomy. He treated the subject from an entirely secular standpoint, and did not at first bring Palestine

into his calculations, though his ultimate aim was to estab. the Jewish people as a nation in Palestine. He pub. his famous pamphlet, *Der Judenstaat*, in 1896, in which he set forth this ideal. See also by J. de Haas, 1927.

Herzog, Emile, see MAUROIS, ANDRÉ.

Herzog, Johann Jakob (1805-82), Ger. Protestant theologian, b. at Basle. In 1847 he was appointed prof. of theology at Halle, and from there went on to Erlangen as prof. of church hist. (1854). His most famous work was the *Realencyklopädie für protestantische Theologie und Kirche* (1853-68, 22 vols.). In 1877 he commenced a second ed. in conjunction with G. L. Plitt, and on the death of the latter in 1880 Albert Hauck took his place, and after the death of H. pub. a third ed. (1896-1909). His other works include *Johann Calvin* (1813), *Leben Okolampads* (1843), *Die romanischen Waldenser* (1853), and *Abriß der gesamten Kirchengeschichte* (3 vols., 1876-82, 2nd ed., 1890-92).

Hesban, see HESBON.

Hesdin, tn, on the Canche, in the dept. of Pas de Calais, France, was formerly fortified. It has a sixteenth-century tn. hall. The chief manufs. are brass and leather wares, and cotton. Pop. 2700.

Heslridge, Sir Arthur, see HASELRIDGE.

Heslune, Philip, see WARLOCK, PETER.

Heshbon (Modern Hesban), chief city of Sihon, king of the Amorites, captured by the Israelites on their way to the Jordan (Num. xxi.). Its site is on a plateau in the N.E. corner of the Dead Sea, on a trib. of the Jordan in Trans-Jordania.

Hesiod, or Hesiodus (fl. eighth century B.C.), earliest didactic poet of ant. Greece. He was b. at Asra, a vil. at the foot of Mt. Helicon, and was the son of a shepherd. On the death of his father, he and his brother Perseus had a law-suit over the patrimony, which the latter won by bribery, whereupon H. left his native place for Naupactus. His brother, who had wasted his substance, now applied to him for help. This incident is recorded in H.'s earliest poem, *Works and Days*, half of which contains good advice given to his erring brother, enforcing honest labour and laying down rules as to husbandry. The rest of the poem deals with lucky and unlucky days for rural work. The poem contains a beautiful description of winter and the earliest fable in Gk. literature of which we have any knowledge, 'The Hawk and the Nightingale.' In this poem, too, H. relates how at some funeral games at Chalcis in Euboea he won in a contest of song a tripod, which he dedicated to the Muses. The other poem attributed to H. is *Theogony*. It is a hist. of the creation of the world—the earth, hell, ocean, night, sun and moon, and a hist. and genealogy of the gods, originating in Zeus and Cronus. The authenticity of the poem was first doubted by Pausanias (A.D. 200); it is now generally accepted that it is the work of H., or of a disciple, and that it contains interpolations by a later hand. The *Shield of Hercules*, once thought to be H.'s, is probably spurious. It is a description of the expedition of Hercules and Iolaus against Cynus, and obviously owes much

to Homer's description of the shield of Achilles. H.'s poetry is mainly didactic, and his moral sayings were enforced on all Gk. children. See the critical eds. of G. Schömann, 1869; F. A. Paley, 1883; and C. Sittl, 1889. The *Edictio princeps* is the ed. of 1493, pub. at Milan. There are Eng. trans. by C. Elton, 1815, and A. Mair, 1908. See also J. Adam, *Religious Teachers of Greece*, 1908, and O. Gigon, *Der Ursprung der griechischen Philosophie*, 1915.

Hesione, daughter of Laomedon, king of Troy, who exposed her to a sea-monster, according to an ann. custom, to appease the wrath of Apollo and Poseidon. Hercules rescued her from the rock to which she was chained and slew the monster, claiming, as his reward, the horses given to Laomedon by Zeus. Laomedon refused to fulfil his promise and was slain by Hercules, who took Troy and gave H. to Telamon.

Hesperer, vil. of Waterloo co., Ontario, Canada, 12 m. S.E. of Berlin. It is served by the Canadian National Railway. It has woollen, flour and saw mills, and manufs. furniture and implements. Pop. 3000.

Hesperia, see HESPERUS.

Hesperides, in Gk. mythology, the maidens who guarded the golden apples which Earth gave to Hera on her marriage with Zeus. Their numbers and genealogy vary in different accounts, but they are usually supposed to be three in number, and to be the daughters of Hesperus. According to Hesiod their dwelling-place was far away to the W. on the borders of the ocean, but Apollodorus places their garden near Mt. Atlas. For the account of how Heracles outwitted the H. with their fellow guardian, the dragon Ladon, and gathered the apples, see HERACLES. See also J. C. Lawson, *Modern Greek Folklore and Ancient Greek Religion*, 1910.

Hesperornis (Gk. *esperos*, west, and *ornis*, bird), name of a genus of extinct birds belonging to the sub-order Neornithes Odontor, and found in the Upper Cretaceous strata of Kansas: they were marine diving birds of considerable size, with rudimentary wings, and a broad tail of moderate length; the sternum is broad and flat and without keel; the head small, with elongated jaws furnished with recurved teeth set in grooves. *H. regalis* stands about 3 ft. high, and *H. crassipes* is an even larger species.

Hesperus (Lat. *Vesper*), Gk. name for Venus as the evening star. Although originally they were regarded as two distinct personalities, H. was very early identified with Phosphorus (Lat. *Lucifer*), the morning star. The Gk. poets called Italy 'Hesperia,' and later writers extended the name to Spain.

Hess, Rudolf (b. 1898), Ger. National Socialist politician, b. at Alexandria, Egypt, his father was of Bavarian origin but a Lutheran. Sent to Godesberg high school showing aptitude in mathematics. In the war of 1914-18 he volunteered as a private in the 1st Bavarian Infantry regiment but later transferred to the 1st

Force where he obtained a commission. His father's business being ruined, he had no occupation after the war and drifted to a mystical anti-semitic association called 'Thule,' whose badge was the swastika and whose radical views were those of Houston Stewart Chamberlain. When the association was suppressed by the Munich communist revolutionaries, H. barely escaped with his life. In the following winter he heard, by mere chance, a passionate speech by Hitler in denunciation of the Versailles Treaty and became an ardent convert to National Socialism. He soon became the close friend and confidant of Hitler and accompanied him in the abortive 'putsch' in Munich (1923), sharing imprisonment with Hitler in Landsberg am Lech fortress. Being an educated man and of calm and self-controlled temperament he exercised great influence over the neurotic Hitler, particularly in the latter's periods of deepest dejection. It was H. who inspired the production, though not the content, of *Mein Kampf* and at Landsberg much of the work was dictated to him by Hitler. In 1928 Hitler made him his private secretary. In 1932 H. who had been appointed chairman of the Central Political Bureau of the Nazi Party, was made Deputy Leader and, logically, his apparent to Hitler. As such, he was consulted on most matters of foreign and domestic policy and probably his advice had some restraining influence on the excited nerves of his leader. But it seems that he was never allowed to go on unimportant missions and when important developments took Hitler out of the cap H. was left behind, for it was his loyalty rather than any special ability that Hitler exploited. Relations between the two men were evidently normal as late as May 4, 1941 when H. sat beside Hitler in the Reichstag session of that date. But on May 13 came the astonishing news that H. had flown in an aeroplane to Scotland, landing near Glasgow by parachute and breaking an ankle. In a long interview with Lord Simon (then Lord Chancellor) H. put before him six proposals: Germany to be given a free hand in Europe, Britain to have a free hand in the Empire, except for the return of the former German colonies, Russia was to be included in Asia, but Germany had certain demands to make of Russia, which would have to be satisfied by negotiation or as a result of war. (H. claimed that there was no truth in rumours that Hitler contemplated an early attack on the Soviet Union, which, however, was invaded 6 weeks later.) Britain was to evacuate Iraq, the peace agreement was to provide for reciprocal indemnification of Brit. and Ger nationals whose property had been expropriated as a result of the war, and the peace proposals were to be valid only if negotiated by a Brit. Gov. other than the existing one (Mr. Churchill's). The information given by H. to Lord Simon repeated what he had already told the duke of Hamilton (near whose house he came down) and Sir Ivone Kirkpatrick, of the Foreign Office. Hence the transcript of

the interview with Lord Simon did not form any part of the case against H. before the War Crimes Tribunal, which was based on the records of the earlier interviews. H. was found guilty at the Nuremberg trial and sentenced to life imprisonment. During the trial he had feigned madness for a long period but afterwards abandoned the pose. See J. Rawlings, *The Case of Rudolph Hess*, 1947.

Hesse, Hermann (b 1877). Ger novelist, essayist and poet, b at Calw in Württemberg. His father and grandfather were missionaries in India. Educated at Maulbronn theological school and Cannstadt Gymnasium, from both of which he ran away he became a mechanic and a bookseller and continued his education by much reading. Lived in Switzerland, at Basle, Montagnola near Lugano, and Rome. In 1921 he adopted Swiss nationality. Married, but left his wife and three children in 1911 to make a protracted tour in India. During the First World War he was ostracised in Germany as a pacifist. His early novels with their vivid portrayal of natural scenery and small in life are reminiscent of the Swiss novelist and poet, Gottfried Keller, of whom he might seem to be the legitimate successor. These novels were remarkable for their musical prose and sympathetic portrayal of childhood which he revered as the only period of human life in which man can abandon himself to his innocent senses, live a full life and find himself. *Siddharta* is a novel containing many autobiographical hints. It describes a young man's revolt against the orthodox religious views of his father who is a mystic and his growing interest in Indian mysticism, the way to which he finds in excursions into worldly life. *Der Steppenwolf* is a severe indictment of Western twentieth-century urban life with its lack of real culture and its harsh struggles below the surface. It is a highly controversial work, full of psycho-analytic imagery. He believes, like Oswald Spengler, that the Western World is bound to go under unless it renews itself with fresh ideas from the East. He was awarded the Nobel Prize in 1946. His poetry, as musical as his prose, by turns sombre and idyllic, is also full of mystical imagery and is a modern echo of German romanticism of the great period. Above all he is the prophet of individualism. Prin. works.—Novels: *Peter Camenzind* (1904), *Unter dem Rad* (1905), *Nachbarn* (1908), *Gertrud* (1910), *Rosshalde* (1914), *Knulp* (1915), *Demian* (1919), *Siddharta* (1923), *Der Steppenwolf* (1927), *Morgenlandfahrt* (1930), *Narziss und Goldmund* (1930), *Das Glasperlenspiel* (1943). Poetry: *Gedichte* (1922, 1928–37), *Traut de Nacht* (1929), *Magnusruh* (1949); Essays: *Krieg und Frieden* (1946). See H. Ball, *Hermann Hesse*, 1927. R. Schmid *Hermann Hesse*, 1928. R. B. Matzke, *Der Dichter und die Zeitstimmung* (with special reference to *Der Steppenwolf*), 1944. Hesse, Alice Maud Mary, Grand Duchess of, see ALICE MAUD MARY. Hesse (or Hesse), previously also called Hesse-Darmstadt, state of W. Germany;

proclaimed a republic in 1918, but, later a state of the Ger. Reich. Enjoying no local autonomy, and including the provs. of Starkenburg, Rhein Hessen, and Oberhessen. In the territorial revisions of 1948, consequent upon the liquidation of the state of Prussia, was constituted a Land or state, and now includes the ter. of the former Land Hesse on the r. b. of the Rhine and the greater part of the former Prussian prov. of Hesse-Nassau. Its ter. on the l.b. of the Rhine because the new state of Rhineland-Palatinate. Ober-

mineral wealth is not great, including some salt, lignite, and iron ores, and a little copper, manganese, clay, etc. The prin. manufs. are leather goods, tobacco and cigars, chem. products, furniture, paper, railway cars, machinery, wagons, cloth, musical instruments, and sparkling wines. There were also many industrial agric. and other special institutes. George I. (1507-96) founded the line which reigned till 1918. H. became a grand duchy in 1806, and part of the Ger. empire in 1871. The H. Crown jewels were stolen from

HESSIE : ASSMANNSHAUSEN ON THE RIGHT BANK OF THE RHINE

Behind the town are vineyards, and the slopes of the Rheingau

hessen and E. Starkenburg are mountainous in character, the former having the Vogelsgebirge (chief peak Taufstein, 2530 ft.), and the latter, the Odenwald (chief peak Melibocus, 1700 ft.). W. Starkenburg is quite level, forming part of the Rhine plain. The Rhine is the prin. riv., all the others, save those rising to the N. and E. of the Vogelsgebirge, which flow into the Weser, being tribs. There are no large lakes, but mineral springs are found at Nauheim and elsewhere. Deer, foxes, and wild swine are among the fauna. The prin. industry is agriculture; wine is one of the chief natural products, being produced in the Rheingau, notably at Rudesheim, Geisenheim, and Assmannshausen, and on the W. slopes of the Odenwald. The

Kronberg Castle in 1946 by an Amer. officer of the army of occupation, but most of them were recovered in Chicago.

*Hesse-Nassau*, former prov. of Prussia, situated between the Rr. Rhine and Weser is now incorporated in H. The surface is very mountainous, the chief ranges being Taunus (highest point 2896 ft.), Westerwald, Rhongebirge (highest point 3115 ft.), and the Hessian Mts. All its rivs. are tribs. of the Rhine and Weser. Agriculture and cattle-rearing are carried on, and timber is plentiful, the chief trees being beeches, oaks, and conifers. There is considerable mineral produce, iron ore occurring in large quantities, as well as manganese ore, coal, and copper. Mineral waters are found at various places, the brine springs of Wiesbaden and the soda-

bicarbonate springs of Ems being famous; and excellent wines are produced in the Rheingau. The prin. manufs. are machinery, pottery, leather goods, iron ware, chems. and textiles, which are carried on at Kassel, Diez, Eschwege, Frankfort, Fulda, Gross Almerode, Hanau, and Hersfeld. Other tns. of importance are Wiesbaden, Homburg, and Marburg, which is the seat of a univ. The prov. was formed in 1867-68 out of the ters. of the duchy of Nassau, the landgraviate of Hesse-Homburg, the electorato of Hesse, and the ter. of Frankfort, etc.

The area of H. is 7,931 sq. m. and the pop. 4,064,000. Cap. Wiesbaden.

**Hesse-Homburg**, former landgraviate of Germany, composed of Homburg-vordere-Höhe on the r. b. and Meisenheim on the l. b. of the Rhine, with a total area of 106 sq. m. The former dist. is now part of Hesse, and the latter of Rhineland-Palatinate. H. was constituted a landgraviate in 1596 by Francis I., son of George I. of Hesse-Darmstadt. It was incorporated with latter duchy from 1806 to 1815, and again in 1866. Later in the same year it was annexed to Prussia.

**Hesse-Kassel**, or Electoral Hesse (Ger. Kurhessen), was until 1866 an electorato of Germany, but now forms part of Hesse, having been until 1916 a gov. dist. of the Prussian prov. of Hesse-Nassau. (See article on the latter for particulars as to configuration, products, etc.). When Philip the Magnanimous died in 1567, he left half of Hesse, with Kassel as cap., to his eldest son, Wm. IV., 'The Wise.' A large part of Schaumburg and other land was added after the Thirty Years war. In 1803 (under Landgravo Wm. IX.) H. was constituted an electorato, the sovereign bearing the title of electorial prince of Hesse. In 1807, however, nearly all the ters. of H. were transferred to Westphalia, but were recovered in 1813. As the Elector Frederick Wm. had taken part with Austria in the war of 1806, a Prussian army entered his dominions, and they were annexed to Prussia in Sept. of the same year.

Hessenens, see ESSENEs.

**Hesse-Rotenburg**, former landgraviate of Germany, which was founded in 1627 by Ernest, the younger son of the landgrave Maurice of Hesse-Kassel. On his death in 1693, his two sons inherited it, but in 1700 they divided the ter. and founded the families of Hesse-Rotenburg and Hesse-Wanfried. The latter died out, and the two were reunited in 1755. In 1801 part of the landgraviate was ceded to France, in 1813 some of the remainder to Prussia, and on the death of the Landgrave Victor Amadeus in 1834, what remained was re-united to Hesse-Kassel.

For the lineage, exploits, and hist. of the houses of Hesse, see Hoffmeister, *Historisch-geographisches Handbuch über alle Linien des Regentenhauses Hesse*, 1874; and Walther, *Literarische Handbuch für Geschichte und Landeskunde von Hesse*, 1821 and 1858.

**Hessian-fly**, or *Cecidomyia destructor*, name of a species of dipterous insects belonging to the family Cecidomyiidae;

they are minute fragile flies, having very few wing nervures; the elongated antennae are furnished with rings of hairs. This fly does great injury to crops, and in some parts of the world causes considerable loss when it has once attacked cereals; the larvæ is lodged at a point in the stem of the wheat enfolded by a leaf; the stem consequently weakens and bends. When about to pupate, the larvæ of *C. destructor* exudes a substance from its skin and this forms a remarkable cocoon, which is called flax-seed.

**Hess's Law**, in chem., states that the total absorption or evolution of heat in a given chemical reaction is uninfluenced by the number of stages in which the reaction is brought about. The law was first formulated in 1840 by the Russian chemist, G. II. Hess.

**Hestia** (the 'fire goddess'), daughter of Cronos and Rhea, one of the twelve chief deities in Gk. mythology. She was the goddess of the hearth and home, the personification of family life; and, by extension of the idea of family life to the nation, she was the goddess of the state. In this character her sanctuary was in the prytaneum, where the central fire of every tn. and stato was kept perpetually burning, and where the magistrates, as fathers of the state, held their meetings. If by any accident this fire was extinguished it might not be rekindled by ordinary fire, but only by the sun's rays or by friction. Apollo and Poseidon both sought the hand of H., but she took a vow of perpetual celibacy, and thereafter Zeus made her the presiding deity over all sacrifices. Intending colonists took some of the sacred fire with them to be kindled on the hearth of their new colony. H. is identified with the Rom. Vesta (q.v.). See T. Allen and E. Sikes (ed.), *Homeric Hymns*, xxix., 1904, and J. Farnell, *Cults of the Greek States*, v., 1909.

**Heston and Isleworth**, urb. dist. in the co. of Middlesex, England. It is a residential suburb of London, 12 m. S.W. of St. Paul's. Pop. 88,000.

**Hesychasts**, known also by the sobriquet of Omphalopsychoi, were a sect of the Gk. Church which arose during the fourteenth century. The sect was a mystic one, its practice being based on the theory that a divine light was hidden in the soul, which was believed to be situated in the stomach. By contemplation at stated times the H. endeavoured to draw out this light. They died out very quickly. See monograph by F. J. Stein, 1874.

**Hesychius**, Gk. grammarian of Alexandria of the fifth century A.D. His lexicon of Gk. words and phrases, with explanations of customs, usages, etc., is of the utmost value, especially in regard to rare words as used by writers like Æschylus. In the only MS., now in Venice, which survives, there are large interpolations by later Christian writers. H. based his work on that of Diogenianus. See M. Schmidt, 1868.

**Hesychius of Miletus**, 'Illustrious,' Gk. chronicler of the fifth century A.D. His hist. of the reign of Justin I. and of Justinian is lost; of his universal hist. an

extremely valuable fragment, giving the hist. of Byzantium (Constantinople) down to the reign of Constantine the Great, survives. His biographical dictionary remains in an epitome of Suidas. See J. Orall, 1820, and J. Flach, 1882.

**Hæteræ**, or **Hætalrai**, name usually applied in ant. Greece to the best class of courtesan. The education of Gk. women was almost entirely neglected, but the H. were among the most beautiful, accomplished, and intellectual of Gk. women. They were nearly all trained to play the cithara or the flute, and to dance; Lasthenia studied philosophy under Plato, Leontion was a pupil of Epicurus, while Aspasia, the mistress of Pericles, and perhaps the most famous of all the Gk. courtesans was one of the first advocates of woman's rights to education and culture, and the friend of Socrates. Other famous H. were Phryne, the mistress and model of Phidias, Lais, Pythionice, and Theodote. Most of these lived in Athens; but Corinth was even more famous for the number, beauty, and refinement of its H. See P. van Limburg-Brouwer, *Histoire de la civilisation morale et religieuse des Grecs*, 1833-12; W. Plankl (ed.), *Heldren-Briefe* (Gk. and Ger.), 1925.

**Heterocyclic Compounds**, organic ring compounds with an atom or atoms of other elements as well as carbon in the ring. Exan  $\text{C}_6\text{H}_5\text{N}$  pyridine, quinoline, furan, thiophen, and penicillin.

**Heterodyne**, method used in wireless telegraphy for the reception of continuous wave-signals, by the production of beats between the incoming waves and the oscillations of the receiving set itself.

**Heteropoda**, name given to a section of gastropod molluscs, and with the Platy-poda constitute the tribe Tanioglossa. The members of this section are free-swimming and large, their chief characteristics are a large-sized head with two tentacles, transparent shell and tissues, and small visceral sac. In most families the foot is divided into the propodium, or anterior part, the mesopodium, on which is a small sucker, and the metapodium, which is elongated and forms the caudal appendage. The H. contain many families, the most important being Atlantidae, Carinidae, and Pterotracheidae.

**Heteroptera**, name given to a sub-order of Hemiptera (q.v.); its members differ from those of the Homoptera in that their wings, when in repose, lie flat on the back. They are divided into Gynnocerata, in which the antennæ are conspicuous and easily moved, and Cryptocerata, in which the antennæ are hidden under the head of each eye; the former series are terrestrial, and include the extensive and important family Pentatomidae; the latter are aquatic bugs, containing six families, which are widely distributed.

**Heterotropic Substances**, see under ISOTROPY.

**Hetman** (Russian *Ataman*), title of the commander-in-chief of the Polish army when the king was not present. It was adopted by Russia as a title for the head of the Cossacks (q.v.), and was later held by the Tsarevitch. It was also used for

the elected elder of the *Stanitsa* in Cossack administration. See COSSACK.

**Hetton-le-Hole**, tn. in the co. of, and 5 m. N.E. of the city of Durham, England. It is the centre of a coal-mining dist. Pop. 19,000.

**Hettstedt**, tn. in Saxony, Germany, 9 m. N.W. of Eilsleben. It has copper mines, and is noted for manufs. of copper and brass ware, and pianos. Pop. 8,200.

**Heuglin, Theodor von** (1824-70), Ger. traveller in Africa, b. at Hirschlanden, in Württemberg. Trained as a mining engineer, he became interested in scientific investigation. In 1850 he went to Egypt and learnt Arabic, and then went to Arabia Petraea. Two years later he went to Abyssinia with Dr. Reitz, Austrian consul at Khartoum, and later became his successor. During his consulate he again went to Abyssinia and to Kordofan, bringing back a valuable collection of natural hist. specimens. His next expedition was to Somaliland, after which he went to Central Africa. In 1862 he joined the Tinné expedition, and in 1870 went to the polar regions.

**Houlandise**, named after H. Houlandise, an Eng. mineralogist; a monoclinic, translucent mineral, of pearly lustre and white, red, gray or brown colour. Occurs in coffin-shaped crystals in the vesicles of basalt, usually with other zeolites. Fine crystals also occur in the Campsie Hills, Stirling, the Kilpatrick Hills, Dumbarton, in Iceland, Faeroe Is., Vindhya Hills, and Nova Scotia. Composition: silica (58-59 per cent), alumina (15-17 per cent), lime (6-7 per cent), soda, etc.

**Hevelius** (Hewel, or Hewelcke), Johann (1611-87), Ger. astronomer, b. at Danzig. After travelling in France and England he settled as a brewer in his native tn., and took a leading part in municipal affairs. Always interested in astronomy, in 1641 he built an observatory in his house and fitted it up with first-class instruments, including a tubeless telescope made by himself. He was the founder of lunar topography, the results of which he pub. in his *Selenographia* (1647). He discovered four comets in 1652, 1661, 1672, and 1677. In Sept. 1679 his observatory was burnt down. His works include: *Prodromus cometicus* (1665), *Cometographia* (1668), *Machina celestis* (1st part, 1673; 2nd part, 1679), and *Prodromus Astronomicus* (1690). See H. Westphal, *Leben, Studien und Schaffen des Astronomen Hevelius*, 1820.

**Heule**, tn. in W. Flanders, Belgium, 2 m. N.W. of Courtrai, on an affluent of the R. Lys. There are manufs. of linen. Pop. 8,200.

**Heverlee**, Belgian tn. in the prov. of Brabant, 15 m. E. of Brussels on the R. Dyle, engaged in agriculture and mkt.-gardening. It has an old abbey and a beautiful castle. Pop. 11,600.

**Hever Castle**, fifteenth-century castle near Edenbridge, Kent, England. Formerly owned by the Boleyn family and once occupied by Anne Boleyn. Now restored as a residence of Viscount Astor.

**Hewart**, Sir John Gordon Hewart, first Viscount and Baron, of Bury, Lancs.

(1870-1943), Eng. lawyer, b. at Hurv, eldest son of Giles H., of Hurv. Educated at Bury Grammar School and at Manchester Grammar School and at Univ. College, Oxford—scholar, 1887. Invited by C. P. Scott of the *Manchester Guardian* to join the staff of that journal and for six years was a regular reporter in the Press Gallery at Westminster and afterwards principal writer on the *Morning Leader*. It was not until 1902 that he was called to the Bar by the Inner Temple, having obtained a certificate of Honour. Had a large practice in Manchester and Liverpool. His rapid rise was due not only to his mastery of the law but also to the scholarly exactness of his oratory and his imperturbability. The most famous case of his earlier days was the well-known libel action in 1909 of *Artemus Jones v. Hulton*. This case, a leading authority on the law of libel, largely increased his reputation. In 1912 he became a B.C. and in 1913 he was elected Liberal M.P. for Leicester. Solicitor General, 1916-17; attorney general, 1921-22—generally considered one of the best, if not the best, of the law officers of modern times. In 1921 he was admitted to the Cabinet as a personal distinction. As attorney general he was a member of the Irish Conference and one of the Brit. signatories of the Irish peace treaty. Had the way to the Woolstack been clear he would have been Lord Chancellor. In 1923 on the retirement of Lord Eversham, he became Lord Chief Justice and brought to that office much legal learning and scholarship. As a criminal judge he was successful, but it was *pari passu* he was apt to forget that he was not still an advocate. Yet though an impartial survey of his career must take note of this criticism, he remains a great judge and for intellectual accomplishment, he was probably never surpassed by any previous holder of his office. President of the War Compensation Court from 1922 till his labours were ended in 1929. As an old Liberal he was tenacious of the rights of the public against bureaucracy and in 1923 he put a veto, *The Act Despotism*, against the delegation to officers of the power of legislating by Order in Council, with the Rating and Valuation Act of 1923, as the starting point of his indictment. Always tenacious of his rights and jealous of the dignity of his office, as was shown during the second reading in 1931 in the House of Lords of the Supreme Court of Justice (Amendment) Bill. As Lord Chief Justice he became a member of the committee established in 1924 to safeguard future transfers of the controlling shares in the *Times*.

Hewins, William Albert Samuel, (1867-1911), Eng. economist and politician, b. at Wolverhampton, second son of Samuel H. Educated at Wolverhampton and Pembroke College, Oxford. He was prof. of economics at King's College, London, 1897; director of the London School of Economics, 1893-1903, and a member of the Senate of London Univ. till 1903, when the Tariff Reform movement of Joseph Chamberlain brought him prominently before the public as one of the chief

economic supporters of the campaign and as secretary to the Tariff Reform Commission, 1903-17. He was Unionist member for Hereford 1912-13. His economic works include *English Trade and Finance of the Seventeenth Century* (1892), *Imperialism and its Probable Effect on the Commercial Policy of the United Kingdom* (1901), *Trade in the Balance* (1911), *Empire Restored* (1927), *The Apologia of an Imperialist* (1929), *The Royal Courts of Britain* (1929).

Hewlett, Maurice Henry (1861-1923), Eng. novelist and poet, eldest son of Henry Giv. H., of Shaw Hill, Addington. Educated at Iskworth. He was called to the Bar and entered the chambers of a prosperous cousin. He then succeeded his father in a respectable post in the Land and Record dept. of the Woods and Forests, 1896-1900. His first literary work was *Lairnark out of Luscany* (sketch of Italy) and *The Masque of Dead Florence* (in vol. 1, 1895). His first popular success was gained by his brilliant, passionate romance, *The Forest Lovers* (1898), full of the colour of early medieval romance. This was so great a success that within three years he had made a sufficient fortune to be able to quit the Land Revenue dept. In the interim he had pub. *Richard Lion and Nay* (Richard Coeur de Lion 1900) an historical novel, which also had proved extremely popular. He then went to stay at Whittingham with Arthur Ballour in order to collect material for his next historical novel, *The Queen's Quair* (Mary Queen of Scots, 1901). A romantic, but not sentimental, he had great integrity and a sense of purpose and these qualities led him in later life to join the Fabian Society and to lasting connections with the Quakers. However, just his claim to be a poet it is as a novelist that he must be judged and in his novels he is always sensitive and poetical, compassionate and selfless. There is a kind of uprightness and simplicity throughout all his stylized, fairy tale background which both illumine and redeem the artificiality. The interesting fact about his *Forest Lovers* is that it was such a striking success in an age which was essentially anti-realistic and, perhaps, because of that very materialism. But he never quite repented that success with his other works in this genre, such as *Little Noddy in Italy* (1893), *The New Canterbury Tales* (1901) and *Read in Luscany* (1909). In the *Foot Lament* (1905) and *Rennys River* (1911), which followed his essays in the field of historical romance, he returned to his medieval romances. *The Sleeping Lady* (1907), *The Harrow* (1910), *Halfway House* (1912), and other novels, deal with more modern times. It might seem that John Senhouse, the character in *Halfway House* whom H. modelled on himself, was the poet and artist that H. wanted to be, though the portrait is not entirely convincing. His poetry includes a dramatic pastoral, *Pan and the Young Shepherd* (1898), *Artemus* (1909), and *Lore of Prosperpine* (1913). His last works were *Flowers in the Grass* (poems), *In a Green Shade* (1920),

and *Wiltshire Essays* (1922). He also wrote a novel, with the incomprehensible title of *Bendish*, which has certain obvious likenesses to the Byron-Shelley episode, Bendish being Byron and the period that of the first Reform Bill. The present generation neglects H., and his Edwardian best-sellers, but there is still to be found in them something both significant and stimulating. See L. Binyon (ed.), *Letters, to which is added a Diary in Greece, 1914, 1920*.

**Hexachord**, term used originally in Gk. music for a diatonic series of six tones, or for the interval of a major sixth. It was also applied to an instrument having six strings. In medieval music, it referred to a diatonic series of six tones containing four whole steps and one half step.

**Hexagon** (Gk. ἑξ, six, and γωνία, angle), in mathematics a figure containing six angles and bounded by six sides. If these are equal the figure is shown as a *regular* H. Hexagonal construction gives a body

HEXAGON

the greatest possible amount of strength and stability, and doubtless for this cause is the one adopted by bees for making their cells. Pascal's theorem with reference to the H. is important. It states that if a H. be inscribed in a conic section the points of intersection of the pairs of sides (i.e. 1 and 4, 2 and 5, 3 and 6), produced, lie on a straight line.

**Hexahydroxycyclohexane**, see INOSITE.

**Hexameter**, form of verse used by the Gks. and Latins, for epic and heroic poems, is perhaps the most important of classical metres. The *Odyssey* and the *Iliad* alone among Gk. productions would have sufficed to make it famous, while the greatest example of its use in Lat. is in the *Æneid*. Though both the Gk. and Lat. forms of the H. are based on the same plan, it is necessary to differentiate slightly between them. The normal line in both, however, consists of six dactylic ft., of which the last is catalectic. With a line of this type the *Odyssey* opens:

ἀνδρᾶ μοι | εἰρήνη | Μυῖσά πολ | ὑμῶσσι  
| ὅς μ' ἔλθῃ | πῶλ' ἄλ'

Variations from this form are, of course, frequent. Spondee may occur in any or every foot, though a line composed entirely of spondee is rare in Gk., and in Lat. still rarer and more barbarous. Thus it is only in an early poet such as Ennius that such a line could occur as:

ὄλλι | ρῆπον/δ'ιτ' ῥῆ | Αἰβᾶν/δ'ιτ' ῥῆ  
One or two caesuras (breaks in a foot)

occur in every line, in the third and fourth ft. In Gk. a single weak caesura (i.e. after the second syllable of the dactyl) is sufficient, but in Lat. it is common to find a strong caesura (i.e. after the first syllable of the dactyl) in the third foot, and a weak caesura in the fourth, or *vice versa*. Thus, for example, in the line from Ovid,

'Addēquod | ingēnd'ās didi|cisse n |  
deltēr | ārtis,'

the strong caesura occurs in the third foot after *ingenuas*, the weak caesura in the fourth foot after *didicisse*. Lines with only a weak caesura are very rare except in the earlier poets.

**Hexamine**, Hexamethylenetetramine (CH<sub>2</sub>)<sub>6</sub>N<sub>4</sub>, is a white solid obtained by the action of formaldehyde upon ammonia. It is used in medicine, under the name of H., or of urotropine, in certain diseases of the urinary organs.

**Hexane**, an important constituent of petrol, especially of the solvent called petroleum—ether or ligroin. The formula is C<sub>6</sub>H<sub>14</sub> and sev. isomeric compounds can exist, but only the normal H. is important. It is a colourless liquid, sp. gr. 0.6603 at 20°, insoluble in water. It can be made synthetically by heating propyl iodide with sodium. In its chemical behaviour it closely resembles heptane (q.v.).

**Hexapla**, ed. of the O.T. and version in parallel columns prepared in the second century by the famous Alexandrian scholar, Origen. It consisted of the Heb., a transliteration of the Heb. in Gk. characters, an amended Septuagint version and three other versions by the scholars Aquila, Symmachus, and Theodotion. The work has survived only in a few fragments (ed. by D. and F. Field in *Origenis Hexaplorum quae supersunt*) but these are invaluable to critics and students of the O.T. It contains, indeed, almost all that remains of the Gk. versions other than the Septuagint.

**Hexateuch**, name now generally used to denote the first six books of the O.T., which modern criticism shows must be regarded as a literary entity. The name is coined on analogy with Pentateuch, which title was early used by Origen and Tertullian for the books of Genesis, Exodus, Leviticus, Numbers, and Deuteronomy. During the first eighteen centuries of the Christian era, the tradition of the Mosaic authorship of the Pentateuch was almost universally received, but such a tradition was bound to vanish before the first appearance of the light of criticism. In many places Moses is spoken of in the third person; and in Deut. xxxiv. 10, it is said that 'there arose not a prophet since in Israel like unto Moses,' while the account of Moses's death in which this occurs can hardly have been penned by the prophet himself. There are similar objections immediately apparent to the tradition that Joshua was the author of the book which bears his name. A more detailed examination of the Hexateuch led to the discovery of a great number of repetitions, discrepancies, and contradictions, and these led to the further con-

clusion that no one of these books was the work of a single hand. The most notable of the repetitions is in the accounts of the Creation. The account given in Gen. ii. 4 f. differs irreconcilably from that which immediately precedes it. The first step in its solution was made by a Fr. scientist, Jean Astruc, who, being guided by the fact that in the early narrative of the Creation the name used for God is *Elohim*, while in the second it is *Yahweh*, divided the book of Genesis into two main divs. or sources. But as criticism moved on to the rest of the Pentateuch, results became far less positive. The clear guidance of the Divine names was no longer to be had, and at first it seemed that the rest of the Pentateuch was a mere disorderly collection of fragments with little or nothing in common. This Fragment Hypothesis owes its origin to the Scotsman, Geddes, and was supported by Vater. W. M. De Wette in his *Dissertatio Critica* (1805) first propounded the now generally accepted theory that Deuteronomy, instead of being the oldest of the Pentateuchal books, is, in reality, the latest, probably being no earlier than the reign of King Josiah. But, a new and more constructive school of criticism was arising under the leadership of Bleek, Ewald, and Hitzig, to whom we owe the Supplement Hypothesis, and to this school, which rapidly superseded the older one, De Wette himself later turned. Here the connection between the Elohist of Genesis and parts of the later books was first clearly seen, and this led to the conclusion that to the Elohist writer was due the *Grund-schrift* or foundation which the Yahwist had used as the basis of the final redaction. This view was attacked by Hupfeld in 1853. Hupfeld distinguished two Elohist sources which he assumed were quite separate both from each other and the Yahwist source. Noldeke showed in detail how the Elohist source was the *Grund-schrift* of all the Hexateuchal books except Deuteronomy. These views, however, have all given way before the now generally received Graf-Wellhausen Hypothesis, which finds in the II. four main strata. These are known as: (1) P, the Priestly Document, or book of the four covenants (Wellhausen's Q), the work of the so-called older Elohist, which forms the framework; (2) E, the (second) Elohist document; (3) J, the Yahwist source, and (4) D, the Deuteronomist. The chief feature of Graf's hypothesis is the alteration in the position of P. This had hitherto been considered the oldest of the documents, but Graf placed it after D, and later critics have endorsed his view. It is now realised that the legal and ritual religion which he seeks to codify came after and not before the prophetic and lyrical Yahwistic conceptions. J is the earliest of the four, but J and E have been wrought so skillfully into a single connected narrative, that it is almost impossible to consider them separately. The result of their union is known as JE. It is impossible here to show the clear distinction between the E and J portions. D either is or contains the book of the law

found in Josiah's reign, from a short period before which it is generally dated. Its characteristic feature is its uniform spirituality, and its pleading for reform. Its style is clearly marked, D was inserted into JE, and then the combined narrative was fitted into the framework provided by P. This last work, the priestly code, differs widely in spirit from the earlier works. It is historical and legislative, dealing with ceremonial regulations and the ordering of the feasts. It formed the framework in which the other three documents were united. Dr. C. A. Simpson in a recent 'critical analysis of the pre-deuteronomistic narrative' of the H. examines certain hypotheses advanced by Eduard Meyer, who himself started from positions laid down by Wellhausen. The essential points are: first, the critical analysis should begin not with the book of Genesis but with the accounts of the exodus from Egypt and the occupation of Canaan; second, that the original tradition of the exodus described a journey from the sea to Kadesh, which became the centre of the Israelites' wilderness life; and that this original tradition had nothing to say about a visit to Sinai or about the law-giving there. Meyer believed that by source analysis he could discover the remains of this primitive account embedded in the H. Dr. Simpson's investigations have satisfied him of the essential correctness of Meyer's view, but he holds that this earliest document was a much simpler narrative than Meyer had realised and that while Meyer was right in thinking that it contained no record of an Israelite mass-journey to Sinai, it may well have once 'told of a pilgrimage made thither by Moses.' We have in the H. what is in effect the sum-total of the available evidence for the hist. of Israel in this period. If, as in this detailed study, we use our hypothetical reconstruction of the hist. to isolate the primitive traditions, and the primitive traditions to establish our reconstructions of the hist., there is a risk of arguing in circles. If, however, the results of this analysis agree with those given by the independent application of linguistic tests, its soundness will be strengthened. See books on the various separate books of the H.; also S. R. Driver, *Literature of the Old Testament* (6th ed.), 1897; C. F. Dillman, *Kurzes exegetisches Handbuch*, (6th ed.), 1892; and C. A. Simpson, *The Early Traditions of Israel*, 1915; and works by authors mentioned in the text.

Hexham, mrkt. tn. of Northumberland, England, situated on the S. bank of the Tyne, about 21 m. by rail W. of Newcastle. It is an old tn. with narrow streets and a mrkt. sq., and is famous for the anct. abbey church of St. Andrew, founded by Wilfrid, archbishop of York, in 673. The present building which stands over the Saxon crypt is a splendid specimen of Early Eng. work. It contains a fine perpendicular roodscreen of oak, and many interesting tombs, particularly one carved Rom. slab. The moot hall and the manor office, two castellated towers of the fourteenth century, are also

of interest. At a short distance S. of the tn. lies the battlefield where the Lancastrians suffered defeat in 1464, and near by are the remains of Dilston Castle where the last earl of Derwentwater was beheaded in 1716. Pop. 10,300.

**Hexoico Acid**, see CAPROIC ACID.

**Heyden, Jan van der** (1637-1712), Dutch artist, b. at Gorkum. His pictures were principally those of the exteriors of buildings, many of them parts of Amsterdam, where, as a rule, he lived, although he did visit other countries. His pictures are characterised by their warm colouring and their breadth of treatment, combined at the same time with a minute attention to detail. One of his best pictures is a view of Amsterdam in. hall.

**Heydrich, Reinhard** (1904-12), Ger. administrator, b. in Halle; served in the Ger. navy, becoming a favourite pupil of Adm. Canaris, head of the naval intelligence dept. From this he passed into the service of the Nazi party, becoming a member in 1931. Under Himmler's (q.v.) protection his career in the Nazi hierarchy was a swift one, and he soon became an Obergruppenführer of the S.S., with the rank of a general of police. As Ger. candidate for the chairmanship of the International Police Commission he used his position in the period immediately preceding the Second World War for the purpose of helping the Ger. espionage service abroad. After the Ger. conquest of Bohemia and Moravia he succeeded von Neurath as Reich protector in Czechoslovakia (March, 1939). He hastened to show that his reputation for cruelty was well merited. He distinguished himself by clothing his instructions for the bestial torture of all opponents of the regime in pseudo-scientific formulae and playing the part of the theoretician who had supplied the doctrine for Nazi practice. In the summer of 1941 he was sent to Norway to assist Quisling to win the Norwegians over to collaboration with the Gers., and, by means of a number of executions and the suppression of what remained of freedom of speech and press, he believed he had placed the security of the Ger. regime in Norway on a firm foundation. Back in Prague he resumed his reign of terror. Between Sept. 28-Nov. 29, 1941, 114 Czech citizens were shot, 55 hanged and 60 others executed in various ways. Ultimately he was assassinated early in 1942, hundreds of Czechs being murdered by the Ger. authorities in retaliation. It was subsequently ascertained that 3 Czech parachutists killed H. They volunteered for a suicide mission to rid their country of the 'Protector of Bohemia and Moravia', who had started a murder campaign against Czech intellectuals. They were members of the Czech Brigade in England and were down to Bohemia in a Brit. plane. They escaped after ambushing H. and hid in the crypt of a small church, but were betrayed by a Church worker whose nerve broke under torture.

**Heylin, or Heylyn Peter** (1600-62), Eng. writer and divine, b. at Burford in Oxfordshire. He graduated at Oxford and

through the influence of Laud became chaplain to Charles I., 1629. He was deprived of all eccles. offices during the Commonwealth, but at the Restoration was made subdean of Westminster. His works number more than fifty, chiefly theological and controversial. He belonged to the High Church party, and wrote *Ecclēstia vindicata; or the Church of England Justified* (1657). His *Ecclēstia Restaurata; or the History of the Reformation* (1660-61) was ed. by J. C. Robertson, (1849).

**Heyn, Piet** (1578-1629), Dutch admiral, b. at Delfshaven. He was taken prisoner by the Spaniards, and afterwards gained victories over them in 1624, and in Brazil in 1626. In 1628 he was successful in capturing the Sp. fleet carrying silver valued at a considerable amount. He met his death in a fight against the pirates of Dunkirk.

**Heyne, Christian Gottlob** (1729-1812), Ger. classical scholar, b. at Chemnitz in Upper Saxony. Although very poor, he was a student at Leipzig Univ., and in 1753 obtained a post in the Brühl Library, Dresden. His ed. of *Tibullus*, which appeared in 1756, secured him the support of Ruhnken of Leyden, and although he suffered many vicissitudes during the Seven Years war, the latter was instrumental in obtaining for him, in 1763, an appointment as prof. at Göttingen. His other works include eds. of the *Enchiridion* of Epictetus; Virgil, 1767; Homer, Plutarch, and Apollodorus, as well as many reviews of books. See life by Ludwig Hoerer, 1813.

**Heyse, Paul** (1830-1914), Ger. author; b. in Berlin; son of a prof. of philology. Educated: Berlin; Bonn. In 1854 he was one of the authors invited by Maximilian of Bavaria to take up his abode in Munich. He excelled particularly as a writer of short stories, all of which are true pictures of life enhanced by humour, by judicious power of rendering detail, and by a graceful style. He wrote some novels and a number of poems. Among his works are: *Thickla* (1858), a poem; *Die Kinder der Welt* (1873); *Das Buch der Freundschaft* (1883), a collection of stories; *Maria von Magdala* (1899), and *Der Heilige* (1902), both of which are dramas. See G. Kemmerich, *Heyse als Dichterschriftsteller*, 1928.

**Heysham, tn.** and port in the co. of Lancashire, England. It is situated about 1 m. S.W. of Lancaster, and has since 1904 been used by the London Midland Region railway in connection with steamboat services to the Isle of Man and Ireland. Pop. 7000.

**Heyst**, watering place in the prov. of W. Flanders, Belgium. It lies about 9 m. N.E. of Bruges, with which it is connected by a steam tramway and by rail. The tn. is attractive and possesses a picturesque harbour. During the First World War the sandbanks of H. held an important Ger. coastal battery. Pop. 6000.

**Heywood**, bor. in the co. of Lancashire, England, situated 8 m. N.N.E. of Manchester. It is engaged chiefly in the manu- of cotton, boilers, machinery, and

chems. It has also brass and iron foundries, and coal mines. Pop. 25,000.

**Heywood, John** (c. 1497-c. 1580), Eng. author, b. probably in London. He seems to have been introduced at court by Sir Thomas More, and to have been a favourite in the time of Henry VIII., Edward VI., and Mary, on account of his ready wit and skill in music. When Elizabeth ascended the throne, however, he retired to Malines. He is chiefly remembered as the writer of interludes, which differed from those of his predecessors in having real persons substituted for qualities personified, thus forming a link with the modern drama. He also excelled as a writer of epigrams. Among his works are: *A Mery Play between the Pardoner and the Frere, the Curate and Neybour Pratte* (1533), *The Play of the Wether* (1533), *The Four P's* (1545f). See P. W. Pollard, *A Critical Essay*, 1903; T. S. Graves, *On the Reputation of John Heywood*, 1923; R. W. Bolwell, *The Life and Works of John Heywood*, 1922.

**Heywood, Thomas** (c. 1775-c. 1850), Eng. dramatist, was a native of Lincolnshire, and a student at Cambridge. In 1596 he had begun his career as a playwright, and in 1598 was an actor in Henslowe's company. He was a prolific writer, for seventeen years before his death he claims to have written about 200 plays. His dramas deal with ordinary domestic life and with adventure, and in addition to these his works comprise pageants, elegies, and poems. Among his writings are: *A Woman killed with Kindness* (1603), *The Fair Maid of the West* (1631), *The English Traveller* (1633), *The Wise Woman of Hogsden* (1638), while among his other writings are: *Troia Britannica* (1609) and *An Apology for Actors* (1612). See J. A. Symonds in an Introduction to *Thomas Heywood*, 1903; P. Aronstein, *Thomas Heywood*, 1913; A. M. Clark, *Thomas Heywood as a Critic*, 1922; L. B. Wright, *Heywood and the Popularising of History*, 1928.

**Hezekiah** (Heb. *Hizkijāhū*, 'Jehovah hath strengthened'), king of Judah, the son and successor of Ahaz, with whose reign his own provides a most favourable contrast. He was young when he ascended the throne (c. 715 or c. 720 B.C.), and the early part of his reign was doubtless spent under a regency. The king was personally intimate with the great prophet Isaiah, and it may well have been to his influence that Hezekiah's reforming zeal was due. But the reign is memorable for great deeds without, as well as for reform within. The Assyrian overlordship was rejected, and in the second of the two expeditions sent to reneatate it, Israel won a conspicuous success.

**Hiawatha**, legendary chief who fl. about 1450, belonging to a tribe of the N. Amer. Indians. He is said to have formed the League of Six Nations, known as Iroquois, and to have been sent on earth to teach men the arts, agriculture, medicine, and navigation. He departed to the land of Ponemah (Hereafter) on the appearance of the white man. Longfellow's famous poem *The Song of Hiawatha* (begun June

25, 1854, finished March 28, 1855, and pub. Nov. 1855) has long held its place as the classic of Algonkin legend. The scene of the poem is among the Ojibways on Lake Superior between the Pictured Rocks and the Grand Sable. Perhaps the best account of the legendary H. is that to be found in H. Schoolcraft's *Algie Researches* (1839), the author having married a half-breed wife. The Iroquois form of the H. tradition is to be found in the same author's *History, Condition and Prospects of the Indian Tribes of the United States* (1851-57). In these we learn that H. was supposed to have been sent among the N. Amer. Indians to clear their rivers, forests and fishing grounds, and to teach them the arts of peace; and that he was variously known as Michabou, Chiabo, Manabozo, Tarenawagou, and Hiawatha.

Hibbert Lectures are a course of lectures first begun in 1878. They were instituted by the trustees of a Jamaica merchant, Robert Hibbert (1770-1849), who left money for the founding of scholarships, particularly for Unitarians. Until the year 1874 the money was used solely for this purpose, but in that year the trustees decided to begin the lectures for the purpose of discussing, and if possible settling, doubtful points of religion, quite apart from any sect. The first series was given by Prof. Max Muller, and since then the lectures have included Renouf, Renan, Knenen, Beard, Revillo, Pfleiderer, Sayce, and Hatch. The *Hibbert Journal*, financed by the Trust, was founded in 1902.

**Hibbing, tn.** in St. Louis co., Minnesota, U.S.A., situated 65 m. N.W. of Duluth. It is in the centre of the great Mesabi iron ore deposits. One of the mines is said to be the largest in the U.S.A., and has produced as much as 4,700,000 tons in one year. The chief industries are iron mining and lumbering. Pop. 16,300.

**Hibernation** (Lat. *hibernum*, winter), term applied to the dormant condition of certain animals during the cold weather. The same process is to be seen in warm latitudes in the summer, and is then called aestivation (*q.v.*), from the Lat. *caestivum*, summer. The cause of the practice of H. is probably the failure of the food supply. Among the hibernating animals are the bat, the bear, the badger, the dormouse, the marmot, the hedgehog, many reptiles, and terrestrial molluscs. The animals take precautions against being exposed to the cold, and bury themselves in caves, hollow trees, under the snow, etc. The hedgehog and the squirrel, however, are uneasy sleepers and are often abroad during the winter. The animals which do not hibernate completely store up 'caches' of food in the summer for the winter months. All such are vegetarians, save the Arctic fox, who hoards up dead hares, ermines, lemmings, etc. Among the soundest sleepers are the so-called cold blooded creatures, snakes, toads, and frogs. The distinguishing features of H. from a physiological point of view are: (1) The lowering of the temperature of the body; (2) the cessation of respiration to a very great extent, as proved by the fact

that hibernating animals can be in a poisonous atmosphere for a long time with no ill effects; (3) the cessation of all activities connected with alimentation and excretion.

**Hibernia**, also *Ierne*, *Iverna*, or *Juverná*, old classical name for Ireland used by the Romans.

**Hibiscus**, genus of malvaceous plants, consisting of 150 tropical and sub-tropical species, most of which are herbaceous in habit. They abound in the hot parts of Asia, America, and Africa, while a few are to be found in Europe, and many are valued for their mucilage and the tenacity of the fibre of their bark. *H. esculentus* is a species which is cultivated on account of its unripe fruit, the abundance of mucilage which it contains rendering it a useful article of diet. *H. Rosa-sinensis* is well known as an ornamental plant.

**Hicough**, or **Hiccup**, abnormal form of respiration in which an inspiration is checked by the sudden closure of the glottis. The inspiration is due to a spasmodic contraction of the diaphragm, and this may be caused by an abnormal stimulus of any part of the phrenic nerve; it is, therefore, usually an involuntary reflex following irritation of the mucous membrane of the stomach. The characteristic sound is caused by the passage of the inward current of air through the narrowed aperture and its sudden arrest on the closure of the glottis. Temporary attacks may usually be cured by a draught of cold water, but in certain complaints the accompanying *H.* may last for days. Bismuth or potassium bromide is generally administered in such cases.

**Hichens**, Robert Smythe, Eng. novelist and journalist, b. 1861, at Speldhurst, Kent; eldest son of Canon F. H. Hichens. Educated at Clifton College and at the London School of Journalism. Very popular novelist and successful playwright. His first novel, *The Green Carnation* (1891), was a satire on the mannerisms of Oscar Wilde, then at the height of his fame. He subsequently pub. *The Call of the Blood* (1906), *Bella Donna* (1909), *The Dweller on the Threshold* (1911), *The Way of Ambition* (1913), *In the Wilderness* (1917), *Mrs. Marden* (1919), *December Love* (1923), *Dorlor Arts* (1929), *The Bravellet* (1930), *My Desert Friend* (1931), *The First Lady Brendon* (1931), *The Paradise Case* (1933), *The Afterglow* (1935), *Secret Information* (1938), *The Million* (1940), *Incognito* (1947), *Too Much Love of Lirio* (1948), and an autobiography, *Yesterday* (1947). He collaborated in three plays, *The Medicine Man* (1898), *Becky Sharp* (1903), and *The Garden of Allah* (1905).

**Hickes**, George (1642-1715), Eng. divine and philologist, b. at Newsham, near Thirsk, Yorkshire. He received many preferments at the beginning of his career, but at the Revolution, on refusing to take an oath of allegiance to William of Orange, was deprived of all his benefices. In 1691 he was consecrated suffragan bishop of Thetford by a nonjuring prelate. His fame rests on *Theaurus Grammatico-Criticus et Archaeologicus Linguarum Flerarum Septentrionalium* (1705). See

biographical notice in J. Nichols, *Literary Anecdotes*, 1812.

**Hickory**, native tree of N. America, belonging to the genus *Carya*. The word is contracted from the native Virginian pohickery. The husk which covers the shell of the *H.* nut separates with four valves, while the nut itself has four, or even more, blunt angles. The male flowers are borne in catkins, and the leaves are pinnate with serrate margins. The tree is fine and graceful with beautiful leaves. The wood is very valuable for fuel purposes. The best known species are: *C. alba* or shell-bark *H.*, which produces very fine nuts; *C. oliviformis*, which produces the popular pecan nuts; *C. porcina*, which has pig-nuts; and *C. amara*, with very bitter nuts which are quite uneatable.

**Hickory**, tn. of Catawba co., N. Carolina, U.S.A., on the S. and the Carolina and N.W. railroads. It manufs. flour, lumber, carriages, and foundry products. Pop. 13,400.

**Hicks**, Sir (Edward) Seymour (1871-1919), Eng. actor-manager, b. at St. Heller, Jersey, son of an army officer. First appearance at Grand Theatre, Islington, 1887; in *In the Ranks*. Chief light comedian at the Gaiety Theatre from 1894. He married the actress Ellaline Terriss (b. 1872) in 1902. H. was author of numerous plays, including *Bluebell in Fairyland* (1901), *The Catch of the Season* (1904), and *The Man in Dress Clothes* (1922). He was knighted in 1935. Pub. *Twenty-four Years of an Actor's Life* (1910), *Between Ourselves* (1930), *Acting: A Book for Amateurs* (1931), and *The Vintage Years* (1943).

**Hicks**, William (1830-83), Brit. soldier. He entered the army in 1849, and served with distinction through the Indian mutiny. He took part in the Abyssinian war (1867-68), and retired with the rank of colonel in 1880. In 1882 he entered the Khedive's army, in which he was known as Hicks Pasha. As chief of the staff he drilled the army into good order, and drove the dervishes out of the country between Sennar and Khartoum. Although he objected that his troops were unfit to accomplish the task, he was despatched to recapture El Obeid, which had been taken by the Mahdi. At the Battle of Kashgil on Nov. 1, between H. and the personally led forces of the Mahdi, the majority of his men were slaughtered, and H.'s head was cut off. See J. Colborne, *With Hicks Pasha in the Sudan*, 1884.

**Hicks-Beach**, Sir Michael Edward, see ST. ALDWYN, EARL.

**Hidalgo**, state of Mexico, bounded on the S. by Tlaxcala and Mexico, Querétaro on the W., San Luis Potosi on the N., and Vera Cruz and Puebla, on the E. The N. and N.E. part is mountainous and rugged, being traversed by spurs of the Sierra Madre range, while in the S. and W. the country is fertile. Mining is carried on to a large extent, the silver and gold mines especially being world famous. Iron is worked at Encarnación and Apulco; other minerals mined are quicksilver, copper, lead, and zinc. The orange and sugar

cane are cultivated, also the staple cereals. The cap. is Pachuca. Area 8057 sq. m. Pop. 771,800.

**Hidalgo** (from *hijo de algo*, son of somebody, or possibly *Italicus*), title of the lower nobility. They had the right to use the title *don*, but when constitutional gov. was instituted their privileges were taken away.

**Hidalgo del Parral**, city of Chihuahua, Mexico, situated about 120 m. S.E. of the tn. of Chihuahua. In the vicinity are gold and silver mines. Pop. 16,006.

**Hides**, see **LEATHER**.

**Hiempsal**, name of two princes of Numidia: (1) Son of Micipsa, was murdered by Jugurtha, who had been given by Micipsa a share in the rule of the kingdom. (2) Probably grandson of Masinissa, and ruler of Numidia after the Jugurthine wars. He was afterwards driven from his kingdom by the followers of Marius, but in 81 B.C. the kingdom was restored to him by Pompey.

**Hierapolis**: (1) 'The Holy City,' so called by reason of its hot springs and cave, Plutonium, mentioned by Strabo, on account of which it was held sacred. St. Paul founded a Christian church here and it was the bp. of the philosopher, Epictetus. It was also a seat of worship of the goddess Cybele, and a centre of Phrygian nationality. See Sir W. Ramsay, *Cities and Bishoprics of Phrygia*, 1895. (2) An ant. city of Syria (Gk. *Bambyce*, Arabic *Mumayy*) on the high road from Antioch to Iraq. At one time an important centre of the cotton and silk trade, its decay dates from the Mongol invasion. Romanus Diogenes captured it in 1068, and it was stormed by Saladin in 1175. It was a seat of worship of Astarte, whose temple was ravaged by Crassus in 53 B.C.

**Hierarchy** (Lat. *hierarchia*, Gk. *ἱεραρχία* from *ἱερός*, sacred, and *ἀρχός*, leader), governing body of the Church, consisting of the bishops and lower orders of clergy.

**Hieratic**, see **HIEROGLYPHIC AND HIERATIC WRITING**.

**Hieros**, see **HYELES**.

**Hierocles**, name of sev. Gks., the chief of whom are: (1) (fl. c. A.D. 430). A Neoplatonist writer of Alexandria. He studied under the Neoplatonist Plutarch at Athens, and for sev. years taught at Alexandria. He later removed to Constantinople, where his religious views caused such offence that he was cast into prison. To him is attributed a commentary on Pythagoras's *Carmina Aurea* (ed. F. W. Mullach, *Fragmenta philosophorum Graecorum*, 1860), and *Φιλογίως*, a collection of over 250 jests (*αστεία*) (ed. E. Eberhard, 1869). (2) Stoic, the author of *Elements of Ethics* (*Ἠθικὴ στοιχειώσις*), which is sometimes attributed to the above. See Prächter, *Hierokles der Stoiker*, 1901. (3) (fl. c. A.D. 300). Proconsul of Bithynia and Alexandria, supposed to be the instigator of the persecutions of the Christians (303), and the author of *Λογοὶ φιλαληθείας πρὸς τοὺς χριστιανούς*.

**Hieroglyphic**, **Hieratic**, and **Demotic Writings**. Hieroglyphic writing (Gk. *hieroglyphiká grámmata*, from, *hierós*, holy, sacred, *glyphe*, 'carving,' *grámmata*,

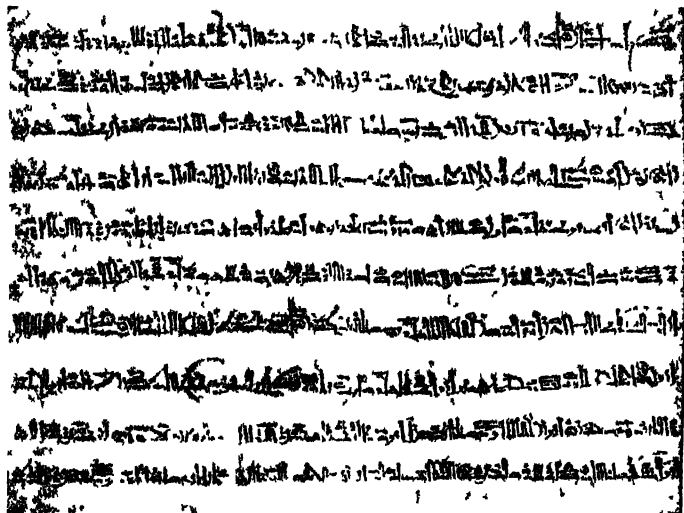

'letters'), was the term applied by the Gks., as mentioned by Clement of Alexandria (c. A.D. 200) in *Strom.* v., 4, to the pictorial symbols carved on Egyptian obelisks, sarcophagi, temples, and other monuments, or drawn on paintings, and which constituted one of the most important systems of writing of the ant. world. The term is also applied, although improperly, to other symbolical systems of writing, like those used on Hittite (q.v.), Mayan (q.v.) and Aztec (q.v.) monuments. The secondary meaning of the term 'hieroglyphic' for any 'unintelligible' characters or, in general, as denoting something mysterious or emblematic, is easily accounted for by the fact that the Egyptian hieroglyphics for centuries defied all attempts on the part of antiquarians and scholars to decipher them.

The origin and the early hist. of hieroglyphic writing are still uncertain. It is almost universally accepted that they were parallel in many respects with those of other so-called 'ideographic' systems of writing (see **WRITING**). According to this common theory, the Egyptian hieroglyphics started with crude pictures delineating objects such as 'flower,' 'sun,' 'horn,' 'eye.' Later, this method of communication becomes too slow and cumbersome, and more or less figurative objects are chosen to express compendiously a whole train of ideas by their essential relationship with that whole of which they form a salient part, e.g. flying arrows to indicate a 'battle.' Thus, pictography (q.v.) becomes ideography (q.v.); the representative signs are a more or less exact pictorial image of the object including the metaphorical or analogical expression of the idea intended, e.g. the sun is represented by a circle, the moon by the crescent. The transition from figurative imagery to symbols representing also abstract ideas, is a comparatively easy one, and it becomes clear that there may be no limit to eclectic ingenuity. For example, an eye with a sceptre beneath it denotes the king or kingly power; a hawk's head surmounted by a disc, the sun. Next come combinations of figurative imagery and symbols representing abstract ideas. Characters used in this way are generally called, although not quite correctly, 'ideographs' (q.v.); they are, to be more exact, word-signs. As soon, however, as the need of continuous discourse arises, it becomes evident that a number of the vital elements of speech, such as prepositions, inflexions, pronouns, or personal names, could not be represented by this means. Hence, the picture-symbols come also to be used to represent the phonetic values of words without any regard to their meaning as pictures, and the system becomes a kind of 'rebus-writing.' The range of expression of hieroglyphics was, therefore, very wide. This was already recognised by the famous decipherers of the Egyptian (1790-1832), Jean François Champollion (1790-1832), who concluded 'that there was no Egyptian writing altogether pictorial or representative, that the ant. Egyptians did not employ a mode of

writing altogether phonetic, that there is no regular writing altogether ideographic existing on any Egyptian monuments, and that the hieroglyphic mode of writing is a complex system—a system figurative, symbolical, and phonetic in the same text, in the same phrase, I would almost say in the same word.

In order to remove ambiguity, there were introduced determinatives, that is signs, which defined the meaning of a word by denoting the class to which it belongs: 'mountains,' 'islands,' 'women,'

either bi-consonantal (numbering about seventy-five, of which some fifty were commonly used) or uni-consonantal, of which originally there were some twenty-four, increased later by *homophones* to about thirty, covering the whole range of Egyptian consonantal sounds. The Egyptians had thus a kind of alphabet. Actually, it was not a true alphabet (*q.v.*), because in practice the Egyptians did not employ it when they could use word-signs or multi consonantal phonograms, which they combined with the determinatives

A PAGE OF THE GREAT HARRIS PAPIRUS

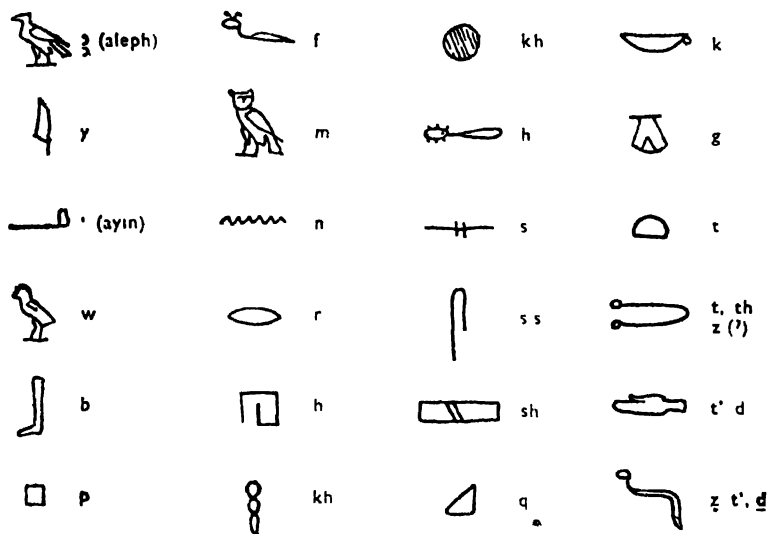

'to see,' 'gods,' 'negation,' and so forth. These determinatives were ideographs or pictorial images, put after a phonetic word, but were not pronounced, because, as mentioned, they only fulfilled the function of determining the meaning of the word they followed. For instance, the symbol representing 'a man with a long beard' was the determinative for 'gods,' 'angust persons,' and 'kings'; 'a man with raised hands' determined 'adoration,' 'invocation,' and 'prayer'; 'the prone figure of a man' determined the ideas of 'death,' 'massacre,' 'enemies,' and so forth. Thus, in general the employment of hieroglyphic characters was threefold, (1) word-signs, (2) phonograms and phonetic complements; (3) determinatives. As to the phonograms, it must be pointed out, that they usually consisted of the bare root of the words, but, as the Egyptian writing (like the Semitic alphabets) was purely consonantal, and there was practically no need for three-consonantal phonograms, generally speaking the phonograms were

into a cumbersome and extremely complicated script, and maintained it for over three and a half thousand years, i.e. from c. 3000 B.C. to about the sixth century A.D., to which the latest hieroglyphic inscriptions belong like the Mayan or Aztec scripts, but unlike the Chinese or cuneiform writings, the Egyptian hieroglyphics were highly pictographic, and maintained their pictorial character right to the end of the employment of this script. Besides, while the symbols of Aztec script, for instance, were crude pictures, Egyptian hieroglyphs on the whole were artistic drawings. The direction of writing was normally from right to left. Sometimes, however, from left to right, and some times inscriptions were written, for purposes of symmetry, in both directions. The signs face the beginning of the lines. Some inscriptions are written vertically.

*Hieratic* (from Gk. *hieratikós*, 'sacred, priestly') or 'priests' writing, was a simple modification of the hieroglyphic system, differing from it only in the external form of the signs. At the time of

Clement of Alexandria, from whom the word 'hieratic' is taken, this script was mainly employed by priests for writing and making copies on papyrus of Egyptian religious texts and literary compositions; and the term 'hieratic' was particularly suitable as opposed to the demotic writing (see below), which then was the script of everyday life. In earlier times hieratic writing was the only Egyptian cursive script employed both for sacred and profane purposes, while the hieroglyphic

scribes as a cursive simplification of hieratic writing. Practically all the chief characteristics of the hieroglyphics, or pictures, that had survived (although only in a schematic form) in the hieratic writing disappeared. Besides, whole associated groups of hieratic characters were fused by ligatures into single demotic signs. On the other hand, as a system of writing, demotic was no more advanced than the hieroglyphic and hieratic scripts, it was neither syllabic nor alphabetic, but

Hutchinson & Co (Publishers) Ltd.

#### EARLIEST HIEROGLYPHIC CONSONANTAL ALPHABET

writing was the Egyptian monumental script. The hieratic script was employed in one way or another from about 3000 B.C. to the third century A.D. The direction of writing, originally vertical, later became horizontal from right to left. A fine example of hieratic writing is to be seen in the Brit. Museum in the Great Harris Papyrus. A page of this papyrus is reproduced in the illustration on p. 125.

**Demotic writing** (from Gk *dēmōtika grāmματα*, as mentioned in Herodotus, II, 36, or *dēmōde*, in Diodorus, from *dēmos*, 'people'), that is 'the people's' writing, 'popular, vulgar' characters, was also called 'enchorial' (on the Rosetta Stone, see below), from Gk. *enkhōria*, *enkhōrios*, of the country, or 'native' writing, or 'epistolary characters' (*grāmματα epistolographika*, in Clement of Alexandria, *Strom.* v., 4). It was a conventional system of signs constructed by the

consisted essentially of word signs, phonograms and determinatives (see above). It was written horizontally, from right to left. Demotic writing was employed from about the seventh century B.C. to the middle of the first millennium A.D. Demotic, the last stage of the native Egyptian script, was thus used until the very end of Egyptian paganism. Coptic, the last stage of the Egyptian language, employed after the introduction of Christianity into Egypt, is written with the letters of the Gk alphabet, but seven signs derived from demotic characters were added to express Egyptian sounds which could not be expressed by Gk. letters.

**Numbers.**—The numbers 1 to 9 were expressed by short perpendicular strokes, as follows. 1 to 3, by one to three strokes; 4 by two above and two below; 5 by three above and two below; 6 by

three above and three below; 7 by four above and three below; 8 by four above and four below; 9 by three lines of three strokes each. 10 was represented by a sign having the form of a reversed U ( $\cap$ ); 100 by a kind of spiral; 1000 by a sign representing the lotus flower; 10,000 by a kind of long, vertical, crooked stroke; 100,000 by a frog; 1,000,000 by a man with upraised arms; all the other numbers were represented by repeating the above signs.

The attempted decipherments of the Egyptian scripts by the *savants* of the sixteenth to eighteenth centuries were unsuccessful, although Warburton conjectured the existence of the 'alphabetic' characters. De Guignes conjectured that some of the signs were determinatives, and the Dan. scholar G. Zoëga 'guessed' that sev. of the hieroglyphics must represent sounds, and actually used the term 'phonetic' in this context in his work on obelisks pub. at Rome in 1797; he also recognised that the oval rings, known as *cartouches* contained royal names. At the beginning of the nineteenth century, real progress was made by Swedish and Eng. scholars in decipherment of demotic and later of hieroglyphic writing. Dr. Thomas Young, of Eumaniel College, Cambridge, pub. various discoveries in the Supplement to the *Encyc. Brit.*, 1819. His was the first real attempt to determine the 'syllabic' or 'alphabetic' values represented by hieroglyphic signs, and his work is extremely important, because it gave one of the clues to Champollion's (see below) celebrated system of phonetic values as opposed to then generally accepted theory that hieroglyphic and hieratic characters were not phonetic. He set himself the problem of determining what groups of demotic characters corresponded to certain Gk. words, and his identification in the hieroglyphic script of sev. names of gods and persons also provided a basis of Champollion's decipherment. However, the Fr. scholar Jean François Champollion may be considered as a real 'father' of modern decipherment; its key was provided by the celebrated Rosetta Stone (now in the Brit. Museum, B.M. 960, No. 24). It was discovered in 1799 by the Fr. captain M. Bouchard, among the ruins of Fort St. Julien, near the Rosetta branch of the Nile, during Napoleon's attempted conquest of Egypt. It was secured for England by Lord Hutchinson under the 18th article of the capitulation of Alexandria. The discovery of this monument of black basalt excited the liveliest interest among archaeologists, orientalists and especially Egyptologists. The stone contains an inscription in three scripts: hieroglyphic (upper part 14 lines), demotic (middle part, 32 lines) and Gk. (lower part, 54 lines). The Rosetta Stone is a priestly decree drawn up in 197-196 B.C. in honour of Ptolemy V. (205-181 B.C.). The fact that a large part of the hieroglyphic version is broken off, the beginning of the first fifteen lines of the demotic version wanting, and the end of the Gk. mutilated, rendered the key a very difficult one to apply. Starting from the

known (the Gk. version) and his knowledge of Coptic, and working upon the way paved by Young, Akerblad, de Sacy, and others, Champollion slowly made the hieroglyphic and demotic writings to yield up their secrets. He commenced by applying phonetic hieroglyphics to the reading of the Gk. and Rom. proper names which occur on various monuments. His principle was this: he estab. that the Egyptians transcribed proper names and foreign words by means of a 'real alphabet,' of which each symbol was equivalent to a single consonant. Extending his views, he applied his 'alphabet' to the reading of groups of hieroglyphics which represent common names, verbs, and other parts of speech, and to the establishing of his theory that the characters or groups of characters which in the hieroglyphic texts express genders, numbers, persons, tenses, etc., are only the phonetic signs of single letters.

Champollion's masterly dissertation on hieroglyphic writing pub. in 1822, his *Lettre à M. Dacier* concerning *l'alphabet des hiéroglyphes phonétiques employés par les Égyptiens*, must be considered of paramount value for the hist. of decipherment, although for more accurate information on the subject reference should be made to more elaborate modern treatises. Much scientific scepticism persisted until the results of Champollion's successful decipherment were confirmed by another important inscription known as the 'Decree of Canopus,' found in 1866 by the eminent Ger. Egyptologist R. Lepsius. The subsequent work of Eng., Ger., Fr., Amer. and other scholars resulted in the fact that at the present day much that is tolerably certain can be postulated of the language and the scripts of ant. Egypt, and an entire civilisation extending over three and a half millennia has been revealed.

The bibliography of the subject is enormous. Following are a few major studies, of recent date, all of them containing rich bibliographies: The Brit. Museum *Guide to Egyptian Collections*, London, 1909; E. A. Wallis Budge, *Facsimiles of Egyptian Hieratic Papyri in the British Museum*, London, 1910, 1923; *Hieroglyphic Texts*, etc., in the *British Museum*, London, 1911-14; J. H. Breasted, *Ancient Records of Egypt*, Chicago, 1909; G. Moeller, *Hieratische Paläographie*, Leipzig, 1909-36; A. Erman, *Die Hieroglyphen*, Berlin and Leipzig, 1912; W. Spiegelberg, *Demotische Grammatik*, Heidelberg, 1925; E. Naville, *L'écriture égyptienne*, Paris, 1926; A. H. Gardiner, *Egyptian Grammar*, Oxford, 1927; T. E. Peet, *Ancient Egypt* (in E. Eyre, *European Civilisation*, etc.), 1934; K. Sethe, *Das hieroglyphische Schriftsystem*, Glückstadt and Hamburg, 1935; E. A. Wallis Budge, *The Rosetta Stone*, 1935; J. A. Wilson, *The State of Egyptian Studies* ('The Ithaca Symposium'), New Haven, 1938; W. F. Flinders Petrie, *The Making of Egypt*, Oxford, 1939; S. R. K. Glanville, *The Legacy of Egypt*, Oxford, 1942; G. Steindorff and K. O. Seele, *When Egypt Ruled the East*, Chicago,

D. Düringer, *The Alphabet*, etc., London, 1948, pp. 58-71.

**Hieron**, or **Hiero I.** (d. 466 B.C.), tyrant of Syracuse, the successor of his brother Gelon. He defeated the Etruscan fleet near Cumæ. On three occasions he won the crown at the Olympic games, and was a patron of Pindar, Archylus, Simonides, and Epicharmus whom he installed at his court.

**Hieron**, or **Hiero II.** (c. 308-216 B.C.), tyrant of Syracuse, a descendant of Gelon. After his victory over the Mamertines (270 B.C.) he was unanimously elected king by all the states of Sicily. In the first Punic war he sided with the Carthaginians, but in 263 became a friend and ally of Rome, to whom he remained faithful till his death.

**Hieronymites** ('Brethren of Goodwill,' 'Gregorians'), hermit order of Hieronymus (or St. Jerome), an offsprig of the Franciscans, founded by Thomas of Sion (fourteenth century). The community settled in Spain and later estab. branches in Portugal, Italy, the Tyrol, and Bavaria.

**Hiero**, or **Ferro**, one of the Canary Is., occupying the most S.W. position of the group. In the attempt to find a meridian circle which should intersect only seas which divide new world from old the Meridian of Ferro was fixed upon. But the Fr. found that the is. was 20° 30' W. of Paris, so reckoned the geographical zero as 20° W. Hence the 'Meridian of Ferro' is really about 30° E. of the is. The chief tn. of the is. is Valverde. Area about 126 sq. m. Pop. about 6000.

**Higden**, **Ranulf** (d. c. 1364), Eng. chronicler, was a monk of St. Werburgh's monastery, Chester, and whose great work was a general hist. entitled *Polychronicon*. This work dealt with events down to his own time, and was printed by Caxton in 1482. It is now ed., with trans. for the Rolls Series (1865-86).

**Higgins**, **Edward**, see under SALVATION ARMY.

**Higginson**, **Thomas Wentworth** (1823-1911), Amer. man of letters, b. at Cambridge, Massachusetts. Graduating from Harvard (1841), he subsequently studied theology, and became pastor of a Unitarian church. He was an enthusiastic supporter of the anti-slavery agitation. During the Civil war he was captain of the 1st S. Carolina Volunteers, a freed negro regiment. He wrote *Army Life in a Black Regiment* (1870), lives of *Margaret Fuller Ossoli* (1884), *Lonsfellow* (1902), and *Whittier* (1902), and *Part of a Man's Life* (1905). See his *Collected Works* (7 vols.), 1900.

**Higham Ferrers**, tn. in the co. of Northampton, England, situated about 13 m. N.E. of Northampton. It is engaged in the manuf. of boots and shoes. Pop. 3400.

**Highbridge**, tn. of W. Somerset, England. It is situated about 25 m. to the S.W. of Bristol, and has locomotive works. Pop. 3000.

**High Church**, that section of the Anglican Church which attaches supreme importance to the administration of word and sacrament by clergy duly ordained,

whose ministrations it considers necessary as the divinely appointed instruments of grace.

**High Commission**, Court of, judicial court estab. by Queen Elizabeth in 1559. It was composed of clerical and lay commissioners nominated by the crown, and its function was to investigate eccles. cases. It attempted to extend its influence over cases which should have been dealt with in the common law courts, with the result that in the reign of James I. Coke tried to check its power by his ruling that it could only fine and imprison in cases of heresy and schism. In 1641 the court, with its lay counterpart, the Star Chamber, was abolished by the Long Parliament. It was revived by James II. in 1686, but finally abolished by the Bill of Rights (1689). A similar court existed in Scotland for thirty years (1608-38).

**High Commissioner**, term of varying import, generally used to mean a high administrative officer in a dependency or protectorate, or a Dominion's Chief representative in London. Thus there was a Brit. High Commissioner for Iraq before that country became independent. In recent years H. Cs. representing the United Kingdom Gov. have been appointed in the dominions of Canada, Australia, New Zealand and S. Africa. They act as confidential channels of communication between the United Kingdom and Dominion Ministers.

**High Court of Justice**, see APPEAL; CHANCERY; COMMON LAW; JUDICATURE ACTS; and SUPREME COURT OF JUDICATURE.

**Highgate**, suburb of N. London, in the co. of Middlesex, about 1½ m. N.W. of St. Paul's. It is noteworthy as having been the place where Bacon and Coleridge d., and also for its cemetery containing the remains of Lyndhurst, Faraday, and George Eliot, among other celebrities. Whittington's Stone is at the foot of H. Hill, and is said to indicate the place at which he turned again after hearing Bow Bells. Pop. 22,000.

**Highland Cattle**, see under CATTLE.

**Highland Dress**, best illustration which the Brit. Isles offer of a costume truly national. The 'garb of old Gaul' consisted of the 'Feile-bracan' or 'belted plaid.' A piece of tartan cloth, 4 yds. long and 2 yds. broad, was drawn in at the waist by a belt, which secured the careful folds of the lower part or skirt. The plaid, that is the upper portion, was usually fastened with a handsome brooch or buckle over the left shoulder, so that the right arm was quite free for use. This simple attire was admirably adapted to the wild, free life of a Highlander. For, if he were overtaken by night or storm he might wrap his warm plaid round both his shoulders, whilst his loose nether garment was no hindrance, whether he wished to scale heights or wade across streams. The tartan (from Fr. *tiretaine*, a linsey-woolsey cloth) was a device with chequered pattern, and one or more stripes relieved against a different-coloured background for signifying the wearer's clan or dist. Members of the

same sept or clan wore tartans whose main characteristics were the same, and whose variations had a local meaning. Broadly speaking, tartans are red and green: the tartan of the Macleods, Graemes, and Forbes was green, whilst the Camerons, Stewarts, and Macgregors all wore red. In time the 'Feilebeag' or 'fillebeag' superseded the 'Feilebreacan'. The lower part of the latter became the 'kilt', which was carefully sewn and tucked, whilst the body part was separate and the shoulder-plaid became merely an ornament. The kilt stopped short of the knees, and over it in front was hung the 'sporrán' or 'spleuchan,' that is a goat's skin purse. The Highland 'bonnet' was a cloth cap adorned with heather, or in the case of a chief with eagle's plumes. Through his belt a Highlander would thrust his dirk, knife, pistols, and fork, whilst on horseback he wore his 'truis,' or 'trews,' that is close-fitting tartan breeches and stockings made in one piece. The gentry were distinguished by silver ornaments and lace embroideries, but these are seen now only in ceremonial dress at balls, gatherings of the clan associations, and the like. The kilt is worn little for everyday dress now, but has a certain popularity for walking and climbing. It is worn by the bandsmen of Highland regiments and the Scots Guards, but is optional wear (with trews or trousers) for other men.

**Highland Light Infantry (City of Glasgow Regiment).** Formerly the 71st and 71th regiments, which were linked in 1851. The 71st was raised in 1777 as the 73rd, but was renumbered 71st in 1786. Lord MacLeod's Highlanders, originally the 73rd regiment of foot but later the 71st, who ultimately became the first battalion of the Glasgow Light Infantry, had, despite their early influx of Glasgow recruits, no nominal connection with Glasgow. That began after the embodiment of a second battalion raised at Dumbarton in 1804, who were disbanded in 1815, six months after Waterloo. For a few months after 1808, at the instance of Lt.-Gen. Sir John Craddock, the 71st were granted the title of the Royal Glasgow 71st Regiment; but in the Peninsula war they became the Highland Light Infantry, though the bonds with Glasgow were not weakened, the regimental records showing that of the 1671 Scottish recruits between 1806-1818 the greater number were listed as belonging to Lanarkshire and Renfrewshire. Later, in 1823, royal approval was given for the adoption of the title 'City of Glasgow Regiment.' This regiment served with distinction in India in the Carnatic and Mysore. It then saw service at the Cape of Good Hope and in the Peninsula war, especially in the retreat to Corunna. It served under Wellington again at Waterloo. After a period in Canada it served in the Crimea war, then in the Indian Mutiny. The 74th was raised in 1787 for service in India. Like the 71st, it served with much distinction in that country, particularly at Assaye under Sir Arthur Wellesley. It served again under him through the

Peninsular war. From 1818 to 1845 it was in Canada and the W. Indies, then went to the Cape, and lost many men in the wreck of the *Birkenhead*. After the Kafir war it went again to India. The H.L.I. saw service in the 1882 Egyptian Expedition, and fought at Tel-el-Kebir. Back to India in 1884, it served later on the N.W. Frontier during the 1897-98 campaign. It fought at the Modder R. during the S. African war (1899-1902). During the First World War it raised twenty-six battalions, which served in France, Flanders, Gallipoli, Egypt, Palestine, Mesopotamia, and Archangel. In the Second World War the H.L.I. took part in the battles on the Western Front both in 1940 and 1944-45.

**Highland Park,** industrial suburb of Detroit, Michigan, U.S.A. with automobile manufs. Its pop. increased from 100 in 1900 to 50,800 in 1940.

**Highland Pony,** see under HORSE.

**Highland Terrier,** see SCOTTISH TERRIER.

**Highlands** are to be distinguished in formation alike from tablelands and mts. Generally speaking, H. may be said to exist in the E. of the Old World, in the E. of Australia, and in the E. of N. America. They occur in broad, expansive masses, unlike high mts. which are much more localised. Their structure, moreover, is peculiar. Both valleys and watersheds or divides radiate, and the riv. systems are like great branching trees; the distribution, as in mountainous countries, of parallel ranges separating valleys is only rarely visible—the Appalachians are an exception; as a rule the valleys branch like fingers in the inner H., thus collecting trib. streams, whilst they broaden and deepen as they pass outward. H. are formed by the denudation or washing out of valleys, as, for example, the H. of Scotland, and by slow crustal movements, and sometimes by volcanic activities.

The H. means specifically that part of Scotland which stretches N.W. of a line drawn between Helensburgh and Stonehaven and the term is used in contradistinction to the Lowlands, of Scotland. See further under GRAMPIONS and SCOTLAND.

The 'White Highlands' is the name commonly given to the plateau and mt. country in Kenya which has been appropriated to settlement by Europeans. The dominating feature of the White H. or H. of Kenya is Mt. Kenia (or Kenya).

H. of the Hudson, mountainous dist. on both sides of the Hudson R., extend through Orange, Putnam, Rockland and Dutchess co., New York. They are from 1000 to 1500 ft. high. The chief peaks are Breakneck (1635 ft.), Crow Nest (1405 ft.), Stony Point, and West Point.

**High Peak,** Derbyshire, England, is part of the Pennine Chain. Height 2038 ft. It is 10 m. S.E. of Manchester, and contains the celebrated Castleton caverns. Also the name of a parl. div. See PEAK DISTRICT.

**High Places,** elevated spots on which altars were erected by the anc. Semitic peoples for worship, in the belief that, as they were nearer heaven than were the

plains and valleys, they were more favourable places for prayer. The practice of worship on these spots became frequent among the Jews, and was with difficulty abolished in spite of the warnings of the Biblical prophets.

**High Point**, tn. in Guilford co., N. Carolina, U.S.A., is 34 m. N.E. of Salisbury. It has a thriving trade, and manufs. bricks, cotton, machinery, and tobacco. It has also furniture factories, silk and cotton mills, carries on a large agric. trade and is a wholesale centre. It is served by three railways. Pop. 39,400.

**High Priest**, head of the Jewish priesthood. In the early days of the Jewish religion there is no trace of this office, which does not appear until the campaign against the local sanctuaries had concentrated worship at Jerusalem. The true prominence of the H. P. dates from the Exile, after the return from which he becomes the head of a theocratic state. The regulations for the H. P. are given (see *HEXAERUON*) in *Leviticus* with great detail, where his ancestry is traced from Aaron and his son Eleazar. The vestments of the H. P. were extremely magnificent, and were worn in the exercise of his duties except on the Day of Atonement, when he alone, clad in white linen, entered the Holy of Holies to sprinkle the blood of sacrifice.

**High River**, tn. of Alberta, Canada, on the Highwood R., 40 m. S. of Calgary, on a branch of the C.P.R. Dairy farming and ranching are the chief occupations. About 20 m. distant are the Turner Valley oilfields. Pop. 1800.

**High School**, term used in the U.S.A. for those schools which superseded about 1850 what were called academies, the difference being that high schools were maintained (as a general rule) at public, not private, expense. In some states their maintenance is part of the state constitution. A H. S. may be regarded as one supported by public funds, usually free, open to both sexes, and where pupils are prepared for technical schools and univs. There are, however, public and private H. Ss.; the term has much the same meaning in Canada, but in England has no definite significance. The Canadian public H. S. is that type of secondary school which in most of the prov. has since 1870 (the period of the origin of the free schools), come to be looked upon as the orthodox institution. Though a separate institution, it is an integral part of the educational chain from the kindergarten to the univ. It made its appearance in Ontario in 1871 as a democratic publicly-controlled, co-educational estab., offering a classical curriculum in preparation for a univ. or, alternatively, an Eng. curriculum for pupils intended for some immediate vocation. The Prince of Wales College, founded in Prince Edward Is. in 1860, the only secondary estab. in that Prov., has some of the features of the public H. S. County academies, the precursors of the H. S. in Nova Scotia were made free in 1864. The grammar schools, the H. Ss. of New Brunswick, were brought under the control of the

local authority in 1884; in 1870, in Quebec, the Protestant Board of Montreal assumed control of the existing H. S. for boys and estab. one for girls in 1875; in the eighties collegiate depts., which later became separate institutions, began to be estab. in Manitoba; in Saskatchewan H. Ss. replaced union schools (i.e. schools arising out of the movement in 1850 in Ontario, where grammar school boards and common school boards were permitted to unite and form schools for giving democratic secondary education in addition to elementary education) in 1907; and in Brit. Columbia a free H. S. was estab. in Victoria in 1876.

**High Seas**, term of international law, denoting the whole extent of sea which is not under the sovereignty of any state. Every country adjacent to the sea owns 'territorial waters' restricted to the area within three m. of its shores. The H. S. are free to all nations, subject to certain laws made for the common welfare.

**High Sheriff**, co. or city officer vested with wide judicial and executive authority. Their duties are defined by the Sheriffs Act, 1887, and include attendance on judges during Assizes, the functions of returning officers during parl. elections, and the preparation of lists of jurors. City sheriffs are appointed annually on Nov. 9.

**High Steward of England**, one of the Great Officers of State under the Eng. crown. The original duty of the H.S. seems to have been to place the dishes on the lord's table at solemn feasts. It would appear that under the Normans the office was vested in the Beaumont earls of Leicester, and passed by marriage from them to Simon de Montfort. After the latter's death in 1265 it was granted by Henry III. to his younger son Edmund, earl of Lancaster, *for life*. Edward II. confirmed it to him *in fee*, and thereafter it descended with the earldom and dukedom of Lancaster. On the accession of Henry IV. the office was merged in the Crown, and has since been created *pro hac vice*. The court of the H.S. formerly decided upon claims to do services at the coronations of the sovereign; but this duty is now performed by the Court of Claims newly appointed on each accession. A H.S. was also created to preside over the House of Lords on the trial of a peer. But after the trial and acquittal of Lord de Clifford in 1935 on a charge arising out of a motor accident it was suggested that this archaic mode of trial be abolished. Privilege of peerage in relation to criminal proceedings was abolished by the Criminal Justice Act, 1948. There is a H.S. attached to both univs. of Oxford and Cambridge, whose duty it is to protect the rights of the univ. courts.

**High Treason**, see *TREASON*.

**Highwaymen**, mounted robbers who infested the high-roads of England during the seventeenth and eighteenth centuries. The most celebrated H. in hist. are: Dick Turpin (1705-39), Swift Nick Levison (hanged at York, 1684), and Jack Sheppard (1702-24).

**Highway. Common Law as to Highways.**—A 'highway,' which in common law (*q.v.*) is a term embracing carriage roads, horse or bridle roads, mere foot-paths, or any other public way, may be comprehensively defined as a way through or over lands of any ownership which is open to the public generally by virtue of an Act of Parliament, a prescriptive right, or by express or implied dedication. The commonest mode by which a public right of way is created is by dedication, which may take the shape of a formal invitation by the owner in fee simple (*see ESTATE*) of the land in question to the public to use a new or existing road, but which more often than not is merely implied from the owner's conduct. Generally speaking, uninterrupted, user for a substantial period of time acquiesced in by the owner creates a presumption of dedication which can only be rebutted by special circumstances. Uninterrupted user for twenty-one years gives the public an absolute right of way by prescription. Dedication may confer only a limited right, whether in respect of seasons, manner, or extent. A limitation in point of duration is void, for a dedication is either in perpetuity or not a dedication at all. It is to be noted that the H. Acts include in the statutory definition of H. bridges (not being co. bridges, or bridges repairable by the inhabs. at l.g.g. of a hundred), towing paths, and navigable rivs., but not railways. Indeed every way which is open to the public is a H., and in this connection it is immaterial on whom is cast the burden of repair and maintenance. A street as defined by the Public Health Act, 1875, is usually, but not necessarily, a H.; a street under the Act being defined as 'any highway and any public bridge (not being a co. bridge), and any road, lane, footway, square, court, alley, or passage, whether a thoroughfare or not.' A H. is also usually a *thoroughfare*, but may, of course, be a *cul-de-sac*. The public right over a H. is merely that of passing along it. There is no right to use it as a place for public meetings or assemblies, and there are sev. recorded cases showing that one's mere presence on a H. for ulterior purposes may well be illegal and actionable. For example, in the case of a man who repeatedly, and for the purpose of annoying, passed and repassed the plaintiff's window while the latter and his family were dining; and again in the classic case of *Harrison v. Duke of Rutland*, where it was held that a man had no right to go on to a H. merely for the purpose of using it to interfere with another man's right of shooting by preventing the grouse from flying towards the butts occupied by the shooters. A public right of way is, as the very term implies, restricted to the surface of the land over which it goes, and the subsoil remains in the freeholder, or, if different freeholders' lands lie on either side of the H., then, generally speaking, the subsoil up to an imaginary line running down the middle of the road belongs to each adjoining landowner. Strictly speaking, the residuary rights in the surface also belong

to the owner of the soil; but in the case of most Hs. such rights are not of any practical value. A mere occupation road laid out through an estate purely for the use and convenience of the inhabs. is not thereby dedicated to the public; such private right may, however, co-exist with a public right of way, and though in general the former would be merged in the latter right, it may well be inherently a larger, and therefore independently subsisting right. A H. cannot at common law cease to be such by abandonment or non-user, for 'once a highway always a highway.' But by Act of Parliament, a H. may be destroyed, and such a course, e.g. in the case of Hs. running along dangerous cliffs, might well be advisable.

**Statute Law as to Highways.**—Under the H. Act, 1835, as amended by the Local Gov. Acts, 1888 and 1894, two justices have power to grant a certificate to 'stop' or 'divert' a H. if both the dist. and par. councils (if any) concur in the proposal to stop or divert. The usual reason for diversion is that some proposed new way is more advantageous, and the only reason for stopping up a H. altogether is that the H. is no longer required. An appeal against the certificate of the justices lies to quarter sessions at the instance of any person aggrieved, who must give the dist. council fourteen days' notice of appeal, and state the grounds of his appeal. The matter will then in due course be tried before a jury. The duty of repairing and maintaining a H. is theoretically still upon the inhabs. of the par. in which it is situated, and an indictment for nuisance lies against such inhabs. at the instance of any one aggrieved if a H. is allowed to fall into disrepair. Nothing in the Local Gov. Act, 1929, with respect to main roads or co. roads affects the liability of any person or body of persons to maintain or repair a H. The Local Gov. Act, 1888, however, practically absolved inhabs. from all liability, so far as main roads were concerned, by instituting the co. council the H. authority for such roads. The allocation of responsibility for maintenance of Hs. has been considerably modified by the Local Gov. Act, 1929 (*see infra*). By a curious rule of law a H. authority is not liable to be proceeded against on indictment for a mere non-repair or non-feasance, but only for misfeasance. The distinction is mainly academic, for a complaint of non-repair to the co. council is equally effective if the cost of repair of a H. is increased by extraordinary weight or traffic, the road authority may, under section 23 of the H. and Locomotives (Amendment) Act, 1878, as amended by the Locomotives Act, 1898, recover the expenses certified by their surveyor to have been incurred by reason of such traffic from the persons by, or in consequence of, whose order such weight or traffic has been conducted. It is entirely a question of fact in each case what constitutes extraordinary traffic, e.g. military manoeuvres, the erection of a mansion or factory in a remote rural dist., excessive weight of a single wagon drawn by a locomotive, may each constitute or

result in extraordinary traffic. It is not easy to reconcile the cases on the subject, but apparently the true test for determining whether traffic is extraordinary depends on what is ordinary traffic on the particular road, not on what other and even similar roads in the neighbourhood have borne without injury. To obstruct a H. is a criminal offence, and any member of the public may remove the obstruction. The owner of any animals which stray upon a H. (not running over common or waste land) is liable for damage occasioned thereby to adjoining property. By the Road Transport Lighting Act, 1927, every vehicle on any road was required, during the hours of darkness, to carry two lamps, each showing to the front a white light and one lamp showing to the rear a red light, and all the lights must be visible from a reasonable distance. There were special provisions as to bicycles, tricycles, and invalid carriages; bicycles not propelled by mechanical power were not required to carry a lamp showing a red light to the rear if an efficient red reflector is shown instead; and, generally, in these special cases, a single front white light was sufficient. But on the introduction of the 'black out' in Great Britain at the beginning of the Second World War a 'live' rear light was made obligatory for bicycles, etc. and the regulation has not been withdrawn. As regards horse-drawn vehicles, the separate red light is not necessary if the front lamps serve the same purpose and provided no part of the vehicle or its load extends more than six feet behind such lamps. 'Darkness' in this context, means, as respects summer time, the time between one hour after sunset and one hour before sunrise, and, as respects the remainder of the year, the time between half-an-hour after sunset and half-an-hour before sunrise.

**Maintenance of highways.**—Important changes in the law of Hs., particularly in relation to the responsibility for maintenance and improvement, were made by the Local Gov. Act, 1929; but these changes do not extend to the administrative co. of London. Under this Act roads are divided into 'county roads' and 'ordinary highways,' and into 'classified' and 'unclassified' roads, and these distinctions are made for the purpose of fixing the responsibility for maintenance. An 'ordinary' H. may become a co. road by an order of the co. council, or by an order of the minister of transport made on appeal by a dist. council from the co. council's refusal or failure to make an order. Briefly, all Hs. in rural dists. and main or classified roads in urb. dists. are co. roads; and neither the maintenance and repair of a co. road by an urb. dist. council nor the delegation of functions in respect of a co. road to a dist. council will result in the road ceasing to be a co. road. A road in the Act of 1929 means a road classified by the minister of transport for the purpose of the Act. Since 1936, however, there has been introduced a third category of H.—the 'trunk roads.' By the Trunk Roads Act, 1936, the minister of transport became the authority for 'the

prin. roads in Great Britain which constitute the national system of routes for through traffic.' But no road within the co. of London or within any co. bor. is included in the category of trunk roads. The roads which became trunk roads are listed in the first schedule to the Act; the total mileage of trunk roads in Great Britain is now 4,500, and the minister of transport is responsible for their maintenance and improvement. The minister may, however, by agreement with any co. council or co. bor. council or urb. dist. council delegate to these councils, all or any of his functions with respect to the maintenance and repair and improvement of any trunk road; but such functions may not be delegated to a bor. or urb. dist. council with respect to any road outside the bor. or dist.; nor, except with the consent of the co. council in which the road is situated, may the minister's functions be delegated to the co. council with respect to any road outside the co. Even where there is delegation, the council merely acts as agent for the minister and in accordance with prescribed conditions, particularly in relation to securing ministerial approval for works expenditure. It is for the co. council or other appropriate local authority to exercise the statutory functions, in relation to trunk roads, prescribed by the Restriction of Ribbon Development Act, 1935, unless they have relinquished those functions in the manner provided by the Local Gov. Act, 1929 (section 32).

To the minister of transport the Act of 1929 transferred all powers and duties of any gov. dept. in relation to (*inter alia*) roads, bridges, ferries, vehicles and traffic thereon, with certain exceptions; but the Board of Trade retains all its powers and duties under any local, special, or private Act, and the minister of health retains all his powers and duties in regard to sanctioning plans by local authorities, under the Housing Acts, and in respect of the confirmation of by-laws. But the minister of transport has succeeded to the powers of the Road Board under the Development and Road Improvement Funds Act, 1919. By the Local Gov. Act, 1929, the rural dist. councils have ceased to be the highway authorities, and the co. councils have taken their place; but the rural dist. council retains 'functions,' which include powers and duties under the Local Gov. Act, 1894, as to rights of way, and encroachments on roadside wastes. The rural dist. council may also have certain functions of the co. council delegated to them as to maintenance and repair. The words 'County Council' in the Act of 1929 do not include co. bor., and for ordinary Hs. within a bor. the bor. council is the H. authority. Where an urb. dist. has a pop. of more than 20,000 the dist. council may claim to exercise the functions of maintenance and repair of any co. road, not including bridges, within their dist. The dist. council may act as agents of the co. council. The co. council may themselves place a road in repair or notify the dist. council to do so within a reasonable time, and such notice may be given whenever

the co. council are satisfied on the report of their surveyor that repair is required.

**Road Traffic Acts.**—The ever-increasing use of motor vehicles on H. has led to the passing of many Acts to regulate such traffic. The Road Traffic Act, 1930, consolidated the law by repealing some thirty earlier Acts, and made numerous amendments and new provisions to keep abreast of the rapid development and universal use of motor vehicles. Motor vehicles used for the carriage of goods are dealt with under the Road and Rail Traffic Act, 1933. The minister of transport has wide powers of making regulations under the Road Traffic Acts. The ministry has compiled a Highway Code as authorized by statute. It is issued with driving licences, and copies may be obtained from the Stationery Office. It is intended as a guide to persons using the road, and may be revised from time to time. Failure to observe the code is not an offence in itself, but it may be relied on as tending to establish or negative the liability of a party to any legal proceedings. Under the Act of 1934 the minister of transport may establish crossings for foot passengers or make regulations as to the precedence of vehicles and foot passengers and, generally, as to traffic movement at or near a crossing and erect traffic signs in connection with the crossings and may call upon local authorities to submit schemes for providing such crossings. This Act also provides a general speed limit of 30 m.p.h. in 'built-up areas.' Speed limits for classes of motor vehicles other than ordinary passenger motor cars are prescribed in the same Act. The minimum ages for drivers of motors are: for motor-cycle, 16 years; for private car, 17 years; for vehicle weighing 2½ tons unladen (or over), 21 years. No person may use, or permit to be used, a motor vehicle unless covered by a policy of insurance in respect of third-party risk. Under the Act of 1934 it is the duty of insurers to satisfy claims in respect of third-party risks notwithstanding provisions in the policy entitling them to avoid liability, unless the policy was obtained by misrepresentation. Full provision is made in the Act of 1930, for the regulation of public service vehicles. The use of certain roads and bridges by goods-carrying motor vehicles is also controlled by the Road and Rail Traffic Act, 1933. Every motor vehicle, excepting motor-cycles, must be fitted with a reflecting mirror.

See Pratt and Mackenzie, *Law of Highways* (18th ed.), 1932; *The Complete Statutes of England, or Halsbury's Statutes of England* (2nd ed.), 1919 ff.; S. and Beatrice Webb, *The Story of the King's Highway*, 1920; W. J. Hadfield, *Highways and their Maintenance*, 1934; G. Bouniephrey, *British Roads*, 1942; C. W. Scott Giles, *The Road Goes On*, 1946; R. Jeffreys, *The King's Highway, 1838-1913*, 1949; Madge Jenison, *Roads*, 1919.

**High Willhays**, hill of Devon, England, the highest point on Dartmoor (2039 ft.) It lies 4 m. S.W. of Okehampton.

**High Wycombe**, see WYCOMBE.

**Hilumaa**, see DAGÖ.

**Hilarion**, St. (c. 290-372), abbot, founder of the monastic system in Palestine. He was b. at Tabatha, and while studying at Alexandria, became converted to Christianity. About 306, through the influence of St. Anthony, he became a hermit, and lived in the deserts bordering on Egypt, and finally d. in Cyprus. The chief authority for his life is St. Jerome.

**Hilarius** (or Hilary), St. (c. 320-368), bishop of Poitiers, b. in Limonum (Poitiers) of pagan parents, and was converted to Christianity through his own studies. He was banished to Phrygia by the Emperor Constantius for his vehement controversies with the Arians. He visited numerous churches in Asia Minor, and ultimately returned to Poitiers still undaunted. His most important work is *De Trinitate*. See J. G. Cazenove, *St. Hilary of Poitiers and St. Martin of Tours*, 1883.

**Hilary**, or Hilarius, surnamed *Diaconus*, deacon of Rome, b. in Sardinia. In 350 he was sent to the Emperor Constantius by Pope Liberius on a special mission to uphold orthodoxy against the Arians at the council of Milan. His opponents scourged and exiled him, with the result that his views were strengthened. Two treatises imputed to him are usually incorporated with the one with Augustine's, the other with Ambrose's works.

**Hilary** (d. 168), pope, successor of Leo I. (461), a native of Sardinia. He was created archdeacon by Leo I., and

POPE HILARY

rigorously upheld the supremacy of Rome. When pope, he improved and enriched the monasteries and churches which had been damaged by the Vandals.

**Hilary**, St., of Arles (401-449), b. in a tn. between Lorraine and Champagne, brought up in the monastery of Lérins. He became bishop of Arles, and later deposed the bishop of Besançon, which seriously embroiled him with Leo I.

**Hilda**, or **Hild** (614-680), patroness of Whitby. She was abbess of Hartlepool

or Heorta (c. 650). She ruled for twenty-two years the monastery for monks and nuns at Whitby (Streonshalh), which she had founded in 658.

Hildburghausen, tn. of Thuringia, on the Werra, 19 m. S.E. of Meiningen. It was formerly (1683-1826) cap. of the duchy of Saxe-Hildburghausen. Pop. 6900.

Hildebrand, see GREGORY VII.

Hildebrand, Adolf E. R. von (1847-1921), Ger. sculptor; b. at Marburg; son of Bruno H., writer on economics. Studied at Nuremberg and Munich, worked in Berlin. Studied in Rome, 1867-8; exhibited bronze statuette, 'Sleeping Shepherd Boy,' Vienna Exhibition, 1873. Lived in Florence, 1874-92; working chiefly at portrait sculpture—roigning princes being among his subjects. He designed fountains at Munich, Jena, Worms, and Strasburg.

Hildegard, St. (1098-1179), visionary, seer, and an appreciated writer, b. at Bockelheim, Germany. She is called the Sibyl of the Rhine, and was abbess of the nunnery of Disibodenberg, Lorraine, at which she was brought up. She founded the abbey of St. Rupert, near Bingen. See life by J. P. Schmelzer<sup>4</sup>, 1879.

Hilden, tn. of Rhineland, Germany, 3 m. S.E. of Düsseldorf. It manufactures velvet, silk goods, carpets, machinery, etc. Pop. 20,000.

Hildesheim, tn. and episcopal see of Hanover, Germany, situated at the foot of the Harz Mts., on the R. Innerste. The Rom. Catholic Cathedral, which dates back to the eleventh century, noted for the beautiful bronze doors executed by Bishop Bernward, was badly damaged, and its cloisters partly destroyed in the Second World War. It holds the sarcophagus of St. Godehard, and the tomb of St. Epiphanius. There are also the Romanesque church of St. Godehard, built in the twelfth century, and the church of St. Michael (burnt out), founded in the eleventh century. Besides these, are the fifteenth century (burnt out) Rathaus, and the Wedekindhaus (1598), and the St. Michael Monastery, now a lunatic asylum. The guild-house of the butchers (1529), a fine example of a wooden building was destroyed by bombing. The chief productions are sugar, tobacco, stoves, and machinery. H. was the seat of a bishopric from 822, and was one of the original members of the Hanseatic League. A unique collection of Rom. silver plate of the time of Augustus was found on the Gaisenberg, E. of the tn., in 1868. Pop. 62,500.

Hill, Aaron (1685-1750), Eng. writer, b. in London. On leaving Westminster School he travelled in Turkey, on which he pub. *A Full and Just Account of the Present State of the Ottoman Empire* (1709). His contributions to the drama include: *Elfrid or the Fair Inconstant* (produced at Drury Lane in 1709), *The Tragedy of Zara* (1735), and *Meropé* (1749). He was included in Pope's *Dunciad*, and retorted in *The Progress of Wit, being a Caveat for the use of an Eminent Writer* (1730). His *Works*, including poems and letter were

pub. in 1753, and his *Dramatic Works* in 1760. See H. Ludwig, *The Life and Works of Aaron Hill*, 1911; and A. Dobson *Rosalba's Journal and Other Papers*, 1915.

Hill, Ambrose Powell (1825-65), Amer. Confederate general; b. in Culpeper co., Va.; son of Maj. Thomas H. Graduated, U.S. Military Academy, 1847. Fought at Williamsburg, Richmond, and second battle of Bull Run. Received surrender at Harper's Ferry, Sept. 17, 1862. Commanded: Div., Fredericksburg, Dec. 13, 1862; Reserve, Chancellorsville, May 2-4, 1863 (wounded); one of three corps into which Lee's army divided May 10, 1863. Engaged at Gettysburg, Bristow Station, Weldon Railroad. Near Petersburg April 2, 1865, shot from his horse and killed.

Hill, Clement (1877-1945), Australian cricketer. Considered by many qualified judges of the game to have been the best left-handed batsman ever known in the hist. of cricket. On all wickets and against any bowling combination, 'Clem' Hill controlled match after match in which he took part. Showed great promise as early as 1891-95 when he scored 150 (not out) and 56 for S. Australia against A. E. Stoddart's team. Came to England with G. H. S. Trott's team in 1896, being one of the mainstays of a famous eleven and surpassed in scoring ability only by Sid Gregory and J. Darling. Against Stoddart's second team in Australia in 1897-98 he scored 829 runs in 12 innings, his record being better than that of either A. C. MacLaren or K. S. Ranjitsinhji. Scored 200 for S. Australia in that season, but his greatest innings was in the fourth test match, at Melbourne, when he made 188 runs out of a total of 323, against the bowling of J. T. Hearne and J. Briggs. When the Australians visited England in 1899 he headed the batting averages, his aggregate including a score of 135 at Lords. In 1901-02 against A. C. MacLaren's team in Australia he averaged 52 in ten innings in Test matches. He was also leading scorer of J. Darling's team in England in 1902, but on return to Australia was at length outrivalled by Victor Trumper. In 1907, however, against A. O. Jones's team he played a great innings of 160 at Adelaide. Possibly his surest quality was an ability to master any ball bowled on the leg stump; he was also a brilliant fielder.

Hill, Daniel Harvey (1821-89), Amer. Confederate general. Graduated, W. Point, 1842. Prof. of Mathematics: Washington College, Lexington, Va., 1848-54; Davidson College, N.C., 1854-1859; won battle of Big Bethel, June 10, 1861. Brig.-Gen., commanded left of army, Leesburg, Va. Fought McClellan: Seven Pines, Fair Oaks. Lt.-Gen., July 1863. Chickamauga, Sept. 19-20, Bentonville, N.C., March 1865. Laid down arms, Durham Station, April 26, 1865. Wrote: *Elements of Algebra* (1858); religious tracts; articles on Civil war.

Hill, George Birkbeck (1835-1903), Eng. literary critic, educated at Bruce Castle School and Pembroke College, Oxford. In 1868 he succeeded his father as head-

master of his old school, and, like him, proved averse from exercising any kind of coercion on his pupils. A contributor to the *Saturday Review* (1869-84), he pub. after his retirement from teaching (1877), a series of scholarly eds. of Johnsonian literature, including *Boswell's Life of Johnson* (1887), and *Dr. Johnson, his Friends and Critics* (1878). His ed. of Johnson's *Lives of the English Poets* was pub. in 1905, with a memoir by H. S. Scott, and a bibliography.

Hill, James Jerome (1838-1916). Amer. railway president, b. near Guelph, Ontario. He graduated at Yale Univ. and then worked in railway offices in St. Paul, Minnesota. In 1870 he formed the Red R. Transportation Co., between Saint Paul and Winnipeg, and was the founder of a syndicate which built what is now the Canadian Pacific Railroad. He was president of the Great Northern Railway, which he helped to build, from 1895 to 1907, and made of it one of the greatest railway systems in the U.S.A. It ran a steamship line to China and Japan. In his later years he was recognised as one of the leading railway authorities in the U.S.A.

Hill, Sir George Francis (1867-1948). Eng. numismatist, antiquary and historian b. at Berhampur, India, son of Samuel John H., a missionary. Educated at Blackheath school for sons of missionaries (later Eltham College), Univ. College School and Univ. College, London, thence as an exhibitioner at Merton College, Oxford, of which he became an honorary fellow in 1931. Ant. hist. was his main subject, and he became a pupil of Prof. Percy Gardner, from whom he acquired his interest in numismatics. In 1893 he was appointed to the dept. of Coins and Medals, Brit. Museum. In 1897 appeared his first vol. in the great Gk. catalogue there, five others following in the next 25 years, covering the Middle East. These catalogues set a new standard for numismatics in their marshalling of evidence, discussion of problems involved, and accuracy of description. Editor of the *Journal of Hellenic Studies* and of the *Numismatic Chronicle* for many years. His study of It. hist. and art resulted in learned works on Pisanello and the *Corpus of Italian Medals before Cellini* (1930). His appointment as director and principal librarian of the Brit. Museum (1931-36) was marked by the acquisition from the Soviet Gov. of the *Codex Sinaiticus* (q.v.) and of the Eumorfopoulos collection of Oriental antiquities, the latter shared with the Victoria and Albert Museum. He spent his retirement in writing a hist. of Cyprus (1940-48) carrying the story of the is. down to 1571 with much detail on the Lusignan dynasty. K.C.B., 1933. Vice-President of the Society of Antiquaries and a member of the Royal Commission on Historical Monuments.

Hill, Sir John (c. 1716-75), Eng. author, b. at Peterborough. He set up an apothecary's shop in St. Martin's Lane, London, became editor of the *British Magazine* (1748-50), and contributed to the *London Advertiser and Literary Gazette*. He also

pub. a trans. of Theophrastus's *History of Stones* (1740), and wrote many botanical works, including *The Vegetable System* (26 vols., 1759-75).

Hill, Octavia (1838-1912), Eng. social reformer, was educated at home. Encouraged by Ruskin, she bought three cottages in Marylebone (1864), and was so successful in increasing the self-respect and improving the material welfare of her tenants that the Countess Ducie gave into her charge a property in Drury Lane. Latterly, she was at the head of a staff of assistants who, between them, collected the rents of 6000 dwellings and tenements in the metropolis. Pubs. include *Homes of the London Poor* (1875) · *Our Common Land* (1878).

Hill, Rowland (1744-1833), Eng. preacher, the sixth son of Sir Rowland H., first baronet, b. at his father's seat, Hawkstone Park, Shropshire. Educated at Shrewsbury and Eton, and whilst still young received deep religious impressions from his eldest brother Richard. Entered St. John's College, Cambridge, in 1764, and whilst there visited the sick and prisoners and preached wherever he could. In 1769 he graduated B.A. with honours, and endeavoured to obtain orders. Ordained June 1773 to the curacy of Kingston, Somersetshire, but refused priest's orders on account of his unconventional style. He continued to preach to immense congregations. In 1783 Surrey Chapel was built for him, which remained the ordinary scene of his labours till the end of his life, and under its pulpit he was buried. H. was deeply interested in Sunday-schools, and there were thirteen attached to Surrey Chapel with over 3000 scholars. He took a prominent part in all philanthropic and religious movements, and his earnest, eloquent, and eccentric preaching attracted large congregations. See life by Rev. Edwin Sidney (4th ed.), 1861.

Hill, Rowland, first Viscount (1772-1842), Brit. general, nephew of the preacher Rowland Hill, was b. at Pries Hall, near Hawkstone. He commanded the 90th Regiment in Abercromby's Egyptian expedition (1801), and served throughout the Peninsular war as Sir Arthur Wellesley's ablest coadjutor. He captured the forts of Almaraz, for which he was created baron (1814). He distinguished himself by his brigade charge at Waterloo, and succeeded Wellington in 1828 as commander-in-chief. See life by Rev. E. Sidney (1815).

Hill, Sir Rowland (1795-1879), originator of the penny postal system, b. at Kidderminster. As a boy he was interested in mathematics, and later in life became engaged in mechanical inventions. His ideas on a uniform rate of postage, regardless of distance, were pub. in pamphlet form, *Post Office Reform* (1837). In 1839 he was attached to the Treasury, and his schemes were realised in the following year. He was dismissed from office when the Conservatives came into power (1841), but on the return of the Whigs was appointed secretary to the Postmaster-General (1846). In the same

year he was presented with £19,960 as a public appreciation of his services. See *Sir Rowland Hill, the Story of a Great Reform*, by his daughter, 1907.

**Hillah**, **Hilla**, or **Hellah**, tn and liwa (prov.) built of materials from the ruins of Babylon near by. It is on the Euphrates 60 m S of Baghdad, Iraq. H. is a resting place for pilgrims to Meshhed Ali and Meshhed Hussein. It manufactures cotton silk and woollen goods. Near H., in 1920 some 300 men of the Manchester Regiment were massacred by Arabs in the course of a rising against British mandate rule (see IRAQ). Pop. (liwa) 263,000 (tn.) 30,000.

**Hillel**, called **Hazaken** (the Elder) and **Hirababli** (the Babylonian) (c. 75 B.C. - A.D. 10), Jewish rabbi, was a native of Babylon. When he was already verging towards old age, he began to study law under Shemaiah and Abtalion in Jerusalem, and soon grew famous for his profound learning when by according to the Talmud, he comprehended all tongues even those of trees and beasts. Being well high priestliness, his learning was only acquired by exceptional zeal and self-denial. It is unlikely that he was ever president of the Sanhedrin yet his humility and loving kindness and what has been described as the 'sweetness and light' of his personality ensured the popularity of his teaching which, like that of Jesus, was everywhere from sacerdotal traditionalism and blind adherence to legal ordinance.

**Hiller**, **Ferdinand** (1811-87) German musical composer, b. at Frankfurt on Main, played a concerto of Mozart at the age of

FERDINAND HILLER

ten, and in 1827 was present at the deathbed of Beethoven. He visited Weimar, Vienna (with Hummel, his master), Paris (where he lived from 1828-35), Italy, St. Petersburg, and England, etc. From 1850 till his death, he was municipal capellmeister at Cologne, where, besides organising

the Conservatoire, he composed, conducted, wrote, and taught, Max Bruch being his most famous pupil. Among his wide circle of friends were Berlioz, Mendelssohn, Cherubini, the Schumanns, Spohr, Liszt and Chopin. His numerous compositions include chamber orchestral, and vocal music. These display conspicuous inequalities, but since his first published oratorio entitled *Die Jersörung Jerusalems* (1839), has been recognised as a masterpiece. In Paris he was celebrated for his fine interpretation of Bach and Beethoven.

**Hill Figures**, see **WHITE HORSES**.

**Hill-forts** are, as their name implies, fortifications erected on the top of a steep cliff or mountainous crag. The summits of hills like is and fens, were peculiarly adapted to serve as the last refuge of a native race in a country invaded by a stronger people. So H. are found of great antiquity, constructed by uncivilised peoples, as D. Wilson says, 'the simple circular H. wherein we have the mere rudimentary efforts of a people in the infancy of the arts.' To this category belong the rude earthworks found on the top of many peaks in the Brit. Isles. Scotland is especially rich in H., many of which are of a somewhat more advanced type. Two or three concentric circular ramparts defend the summit of the hill, so that as the invading party stormed one line of defence the defenders might retire gradually into their innermost stronghold. The H. which is at the summit of White Caterthun in Dorsetshire may be described in some detail as being typical of many others. The hill in question is 976 ft. high. The first resistance to an attacking force is offered by a double entrenchment 200 ft. below the summit. The formation of the cliff then precludes further advance save on one side. The end of this path leads to an oval rampart of stones 436 ft. by 200 ft. The width of the walls in which are found chambers, as in the Irish castles (q.v.) is 26 ft. Among other H. in the Brit. Isles may be mentioned Arbury in Leicestershire, Dun Murray in Argyllshire, and Dun Argyll in the Aran Isles. In many cases of course a H. was the residence and headquarters of a warrior chief or a robber baron, as in the medieval ages. In this class come the H. of the wild tribesmen of Afghanistan and the N.W. frontier of India. For the vital location of the stones of H., see **under** **VIRGIFIED FORTS**. See Dr D. Christison, *Early Fortification in Scotland*, 1818; F. J. Burrow, *Ancient Earthworks and Camps* 1924.

**Hillgrove**, gold and antimony mining tn on Bakara Creek, Sandown co., 80 m. E. of Armadale, New South Wales. Pop. 00.

**Hillhead**, Sootland, a suburb to the N.W. of Glasgow. Pop. 4000.

**Hilliard**, **Nicholas**, miniature painter and goldsmith painted Queen Elizabeth and Mary Queen of Scots, and for twelve years enjoyed the exclusive privilege of executing portraits of James I. and other members of the royal family. Charles I. counted among his art treasures a jewel

of H.'s workmanship with an enamelled picture of the field of Bosworth, and the likenesses of four sovereigns. See J. Pope-Hennessy, *A Lecture on Nicholas Hilliard*, 1949.

**Hillsborough, or Hillsboro**, cap. of Hill co., Texas, U.S.A., 50 m. S.W. of Fort Worth. It is served by three railways and also by the Texas Electric Interurban. It manufs. cotton, hosiery, leather, flour. Pop. 7700.

**Hillsborough**: (1) tn., Alberta co., New Brunswick, Canada; on Petitcodiac R. There are valuable granite-gypsum quarries and coal mines near. Pop. 1000. (2) par. and mrkt. tn., N. of co. Down, Ireland, 12 m. S.S.W. of Belfast. Its chief industry is linen manuf. Pop. 2000. Rural dist. 22,000. (3) Chief tn., on the coast of Carriacou, an is. N. of Granada, Brit. W. Indies.

**Hillsdale**, cap. of H. co., Michigan, U.S.A., on the R. St. Joseph, 90 m. S.W. of Detroit. Hillsdale College is situated here. It is served by the N.Y. Central Railway. Pop. 6300.

**Hill 60 and Hill 70**. Hill 60 is situated just S.E. of Ypres, and during the First World War was concerned with all the operations towards the E. and S. of that place. Small as the hill was, its elevation gave it command over a considerable expanse of country, and in April 1915 it was the scene of much hard fighting, victory ultimately resting with the Brit. Hill 70 is situated just N. of Loos and E. of Loos. In the 1915 battle of Loos it changed hands during the last week of Sept. Here, again, its height, though little, gave it command over a considerable area, which was particularly valuable from an artillery observation point of view. It was here that the Guards Div. greatly distinguished itself by capturing most of the hill.

**Hill States**, general name for the small native states on the S. slope of the Himalayas in the vicinity of Simla, India.

**Hill Tippera**, Indian native state of about 4000 sq. m., at the extreme E. of E. Bengal, Pakistan, and adjoining the dist. of Tippera. It is for the most part thick forest land, and produces cotton, chillies, and rice. The inhabs. are hill tribes. Argatana, the cap., is 70 m. N.E. of Dacca.

**Hilton, John** (1804-78), Eng. surgeon. He attended Guy's Hospital first as a student and afterwards as demonstrator of anatomy (1828), assistant-surgeon (1845), and surgeon (1849). As president of the Royal College of Surgeons, he gave the Hunterian address in 1867. 'Anatomical John,' as he was called, was joint-founder with Towne of the excellent museum of models at Guy's, and was the foremost anatomist of his day. His *Less and Pain* (1863) is a valued addition to medical literature.

**Hilton, William** (1786-1839), Eng. painter. In 1820 he was elected to the Royal Academy, which to-day possesses his masterpiece, a representation of 'Christ crowned with Thorns' (1823). His other pictures include 'Rebecca and Abraham's Servant' (1829), and 'Edith finding the Body of Harold' (1834).

**Hilversum**, tn. in the prov. of N. Holland, 18 m. S.E. of Amsterdam. It manufs. horse-blankets and carpets. It is a popular summer resort, and its neighbourhood is attractive. It has a large wireless station. Pop. 84,200.

**Himalaya Mountains**, in Central Asia, most elevated highland system in the world. The word Himalaya is Sanskrit, and means, 'Abode of Snow,' the same Aryan root being preserved in the Gk. *himu*, snow, and the Lat. *hiems*, winter. The H. M. stretch from the seventy-second to the ninety-sixth meridian E. of Greenwich, and, with a breadth varying from 180 to 220 m. form a broad, sweeping barrier between Tibet and the Indian peninsula from the W. confines of Kashmir to the E. limits of Assam. Undoubtedly they belong structurally to the great plateau of Central Asia, of which they may be regarded as forming the S. scarp. On the Indian side the slopes of the main ridge are precipitous right down to the marshy 'Tarai' or 'Tariyani.' This is a belt of grassy lands, about 12 m. wide, traversed by many sluggish streams, along whose banks are treacherous morasses covered with tall reeds. It fringes the Pakistan, Indian, and Nepal frontiers for almost 500 m. from W. to E. Towards Central Asia the fall of the H. M. is gentle. Broadly speaking, their direction W. of Mt. Everest, the highest known peak on the globe (29,141 ft.), is N.W. and S.E., but from this height to the boundaries of China the lie is almost due E. It is a mistake to regard the H. M. as a single unbroken chain; they are rather a series of ridges roughly parallel, whose symmetry is confused by a multitude of subsidiary spurs, which strike out from them in all directions.

What is sometimes called the Indian watershed separates into two classes the rivs. which pass out to the Indian Ocean: those which cut a direct way through the mts. on to the plains of India, and those which after being gathered on the top of the tableland reach the sea by two streams which set out at distant points towards opposite limits of the chain. But the great divide, sometimes referred to as the Turkish watershed, is the ridge of the N. range, which is the natural cleavage line between the rivs. which disappear somewhere in the level stretches of Mongolia and Turkestan and those which eventually join the Indian Ocean. The Indian watershed is remarkable for its height, which averages about 18,000 ft. between the Brahmaputra and the Indus. The valleys traversing the highlands from the watershed to the Indian plains are gigantic gorges and offer small encouragement to human habitation. Yet some few, with an elevation of from 6000 to 7000 ft., are fast becoming favourite situations for summer retreats of Europeans eager to escape the sweltering heats of Bengal. Other valleys reach right up into the line of highest summits without rising to a higher elevation than 3000 ft., and thus harbour tropical heat and vegetation at the foot of snow-capped heights. For the most part the valleys slope gradu-

ally till within 20 m. or so of the line of greatest elevation, and afterwards often shoot upward from 5000 to 10,000 ft. within a very small distance.

It is convenient to divide the H. into three sections. The W. begins from that point where the Indus turns southward between Gilgit and Kashmir, a point which is marked by Mt. Nanga-Parbat (26,829 ft.). This section, which also contains Nanda-Devi (25,661 ft.), is not conspicuous in well-marked ranges, but it is

Frank Smythe

#### WEDGE PEAK

One of the peaks of the Kangchenjunga group which rises 8000 ft. above the Kangchenjunga glacier.

crossed longitudinally by sev. valleys which confine the Indus and other rvs. for hundreds of miles before giving them an opening southward. The Central Himalayas contain the highest summits in the world, and comprise the regions of Hindes, Garhwal, and Kumaon, which were scientifically surveyed in 1892. They are sometimes called the Nepal Highlands and extend from the source of the Indus to the Tista—an affluent of the Jumna. The highest group of mts. in the world is in the Karakorum, not in the H. M. Other outstanding crests besides Everest are Kangchenjunga (Kunchinjunga) (28,225 ft., the third highest mt. in the world), on the Sikkim frontier, N. of Darjeeling, and Dhaulagiri (26,286 ft.) in the W. Some conception may be conveyed of the stupendous scale upon which these mts. are built, if the peaks which lie between the seventy-eighth and the eighty-first meridians—a distance under 150 m. in length—or rather their main groups, are enum-

erated: (1) Between the Alaknanda and Bhagirathi, tribes of the Ganges, are the heights of Badrinath, Kedarnath, and Gangotri; (2) the peaks between the Dhaoli and Vishnuganga; (3) Nanda-Devi, Nanda-kot, and Dunagiri between the Gori and the Dhaoli; (4) the Panchchuli cluster between the Gori and the Darma; (5) Yirnamang between the Kall and the Darma; (6) the Api cluster in Nepal. In altitude these summits range one and all from 22,000 to 28,900 ft. Before the highlands of this div. roll down to the plains, there rises a sandy, waterless ridge, known as the Bhabar, whose average elevation is some 4500 ft. This tract is densely forested and absorbs all the streams which flow down from the outer highlands, but as it undulates down to the Tarai the waters are collected together and once more reappear above the surface. The easternmost section covers a great part of Sikkim, Bhutan, and N. Assam. Its loftiest peak is Chomolhari (23,933 ft.), but 16,000 ft. probably represents the mean altitude. There is still a wide field open to ambitious surveyors in this part of the mts., for the lower reaches of the Saipo have never been traced, and little is known of the E. uplands.

There are naturally great variations of climate at different heights and in different regions of the H. M. A comparison between ranges in the W. and E. shows that the latter enjoy a warmer and more equable but also a wetter climate. Moreover, the forest tracts are more widely dispersed in the E., and the area of lands under cultivation is probably less. Both the meteorological conditions and the scenery in the W. are similar to those of S. Europe, provided, that is, that the Himalayan altitude be over 5000 ft. The snow line is much higher on the Tibetan than on the Indian side, because the latter has the greater snowfall. On the S. exposures of the Himalayas there are perpetual snows to within some 15,500 ft. of the sea-level, whilst at the top of the N. tableland of Tibet the snow line is actually as high as 20,000 ft. Precipitation is naturally greatest on the slopes of the outermost spurs, and by the time the limits of Tibet are reached, beyond the line of highest peaks, it is so small as almost to elude measurement. Rain falls between May and Oct., and the season is known as the S.W. monsoon, which is accompanied by moisture-laden winds from the S.W. As regards tem., both the ann. and diurnal range diminish with increase in elevation, whilst the variation of temp. according to altitude is greatest in summer. The rvs. hardly ever freeze, probably because they are too rapid. Glaciers descend much lower on the outer than on the Tibetan slopes. On the valleys of the latter they come down to within 15,000 ft. of the sea-level, but on the S. faces 11,500 ft. is a normal limit. In different parts Alpine, European, and tropical flora abound; the Sal, Toon, Sissoo, and Deodar supply the only timber of commercial value; cereals, fruit, and tea are grown with success up to a height of 7000 ft.

The H. M. afford the supreme illustration of the sublimity and incomparable grandeur of mt. scenery. The reader has only to remember that the mean elevation is some 18,000 ft., and that at least forty heights exceed 24,000 ft., to grant the truth of the assertion that 'the great mt. solitudes of the Himalayas, . . . the apparently endless succession of range after range, of ascent and descent, of valley and mt. top, of riv. torrent, and brook, of precipitous rock and grassy slope, of forest and cultivated land, cannot fail to produce impressions of wonder and awe of such intensity as can be conjured up by no other range in any quarter of the globe.' (F. S. Smytho, *The Kangchenjunga Adventure*, 1930). Numerous expeditions have been organised for exploring the peaks of the H., apart from sev. to Mt. Everest (*q.v.*). As recently as 1936 a small Anglo-Amer. expedition, organised by Prof. Graham Brown reached the summit of Nanda Devi in the Gharwal H., after incredible difficulties (Aug. 29, 1936). This was the greatest feat of Himalayan mountaineering ever accomplished. The two members who reached the summit were N. E. Odell and H. W. Tilman, both Englishmen. Two disasters overtook Ger. attempts to climb Nanga Parbat in 1936 and 1937. In the first many Ger. and native lives were lost in a storm before the higher camps had been properly estab.; the second under Dr. Karl Wien was frustrated by an ice avalanche (June 5, 1937), in which all but one of a party of eight and their six Nepalese porters were overwhelmed. See S. C. Burrard and H. H. Hayden, *Sketch of the Geography and Geology of the Himalayan Mountains*, 1907-08; W. Whistler, *In the High Himalayas*, 1924; A. Albers, *Himalayan Whispers*, 1926; F. S. Smytho, *The Kangchenjunga Adventure*, 1930, *Kamel Conquered*, 1932, and *Camp Six*, 1937; E. E. Shipton, *Nanda Devi*, 1936; H. W. Tilman, *The Ascent of Nanda Devi*, 1937; Paul Bauer, *Himalayan Campaign*, 1937; Sir F. Young, *Heart of a Continent*, 1937; A. Helm and A. Gausser, *Thron der Götter*, 1938; W. Noyce, *Mountains and Men*, 1947. See also under EVEREST, and the various accounts of the Everest expeditions.

Himera, famous ant. Gk. city of the N. coast of Sicily, Italy. In 409 B.C. it was razed to the ground by Hannibal H. was never rebuilt, but the Carthaginians built Thermae, a tn. on the opposite bank of the R. Himera.

Himmeler, Friedrich Heinrich (1765-1814), (Ger. composer, profited much by the patronage of Frederick Wm. II., who, besides giving him a three years' musical education and sending him to Italy for two years of further study, gave him, on Reichardt's dismissal, the court-capellmeistership of Berlin. H.'s *Trauercantate* was especially written for the king's funeral in 1797, and his opera *Alessandro* was the result of a commission from the Czar. But his finest operatic work was *Fanchon, das Leiermädchen* (1801), for which Kotzebue wrote the libretto. Despite their melodic charm, his songs and pianoforte sonatas are rarely performed.

Himmler, Heinrich (1900-1945), Ger. Nazi leader, chief of the Gestapo, b. at Munich of a middle-class family and educated at the High School of Landsbut, Bavaria. At seventeen he joined a Bavarian infantry regiment as a cadet. Leaving the army in 1919 he studied at the Munich Technical College and, later, was employed at a nitrate works; then in 1928 he turned to poultry farming. He was an early member of the Nazi Party of Strasser (see HITLER) and in 1929 Hitler appointed him leader of the S.S., which was then the Black Guard or Hitler's bodyguard. He began early to study systematically the records of the Party chiefs and of their subordinates, and so accumulated a great mass of information about individuals which eventually gave the Gestapo so much power for blackmail. Hitler gave him a free hand in the development of the Black Guard as a strong carefully selected semi-military corps. When Hitler decided on the purge of 1934 (see HITLER), H. and his force were the instruments of assassination. It was, perhaps, H.'s greatest political feat that he succeeded until the Second World War was well advanced in disguising the real purpose of his organisation. The S.S. had already assumed the functions of the police and was controlling the home front as a whole when he acknowledged the fact in 1935. But he remained silent in the face of demands from the Army Command that the S.S. should not interfere in Army affairs, built up a completely independent force—the Waffen S.S. equipped with the most modern weapons—and insinuated his agents into the *Wehrmacht* itself, spreading his tentacles throughout all branches of Ger. life. Besides organising the Gestapo in Germany and beyond the frontiers he estab. a Fifth Column (*q.v.*) wherever the opportunity offered. After the attempt on Hitler's life in 1944 (see HITLER) he was the open master of Germany. He took command of the home army, suppressed the elements of revolt and organised the looting of the *Volkssturm*. When the final Russian offensive approached Berlin in 1945 he headed a section of the defences, and it was he who in the last days of the Reich cap. made overtures for capitulation. The fearful chapter of Germany's reign of terror was primarily his work though it must not be supposed that he did not find numerous and fanatical coadjutors; but his was the baneful master mind behind the horrors that took place in Germany and in the conquered territories. He was the cold and ruthless instigator of reprisals against civilians and of similar crimes. He typified the most extreme element in the forces of Nazi revolution, and caused it to become the predominating force in Ger. politics. Yet in appearance he betrayed nothing of his true character, being small in stature, insignificant looking and shy in manner. It cannot be assumed that his actions were governed solely by blood lust. His motives were deeper. He organised a vast machine of political oppression, and instigated the mass murders in the terrible concentration

camps (*q.v.* and see also BUCHENWALD, BELSEN) of men and women—Gers., Russians, Poles, Czechs—for the sake of what he would have called 'posterity'—not for a Germany victorious in the war but for a Germany 'reborn' through the extermination of all who might stand in the way. This rebirth of the nation was to be achieved through his instrument—a body of Gers. selected for their supposed racial characteristics (*See* ARYAN PARAGRAPHS) and educated by him in the belief that the 'regeneration' of the individual according to National Socialist principles was an essential factor in the enduring dominion of the world; and military conquest by Germany was, in his view, no more than a condition precedent to the foundation of a new ruling class exclusively Ger. and privileged to be the embodiment of the 'Herrenvolk.' His part in the end of Nazism is obscure. With Hitler dead he made his clumsy move for capitulation, trying vainly to play off the W. Allies against Russia. He did not ask that his own life should be spared; that he knew was forfeit. He was captured, after the Ger. surrender, at Bremervörde near Bremen trying to get away with some other Gers. with the aid of false identity papers and more or less disguised. His captors, Brit. security police, took him and his companions to an internment camp for interrogation, and one of the latter disclosed his identity. He was then removed to Brit. Second Army headquarters, but in Lüneburg while being medically examined before being handed over to the appropriate authorities as a war criminal he succeeded in taking cyanide of potassium from a phial concealed in his mouth, dying almost at once.

**Hinckley**, mkt. tn., 13 m. S.W. of Leicester, England. It is an ant. tn. on Watling Street, and has mineral springs. The chief trade is in boots, shoes, hosiery, and coarse pottery. Pop. 36,400.

**Hincks, Sir Francis** (1807-85), Canadian statesman and Brit. Colonial governor; b. in Cork, Ireland; youngest son of Thomas Dix H., LL.D., Presbyterian minister. Received classical education at Fermoy and Belfast. Clerk to a Belfast firm of shipowners, emigrated in 1831, opened warehouse in Toronto. A Liberal, he estab. the *Examiner*, 1833. Elected to first parliament of Upper and Lower Canada 1841, inspector of public accounts, (or receiver general) 1842-43 in the Baldwin-Lafontaine Gov. Defeated in election of 1844, estab. the *Pilot*, Montreal. Again inspector-general, 1848-1851. Jolnt Premier with A. N. Morin, 1851-54. Governor of: Barbados, 1853-1862; Brit. Guiana, 1862-69. C. B., 1862; K.C.M.G., 1869. Returned to Canada; minister of finance, 1869-73. Suffered through failure of a bank of which he was president. Ed. *Journal of Commerce*, Montreal. Made sev. official visits to Washington and London. His gov. rendered important services in the matter of railway building and in negotiating the reciprocity agreement with the United

States in 1854. In the struggling colony, as was Canada a century or more ago, money for the promotion of railways was not easily obtained from the imperial gov. whether to bring the maritime provs. to the lakes or for opening up the W. before the Amers. could get there for their own commercial benefit. Hence the methods of H. as a railway promoter were coarse, but he was a first-rate business administrator in politics, though, being a man of crude sensibilities, he hardly emerges in Canadian hist. as a very interesting figure. The most instructive period of H.'s political life is before 1851, when he was occupying himself in building up the Reform party as the instrument through which responsible gov. was to be secured. On his return to Canada in 1869 he was at once pressed into service by Sir John Macdonald as finance minister—a tribute to his recognised ability. But he had by then lost touch with Canadian affairs and resigned in 1873, and it was six years after that that he became president of the inflated City Bank of Montreal. H. pub. *Reminiscences* of his public life in 1884. In 1907 Stephen Leacock pub. the life of H., in the 'Makers of Canada' series. R. S. Longley's *Sir Francis Hincks* (1943) is not so much a biography as a 'study of Canadian politics, railways, and finance in the nineteenth century.'

**Hinomar** (c. 806-882), archbishop of Rheims from 845; was educated in the abbey of St. Denis, and held the abbacy of Compiègne and St. Germain before he attained to his archbishopric. He was a bitter opponent of Gottschalk, the refractory monk and champion of predestination and exposed his heresies in a series of theological polemics. As metropolitan, he had excommunicated his suffragan bishop, Rothad; by eventually reinstating the offender, he undoubtedly encouraged papal autocracy. Yet in the matter of the sovereignty of Lorraine he boldly refused to countenance Pope Adrian's interference.

**Hind**, name given to the female of *Cervus elaphus*, the red-deer, a ruminant ungulate mammal belonging to the Cervidae; *hart* is the correlative term for the male.

**Hindemith, Paul**, Ger. musician, b. at Hanau, 1895. Studied at Frankfurt. Viola-player and conductor in the Frankfurt Opera House orchestra. From 1927, prof. of composition at the State High School of Music, Berlin. As a composer he is important and prolific in the modern Ger. school, and has written much chamber music, operas, song-cycles, including *Die junge Maid*, and one-act operas, among them *Sancta Susanna* and *Cardillac*.

**Hindenburg, Paul Ludwig Hans von Beneckendorf und von**, (1847-1934), Ger. soldier and President of the Ger. Republic, b. at Posen. He came from the Beneckendorf stock, which took the name of Hindenburg in 1789. The majority of his immediate ancestors had been soldiers, and he claimed himself to be 'the son of a soldier.' His father at the time being a lieutenant in the 18th Infantry Regiment. His mother was the daughter of Surgeon-

Gen. Schwichtart. In 1859 he entered the Cadets' Academy at Wahlstatt and in 1865, became a 2nd Lieut. in the 3rd Regiment of Foot Guards. His first campaign was the Austro-Prussian of 1866, in which he was wounded in the head. He was a deeply religious man, simple and direct, and his conduct during his first spell of active service gave evidence of these qualities. He gained the Order of the Red Eagle (4th Class) with swords for his services. (On the outbreak of the

Topical Press  
PRESIDENT VON HINDENBURG

Franco-Prussian war of 1870-71 he was adjutant of the 1st Battalion of his regiment. He showed his fearlessness in this campaign by carrying out his duties with an utter disregard of the shot and shell flying about him. In 1873 he entered the Kriegsakademie, joined the General Staff in 1878, and was promoted captain. He was posted to the Headquarters Staff of the 2nd Army Corps at Stettin. Here he married the daughter of Gen. von Sperring. He had three children—one son and two daughters. In 1881 he was transferred to the 1st Div. at Königsberg, where he was fortunate to serve under the brilliant and talented Gen. von Verdier du Vernoy, to whom he owed much, and in 1886 he came under the influence of the great Moltke, to whom he was also indebted. In 1889 he transferred to the war ministry, and took over a section of the common war dept. His former chief Gen. von Verdier was war minister at the time. Here he was engaged in drawing up field engineering regulations and details connected with heavy artillery. In 1893 he was appointed to command the 91st Infantry Regiment at Oldenburg. He always endeavoured to cultivate a sense

of chivalry among his officers, efficiency and discipline in the battalions, and a high ideal of service generally. He was particularly happy among the quiet, homely people of Oldenburg, whose manners strongly appealed to him. In 1896 he was appointed Chief of Staff to the 8th Army Corps at Koblenz, to the command of the 4th Army Corps in 1905, and retired from the service in 1911. On the outbreak of the war of 1914, he was not immediately recalled to active service, but the retreat of the Eighth Army in E. Prussia demanded a new commander, and H.'s acquaintance with E. Prussia marked him out for appointment in preference to Ludendorff. Soon afterwards he won the victory of Tannenberg (q.v.) over Samsonoff and, turning against the army of Rennenkampf at the first battle of the Masurian Lakes, routed that general too. He was then promoted to be commander of the Eighth and Ninth Army Group which Falkenhayn was leading against the Russians in Poland. The Ninth Army reached Warsaw but the Eighth was forced to withdraw to the Masurian Lakes again, and it was only when he received the Tenth Army as reinforcements that H. again defeated the Russians at the Masurian Lakes. Already made a field marshal, his fame was now greater than that of von Mackensen, whose Austro-Ger. armies, in the middle of 1915, had driven the Russians out of both Galicia and Poland. In 1916, after the battle of the Somme, he was transferred to the W. front, being given the supreme command of the Ger. Field Army, with Gen. Ludendorff as his First Quartermaster Gen. He organised the retreat to the famous Hindenburg (or first Siegfried) Line, while abandoning the offensive against Verdun. But he won no other great victory and, on Nov. 11, led his armies into Germany, a defeated commander, but with his spirit unbroken and having to his credit the successful planning of a great retreat, followed by an orderly demobilisation. By no means a brilliant strategist, H. was a sound general and steadfast in purpose.

There seems little doubt that his victories were achieved largely with the advice of Gens. Ludendorff and Hoffmann. After the Armistice, he retired to Neudeck. Despite the defeat of Germany, H. remained a legendary figure with the Ger. people, who had never forgotten their Russian invaders. In 1925 he was elected President of the Ger. Republic in succession to Ebert. A monarchist at heart, it was believed that he might support the restoration of the monarchy; but he had a high conception of duty and of loyalty, and he followed a strictly constitutional course, until the economic crisis and the rise of Nazism in 1930 when, now 83 years of age, he became the tool of Junker reactionaries. He effected a *coup d'état* in 1932 and ruled by means of emergency decrees; he became the object of bitter personal attack by Hitler, whom at first he refused to accept as Chancellor. In the year following Hitler's advent to power, he died and was given a national

mausoleum at Tannenberg. His memoirs *Aus Meinem Leben* (1920) show liberality of thought and restraint. See life, 1936, by Major Hindenburg, his nephew.

Hindenburg, see ZABRZE.

**Hindenburg Line**, otherwise **Siegfried Line**, name given to the line of field fortifications taken up by the Ger. armies in their retreat or withdrawal following the battle of the Somme, 1916. The withdrawal was, to some extent, an acknowledgment of defeat on the Somme; but with characteristic resourcefulness, the Ger. High Command had prepared the field fortifications and works of this line so as to constitute it the most formidable defensive system theretofore evolved by the skill of military engineers. Its alternative name, **SIEGFRIED LINE**, was equally designed to inspire the Ger. soldiers to hold the system at all costs; and the fact that the Ger. High Command really believed the line to be impregnable is to be gathered from Orders of the Day, as e.g. No. 111, dated Sept. 18, 1918. Yet even in 1917 the Brit. forces began a drive on Nov. 20 towards Cambrai, which for a time threatened to pierce the H. L. and even to terminate the deadlock on the W. Front. (See also **BOURLON WOOD**; **CAMBRAI**; **FRANCE AND FLANDERS**, **FIRST WORLD WAR CAMPAIGN** IN.) The H. L. was eventually smashed by the Brit. forces in Sept. 1918, following the successful piercing of the line at its strongest point, the Droocourt-Quéant (q.v.) Switch.

**Hinderwell**, par. and fishing vil., N. Riding, Yorkshire, England, 9 m. N.W. of Whitby. There are iron mines. Pop. 2100.

**Hindhead**, extensive hill ridge and common, rising 2 m. N.W. of Haslemere, Surrey, England. Gibbet Hill, the highest point, is 895 ft. To the E. of H. vil. lies the Devil's Punch Bowl. Inval and Weydown Commons lie S. of Gibbet Hill. The greater part of this area of heath and open wood was presented in 1906 by the Hindhead Preservation Committee. Highcombe Copse on the W. side of the Punch Bowl was purchased in 1908 through the W. H. Robertson Memorial Fund, and 14½ ac. of land in the Punch Bowl, known as Highcombe Bottom, were acquired in 1930 as the result of a public appeal.

**Hindley**, township, 2 m. E.S.E. of Wigan, Lancs., England, celebrated for cannel coal. There are iron works and cotton mills. Pop. 18,900.

**Hindmarsh**, suburban post tn. on Torrens R., 2 m. N.W. of Adelaide, S. Australia. Pop. 12,000.

**Hindo**, largest is. of the Lofoten group off the coast of Norway, within the Arctic circle. It is mountainous and somewhat wooded. Digermulen to the S.W. is a port of the Vesteraalen steamers. Area 864 sq. m. Pop. 10,000.

**Hindol**, small trib. state, Orissa, India, 50 m. W.N.W. of Cuttack. Area 312 sq. m. Pop. 380,000.

**Hindustan**, see **HINDUSTAN**.

**Hinduism**, comprehensive term which is used to designate not only the social customs, but the religious beliefs of the majority of the peoples of India. The actual

proportion of the total pop. which comes under the heading 'Hindu' is 65 per cent, and the number of 'Hindus' (census of 1941) is 254,930,500. The creeds and practices of H. differ no less than the organically connected social principles, rendering it very difficult of definition. The close alliance and interaction between Brahmanism (q.v.) and H. make it impossible for a strict line of demarcation to be drawn from a chronological or a sectarian point of view. H. may be said to date roughly from about the sixth century, when the local revolts of the laity against Brahmanic supremacy culminated in Buddhism and Jainism. Until then the authoritative doctrine of pantheistic belief formulated by speculative theologians during the centuries succeeding the Vedic period had held sway; these revolts had the effect of rendering Brahmanism still more tolerant, although its erstwhile severely metaphysical and ritualistic rigour had previously been modified by the currents of Sivaite and Vishnuite thought. The doctrine of the Trimurti, or Trinity, was often put forward under the influence of Upanishad monism. Brahma, the creative principle of the universe; Vishnu, the conservative principle; and Siva, the destroying, but also the generative, principle, are represented as a Trinity of equal and identical deities. Early Brahmanism and Buddhism co-existed down to about A.D. 800 when the latter disappeared from the peninsula, leaving a new Brahmanism, the product of the two philosophies. This modern H., based on the *Puranas* (see *PURANA*) gives less prominence to Brahma than to his associates, Vishnu and Siva. To the vast majority of Hindus some form of either Vishnu or Siva is the highest source of all existence, and the object of supreme adoration. The sub-divs. of the Vishnuite sects range from the broadest pantheism to extreme sectarianism. The cult of Siva affects the two extremes of society: he is favoured by many high-class Brahmans and metaphysical ascetics, and also by the lowest classes. The reason for this is that he is regarded not only as a mystic miracle-working deity, but as a blood-loving, awe-inspiring god. The Sakia movement, the worship of Siva's wife, under various names, as the cosmic energy of the universe, is closely allied to Siva-worship. The whole ground of Hindu sectarianism is by no means covered by these broad outlines; many miscellaneous cults exist which are still included under the general term H. The pantheon of the latter finds room for hosts of minor deities, which are in the main accepted both by Vishnuites and Sivaite. Closely allied and interwoven with all the sects of H. is the system of caste. The infinite variety of caste-divs., each with a social and religious organisation of its own, was evolved from its beginnings in the Vedic age by the Brahmans. For details, see *under* **INDIA**. Although H. has preserved numberless myths, and has incorporated much that is gross and unworthy, it has also gathered many spiritual truths from nature and the universe. Its

main planks, the doctrines of 'Karma' (works), 'Samsara' (wandering, i.e. metempsychosis), and 'Moksha' (release and absorption, or union, with the Infinite) may seem fantastic to the European mind; but the Hindu mind is essentially mystic and transcendental, regarding all finite phenomena as evanescent and illusory, and, if this is remembered, due honour and praise will not be withheld from its vast and beautiful religious literature. In such works as the *Upanishads*, the *Bhagavad-gita*, the *Tamil Saivite* poems, the *Ramayana*, and many

and its general direction is from W.S.W. to E.N.E. As the range turns away from Ab-i-Panja, an affluent of the Oxus, it attains greater elevation, rising sometimes as much as 24,000 ft. above the sea. One of its loftiest summits is Tirach Mir, 25,400 ft., which towers above Chitral and its fort. The passes of Barogil, Agram, and Khartaza, etc., link the Oxus with the Chitral, whilst westwards the chief passes are the Khawak, the Kaoshan (14,340 ft.), the most frequented of them all, the Chahardar, and the much lower Shibar (9800 ft.), after which the

Indian Kailash Bureau

#### HINDUISM: THE TRIMURTI OR THREE-HEADED BUST

A representation of Siva in the character of Brahma, the Creator, Rudra, the Destroyer, and Vishnu, the Preserver

others, the truth that the pure in heart, of whatever creed or race, shall see God is manifested. Despite their faults they represent a notable progress of the human mind in spiritual and religious evolution. 'They are but broken lights of Thee, and Thou, O Lord, art more than they,' and more than any other religious system. See Sir M. Monier Williams, *Hinduism*, 1877; J. Robson, *Hinduism and Christianity*, 1883; J. Murray Mitchell, *Hinduism, Past and Present*, 1897; L. D. Barnett, *Hinduism*, 1906; C. N. Eliot, *Hinduism and Buddhism*, 1921; L. S. O'Malley, *Popular Hinduism*, 1935; N. Macnicol (ed.), *Hindu Scriptures* (Everyman's Library), 1938; J. Herbert, *La Notion de la vie future dans l'Hindouisme*, 1945; A. C. Bouquet, *Hinduism*, 1919. See also ARYA, SAMAJ, BRAHMANISM, INDIA, SIVA, VISHNU, etc.

Hindu-Kush, name of a mt. chain of Central Asia which, for 200 m from its E. extremity, forms the S. frontier of Afghanistan. It is the great watershed between the Kabul and the Oxus basins,

range is merged into Koh-i-baba. See H. Schomberg, *Between the Oxus and the Indus*, 1935.

Hindu Law is theoretically of divine origin, and cannot be changed by human agency. The books which lay down the law, the Shastras, are of very ancient origin, and the state of society in the time in which they were written was quite unlike that of the present time. Consequently they enact rules which no Hindu follows, and do not give any pronouncement on many things which need regulation. The chief agents in changing the operation and scope of the law are custom and different interpretations, as laid down in commentaries. Legislation has not been employed, although the Brit. parliament and the Hindu legislatures had power to legislate on all matters. In the *Laws of Manu*, it is said that 'the king who knows the sacred law must inquire into the laws of castes or districts, of guilds, and of families, and thus settle the peculiar law of each.' Formerly the only persons whose interpretations of the law

were binding were the writers of commentaries, but the Indian courts will not accept the opinions of modern commentators, although their own rulings are binding. Thus different schools of H. L. have arisen, which may be divided into two main branches, that of Benares (including those of Bombay, Dravida, and Mithila, for W. India, S. India, and Nepal, respectively), and that of Bengal, or Gawinja. The most important books laying down the law are: the *Laws of Manu*; the *Smitri of Yaghavalkya*, and the *Smitri of Narada*. More important still are the commentaries which are not sacred: the *Mitashara of Vijñaneswara*, on the *Smitri of Yaghavalkya*, is the commentary which exercises the most influence, though in the valley of the Ganges the *Dayabhaga of Jimutavahana*, in S. India the *Smitri Chandrika*, in W. India the *Vijñaneshwara Mayukha*, and in Mithila the *Vivada Chintamani* are respectively of importance. See J. D. Mayne, *Hindu Law*, 1892; Jogendra Nath Bhattacharya, *A Commentary on Hindu Law*, 1894; Jogendra Chundar, *Principles of Hindu Law*, 1906; K. P. Javuswal, *Manu and Yajñavalkya: Basic Hindu Law*, 1930.

Hindur, hill state, E. Punjab, some 50 m. N. of Ambala, India. Chief products, opium and grain. Area 250 sq. m. Pop. about 46,000.

Hindus, Maurice Gerschon (b. 1891), Russo-Amer. author; a native of a Russian vil., who became a distinguished Amer. man of letters. He migrated to the United States in 1903 and graduated from Colgate Univ. in 1915. He has frequently revisited Russia and returned there after the Civil war to see the progress of the collectivists' experiment in agriculture, with which, indeed, he was in sympathy. An account of what happened in the course of the collectivisation of the farms will be found in his two very remarkable novels *Broken Earth* (1926) and *Red Bread* (1931), in which latter he describes the collectivisation of his old vil. (see also KULAK). His other novels include: *Humanity Uprooted* (1929), *The Great Offensive* (1933), *Moscow Skies* (1936), and *Sons and Fathers* (1940). His non-fictional studies of Russia include *The Russian Peasant and Revolution* (1920), *We Shall Live Again* (1939), and *Mother Russia* (1943). *Green Worlds* (1938) is an autobiography of his youth.

Hindustan, or Hindostan, means the 'country of the Hindus.' The Persians used to call the R. Sindhu 'Hindu,' and that part of the dist. was therefore called H. The region denoted was gradually extended, until the whole tract of country between the Himalaya Mts. and the Vindhya Mts., W. of Bengal, was so designated. At one time H. was often used as a name for the whole of India, but is now seldom used either with such extended or the old very restricted meaning.

Hindūstāni Language and Literature. H. is the name given by the Eng. to Urdu, an Indian dialect; but H. proper includes the many Indian dialects in existence in Hindustan, such as E. Hindī, W. Hindī, and Rajasthani. Muhammed Hussain Azad

maintains that Urdu is derived from Brīj Basha, a variation of W. Hindī, but it is almost certainly a sister dialect, both being descended from Saur Sentic Prakrit, II, or Urdu, meaning 'camp language,' originally derived this name from being the language spoken by the soldiers camped near Delhi, which was the centre of Moslem rule. It is now spoken in the neighbourhood of Delhi and Meerut. Modern High Hindī was developed from Urdu, but for the many words of Persian origin words of Sanskrit origin have been substituted, Sanskrit really being the original language, and in consequence the literary languages of Urdu and High Hindī have become widely different. Urdu was originally a simple language, sufficient to the needs of the peasants. It did not become a literary language until the sixteenth century, and under the influence of their Mohammedan conquerors the Urdu writers sought inspiration in Persian literature. The Urdu alphabet is practically identical with that of Persian and Arabic, and is written in Arabic characters. Urdu writers borrowed both form and imagery from Persian poetry, while their prose is also largely imitative of Persian prose. During the time of Akbar (1556-1605) it was compulsory that all gov. clerks should know Persian, and from this date the Urdu language became more standardised. From the sixteenth century onwards European languages, chiefly Portuguese and Eng., have also influenced Urdu. In Urdu prosody there is no accent as in Eng., but only vowel quantity. Rhyme (*qafā*) and double rhyme (*radīf*) are greatly used. There are fifteen standard metres, while the prin. kinds of verse are *ghazal*, an ode; *qasida*, a purpose poem; *qita*, a fragment of *qasida* or *ghazal*, but differing from them in rhyme and often used for didactic poetry; *rubai*, a quatrain form; *masnavi*, double-rhymed, used for ballads, epics, and romances; *mustad*, a poem in which a few words are added to each line beyond the length of the metre; *murabba*, rhyming hemistichs in sets of four; *mukhammas*, rhyming hemistichs in sets of five; *musallat* in sets of six and others such as *musabba* in sets of seven. *Wano'kh*, burning backwards, is a love poem in which the poet complains of the heedlessness of his beloved, and *tarikh* is a chronological poem, while *fard* is a single verse used as a quotation. The earliest form of Urdu literature is poetry, and Amir Khusrā is the first known poet, writing in the thirteenth century. The two most celebrated of Urdu poets—Rafi Saadi, the satirist, and Mir Taqi, the narrative poet and sonneteer—lived in Delhi in the eighteenth century. There are three kinds of Urdu prose: *ari*, naked and unadorned; *murajfas*, cadenced, using metre without rhymes; and *musajja*, in which rhyme is used without metre. There are also three kinds of *nastr musajja* or rhymed prose. Early Urdu prose is marred by the frequency of its lingering rhythms, and it was not until the sixteenth century under the influence of Ghalib and Sir Syed Ahmed Khan that

It became free of rhymes and the long, complicated Persian constructions. Fictions, as distinct from romances, together with journalism did not come into existence until the end of the nineteenth century, and then under Eng. influence, while Urdu drama is still in its infancy.

**Hine, Reginald Leslie** (1883-1949), Eng. lawyer and historian of Hitchin, b. at Nownham, Hertfordshire. A scholar of great ability and skill, and a writer and lecturer of charming and gracefully allusive style, who devoted his gifts chiefly to the comparatively limited world of local tn. and co. hist. Hitchin was H.'s special study, to which he gave himself intensively for many years. Beyond it, he had many wide interests: in the co. of Hertfordshire, on whose hist. he was engaged when he died by suicide, and in Eng. hist. and traditions in many directions. His writings include: *Lyra Celtica* (1912), *Dreams* (1913), *The History of Hitchin* (2 vols. 1927-29), *Samuel Lucas, Life and Art Work* (1928), *A Mirror for the Society of Friends, Being the Story of the Hitchin Quakers* (1929), *Hitchin Worthies* (1932), *The Natural History of the Hitchin Region* (1934), *Confessions of an uncommon Attorney* (1945), and *Charles Lamb and his Hertfordshire* (1949).

**Hinganghat** (anc. Innyecotta), tn. of Wardha dist., Central Provs., India, 48 m. S.S.W. of Nagpur. It is the centre of the trade in Wardha valley, which is famous for raw cotton. Pop. about 17,000.

**Hingham**, tn. of Plymouth co., Massachusetts, U.S.A., on Massachusetts Bay, 12 m. S.E. of Boston. It is a manufacturing tn., has an arsenal, and is a popular summer resort. Here is the Derby Academy. Pop. 8,000.

**Hinkler, Bert** (1891-1933), Australian airman, b. in Bundaberg, Queensland; he took to flying and came to England in 1914. In 1928 he carried out a lone flight to Australia in 15 days, covering 10,000 miles. After disappearing on a cross-European flight, his body was found in Italy.

**Hinkson, Mrs. Katharine Tynan**, see TYNAN.

**Hinny**, hybrid offspring of a stallion and a female ass. Compared with the mule, which is the cross between a male ass and a mare, it is more tractable and less obstinate: at the same time it is not so sturdy and is smaller in size. It is less common than a mule, because less useful. See also under MULE.

**Hinojosa del Duque**, tn. 18 m. N.N.W. of Cordova, Spain. There are valuable copper mines, and line and woollen goods are manufactured. Pop. 10,000.

**Hinsley, Arthur** (1865-1943), Eng. cardinal, b. at Carlton, near Selby, Yorkshire. Educated at Ushaw and passed to the Eng. College at Rome. Took a doctorate at the Gregorian Univ. and returned to Ushaw as a prof., 1893. In 1899 he became headmaster of St. Bede's Grammar School, Bradford. Transferred in 1904 to the archdiocese of Westminster as parish priest of Sutton Park. In 1917 he was chosen to be Rector of the Eng. Col-

lege in Rome. Created bishop of Sebastopolis *in partibus*, 1926. In 1928 he was appointed to the post of 'Apostolic Visitor to the African Missions in Brit. Territory' and secured the co-operation of the Rom. Catholic missions in schemes of educational reform in all parts of Brit. Africa, being created, in 1930, Apostolic Delegate in Africa and titular archbishop of Sardes. He will be remembered as one of the more significant of those men who have influenced Africa for good, especially as he represented the Pope in the Fr. colonies as well as the Brit. In 1934, after a serious illness, he was created a canon of St. Peter's, but at the age of sixty-nine, was chosen to succeed Cardinal Bourne in the See of Westminster. Went to Rome in connection with the canonisation of the Eng. martyrs Thomas More and John Fisher. At the end of 1937 he was raised to the sacred college with the title of Santa Susanna. Held strong views on the subject of the persecution of the church in Russia, Mexico and Spain, and, later, turned his powerful oratory against Nazi paganism. After the fall of France in 1940 he founded a new society, 'The Sword of the Spirit,' for mobilising Catholics to promote, as a religious duty, the victory of the allied arms, and the reconstruction of Europe. Had an engaging personality, which made him beloved by all who came in contact with him.

**Hinterland**, Ger. word expressing the country which lies at the back of colonies which, in an unexplored continent, naturally grow up near the coast. It is connected with a theory of colonial expansion. Most early settlers, like those in N. America and in Africa, assume rights over a much wider area than that which they have so far developed or explored. Thus those Eng. colonists who had peopled a mere coastal strip arrogantly claimed jurisdiction over vast regions W. of the Mississippi, and were not slow to show their resentment at what they regarded as the iniquitous appropriations of Fr. explorers along that river's course. The theory about the 'hinterland' made a very strong appeal to the Ger. emigrants of Bismarck's day.

**Houen-thsang**, see IWEN T'HSANG.

**Hip-joint**, ball and socket joint (orthopedic), somewhat resembling that of the shoulder but with considerably less extent of movement. The pelvis socket (acetabulum) is considerably deeper than is the case in the glenoid cavity of the shoulder joint. The investing membranes and tissues are also much less lax than those of the upper limb, and in consequence the whole is considerably stronger. The capsule has three well-marked investing bands: (1) The ligament of Bigelow, which is mainly concerned in the maintenance of the erect position of the body, is particularly strong and seldom ruptures, even in cases of the dislocation of the joint. It is in the form of an inverted Y, in which the upper part is attached to the ilium and the limbs of the Y are fastened to two distinct portions of the head of the femur. The other ligaments connect the femur with the pubis

and the ischium respectively. The ligamentum teres or round ligament passes from a slight fossa in the spheroidal head of the femur to the interior of the acetabulum. This ligament, on account of its situation, has been the subject of much discussion. It is absent in some mammals. Gripping the head of the femur is the cotyloid ligament, which lies inside the capsule and deepens the margin of the socket; it is continued as the transverse ligament. The synovial cavity extends along the neck of the femur beyond the limits of the auricular cartilages.

HIP JOINT, FRONT AND BACK VIEW

1. Haunch bone; 2. Femur; 3. Round ligament; 4. Capsular ligament.

**Diseases.**—The H. is peculiarly subject to many of the diseases which attack joints. *Hip disease* has been definitely associated with scrofula, and the symptoms of it usually appear before puberty. Failing satisfactory treatment the disease passes through well-marked stages, and finally dislocation may result from the breaking down of the surrounding tissues, which is frequently accompanied by a fungoid growth from the base of the acetabulum, which growth pushes the head of the femur from the socket; the whole may be rendered immovable (anchylosed), and although cases occur in which a permanent lateral displacement and shortening of the limb are the most serious consequences, yet more frequently the characteristic tubercular infection of the synovial membrane supervenes with dire results. *Accidental dislocation* is not frequent, largely due to the depth of the cavity and the general strength of the joints. In adults such dislocation is often accompanied by a fracture of the head of the femur; its rarity of occurrence is partly neutralised by the much greater difficulty which is experienced in reducing this dislocation. *Congenital dislocation*, which may be double, may be caused by the position of the child during intra-uterine life. The dislocation may not be discovered until walking commences, when the peculiar rolling gait will hint at it. X-ray examination is necessary in order to discover whether a hollow exists

in which the head of the femur may be placed, otherwise the treatment is much more difficult and may even demand the artificial construction of a socket. *Rheumatoid arthritis* often makes its appearance at the H. which, in certain cases, it renders totally inoperative.

Hipparchus, see HARMONIUS.

Hipparchus (c. 160–120 B.C.), founder of scientific astronomy, b. at Nicaea (in Bithynia), and lived in Rhodes and Alexandria. His greatest discovery was that of the precession of the equinoxes, but he also investigated the true periods of the revolution of the moon and of the solar year, and showed how places might be more accurately located on the globe with reference to the lat. and long. of stars. To H. also are traceable the beginnings of trigonometry, both plane and spherical. It is only recently that the true greatness of H. has been appreciated, as Ptolemy had for centuries the credit of his predecessor's observations. See H. Berger, *Die geographischen Fragmente des Hipparchus*, 1870.

Hipparion (Gk. *ἵππιον*, a pony), name of a genus of extinct fossil ungulate mammals belonging to the sub-order Perissodactyla and the family Equidae, and found in the Upper Miocene and Pliocene strata of Europe, N. America, and Asia. This animal is usually regarded as one of the ancestors of the horse, though differing considerably in structure and size. The H. has three toes, the outer digits not reaching the ground, the ulna being better developed than in the horse, and its size is rather less than that of a donkey.

Hipper, von (1863–1932), Ger. admiral. At the outbreak of the First World War he was in command of the 2nd Squadron of the Ger. High Sea Fleet. At the battle of the Dogger Bank (q.v.) in Jan 1915 he commanded the Ger. raiding cruiser squadrons. At the battle of Jutland (q.v.) in May 1916 he was in the *Lützow* as Chief of the Reconnaissance Force, an appointment of great responsibility, which he ably filled. He succeeded von Scheer as commander-in-chief of the Ger. Fleet in Aug 1918, and it fell to him to make the arrangements with the Brit. naval authorities regarding the surrender of the Ger. Fleet. He received the freedom of Wilhelmshaven for his Jutland services. See life by H. von Waldeyer Hartz (trans. by F. A. Holt), 1933.

Hipperholme, par and tn., W. Riding, Yorkshire, England, 2 in. N.E. of Halifax. Quarries and tanneries. Pop. 5300.

Hippias of Elis, Gk. sophist, contemporary with Socrates, who taught in Athens and figures in the *Hippias Major* of Plato as a man puffed up with his own conceit. In learning he was a pedant; in literature a dilettante who tried his hand at every form of composition. Once at the Olympic games he boasted he had made all his apparel and was master of every mechanical as well as liberal art.

Hippius, Zinaida Nicolayevna, (1869–1945), Russian authoress: b. at Bokey, Tula prov. Married, 1889, Dmitry Merzhkovsky (q.v.), and belongs to his 'symbolist' school of poetry—fashionable

in their youth. Works:—three vols. of poetry; five of short stories; novels (e.g. *New People* and *The Devil's Doll*); essays; *La Révolution et la violence—la parole forcée du Tsarisme* (in collaboration with D. S. Merezhkovsky and D. Filosofov, 1907); one play, *The Green Ring* (Eng. trans., 1920); and *My Journal under the Terror* (i.e. in Leningrad after the fall of Tsarism—Fr. trans. 1921).

**Hippocampus**, name of a genus of teleostean fishes belonging to the family Syngnathidae and commonly called sea-horses.

**Hippocras**, or *Vinum Hippocraticum*, old aromatic medicinal wine, prepared from spices, such as cinnamon, ginger, lemon peel and almonds mixed with white wine and sweetened with sugar or honey.

**Hippocrates**, chief genus of the order Hippocrateaceae, and was named after Hippocrates, despite the fact that the species have no medical value. The species are twining shrubs indigenous to the tropics.

**Hippocrates** (c. 460–c. 357 B.C.), celebrated Gk. physician, a native of the is. of Cos. As a youth he is said to have studied the tablets in the temples of the gods, where each person had inscribed the ailments from which he suffered and the means by which he had recovered. At the beginning of the Peloponnesian war he is said to have saved Athens from a dreadful pestilence. Subsequently, on being invited to the court of Artaxerxes, he patriotically refused and said that he must serve his own country. He was given the civic privileges of Athens, and rewarded with the golden crown. He travelled widely throughout Greece, and died at Larissa in Thessaly. His two sons, Thessalus and Dracon, and his son-in-law, Polybus, all followed the same profession. He was a careful and observant physician, and a strong believer in surgery. The presence of disease, he believed, was due to a wrong proportion in the body of the humours, which he classified as phlegm, blood, and black and yellow bile. The chief works attributed to him are: *Aphorisms*, *Prognostics*, and *About Air, Water and Places*. The best known ed. are: *Foissil* (Geneva, folio, 1657); E. Littré (10 vols., 1839–61), with Fr. trans.; *Ermerius*, 1859–63 (with Lat. trans.), and the Eng. trans. of Adams, 1849, and W. H. S. Jones, 1923. See also F. Jevons, *History of Greek Literature*, 1886.

**Hippocrène**, see **HELICON**.

**Hippodamia**, wife of Pelops (q.v.).

**Hippodrome** (Gk. ἵπποδρόμος from ἵππος, horse, and δρόμος, racecourse), course used by the anc. Gks. for chariot or horse racing. It was much wider than the Roman circus, and was usually made on the slope of a hill. Its length varied from 650 to 750 ft., and it was about 450 ft. wide. In shape it was oblong with one semicircular end, and the right side was somewhat longer than the left. Homer gives a fine description of a chariot-race, and shows that the critical point of the race was to turn the goal as sharply as possible, with the nave of the near wheel almost grazing it, and to do this safely.

**Hippodrome**, London, place of amusement which was opened at the beginning of 1900. It affords a good entertainment, which is a combination of that given at a music hall, circus, and hippodrome. A feature of past performances was an aquatic display, for which the building is specially adapted. The arena can be filled with water to a depth of 8 ft., and has a capacity of about 98,000 gallons. In recent years only revues have been produced.

**Hippogriff**, or **Hippogriff**, fabulous animal, unknown to anc. writers, represented in comparatively modern literature as a winged horse with the head of a griffin, and described as the horse of the Muses. It was used by Ariosto in his *Orlando Furioso*, and by many writers of the Renaissance.

**Hippolyte**, in anc. Gk. legend, the queen of the Amazons. She was the daughter of Ares and Otrera, and the sister of Antiope and Melanippe. She headed a troop of Amazons in pursuit of Antiope, but was defeated and fled to Megara, where she died of shame and grief. According to another version, after her defeat she became the wife of Theseus. Still another tradition recounts that Theseus slew her in order to become possessed of her girdle, the gift of Ares.

**Hippolytus**, in anc. mythology, the son of Theseus, by Hippolyte or Antiope. His step-mother, Phædra, fell in love with him, and, on his refusing to gratify her desires, complained to Theseus that he had made attempts on her honour. His father thereupon cursed him and besought Poseidon's aid to bring about his destruction. While H. was riding in his chariot by the sea-shore, Poseidon sent from the water a sea-bull which frightened the horses, so that the chariot was overturned and H.'s body dragged along the ground till he died. According to Virgil, Artemis persuaded Æsculapius to restore him to life, and placed him under the care of Egeria in the grove of Aricia in Latium. He is the hero of Euripides' play of that name.

**Hippolytus** (c. A.D. 160–236), an early Christian writer, supposed to have been born in the East and to have become a disciple of Irenæus. Very little is known about his life. He became a presbyter of the church at Rome in the time of Bishop Zephyrinus (199–217). He disagreed with the succeeding bishop, Callixtus I., with the result that there was a schism, when apparently H. became the head of a separate church and styled himself Bishop of Rome. In 235, during the persecutions of Maximinus, the Thracian, he was exiled to Sardinia, where he died in the following year. Origen ascribed to him the *Philosophumena*, with which has been identified a fourteenth century MS. found in 1842 and published in 1851. His works have been collected by Fabricius (1716–18) and Lagarde (1858). See studies by C. O. J. Bunson, 1852; C. Wordsworth, 1859; J. Dollinger, 1853; H. Achells, 1897; A. d'Ales, 1906; and A. Donini, 1925.

**Hippomane** *Manzanilla*, manchineel-tree, a genus and species of Euphorbiaceæ

which frequents Central America, Columbia, and the W. Indies. It is a tall, handsome tree containing a most venomous milky latex and is among the most poisonous of all known vegetable productions.

**Hippomenes**, son of Megareus, won the Buteian Atalanta by fraud. The swift-footed maiden promised to marry the suitor who should outrun her. He had three golden apples dropped in her path, which she stopped to pick up, thus losing the race. See *ATALANTA*.

**Hipponax** (fl. sixth century A.D.) Gk. iambic poet of Ephesus. He was banished from his native city by the tyrant Athenagoras in 516 and spent his exile in Clazomenae. He was regarded as the inventor of a limping metre called the *choliambus* or *scazon* in which a spondee is substituted for the final iamb of an iambic senarius. His poems are satirical and not infrequently coarse. See *FRAGMENTS* collected in F. Bergk, *Poetae Lyrici Graeci*, and E. Dichtl, *Anthologia Lyrica Graeca*, vol. 1, 1936.

**Hippopotamus** (Gk. for river horse) the sole member of a family of artiodactyle ungulate mammals. It lives in the wild only in Africa, but fossils of a larger breed of hippopotami have been found in England, the rest of Europe and in India etc.

HIPPOPOTAMUS

The common species, *H. amphibius* in habitus, in all parts of Africa, but the smaller *H. liberiensis*, is restricted to the W. of that continent. In fact *H.* is only a little inferior to the elephant. Its legs are very stout so that it belly touches the ground when it walks on mud or other yielding surfaces, there is often as much as 2 in. of skin on the back and flanks, but no hair covers its dark brown hide, its small eyes are set high in the huge, ungainly head with its great snout and

enormous rounded muzzle, the tail is quite short, and on each foot there are four even and hooved toes. The animal is aquatic, nocturnal and voracious. It is a good swimmer and diver and as its respiration is slow, it can stay a long while under water. By day it is sleepy and languid, but by night it often comes out of the water to graze on the banks or if it lives in a cultivated region, it will make substantial inroads into crops and cause great destruction. It is a bad habit which accounts for its disappearance from the fertile plains of the lower Nile. It is sanguine by nature and usually playful and good tempered, but persistent pursuit often provokes a dangerous passion. When angered it emits a loud and piercing noise which has been likened to the grating sound of a creaking door. Hunters chase it in a variety of ways, sometimes it is ensnared in pits, sometimes it is shot or poisoned, or pierced with spears from a canoe. The teeth are valuable as ivory, the tongue, the fat and the jelly from the feet are favourite articles of diet, whilst the hides find many markets.

**Hippuric Acid** or **Benzoyl-glycocol** ( $\text{C}_6\text{H}_5\text{NHCOCH}_2\text{NH}_2$  (OOH)) colourless crystalline substance melting at  $18^\circ\text{C}$ . It is soluble in hot, but scarcely soluble in cold water. It occurs in the urine of herbivorous animals from which it may be obtained by evaporation. It is best prepared by the action of benzoic chloride on glycocol or of chloracetic acid on benzamide. On boiling with dilute acids *H.A.* is hydrolysed to benzoic acid and glycocol.

**Hirado**, or **Firando**, is of Japan in the strait of Korea, lying to the W. of Kjusiu from which it is parted by the *Speex* Straits. It is noted for its beautiful blue and white porcelains (*Hiradoyaki*), and also because the missionary, St. Francis Xavier, worked there and the Dutch once used it as a trading centre (1600-40). It is 419½ m. long and 6 m. broad.

**Hiranyagarbha**, Hindu name for the Creator or First Born, which may be rendered into Eng. as 'Golden Embryo' or 'Golden Child'. To him is addressed an exquisite hymn of the *Rig Veda Samhita*, which is an anthology of sacred songs composed by the *Viras* of India from 1500 to 1000 B.C. The hymn refers to it, which, as poetry runs with the Book of Job, shows how the Vedic philosopher was groping his way towards the Oneness of Deity. *H.* was Brahma who came forth from a golden egg.

**Hire Purchase Agreement**, agreement under which is called the hire system, is a document whereby goods, generally furniture, are delivered to a person by the vendor to be paid for by instalments of rent the goods to become the property of the hirer if he pays the whole of the instalments. By the terms of some agreements the so-called 'hirer' is bound to pay for and purchase the furniture, which is therefore his property *ab initio*, subject to the obligation to pay on easy terms. But usually *Hs.* are so drawn as to reserve the property in the goods in the vendor until all the instalments have been

paid, the hirer, properly so called, being under no obligation to purchase. The disadvantage to the hirer in this latter form of H. is that if he does not keep up his instalments, or exercise his option to purchase, the vendor is entitled to seize the goods and keep the whole of the payments already made to him. Most firms who sell goods on 'easy terms' have printed forms of Hs., and it is essential thoroughly to master the details of the agreement before signing it, so as to avoid liability in the event of inability to keep up instalments. Abuses of the system long excited complaints, and in 1938 an Act was passed giving the hirer protection from unreasonable demands and conditions, and allowing for the termination of an agreement by return of the goods hired after a specified number of instalments has been paid. The Hire Purchase Act, 1938, applies to all Hs. and credit-sale agreements under which the hire-purchase price or total price, as the case may be, does not exceed (a) for a motor vehicle or railway wagon, £50; (b) in the case of livestock, £500; (c) in any other case, £100. Before any agreement is entered into, the owner must state in writing (otherwise than in the note or memo of agreement) a price (the 'cash price') at which the goods may be purchased by the prospective buyer for cash; but this requirement has recently been complied with if the hirer has already inspected the goods and also if they were labelled with the price or he has selected the goods from a priced catalogue. An owner cannot enforce a H. or any contract of guarantee relating to it or any right to recover the goods from the hirer, and no security given by the hirer or by a guarantor for him will be enforceable against the hirer or guarantor unless the requirement as to stating the price has been complied with; and also unless a note or memo of the agreement is made and signed by the hirer and by all other parties to the agreement; and the note or memo must contain a statement of the hire-purchase price and of the cash-price and of the amount of each of the instalments and of the date on which each instalment is payable, and it must contain a list of the goods to which the agreement relates sufficient to identify them. A copy of the note or memo must be delivered or sent to the hirer within seven days of the making of the agreement. The Court, however, has a discretionary power to dispense with some of these requirements if the hirer has not been prejudiced by the failure of the owner to comply with them. There are analogous provisions on the statutory requirements relating to credit-sale agreements where the total purchase price exceeds £5. A hirer can, at any time before the final payment under a H. falls due, determine the agreement by notice in writing to any person entitled or authorised to receive the sums payable under the agreement. He will be liable, without prejudice to any liability which has accrued before the termination, to pay the amount, if any, by which one-half of the hire-purchase price exceeds the total of the sums paid

and the sums due in respect of the hire-purchase price immediately before the termination, or such less amount as may be specified in the agreement. Where the hirer, having determined the agreement, wrongfully retains possession of the goods, then, in any action by the owner to recover them, the Court may order the goods to be delivered to him without giving the hirer an option to pay the value of the goods. Knowingly selling or pledging goods not completely paid for under a H. which does not vest the property in the hirer *ab initio* may render the hirer liable to prosecution for larceny as a bailee. A H. under which the goods remain the property of the vendor till full payment is not a bill of sale within the meaning of the Bills of Sale Acts, and therefore the goods, not being within the hirer's apparent possession, may not be seized in execution (*q.v.*) by the hirer's creditors, and they cannot, generally speaking, be distrained upon for rent owing in respect of the premises in which they may happen to be. The licence to seize frequently inserted in such H. As. merely enables the vendor to retake what is his own property in the event of non-payment. The goods of a bankrupt trader delivered under a true H. or hire-purchase agreement vest in his trustee in bankruptcy and form part of the assets available for his creditors generally, unless there is a well-recognised custom in the bankrupt's trade to hire goods of the kind comprised in the H. A H. requires a *6d.* stamp, and if under seal (*see DEED*), a *10s.* stamp.

**Hirohito** (*b.* 1901). Emperor of Japan, bearing the title Dai Nippon Teikoku Tennō, or Imperial Son of Heaven of Great Japan. Descended from a dynasty that is believed to go back to the middle of the seventh century B.C. Educated partly in England; succeeded his father Yoshihito in 1926. Married Princess Nagako in 1924. Akihito, his eldest son, is Crown Prince. Held the Brit. honours K.G., G.C.B., and G.C.V.O. After the defeat and surrender of Japan in the Second World War, a new draft constitution (Aug. 1946) profoundly changed the status of the Jap. Emperor. The constitution rests on the foundations of the state not, as theretofore, upon divine mandate, but upon the will of the electorate; and it restricts the functions of the Emperor, who becomes a symbol of the State.

**Hirosaki**, tn. in the N. of Hondo, Japan; famous for its apples and lacquered ware. V.uable manganese mines in the vicinity (Iwakura). Pop. about 40,000.

**Hiroshima**, cap. of the gov. of Hiroshima (3000 sq. m.), in Hon-shū, Japan. Situated on the is. and shores of the delta where the R. Otawara falls into the Inland Sea; but, although hills rise to 700 and 800 ft. to the immediate N.W. and N.E., the city stretches over flat ground in all directions for roughly 2 m. from the centre. Before the Second World War it was an important seaport and the centre of a thriving commerce, though with every Jap. and traveller its name was

inseparably associated with the 'Island of Light,' Miyajima, which rises from the picturesque bay opposite. This is of woods and crags is famous for the great temple of the goddess Bentin (begun in 587), which is accounted one of the three wonders of Japan, and was yearly thronged by a multitude of pilgrims. The name of this ill-starred city, however, will go down to hist. as that of the first victim of the terrible atomic bomb. On Aug. 6, 1945, shortly after 8 A.M., an Amer. Super-Fortress flying at 30,000 ft. dropped a single atomic bomb over the city and the bomb exploded over the city centre. The city centre, once the Old Tn., was dominated by a number of reinforced concrete buildings owned by banks, insurance companies, department stores, newspapers, and similar mercantile enterprises. Beyond the Old Tn. lay an industrial zone developed during the early part of this century, and consisting of many small wooden workshops set among dense Jap. houses. A few larger plants devoted to engineering and silk manufacture lay on the S. and W. outskirts of the city. The city was a prosperous trading community having some contacts with the outside world, and its centre was spaciouly planned, with fine streets and temples. Like other Jap. cities, H. was growing rapidly before the war; its census pop. rose from 270,000 in 1920 to 315,000 in 1940. It remained at this figure for the greater part of the war, but began to fall in 1944, and at the time of the attack it was below 245,000. This fall was the result of evacuation, in the main compulsory and accompanied by the systematic destruction of houses to form fire breaks—a programme to which impetus had been given by the great incendiary raids on Tokyo and other Jap. cities in the second week of March 1945, and the process was only partly completed in H. when the atomic bomb fell. The result of the explosion of the bomb was catastrophic and it was soon followed by the dropping of a second atomic bomb on Nagasaki and the ending of the war, towards which the two bombs largely contributed. In H. the bomb exploded above a level expanse of more than 10 sq. m. of wooden houses, destroying over 4 sq. m. first by blast and then by fire. The strong reinforced concrete buildings which dominated the centre of the city usually resisted the blast, but were burnt out. The modern industrial zone outside the city, at 1½ m. and more from the centre of damage, was beyond the range of severe blast. It is officially estimated that approximately 80,000 persons were killed. The severity of the disaster (as also at Nagasaki) was increased by a panic flight of pop., in which even fire and rescue services were abandoned, and which brought communal life virtually to a standstill. The mere clearance of debris and the cremation of the dead trapped in it had to wait a month for the return of the pop. Most striking of the blast effects was the distortion of all types of building as a whole, leaving them leaning as if after a high wind rather than an explosion. Many of the reinforced

concrete buildings at H. were of unusually strong design, intended to resist earthquake. These, even when virtually under the explosion, usually suffered no serious structural damage except some depression of the flat roof, sometimes to saucer shape. As might have been expected from a bomb exploded at such a height, the effect on underground services was insignificant. Similarly, roads and railway tracks were unaffected. Bridges were displaced but usually by very small amounts. For a fraction of a second there was an intense flash from the bomb, the radiated heat from which scorched objects fiercely and to great distances. Among the resulting effects were the roughening of polished granite and other stones, the raising of bubbles on roof tiles, the reddening of concrete, the darkening of asphalt road surfaces which retained the 'shadows' of passers-by at the instant of the explosion, and the scorching of painted and unpainted timbers, of fabrics, and of the human skin. Pregnant women who survived within 1000 yards of the centre of damage had miscarriages; those who survived up to 1½ m. from the centre had miscarriages or premature infants who soon died. Even substantial buildings were penetrated by the gamma rays from the explosion and gave no protection. The ray had the effect of passing through the skin without seeming at first to affect it. It is thought that the gamma rays caused the death of nearly everyone who was fully exposed to them up to a distance of half a m. from the centre of danger. People who were directly under the explosion in the open had their exposed skin burnt so severely that it was immediately charred dark brown or black; those people died within mins. or at most hrs. Both in H. and in Nagasaki, burns on exposed skin were very severe up to about 1500 yds. from the centre of damage. Buildings and walls gave complete protection from flashburn. There was strong evidence that heat radiation was a cause of fires in unscreened buildings, probably up to a distance of a m. from the centre of damage. A number of reinforced concrete buildings with shuttered windows escaped fire, apparently because the heat radiation, travelling at the speed of light, arrived and died away before the blast, travelling only at a few thousand ft. a sec. blew out the shutters to expose the interior. See *The Effect of the Atomic Bombs at Hiroshima and Nagasaki: Report of the British Mission to Japan*, H.M.S.O., 1946. and J. Hershey, *Hiroshima*, 1946. By 1948 H. was to some extent rebuilt. Plans exist, on paper, for making the city a permanent centre of culture and peace. There are to be wide roads, parks and tree-lined boulevards; hotels in the W. style are to be built for foreign tourists, and it is hoped also to build a casino on one of the nearby is. Whether these schemes will ever come to anything is in some doubt, for there is a great lack of building materials and there are virtually no funds, and up to late 1945 the Jap. Gov. had granted only 60 million yen for the work of reconstruction. The

immediate tasks then were road repairing, waterworks construction, and school rebuilding.

**Hirozhige** (Ando Tokitaro) (1797-1858). Jap. landscape painter. True name Ando Tokitaro, he adopted the name of H. conformably to convention in recognition of his being a pupil of Toyohiro. H. was one of the chief members of the *Ukiyo-yo* or Popular School of Painting in Japan (see also HOKUSAI) a school which was especially occupied in making colour prints. H. and his pupils (two of whom adopted the name of H.) applied the process of colour block printing for landscapes with a skill and harmony of effect that have only been equalled in Japan by Hokusai and certainly by no W. artist. Most of the subjects of H. and his pupils were taken from the vicinity of Yedo or were scenes on the old highway between Tokaido and Kioto.

**Hirpne**, one of the hardy tribes belonging to the country of Samnium, E. of Naples, Italy. In 4 B.C. they joined the Samnite alliance; their chief tn. was *Æculanum*.

**Hirsch, Maurice, Baron de** (1831-96), Jewish philanthropist, was by birth a Ger. As partner in the banking house of Bischoff-heim and Goldschmidt, of Brussels, London, and Paris, he amassed a huge fortune. He founded the Jewish Colonization Association, and endowed it with a cap. of £9,000,000 the object of which was to give his persecuted co-religionists of Russia facilities of emigration.

**Hirschberg**, (Polish, *Jelenia Góra*), tn. 1120 ft above the sea-level, 48 m. S.E. of Górlitz (Zgorzelec) in Silesia, Poland, formerly Prussia. Situated at the meeting of the Bober and Zuckau rvs., it is especially noted for its beautiful surroundings. Pop. 30,900.

**Hirson**, tn. on R. Oise, dept. Aisne, France. There are nail and glass works and foundries; basket making is carried on. Hero on Sept. 2-3, 1914, the VII Corps of Gen. Hodges's First Amer. Army crossed the Belgian border in a rapid advance of 40 m. in 2 days. Pop. 10,400.

**Hirtius, Aulus** (c. 90-43 B.C.), Rom. historian, was a friend of Cicero and Cæsar, and the reputed author of the eighth book of the Gallic wars. The narratives of both the Alexandrian and Sp. campaigns are also usually attributed to him. The colleague of Pansa in the consulate of 13, he was slain in the battle of Mutina, though it was Antony his enemy, who met defeat.

**His Majesty's Theatre, Haymarket**, was designed originally by Sir John Vanbrugh, and was opened as 'the Queen's' in 1705. In 1789 it was burnt down, and a second theatre erected which lasted from 1791 to 1867, when it, too, was utterly demolished by fire. It was in this building, which became known as the 'Italian Opera House,' that Madame Rachel appeared in 1841, and here Jenny Lind made her debut. The third theatre dates from 1872 to 1892. It was put to various uses; for Moody and Sankey hired it for revival meetings, and it was also the scene of promenade concerts, Wagner's operas performed by the Carl Rosa Com-

pany, and Fr. plays with Sarah Bernhardt in the cast. Coquelin *and* here played Cyrano de Bergerac in Rostand's play of that name. The fourth theatre was opened in 1897 with Sir Herbert Beer-bohm Tree as proprietor and manager. Under his direction many representations of Shakespeare's plays were staged; while excellent performances of other dramatic works were given, including Stephen Phillips, *Herod* and *Ulysses*, and the Japanese play, *The Darling of the Gods*. *Joseph and His Brethren* appeared in 1913, *David Copperfield*, and Shaw's *Pygmalion* with Mrs. Patrick Campbell and Tree, in 1914. The most remarkable run was made both during and after the 1914-18 war by *Chu-Chin-Chow* (1916-1921), with Lily Brayton and Oscar Asche in the leading parts. Other Eastern plays, such as *Cairo*, *East of Suez*, and *Hassan*, each ran for nearly a year. *Beau Geste* and *Mozart* with Sacha Guitry and Yvonne Printemps as leading performers, were notable theatrical events of 1929. Another long theatrical run was recorded by Noel Coward's operette *Hitler Sweet*, 1929-1931. Later successes are *The Good Companions* (1931); *Conversation Piece* (1934), with Yvonne Printemps; *Balalaika* (1937), *Le Lilac Domino* (1944) and *Brigadoon* (1949).

**Hispaniola**, see HAITI.

**Hissar** (1), cap. of the dist. of H. in the Bokhara Region of the Ozbek S.S.R., Central Asia. It guards the approach to the fertile valleys of the Kafirnihan and Surkhan. Pop. 10,000. (2) The name of a dist. and tn. in the Ambala div. of the E. Punjab, India. The dist. (5217 sq. m.), which is fed by three railways is partly irrigated by the W. Jumna Canal. Sandy for the most part, but in rainy years produces good crops of barley, rice, etc. Ginning and cotton-weaving are carried on in Hissar and Sikra, besides H. Founded in 1356 by the Emperor Feroz Shah. Pop. (dist.) 820,000 (tn.) 25,000.

**Hissar, Aflorim Kara**, see AFLORIM KARA HISSAR.

**Histology**, that branch of microscopic anatomy which deals with the intimate structure of the textures. A differentiation of functions in the higher animals has led to the development of a large number of organs, each composed of various tissues and textures. The result of minute dissociations and microscopic analyses proves that the actual number of elementary tissues, which are distinct in origin and structure, is small, though transition forms are encountered. The general enumeration is as follows: epithelium, or epithelial tissue; connective tissue (many varieties, including adipose tissue); cartilage and its varieties; bone or osseous tissue; muscular tissue, and nervous tissue, to which it is usual to add the elements suspended in the fluids of the body, viz. blood and lymph corpuscles. Many of the organs are formed wholly of one form of tissue, or show but slight admixture; other parts are much more complex in composition, yet in some cases their uniformity of structure leads to their being described along with the elementary

tissues. Examples of these are: blood and lymphatic vessels; lymphatic and secreting glands; serous, synovial, and mucous membranes; and integument—all of which are described in detail elsewhere.

**Histon**, vil. in Cambridgeshire, England, 4 m. from Cambridge. Noted for jam making. Pop. 1600.

**Historical Manuscripts Commission**, The, royal commission which began to sit in 1809. Sir Thomas Duffus Hardy (1804-1878) was influential in obtaining its appointment, as he felt keenly the desirability of some systematic investigation into the collections of valuable MSS. which at present are dispersed up and down the country in the libraries of colleges, corporations, and private individuals. Under the auspices of this commission many records and appendices have been issued, twelve of which deal with the sixteenth-century MSS. in the possession of Lord Salisbury at Hatfield House. This research is valuable in giving to students what would otherwise lie hidden for all time or, as has often happened, find a foreign purchaser. Similar bodies have been founded abroad since the appointment of the H.M.C.

Complementary to the work of this Commission is that of the Brit. Records Association, which is especially concerned with the principles to be followed in deciding whether to keep or destroy modern records. A very large proportion of the historical documents preserved in this country are or have been records or archives, i.e., documents accumulated in the course of organized business, social activity, or domestic affairs, by a natural process of growth, or in other words not consciously collected, and it is this natural process of growth that gives such documents their value as evidence of contemporary facts. It is said that survivals of accumulations of this kind are more numerous in England than in any other country. Such are, e.g., co. sessions records, anct. endowments, and the like. It is obvious that through ignorance there is some danger of the destruction or dispersal of these records or archives, a danger supplemented by their increasing value in the sale room. The generally accepted classification of Eng. archives divides them into public, central and local; semi-public; private; and eccles. The control of these archives has, however, never been centralised in England as it has in most of the greater European countries. The Public Record Office brought together, or arranged to bring together, under one authority the archives of nearly all divs. and depts. of central gov.; but it estab. no relation between this authority and the local, private and eccles. custodians or owners. Nor, generally speaking, has any Act estab. any inter-relations between these other authorities and individuals. The State has in fact intervened sporadically in regard to all the above classified categories of archives, but such intervention in other fields, notably that of Historical Monuments, has been wider and more definite.

The present Royal Commission on Historical Monuments was set up in 1908 and has been at work ever since; but in its first report (1910) it directed attention to the necessity for an executive authority, and this was set up by legislation in 1913 in the shape of an inspectorate forming part of the Office of Works. See *Proceedings of the British Records Association*.

**Historiographer**, writer of history. The title has sometimes been given as a mark of honour by European courts to various learned historians. Thus Racine was H. to Louis XIV., Voltaire to Louis XV. The post of King's H. in Scotland was revived in the eighteenth century and still exists.

**History**, term briefly defined as the story of the past. The meaning of the Gk. word *istoria*, from which it is derived, is 'that which we come to know as the result of an enquiry.' H. is not therefore to be limited to a simple record of what is known or believed to have occurred. H. is more properly concerned to examine, analyse, and explain past events, particularly in human affairs, and in the words of R. G. Collingwood 'to tell man what man is by telling him what man has done.' The oral traditions of primitive peoples which are obscured by mists of legend and of miracle are not so much H. as the sources of H. The written records of more advanced peoples may similarly be but the materials of H. The anc. Egyptians, the Assyrians, and the Chinese possessed extensive records, but they were never analysed or explained or assimilated into a connected narrative; records they remain. It is with the Gks. of the fifth century B.C. that H. begins. They developed a reasoned approach to the past, combined with an ability to analyse the causes, examine the effects, and from the result build up an account of past events. Herodotus gave his work the title of 'a history,' meaning an investigation or enquiry. It is the use of this word and its implications that makes Herodotus the father of H. He not only recounted the conflict between Greece and Persia but set out his interpretation of that conflict as a struggle between oriental autocracy and hellenistic constitutionalism. Similarly, Thucydides in his history of the Peloponnesian war not only described the course of the war but gave an account of the underlying causes.

Since therefore H. is concerned to analyse and explain as well as to describe the events of the past, it is impossible for it not to be coloured by the personality and mind of the historian. Again, only the earliest historians could attempt to record and discuss all the events of which they had knowledge. A later historian must necessarily select those events which he regards as memorable, and the selection which he makes must be a matter of personal judgment. The most clear-sighted historian will make allowance for his personal prejudices in his writing of history, but he will also be the first to admit that H. cannot be entirely free from bias. The standard of values which the historian applies to his

study of the past is determined by the general social, philosophical, religious, and economic ideas of his age, either because he is in accord with the predominant thought of his time or because he is in revolt against it. Thus, the history of the Jewish people in the books of the O.T. became primarily an account of the way of God with the world, while to the Marxist historian the story of the growth of human thought and behaviour is primarily the story of the influence and effect upon man of his economic environment. H. needs to be, as indeed it is, re-written from time to time and past events re-valued in the light of fresh developments and new ideas. In addition, advances in other branches of knowledge bring to the historian new means of discovering the facts of the past and suggest to him new methods of handling his sources. The modern historian of auct. Britain has, for instance, been assisted in his knowledge of his subject by the field-work of the archaeologists and, more recently still, by the development of aerial photography, radiography, and pollen-analysis which have brought to light new facts about auct. settlements. In the nineteenth century the progress of the physical sciences and the development of the scientific method prompted the historian to use new and more critical methods of handling and classifying his material. Lastly, mention may be made of the influence on the historian of the general educational and social standards of the civilisation in which he lives. He is influenced in the style as well as in the subject matter of his work by the society for which he writes. In a society in which all classes are literate, the historian is likely to be influenced in the presentation of his material by the wide range of his potential readers.

For the modern European world the Gk. and Rom. historians stand as the great originals. Herodotus and Thucydides, Livy and Tacitus regarded H. as both a science and an art. In writing down the results of their studies they accepted literary and artistic standards, but they were at pains to collect the facts and submit them to analysis. To the Gks. in particular H. had a definite value in that it led to the formation of right opinion which in their view was as necessary for the conduct of life as scientific knowledge. At the same time they did not develop in their historical thinking any conception of an ultimate goal of human society. They were conscious of continual change in human life but not of any age-long tradition moulding it. The theory of H. which they developed was consequently one of recurring cycles.

With the rise of Christianity as the dominating theory of life the theory of H. and the writing of it changed. By the fifth century A.D. the W. Empire was overrun by the barbarians, and Rome itself had been sacked. Much of pagan literature and learning was lost, and what was still known was regarded with hostility. Human history came to be seen as a series of events essentially condi-

tioned by divine intervention and revelation which could ultimately guide mankind to a definite and desirable goal. This interpretation of H. was first outlined in St. Augustine's *City of God*, and from the fifth to the fifteenth century it continued to be generally accepted. It gave a unity to H. since it presented all significant events as the effect of a single cause—the Will of God. Since the 'city of God' would ultimately triumph and might indeed come suddenly upon the world, what happened to the world meanwhile was of minor importance. Mainly because so few others were literate, monks were the chief (though not the only) historians of the Dark and Early Middle Ages, and the bulk of their works consisted of chronological notes (e.g. the *Anglo-Saxon Chronicle*, and the works of the Venerable Bede and Matthew Paris) while a few educated observers, like Froissart left descriptions of local contemporary events.

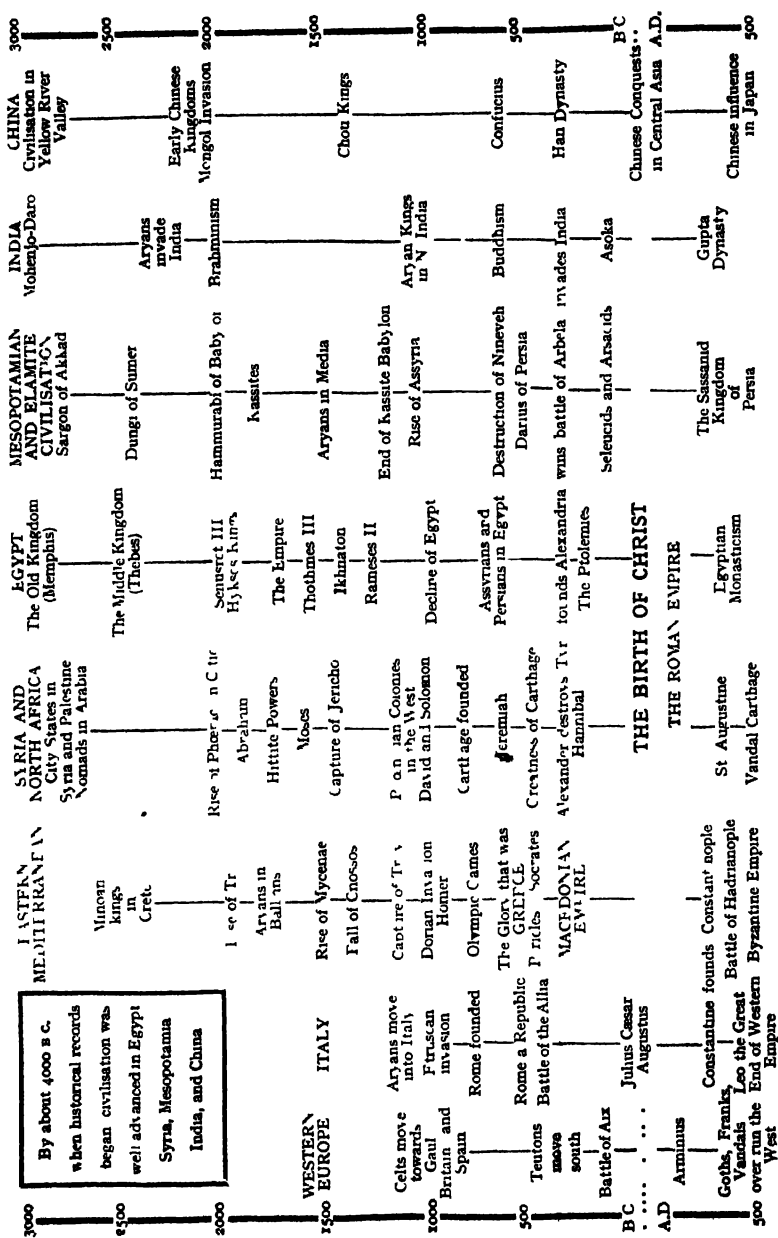

With the Renaissance there was a return to the humanistic view of H. based on that of the aucts. Again it became a function of the historian to study and interpret human actions and human thought. H. after the Græco-Rom. model again became concerned with material values and with instruction in the art of politics and practical life. Machiavelli set himself to understand human actions, to study political history, and to explain to the Its. why things had happened as they did. From Italy the new approach to learning spread to other countries. It. historians, often at the invitation of the rulers of the new nationalist states—states which were in part the result of the revival of the later Rom. conception of sovereignty (absolute military monarchy or 'Caesarism'—Mommson)—introduced the new idea of H. to European courts. Polydore Vergil of Urbino was commissioned by Henry VII. to write the history of England, a task which was completed in 1533 and presented to Henry VIII. At the same time, the discovery of America and the formulation of the basic principles of experimental scientific method played a part in encouraging an interest in H. While less and less could be taken for granted in a world which had felt the impact of the new discoveries, the beginnings of science suggested new critical methods of approaching the past. Thus Wm. Camden in his work on the topography and archaeology of Britain reconstructed the past from data in much the same manner as the natural scientists of the time were using data as the basis of their scientific theories.

The reaction away from the medieval view of the nature and history of man was virtually complete in the eighteenth century.

Hume and Voltaire established the belief that human life had been in the main a matter of blind and irrational forces but

yet was capable of being converted into something rational. To them the Middle Ages were a period of barbarism. They consequently had little interest in any but the modern period and for this reason did little to improve the methods of historical research. Hume's *History of England* is slight and sketchy in its account of any period earlier than the Tudors, and Voltaire expressed the view that there was no reliable historical knowledge of events earlier than the sixteenth century. To Gibbon also the motive force of H. lay in human irrationality, and in *The Decline and Fall of the Roman Empire* he wrote the story of what he himself described as the triumph of religion and barbarism. In the latter half of the eighteenth century, however, greater emphasis was laid upon the idea that mankind was capable of a rational life, and a more scientific study was made of the advance of H. from barbarism towards reason and enlightenment. Turgot drew a distinction between natural phenomena, which remain the same for ever, and human society, where knowledge is acquired and experience transmitted. In this view the H. of mankind, despite periods of disturbance, is one of continual advancement. Condorcet also set out to show 'the successive changes in human society, the influence which each instant exerts on the succeeding instant, and thus in the successive modifications, the advance of the human species towards truth and happiness.'

The Fr. Revolution broke rudely upon the idea of progress. As a reaction from the excesses of the Revolution a new interest was taken in the Middle Ages; there was a sense of glamour in far-off times by contrast with the doubt and disturbance of the present. This historical interest was linked with the Romantic movement in literature in which it found its chief expression. It showed itself in historical scholarship, however, mainly in the work of the Ger. historians of the time, among them Mommsen, men who first directed their attention to the study of classical texts and auct. inscriptions but later extended their range to include the Middle Ages. In Germany the impulse to study medieval H. came from outside academic circles and was due in part to political motives: the medieval empire had been the archetype of Ger. unity and what Germany had once achieved she might, it was argued, achieve again. The critical methods of the Ger. historians in the examination and analysis of their sources and the solid basis of their scholarship had a great influence on the work of historians in other countries. In England up to the middle of the eighteenth century H. had been mainly regarded as a specialised branch of literature, and the greatest names of that time, for instance Macaulay and Carlyle, were those of men who were writers and men of affairs as much as they were historians. By the eighteen-seventies, however, Eng. historians were following the method adopted by the Gers. and were becoming increasingly scientific in their assessment of historical evidence. This tendency was furthered

by the growing importance of H. as a subject of univ. study, and the historical writers of the time were more akin to the professional or 'professorial' historians of the twentieth century than to their predecessors. Stubbs, for instance wrote for scholars and students, and Maitland's work on the history of law and institutions in England, despite the brilliance and lucidity of his style, is mainly a technical study which is not always easy for the layman to follow. At this period a number of societies were founded for the editing and pub. of auct. legal and historical documents. In 1887 Maitland founded the Selden Society for the pub. of auct. legal records and himself ed. sev. of its pubs. As the sources of H. came to be more and more explored and knowledge was amassed, research tended to concentrate on various detailed aspects with the background of which only the expert could be familiar. H. was in fact in danger of becoming a purely technical subject, and the wider function of the historian in interpreting the past to the present tended to be forgotten. Already, however, a note of revolt against the conception of H. as being concerned only with politics and constitutions had been sounded by Carlyle: 'the thing I want to see,' he wrote, 'is not Red-Book lists and Court Calendars and Parliamentary Registers, but the Life of Man in England: what men did, thought, suffered, enjoyed.'

The very title of John Richard Green's *Short History of the English People* is, again, indicative of a wider, more human approach to H. His work was the result of an awakening social conscience. Arnold Toynbee's *Lectures on the Industrial Revolution* reflect a similar impulse and were written under the influence of a new and wider conception of social justice. The influence of Karl Marx tended in the same direction. To Marx, H. was basically a story of the struggle between social classes created by the methods of production in use at any given time. In his view the economic structure of society is the real basis on which rested the legal and political superstructure. Relatively few historians have accepted the Marxian thesis that economic history is the clue to all H., but the influence of Marx stimulated an interest in the economic and social approach to H.

In recent years historians, while shedding nothing of the tradition of sound scholarship and careful research inherited from the later nineteenth century, have combined these qualities with a determination to examine the wider aspects of H. Among many modern scholars, Prof. G. M. Trevelyan may be quoted as one who holds the view that H. is both a science and an art, that while the discovery of historical facts should be scientific in method the exposition of them for the reader should partake of the nature of art, 'the art of written words, commonly called literature.' Trevelyan too is among those who have embodied their learning in general works of interest to the non-specialist reader as well as to the specialist. H. becomes an aid in the philosophical

interpretation of human life, and in this connection mention must be made of the great comparative study of civilisations which has been undertaken by Prof. Arnold Toynbee in his *Study of History*.

Collingwood, *The Idea of History*, 1946; K. B. Smellie, *Why we read History*, 1947.

Hit (anc. Is), tn. of Iraq, on the r. b. of the Euphrates, 100 m. W.N.W. of Bagdad. Camel posts start from here for Damascus, and the Euphrates is navigable up to this point. There are famous anc. bitumen and naphtha pits. Pop. 5000.

Hitchcock, Edward (1793-1864), Amer. geologist, began life as a congregationalist minister in Conway, Massachusetts, but in 1825 accepted the chair of chemistry in Amherst College—a post which had been offered him largely because of his *Geology of the Connecticut Valley* (1824). In 1841 he pub. the third and final report of his indefatigable researches into the geology and mineralog. of Massachusetts. In 1844 he became president of his old college where he taught natural theology, besides his chosen science. An assiduous contributor to scientific journals, H. strove to popularise his subject, and also pub. in 1851 *The Religion of Geology*.

Hitchendon, see HUGHENDEN.

Hitchin, mkt. tn. of Hertfordshire, England, on the R. Hiz, 32 m. N.N.W. of London. The chief trade is in corn, malt, and flour, while lavender and peppermint are grown and their oils distilled. Girton College (Cambridge) was originally estab. here; St. Mary's church is the biggest church in Hertfordshire. It stands on a Norman foundation and has in its fabric Rom. bricks, a massive buttressed tower, and a thirteenth century doorway. H. has associations with famous men. Here at Church House, once a school, Eugene Aram was a master. George Chapman dramatist, poet, and translator of Homer was born at Tilchouse Street. In the Baptist Church in the same street is a chair John Bunyan gave the minister in his day. Sir Henry Hawkins (late Lord Brampton), who as a criminal judge has had few equals, was born at The Grange in 1817. Sir Henry Bessemer, inventor of the steel process which bears his name, was born in 1813 at Charlton nearby. Pop. 14,000. See H. Hine, *The History of Hitchin*, 1927-29, and *Hitchin Worthies*, 1932.

Hitler, Adolf (1889-1945), Ger. dictator, b. at Braunau-am-Inn, Austria, his parents being of Bavarian and, perhaps, Bohemian, peasant origin. His father was a Customs officer in the Austrian service, who till late in life was known as Schickelgruber (Austrian peasants have two names, a

*Hausname* and a *Schreibname* and the change from one to the other is evidence of the sale or cession of property rights to a new owner) and who married three times, Adolf being the only son of his third wife. Adolf went to the best school available and was intended for the civil service, but the boy was interested only in drawing and architecture. His father dying, however, in 1902, left no resources for Adolf's continued education, and for some years he lived a life of hardship.

ADOLF HITLER

E.N.A.

With his mother he went to Vienna hoping to become an architect, but had to earn his living as assistant to a house-painter and by selling indifferent sketches. After a few years' miserable existence in Vienna he left in 1912 to settle in Munich. These years of penury and even mendicancy were formative of both his philosophy of life and of his character. Vague Nordic epics mingled in his mind with ideas of the 'elevating' influence of war and with less national dreams of Ger. national unity; and in the attempt, later, to realise these dreams he proved himself the successor of Bismarck. He completed Bismarck's work because, having himself a singularly forceful and sensitive personality, he was exposed to and responded to all the influences that were moulding Germany's character and destinies in the first three decades of this century. In the period of his extreme obscurity between

1904-12 he imbibed the pan-Germanism of Georg von Schoenerer, who indeed inspired H.'s strange views in *Mein Kampf*, and he studied the tenets of Karl Marx and Engels only to reject them. Even thus early he conceived a violent antipathy to the Slav influence in the Dual Monarchy and an equally violent anti-Semitism.

When the First World War opened he first volunteered for service with the Austrian forces but was rejected for physical unfitness. He then joined a Bavarian reserve regiment. He fought in the trenches, acted as despatch rider, reached the rank of *gefreiter* or lance-corporal, won the Iron Cross, was wounded in the Somme Battle, 1916, and was badly gassed in 1918. He lay blinded and helpless in hospital through the months of the revolution and the Armistice. It would have needed a man of much greater equipoise not to be carried away by the legend of Germany's 'stab in the back,' and he convinced himself that Germany had been defeated through the treacherous and enfeebling influence of the Marxist socialists. Back in Bavaria while attending and, later, conducting, courses designed to keep ex-servicemen away from Bolshevism, he came under the influence of Gottfried Feder, the intellectual father of the Nazi movement. It was at this time that he began his political career. He became the seventh member of an insignificant political group in Munich, the 'German Workers' Party,' and, equipped with a few definite ideas and a clear insight into the value of the arts of propaganda, he soon distinguished himself by his gift of popular oratory. Through his friends, Capt. Roehm, a staff officer of Munich, and Gen. von Epp, he maintained close contacts with the *Reichswehr*, which were to stand him in good stead. In 1921 he ousted Drexler, the founder, and himself became leader of the party, which now styled itself the 'National Socialist German Workers' Party,' its programme being H.'s nationalist and anti-Marxist creed. Differing from Roehm as to the function of the newly-created *Sturm Abteilung* troops ('Brownshirts') H. organised a special detachment to be his own political executive. This was the origin of the *Schutz Staffel* (S.S.) or Blackshirts formally established in 1926 in imitation of Mussolini's organization. Through Roehm H. secured the tacit approval of the local high command, together with financial resources. Thus encouraged he made his first attempt, in alliance with Roehm, Ludendorff and Goering, to seize power, in the notorious *putsch* in Munich of Nov. 9, 1923, the intention being to make Ludendorff Dictator. Two days later he was arrested and with others, including Ludendorff, tried for treason. The *Reichswehr* intervened behind the scenes to stifle the military connection with the reactionaries, but H. was sentenced to five years' imprisonment and incarcerated in the fortress of Landsberg im Lech. Here he worked on the final draft of *Mein Kampf* (q.v.) with the aid of his friend Rudolf Hess. No-one can understand H.

who has not read this strange rambling one-thousand page autobiography, philosophy and programme, with its prolixity and bombast, its candour, its peasant shrewdness, its fanaticism. Meanwhile his party disintegrated. Released under an amnesty in 1925 he set to work immediately to rebuild the party organization, though for some time Strasser, creator of the Nazi party in N. Germany, was more influential than H. in the party ranks, whose strength in the Reichstag was only twelve. H., however, gradually recovered the ground he had lost since the abortive *putsch*. By 1930 he was the undisputed head of a considerable party. Funds were increasingly flowing in from the big industrialists, who saw in National Socialism (q.v.) their best safeguard against Communism. 'Nationalism' gradually superseded 'Socialism' in the party programme, though its language was still wildly revolutionary.

When the world economic crisis came in 1930 H.'s party exploited the disillusioned and discontented masses as well indeed as the more solid elements, who saw their standard of living threatened by the crisis. And in the next election, after Brüning (q.v.) had dissolved the recalcitrant Reichstag, H.'s party won 107 seats. Shortly after this he stood against von Hindenburg in the presidential election and in the first ballot he barely succeeded in preventing von Hindenburg from securing the necessary absolute majority. Beaten in the second ballot H. was, nevertheless, now a political power to be reckoned with. In a rapidly deteriorating political situation Chancellor Brüning felt compelled to govern by decree and, though liberal in outlook, his regime paved the way to dictatorship. But in May 1932, he fell, after securing the re-election of von Hindenburg as president and dissolving H.'s Brown Army. But though H. regarded himself as heir to the chancellorship, he was now balked by the covert resistance of the old right wing regime, with its backing of industrialists and Junkers. When von Papen became Chancellor, H. remained aloof. Von Papen dissolved the Reichstag but the Nazi party doubled its strength and they and the Communists seemed to be sweeping the country. H. was now at the head of the biggest single party. When, however, von Hindenburg intimated that he would not tolerate H. as Chancellor, though he would admit national socialists in a coalition gov., the Nazis launched a violent campaign of opposition inside and outside parliament. Von Papen took up the challenge and again dissolved the Reichstag and stopped many of H.'s financial sources. In the next election the Nazis lost a million votes. Then, however, having been superseded by Schleicher, who was also manoeuvring for the support of the moderate national socialists led by Strasser, von Papen veered round, released the subsidies from the industrialists to H.'s coffers, and induced von Hindenburg to accept H. as Chancellor of a gov. in which there would be only three National Socialists.

Thus in January, 1933, began the period of the Third Reich. By the end of that year the one-man Party had become the one-Party State. In the elections it was only by the support of the other Right parties that the Nazis had won a majority vote. Terrorism and brutality, however, estab. H. in an unassailable position. Opponents disappeared by assassination or into concentration camps (see BUCHHEWALD). The conservatives were shouldered aside, though H. was astute enough not to offend any powerful interest. When some of his followers, wearied of Socialist- and Jew-baiting, murmured against the dropping of the 'Socialist' and Radical elements of the Party programme, H. suddenly struck down any and all of the leaders, Nazis or reactionaries, likely to give trouble, the chief victims being Strasser, Roehm, and Schleicher and his wife. This was the infamous 'purge' of June 30, 1934, in which a hundred National Socialists were murdered. All power now passed to the National Socialist executive, which, for all practical purposes, meant H. himself. The true reason for this purge may never be precisely known, but it is generally believed that Roehm aimed at getting the Reichswehr embodied in his *Sturm Abteilung* organization, which H. of course resisted. Soon afterwards Hindenburg died and H. was declared his successor; but he abjured the title of Reichspräsident in favour of Fuehrer and Kanzler. Thus the mendicant adventurer of Munich now became the master of Germany.

Sure of his position in Germany by ruthless terrorism, H. now began his long campaign to restore Ger. power in Europe, heralding his advent to power by a series of increasingly grave breaches of treaty obligations and by flouting European opinion. The first need was to rearm Germany which was done secretly at first and then ever more flagrantly. But before launching his attack on the Versailles Treaty he awaited the plebiscite on the Saar in Jan 1935. The result, partly influenced by terrorism, was an overwhelming majority for retrocession to Germany. In March he denounced the military clauses of the Treaty and introduced conscription for the Reichswehr. A year later he boldly risked marching his forces into the demilitarised Rhineland zone, at the same time denouncing the treaty of Locarno (*q.v.*), which, he claimed, had been abrogated by the Franco-Soviet Alliance. This, coupled with conscription, transformed the military situation, for at one blow it deprived the W. Powers their strongest weapon, freedom of entry into Germany. Thenceforward H. could hope to resist an attack on his W. front with one arm while the other was free to threaten the E. In July, when the civil war in Spain broke out, H. seized the opportunity to test his army and air force on the side of Franco. And once again the democracies held off and weakened, while Germany waxed in strength and H. in defiant confidence, conformably with doctrines contemptuously expounded in *Mein Kampf*. H. now pursued his tech-

nique of deliberately lying so as to lull future victims into a sense of false security while hatching his aggressive schemes. Yet in all candour he himself had avowed that the bigger the lie the better the chance of its being believed. The remilitarisation of the Rhineland was followed by two years of the most active Ger. military preparations coupled with an economic reorientation aiming at autarky. Events abroad in 1936-37, such as the League's ignominious failure to check Mussolini's Abyssinian adventure, increased the nervous tension in Europe, and went far to strengthen H.'s position. Mussolini was drawn into the orbit of H.'s machinations and intrigues, and their collaboration found expression, in Sept. 1937, in the Rome-Berlin Axis (see AXIS) a diplomatic coup whereby H. gained an ally at the expense of the Powers of the Versailles *Diktat* whose moral influence had well nigh vanished in a welter of appeasement.

The end of 1937 saw Germany's course set for an expansionist foreign policy which for two years won spectacular successes. Austria was seized without a fight, a country which even Bismarck had shrunk from touching. H. had acquired Austria by the simple process of manipulating an abrupt crisis in Austro-Ger. relations and then sending the Ger. army across the frontier and forcibly incorporating Austria in the Reich. Mussolini despite his apprehensions was too cowed to make a counteracting move. But the great test of this policy came with the campaign for the liberation of the Sudetenland; for this was an attack on a sovereign State bound by Treaty with the W. Powers and by ethnic ties with Russia (see further under CZECHOSLOVAKIA). But H. had gauged to a nicety the underlying realities of the immediate political situation. Enough for him that the cove. in the W. were not then prepared to fight. Then followed the humiliating pact of Munich (*q.v.*) and H. now seemed in the eyes of the average Ger., not only to be the preserver of peace but a consummate statesman, outtravelling all his predecessors in extending the Reich frontiers. No doubt each successive seizure enhanced the feeling of resentment in the W. as much as it enhanced H.'s prestige in the Reich. Yet his occupation of Prague was his first bad blunder owing to its effect on Brit. foreign policy and on Mr. Chamberlain. It in fact led to the Brit. guarantee to Poland and all that that was to imply in the ensuing seven years. A general European war was in fact only narrowly averted during the Sudetenland crisis. At the Nazi Party rally at Nuremberg H. appeared as the avowed champion of the Sudetic Gers. With the Reichswehr mobilised and his W. front fortified by the Siegfried Line, confronted by potential adversaries who were all militarily unprepared and divided geographically and ideologically from each other, H. was then in a position to dictate terms. Thus within less than a year he had added ten million Gers. to the Third Reich, broken the one formidable bastion to Ger.

expansion S.-E. and made himself the most powerful dictator in Europe since Napoleon I. In the talks with Mr. Chamberlain at Berchtesgaden and Godesberg he had reiterated his stock phrase used after the rape of Austria—that he had no more territorial claims to make. Yet soon afterwards he was invading and overrunning, not merely the Ger. inhabited regions of Bohemia, but the whole of Czechoslovakia, and then himself went to Prague to proclaim yet another bloodless victory, while at the same time he announced his annexation of Memel in violation of the Versailles Treaty.

Poland was the next victim marked out for H.'s hatred and aggression. He was now claiming the retrocession of Danzig and demanding the Polish corridor (*q.r.*) and, in response to Poland's appeal, Britain and France at once guaranteed Polish independence. H. was shaken by this development, more particularly when the two W. Powers began negotiations with Moscow. For if he now precipitated war it would be to rouse the haunting spectre of a war on two fronts. But rather than abandon his cherished designs on Danzig and the corridor he preferred to swallow all that he had previously said in condemnation of the Bolshevik regime and proposed the non-aggression pact with Russia to which Stalin agreed on August 23. With the removal of any probability of Soviet assistance to the W. Powers the way was clear for H.'s *blitzkrieg* on Poland. He went himself to superintend the slaughter and strutted among the ruins of Warsaw, which were festooned for the occasion.

The first weeks of the Second World War, involving the callous conquest of Poland, illustrated H.'s cynical fiction of a defensive war against 'encirclement' or, in his own phrase, a state of neither war nor peace, a convenient fiction which left him with the initiative both on the battlefield and in the sphere of diplomacy. Had they but taken literally the crude assumptions in *Mein Kampf* his enemies would sooner have understood the full implications of his methods, his policy of attack from within or of corrupting a nation from within and of repeating the process with one nation after another, while his opponents continued to rely on the false security of an outmoded diplomacy. After the immolation of Poland, H., speaking in the Reichstag on Oct. 6, in a remarkable rhetorical outburst, made his 'last offer' to the Allies. But as a plea for peace it suffered from the now universal realization that his word could in no circumstances be trusted. A month later he spoke at Munich in the Bürgerbräu beer cellar on the anniversary of the 1923 *putsch*, announcing that he had ordered Goering to prepare for a five years' war. He left the beer cellar somewhat abruptly and soon afterwards there was an explosion in which a number of persons were killed. Though it was averred by Ger. propagandists that the attempt was engineered by foreign agents, it was generally believed that H. had departed early in the knowledge that it would occur.

In his New Year address in 1940 he declared that he was fighting for a 'New Order' (*q.r.*) in Europe, and in March he met Mussolini on the Brenner, a prelude to the invasion of Norway and Denmark and the overrunning of the Low Countries and France.

The disastrous events of spring and summer, 1940, culminating in the disgraceful armistice with Pétain (*q.v.*) only confirmed the average Ger. belief in H.'s genius. Following these conquests the natural littleness of H. revealingly asserted itself in the resurrection of the armistice coach of Compiègne of 1918 for the armistice of 1940. But although the *Hitlerkrieg* had won remarkable successes it had failed, owing to the obtuseness of the incomprehensible Brit., to bring victory. After the Battle of Britain (*q.r.*) had been in progress for some time H. began to realise that Britain could not be conquered from the air and, having met Mussolini at the Brenner and again in Florence to concert further measures against her, he also met Franco in Spain, probably with the object of inducing him to co-operate in the blockade of Britain. H.'s thoughts, indeed, turned increasingly on U-boat warfare. In his New Year's proclamation to the Reichswehr in 1941, he promised victory over Britain that year and the destruction of every nation which 'ate of democracy.' He continued to repose confidence in submarine warfare and sought to fix on Mr. Churchill's shoulders the responsibility for unrestricted or indiscriminate bombing. In the spring of 1941 he attacked Yugoslavia and Greece and went to join his advancing armies there, while continuing to belabour Britain with his bombers and striking under water at her seaborne supplies. H. knew that only successful invasion could bring Britain to her knees. But both H. and his military experts feared to make the effort, and as an alternative H. in 1941 planned to attack the empire at its Achilles-heel in the Middle E. This plan, however, depended for its success on the neutrality of Russia and, not being sure of this, H. and his advisers decided to combine the attack on Egypt with an invasion of Russia itself. Just previously (June 3, 1941) he again met Mussolini at the Brenner, ostensibly to set in motion a European peace. Three weeks later he doffed the mask and, breathing anathema on the Soviet gov. as the 'Jewish-Bolshevik clique', launched his legions against the hated Slavs of Russia—a piece of bluff and treachery which he had revolved for many years, having in fact imparted his scheme to Dr. Rauschning in 1934. This fatal decision revealed the essential weakness underlying all H.'s *weltpolitik*, and it is probable that he took it against the opposition of other Nazi leaders and against the advice of many members of the Ger. General Staff. But in June 1941 he had taken the plunge for good or ill. Thenceforward he strove to divide Russia from the W. Allies by harping eternally on Germany's anti-Bolshevik crusade (see also ANTI-COMINTERN PACT) and even

sent Hess to England on the amazing mission of winning over Britain to a crusade which, had it by any conceivable mischance succeeded, would have out-Muniched Munich. It is, of course, possible that Hess flew over on his own initiative, but this is improbable except on the extreme supposition that Hess, alone of the leading Nazis, was utterly opposed to the Russian venture and hoped somehow, to thwart it through British action.

The Ger. campaigns in the Balkans and the Mediterranean were brilliant in conception and execution but Brit. intervention in Greece and Brit. resistance in Crete and Lihvia delayed H.'s time-table, probably fatally, and, as the summer of 1941 wore on it was becoming obvious that Ger. optimism had outrun itself. For some time H. was silent, but on Oct. 4, at a meeting of the Winter Help Campaign, he announced a 'gigantic operation' which would bring about the defeat of Russia. Then a few days later, he boasted that he had smashed her. The final desperate assault on the Caucasus failed disastrously, and at last the voice of the critics in Germany was heard. But, as always in these military crises, it was unknown whether H. had imposed his will on the Ger. General Staff or whether the generals, appreciating the disastrous effects of the retreat in Russia on Ger. military and civilian morale, asserted themselves against H. But on Dec. 21 following the ominous failure of the Reichswehr before Moscow, H. abruptly announced the dismissal of the commander-in-chief, Brauchitsch, and his own assumption of direct control of all military operations. Against further disaster he staked the legend of his own intuitive talent—a decision no doubt hastened by the entry of the United States into the war and the fact that four-fifths of the world was now ranged against Germany. For the circumstances of the Amer. intervention disposed of the last chance of a compromise peace even if the generals overthrew H. and sought peace as a military dictatorship. Whence the very natural desire of the generals to escape responsibility for the ultimate collapse which they knew they were powerless to avert.

H.'s New Year message for 1942 showed a marked decline in buoyancy. 'Let us all,' he said, 'pray to God that the year will bring a decision—a strange invocation in the light of the Nazi creed.' But there were rumours of disaffection among the Ger. generals and among the radicals in the Party, and H. then appointed Bormann to secure co-operation between the Party and the State. At this time he was making the greatest efforts to strengthen the home front and to augment the vast numbers of foreign slave-workers driven into Germany to supply the Reichswehr for the spring offensive. The Ger. armies had not yet shot their bolt, and, with the Allies still far from their total war-effort, H. could hope for further success in the field and, in fact, in the earlier half of

1942, the Ger. armies in Russia reached the Volga at Stalingrad while Rommel (q.v.) in N. Africa was threatening Cairo and Alexandria. Yet before the autumn was past Rommel had been routed at El Alamein and the Russians had destroyed von Paulus's Sixth Army before Stalingrad. H.'s repulse in his second thrust into the Caucasus was decisive, especially as his armies had penetrated deeply before being hurled back by a mighty Russian reaction. But the Ger. disaster of Stalingrad was even more reverberating. For, not long before, H. had exulted over the expansion of Ger. *lebensraum* at the expense of other European nations, and, on Oct. 1 at the Sportpalast, with characteristic vainglory, he had promised the capture of Stalingrad. His strenuous attempts to make good his pledge cost Germany tremendous losses in life and material in a defeat which will loom large in the chronicles of war for all time. From that time H. spoke less of Ger. victory than of the inability of the Allies to defeat Germany and in his New Year Order of the Day for 1943 his tone indicated a more chastened Fuehrer. For Germany's industrial potential was now being severely damaged by air attack, and the Soviet armies were pressing ever more massively on the E. Front. On Feb. 25, instead of speaking, H. issued another proclamation, this time to celebrate the anniversary of the Nazi Party's foundation. His silence set rumour abroad and a month later he felt bound to break his long reticence. His address, however, was a lifeless reiteration of raw clichés uttered in a perfunctory hurried mumble.

But new crises soon faced him. In July 1943 his brother dictator, Mussolini, fell from power a few days after he had met H. to demand more help in the defence of Italy. H. tried to palliate the capitulation of Italy, which soon followed, by stressing Italian sabotage and weakness of will to fight and by claiming that he had for some time foreseen this result. Two months later, in Munich, at a party gathering he seemed to regain something of his old confidence. In emphatic tones he declared that the hour of retaliation had come and that everything was possible in the war but that he should lose his nerve. He assured his audience that however long the war might last Germany would never capitulate. 'Even at the eleventh hour,' he declared, 'Germany would not surrender; she would go on fighting past twelve o'clock.' At the beginning of his twelfth year of power, on Jan. 30, 1944, he spoke of the Russian menace saying: 'There will be only one victor in this war, and that will be either Germany or Soviet Russia.' After the Ger. armies had been driven out of Russia in a series of sweeping counter-offensives, and after the Anglo-Amer. landing in Normandy, where it soon became clear that the W. Allies would not, as H. had promised, be 'driven into the sea,' the last remnants of a Ger. 'opposition,' led by certain generals of the Reichswehr, supported by industrialists, Liberals, and even elements of the Left, attempted a

*coup d'état* which had obviously been long prepared. The signal was to be the assassination of H., but the bomb which was placed in his headquarters by a staff officer named von Stauffenberg failed in its purpose. H.'s staff were all killed or wounded. H. is said to have sustained injury to an eardrum besides possibly other injuries. The fact that he had escaped death was not known to the conspirators, who proceeded to execute their plan, but with disastrous results to themselves, for they were quickly rounded up and executed after trial before a 'People's Court.' The revolt, however, had shaken the Nazi regime to its core. On the night of July 20 H. broadcast an appeal for loyalty and discipline. When the immediate danger was past, the badly-frightened Fuehrer instituted his last and most savage 'purge,' thousands of men and women being shot, not because they were implicated, but because they might conceivably have led another rising. At the same time Himmler (*q.v.*) took command of the army inside Germany so as to tighten the Nazi grip on it. Thenceforward the Ger. people had no alternative but to follow H. to perdition. After his microphone appeal of July 20 he again relapsed into silence and obscurity. It is not improbable that he had been more seriously affected by the bomb explosion than was revealed and that Himmler had in practice assumed the gov. of the country. This seemed to be confirmed by the proclamation on the formation of the *Volks-sturm*: but H. continued to issue some proclamations and once again, on Jan. 1, 1945, he spoke on the wireless, from E. Prussia. But as the Allies pressed into Germany from all sides H. succumbed to the pressure of great events. Obscurity shrouds his final hours. It was rumoured that he would retire with the S.S. and Nazi fanatics to some last redoubt in Bavaria and then that he had changed his mind and resolved to remain in Berlin, perhaps with the idea of creating a legend by an heroic death on the barriers as those were stormed by the triumphant forces of Marshals Zhukov and Konlev. But as events proved he had no need to seek death, for death in any case was already at hand.

H. achieved the triumph of the Nazi party in Germany by a mixture of deceit and violence, and used the same devices to destroy other nations. From the time he became master of Germany he made lies, cruelty and terror his prin. means to accomplish his purpose; and he became in the eyes of virtually the whole world, an incarnation of absolute evil. The neurotic, who made himself leader of the Ger. race, inflamed it with his ambitions. His monument is the devastation he wrought, his dirge the grieving of nations at the miseries he heaped on them. None of those who in past centuries have sought to conquer Europe set his traps with the same cold deliberation, invigiled his prey towards them so cunningly and, when it was in the toils, struck with such ferocious and concentrated fury. None had his scorn of peoples weaker than his own nor

his ingenuity in torturing them when once within his power. His portentous power came from a combination in a single being of a soul obsessed by injured pride and hatred, a mind able to devise the means of gratifying them, and the tenacity of a remorseless purpose. His immediate aim when he entered politics was the redemption of the Ger. people from the humiliation and consequences of defeat; but even then he was looking far ahead of this goal, to a *Herrenvolk* to be. The Nordic theories of Gobineau and Lapouge equipped him with a philosophy which demanded belots for its fulfilment, and he found these among the Jews, Slavs and marxists whom he bent to his purposes with an impassioned hatred. He found in the divided and tortured state of mind of the Ger. people the symbol and expression of his own morbid emotions and inferiority complex. He made it his life-work to identify himself with the Ger. people and, by inflaming their animosities and ambitions, to find an outlet for his own. From an intuitive understanding of the Ger. mind and psychology he elaborated theory and practice of propaganda which, because it worked on people with obsessions similar to his own, achieved startling success; and later, with Goebbels (*q.v.*) he developed it into a new and fearful instrument of tyranny. His resourcefulness was extraordinary, and in the art of suiting policy to necessity he had no equal. If he had cunning and ruthless coadjutors in Goering, Himmler, Goebbels and others at his side, it was H. who had appointed them and shaped their course; it was his name which rallied Germany and his character which informed every development of Nazi policy. It has been well said that if his life and statecraft be seen in true perspective it becomes plain that, though he would gladly have kept England and, later, the United States, out of the war, he was ready to risk doing a world in arms if by that means alone he could estab. the Germany of his ambition.

It is difficult in these years to achieve full objectivity in the assessment of H.'s record in mankind's story. Evil genius of Germany and indeed of mankind, he was yet also, or so hist. may decide, the one political leader of genius Germany has produced since Bismarck. One thing is certain: like Napoleon he changed the world even if he could not conquer it, and the tragedy of the war he unleashed upon all the nations induced the profoundest questionings of the moral basis of most existing political and social institutions. His tragedy and that of Germany was that his later madness undid all that had been achieved for his country in the years before moral and perhaps mental corruption set in.

H. was a little, slim, dark man, most un-Nordic in appearance, with his sensitive nose and fanatical eye. He was unimpressive to meet on informal occasions, but seemed to become transformed in front of an organised crowd of his followers, speaking to them like a man possessed by an all-consuming passion. His speeches

revealed no truly original ideas. In them he relied largely on the emotional impact wrought on his followers by constant iteration of past hist. and deep-seated prejudices common to many Gers.; and it may truly be said that his remarkably keen and subtle comprehension of the mind of the Ger. people was at once the mainspring and the ultimate source of his power for evil. His whole life illustrates the force of Plato's aphorism: "Those who have no natural aptitude for justice and other noble ideals, and no affinity with them, will never learn the full truth about good and evil, however good their intelligence and memory may be in other fields."

Hitopadesa, or 'Friendly Instruction,' free adaptation of the *Fables of Bidpai* (or *Pilpay*), which was itself a collection of old Hindu stories, derived eventually from the *Pancha Tantra*, or the legends and apologies of the Brahma Vishnu Sarnan (second century B.C.). Though the *Fables of Bidpai* were trans. in the sixth century A.D. into Pahlavi (anc. Persian), and afterwards into Arabic, Gk., Lat., and so into the tongues of modern Europe, they are best known to W. peoples by their modernised version, the H. This latter anthology, of which there are at least three Eng. trans., contains a number of loosely-interwoven animal tales, etc., which are strewn with moral apothegms and quaintly recounted after the manner of Aesop or La Fontaine.

Hittite Language, see under INDO-EUROPEAN LANGUAGES.

Hittites, anc. people, or group of peoples, whose origin is still a matter of dispute. The Biblical names Heth and Hittite indicate a people practically unknown until recent exploration, after 1870, brought to light a number of distinctive monuments. In 1880 Prof Sayce announced the discovery of a forgotten Hittite Empire once flourishing in Asia Minor. Their settlements and rule extended at various periods from Armenia to W. Asia Minor, and as far S. as Palestine. It is possible that they were the White Syrians, or Syro-Cappadocians, known to Herodotus. Many monuments and tablets have been discovered in different parts of Asia Minor, particularly on

the site of one anc. city, now known as Boghaz Keui, formerly Pteria, the anc. cap. of Cappadocia, which appears to have been occupied by the H. at a very early date. Pteria lies E. of the Halys, from which point roads radiated to harbours on the Aegean, to Northern Syria, and the plain of Cilicia. In the O.T. they are spoken of in Gen. xliii. 10 as the children of Heth, dwelling in Kiritharba (Hebron). In this reference Abraham appears dwelling among them as a stranger and wishing to purchase a place to bury his dead wife in. This he accomplished through Ephron the H., who sold him the cave and the fields of Machpelag. In the book of Ezekiel (xvi. 3), Jerusalem is described thus: 'The Amorite was thy father, and thy mother was a Hittite'; there are sev. other general references in the O.T. and they are also mentioned as individuals, e.g. Uriah the H. One reference (1 Kings x. 28, 29) mentions the kings of the H. buying horses and chariots from Egypt. This is interesting, because until the coming of the Hyksos to Egypt, the horse appears practically unknown or little used, and the H. people came from a country where horses had probably been bred and used for a considerable time. To the Egyptians the H. were known as the Kheta, and they appear to have borne them an extraordinary hate; there is a probability that the Hyksos who conquered the Egyptians were the same as the Kheta, but at present it cannot be proved, but so far the extreme difficulty of correct dates makes it impossible to do more than theorize. Thothmes I. led his triumphant armies over N. Syria, and took the tn. of Kadesh, or Qadesh, the stronghold of the Kheta; this was not long after the expulsion of the Hyksos from Egypt. Thothmes III. waged terrible war against the Kheta, who were by this time evidently strong enough to be regarded as serious foes. They rose in revolt against Egypt, and Thothmes III. marched over N. Syria and reduced the tribes who had banded together with the H. to utter submission. Kadesh and Carchemish on the Euphrates fell into the hands of Thothmes, who marched back to Egypt laden with plunder and captives: the king of Kadesh, however, escaped. In the reign of Amenhotep IV. (Akhnaton) the H. appear to have gathered great strength, and, throwing off the yoke of Egypt, began to press steadily down on to the frontiers of her empire, taking forcibly one by one the tns. of Syria. The Tel-el-Amarna letters contain reports from various governors in the Syrian dists., asking for help against the H. All of them implore help from 'their Lord the King' against the terrible H. They cried to deaf ears, for the king (Akhnaton) was busy in his sacred city, dreaming of universal peace and brotherhood, and the H. took for themselves all that the fierce Thothmes III. had won. Amenhotep IV. took no notice of the perilous position, and the Hittite king, Suppiluliuma, overran the country as far as the Tigris. Seti I. led two campaigns against the H., now spoken of in Egypt as 'the abominable

Kheta.' He appears to have won some victories over them, but by no means to have broken their strength, for his son Ramesses II. was unable to conquer them. The H. king, Mauthnuro, collected a vast army and prepared for a final struggle with Egypt for the possession of N. Syria. Ramesses II. marched N. with his army, and a great battle was fought in the fields of Kadesh which ended in the victory of neither. After this a treaty was arranged, and the two kings formed an alliance, which seems to have been very necessary,

THE DEFEAT OF THE HITTITES AT  
THE BATTLE OF KADESH

against some other unnamed enemy, probably Assyria, who appears at this time as a growing danger. Trouble was also threatening from the Mediterranean—'the islands were restless'—so these two great empires allied themselves for mutual protection. This is a very early example of an international agreement. Some years later this newly-formed friendship was cemented by Ramesses marrying a H. princess. In Assyrian references, the H. (whom they call Khatti) appear as a powerful people, occupying Carchemish on the Euphrates. Sargon III., in 717 B.C., left records of how he finally overthrew the Khatti of Carchemish, and captured their king, Pisiris.

From all these records, and from the discoveries of archaeologists, we gather a brief hist. of the H.

White Syrians, or Hatti, were found in Cappadocia, after the Cimmerians had destroyed Phrygia. Croesus, king of Lydia, defeated what remained of them. Boghaz Keui formerly Pteria, is the only H. city that has been really thoroughly examined at present. It was evidently a city of immense size. The acropolis was strongly fortified, and a wall 14 ft. thick

surrounded the whole city. Many inscriptions and sculptured reliefs were found, and a number of tablets in Babylonian and in the H. language, among them a cuneiform copy of the treaty with Ramesses II. Euyuk possesses remains of a large palace entered between sphinxes, on one of which is sculptured a relief of a double-headed eagle; this device is said, without definite proof, to have been adopted by the Seljuk Sultans of Konia, and to have been brought by the crusaders to Europe, where it was taken by the Ger. emperors as their arms. In various places, widely distributed, fragments of pottery, sculptured lions, reliefs, and buildings have been discovered; in some of the buildings columns rested on bases carved with winged lions.

The style of all their sculptures is quite individual and easily distinguished from the Assyrian and Babylonian art. The facial type is very markedly non-Semitic, the figures are usually depicted short and heavily built, with prominent bones, broad-shaped heads, receding foreheads, long noses, thick lips, and short chins. The hair of the men is frequently worn in a pig-tail. The dress usually represented consists of a long robe worn over a tunic, a high conical cap, and long boots turned up at the toes. The outer robe was bordered with a fringe. The females wore a long veil or shawl covering the head and forehead and falling to the feet: one relief pictures two H. women sitting together with this veil or mantle draped over a head-dress resembling a modern brimless top hat. Very little can be said with certainty of their social conditions; one thing is clear, that their women enjoyed the same high status and freedom as in Babylonia. They appear to have adopted the Babylonian cult of the goddess Istar (Ashtoreth); she is depicted in the sculptures of Boghaz Keui with a mural crown; the H. may have introduced her worship to Lydia where she became known as Cybele, 'the Great Mother of the Gods.' The bee was sacred to her, and a H. gem, found at Aleppo, represents her standing on a bee. Her priestesses who served her in Lydia are represented bearing a double axe, a symbol found frequently at Knossos in Crete. The Lydians, who were among the first to use coined money, employed the silver 'Mina' of Carchemish, i.e. a H. silver coin.

A new and possibly decisive step towards deciphering the Hittite hieroglyphs which, discovered in various parts of Anatolia and Syria, had baffled archaeologists and philologists for a century, was claimed in 1949 to have been taken by Prof. Bossert, head of the Institute of Research in Ancient Oriental Civilisation at Istanbul University, as the result of discoveries made during excavations (1947-49) at Karatepe, in the foothills of the Taurus Mts. near the Jeyhan Riv. Among the discoveries were two T-shaped gateways leading up to a hall, with two lateral recesses, giving access to the Karatepe fortress. One of the gateways led into another rectangular enclosure containing a colossal royal statue mounted

on a stone base with two bulls led by a female figure. Whole panels of the walls were covered with inscriptions, which were continued on the statue itself and on the sides of the bulls. It was found that the inscriptions on the walls were bilingual, those on the panels on the left of the entrance being in old Phœnician and those on the right in Hittite hieroglyphs. They are dated about 730 B.C. The hope that by comparing the two texts one might decipher the hieroglyphs was strengthened when Prof. Bossert found the phonetic rendering of the name of the city of Adana which figures in both texts. Since then he and other philologists have continued research work on the twin texts, and it is claimed that about one-third of the whole text of these hieroglyphic inscriptions has been deciphered. In the past some philologists had succeeded in reading the sense of some hieroglyphic ideograms, but no key had been found to the language represented by Hittite hieroglyphs, which was assumed to be a language of Indo-European origin. Prof. Bossert's discovery may provide the missing key to this part of the early hist. of Asia Minor. Hittite cuneiforms found earlier at Bogaz-Koy (Boghaz Keul; anct. Hattushah) dealt with a period between the fifteenth and twelfth centuries B.C., at which later date the cap. of the Hittite empire was destroyed by invaders. The hieroglyphs are believed to describe events of a later period until about the sixth century B.C. and their deciphering should yield information on historical and religious events and developments during the intervening six centuries. Hittorf, Johann Wilhelm (1824-1914), Ger. physicist, b. at Bonn. At Munster he was prof. of physics and chem. from 1852-79 and director of physical laboratories from 1879-89. Resigned on account of ill-health; but, having recuperated, continued his labours. In 1862, H. and Plücker discovered the influence of temp. on the spectra of substances. In 1869, H. performed experiments in relation to the passage of electricity through rarefied gases (which later led to the Crookes Tube and Röntgen Rays)—noticing, *inter alia*, the defective influence

exercised by a magnet on the rays proceeding from the cathode. H. investigated allotropic forms of selenium and phosphorus—producing black crystals of the latter. He contributed many papers to Poggendorff and Wiedemann's *Annalen der Physik*. A famous one, *Über die Wanderung der Ionen während der Elektrolyse*, was trans. into Eng. 1899.

Hivites, one of the Canaanite tribes or races who were expelled by the Israelites when entering Palestine under Joshua (Jo. xxiv. 11). They seem to have dwelt in Central Palestine: e.g. Gibeon (Jo. ix. 7) and Shechem (Gen. xxxiii. 18) were cities. The origin of the name is in doubt, but the suggestion that it simply means 'villager' is inconsistent with their dwelling in the above mentioned cities. A remnant of their descendants survived until the time of Solomon (I Kings x.).

Hjörning, anct. city of Denmark in the N. of Jutland, 7 m. from Jammer Bay. It is the cap. of H. co. ('amt'), and is on the Jutland Railway. Pop. 11,000.

Hkamti Long, collection of seven Shan states controlled by Burma, and bounded northward by the Mishmi region, E. and S. by various Chingpaw (or Kachin) communities, and westward by the Hukawng valley. The estimated area and pop. of this little-known country are 200 sq. m. and 8000 respectively.

Hlassa, see LHASSA.

Hoadly, Benjamin (1676-1761), Eng. divine, graduated as M.A. from Catherine Hall, Cambridge, and, after holding several minor livings, became in turn bishop of Bangor (1715), Hereford, Salisbury, and Winchester (1734). An eminent theological controversialist, he strongly upheld the doctrines that the church is subject to the jurisdiction of the civil magistrate, and that its authority does not extend to the individual conscience. The first is expounded in his *Measures of Submission to the Civil Magistrate*, etc., and the second his celebrated sermon on the 'Kingdom of Christ,' which gave rise to the Bangorian dispute, and so exasperated and disorganised the lower house of convocation that to this day it has never been allowed to despatch any but formal business. H. anticipated many of the modern Unitarian views, and in his own day was both praised and blamed as a latitudinarian and as a rationalist. His works were ed., with a life, by J. Hoadly (1773).

Hoang-Hai, see YELLOW SEA.

Hoang-Ho, or Hwang-Ho, see YELLOW RIVER.

Hoare-Laval Pact, pact signed by Brit. and Fr. representatives in 1935 in the hope of settling the conflict between Italy and Abyssinia. Abyssinia, which was being invaded by Italy, was the real test of the League of Nations and the turning-point of its fortunes. In the Mediterranean the members of the League could have assembled naval forces, with secure bases, easily sufficient to cope with Italy if the need arose. Ger. rearmament was then only in its beginnings. Amer. co-operation in arms was not essential. The Brit. and Fr. navies by themselves had ample power to cut the communications between Italy

and E. Africa. At Geneva 50 States aligned themselves against Italy; only 3—Austria, Hungary, and Albania—supported her. Certain economic sanctions had been agreed upon and applied. All that was necessary was that they should be extended to the supply of oil to make it impossible for Italy to wage effective war. There was good reason to believe that the United States would take part in such an embargo. But at that moment the Fr. gov. wavered: the sinister figure of Laval (*q.v.*) had emerged in control. Then the Brit. gov. of Mr. Baldwin weakened. In Dec. 1935, without any consultation with the League, the H. agreement was signed. Instead of pressing home the economic measures against Italy, it was Abyssinia that was to be constrained. Under the Pact she was to be called upon to surrender almost half her ter. with the sure prospect that the rest would be taken at the next opportunity. A storm of protest burst in Britain and France. Sir Samuel Hoare (foreign secretary) resigned; Laval was dismissed from his premiership. The Council of the League refused even to consider the proposals of the Pact. But the mischief had been done. From that moment the heart was taken out of the League of Nations. Its moral authority disappeared. After a few months the sanctions against Italy were formally ended. The It. campaign, aided by poison gas, was pushed to a victorious end; and it was not long before the next Brit. Prime Minister, Mr. Neville Chamberlain, visiting Rome, proposed at a banquet the toast of 'The king of Italy, emperor of Ethiopia.'

**Hoare, Sir Samuel John Gurney, see** TEMPLEWOOD, VISCOUNT.

**Hoar-frost** adorns trees, grass, and twigs in winter, because they freely radiate their heat. The cause of its formation is as follows: On a clear night dew is deposited because after sunset the earth cools and lowers the temp. of the atmosphere in contact, until its moisture begins to condense. This it will do as soon as the temp. has fallen below that

point at which the air would just be saturated by the amount of aqueous vapour which happens to be present. Now H., instead of dew, is precipitated when at the time of its formation the temp. is already below freezing-point ( $32^{\circ}$  F. or  $0^{\circ}$  C.). It is therefore not frozen dew, as such an expression would imply that the vapour was first of all deposited as dew, but rather water directly deposited in a solid form. If the dew-point is below  $32^{\circ}$  F., gardeners should screen young or delicate plants from the atmosphere, as there is every likelihood of a H.

**Hoarseness**, condition of the voice in which the sound is diminished in intensity and purity; it is usually accompanied by a feeling of pain or undue effort in producing sounds. H. is caused by the swelling or roughness of the vocal chords, the vibration of which causes the sound which we know as voice. It is possible that the roughness of these ligaments is sometimes due to fatigue or lack of tone in the muscles and nerves controlling them, but in the majority of cases there is definite inflammation of the mucous membrane of the larynx. H. is therefore usually indicative of some form of laryngitis, and should never be neglected. Inflammation may be set up as the effect of irritating vapours or dust, or as the result of a cold extended downwards from the nose or throat; it may be induced by fatigue through excessive use of the voice, or may accompany some other disease, such as influenza. The swelling of the parts which interferes with normal voice-production may progress so as to constitute a danger to respiration. An attack of H. should therefore be construed as a symptom of laryngitis. Neglected H., particularly if associated with excessive use of the voice, may lead to a chronic condition in which a certain amount of inflammation is always present, and a more or less permanent change in the constitution of the pharyngeal membrane may take place. The treatment for laryngitis is rest in bed, inhalations of friar's balsam (a teaspoonful to a pint of hot water and the steam inhaled), cold or hot fomentations to the throat, and aspirin in small doses internally. Chronic laryngitis demands examinations of the larynx by a doctor who is accustomed to use a laryngoscope. The first essential in its treatment is rest for the voice, and sometimes silence must be maintained for a prolonged period. A simple alkaline douche, which clears a blocked nose, may be very helpful in this condition, but application of oily or astringent preparations to the larynx may be necessary. This, however, requires the skilled hand of a surgeon.

**Hoar-stones**, called **Hare Stones** in Scotland. They are single blocks of unwhewn stone, which now serve the purpose of boundaries, but which must at one time have been commemorative. Usually they stand alone, though rarely a ring is indicated by pieces of rock clearly arranged by human agency.

**Hoatzin**, or **Hoszin**, name given to the

HOATZIN

galliform birds belonging to the family Opisthocomidae, which consists of the single genus and species, *Opisthocomus cristatus*. They are fowl-like in appearance and about the size of a pigeon, the plumage is olive with white markings, and reddish underneath, the sternum has a large patch of thick, naked skin, on which the bird generally rests. They are chiefly arboreal, nesting on low trees or shrubs, but are also able to swim and dive. The H., which ranges from Guinea to Venezuela, is also called the stink bird, or stinking-pheasant, because of its strong, musky odour.

Hoazin, see HOAZIN.

Hobart, cap. of Tasmania in the co of Buckingham, 100 m. S. of Launceston on the S. shore of the is. Situated at the foot of Mt Wellington (4166 ft.) amid delightful scenery, of which the bay of Sullivan's Cove is a picturesque feature, it draws many visitors from New S. Wales and Victoria, especially at the trout fishing season and during the time of the Derwent regatta. Its deep and sheltered harbour on the R. Derwent can accommodate vessels of the largest tonnage afloat. Both the *Queen Mary* and the *Queen Elizabeth* have anchored there. Docks, wharves and warehouses have been built. There are numerous saw and flour mills, iron foundries, and potteries, etc. The Australian Newsprint Mills and the Electrolytic Zn Works are estab. in the vicinity. There are important industries dealing with the processing of small fruits, apples, and pears. It is the see of an Anglican bishop and a Rom. Catholic archbishop, and possesses many fine squares, parks, and buildings, among which the Univ. tn hall, and St. Mary's Cathedral deserve especial note, and also a statue of the explorer, Franklin, who was governor here from 1837 to 1843. Here, too, are parliament buildings. Pop. 70,000. See Isabel Dick, *Wild Orchard* 1916, F. Hurley, *Garden of Tasmania*, 1947 and C. Barrett, *Isle of Mountains*, 1948.

Hobart Pasha, Augustus Charles Hobart-Hampden (1822-86) admiral of the Turkish fleet, the son of the earl of Buckinghamshire. Having won his captaincy in the Eng. navy, he retired in 1862. As block-ade runner during the Amer. Civil war, he gained considerable distinction, but his daring and strategic ability were most in evidence during his blockade of Crete at the time of the insurrection, and during the Russo-Turkish war (1878), when he cleared the Black Sea of the enemy. He had entered the Turkish navy in 1867.

Hobbema, Meindert (1638-1709), Dutch landscape painter, was a contemporary of Berchem Van de Velde, and Wouverman, who sometimes inserted animals and figures in his pictures. Save that he married, died in poverty like Rembrandt, Hals, and Jacob Ruysdael, and was buried in the pauper section of an Amsterdam cemetery, little has survived either about his personality or life. In this country he is honoured chiefly for his 'Avenue at Middelharnis' 1889 (National Gallery, London), but his masterpieces are scattered over the museums of Antwerp, Brussels, Leningrad, Dresden, Rotterdam, etc. H.

#### HOBERT

Elizabeth Street, the main shopping centre of the city from Franklin Square. Facing the square is the Town Hall and in the opposite corner is the General Post Office.

was content to paint his native woods and mills, hedgerows and pools, winding tracks and leafy cottages, but his manipulation of cloud and light, the truth and finish of his varied foliage, and the sympathy with which he expresses nature in her moods of tender melancholy and puritanic calm, prove him the equal of Ruysdael in all except the breadth of his range. See monographs by W. von Rode 1917, and G. Brouillet, 1933.

Hobbes, John Oliver (pen-name of Mrs. Pearl Mary Theresa Craigie, née Richards) (1867-1906) Amer. novelist, made an unhappy marriage (1886), which was dissolved on her petition in 1891. Reared in an atmosphere of Nonconformity she entered the Rom. Catholic Church in 1892, and that mystical philosophy which so pervades *The School for Saints* (1897) and its sequel, *Robert Orange* (1900), was assuredly the cause or effect of this conversion. Her positive genius for epigram is conspicuous in her first pub., *Some Motions and a Moral* (1891), and likewise in her *Love and the Soul Hunters* (1902). As a dramatist she was most successful with *The Ambassador* (1898) though as joint-author she shared in the success of *The Bishop's Move* (1902). See biographical sketch by J. M. Richards in *The Life of John Oliver Hobbes, told in her Correspondence with her Friends*, 1911.

Hobbes, Thomas (1588-1679), Eng. philosopher, the son of a clergyman, b. at Malmesbury, April 5. He graduated at

Magdalen College, Oxford, and between 1610 and 1637 thrice went abroad as private tutor with the Cavendish family, visiting France and Italy, where he made the acquaintance of the Cartesian Father Mersenne and of Galileo. Many other illustrious men, including Ben Jonson, Bacon, Lord Herbert of Chobury, and, among foreigners, Descartes and Cosimo de' Medici were counted among his friends. His political principles were fundamentally opposed to those of the Long Parliament and from 1640 to 1652 he lived in France lest his opinions, mostly expressed in works then only in MS., should attract hostile attention. The plan of his philosophic work had already been formed and it was in this period that most of his works appeared. When his unorthodox opinions, particularly his ideas on religion, brought him into collision with the Church and the exiled court, he returned to England, submitted to the council of state and finally went into retirement in Hardwick, where he wrote a trans. of the *Iliad* and the *Odyssey* (1676), *Behemoth* (1680), and an autobiography in verse. For some time he was mathematical tutor to the Prince of Wales (afterwards Charles II.), and though, after the issue of the *Leviathan* (1651), his pupil forbade him his presence, yet the pension he freely gave to H. on his accession (1680) showed that he knew no other feelings than gratitude and respect for his former teacher. The Homeric and Thucydidean trans., and likewise the many controversial writings of the philosopher, which at the time loomed so important, have long been condemned to the dust of oblivion; his *Behemoth*, or narrative of the Civil War (1640-60), is now a curiosity in literature. But his *De Cive* (1642 and 1647), and his *magnum opus*, the *Leviathan*, both of which were censured by parliament in 1666, gave 'an extraordinary impulse to the spirit of free inquiry in Europe' and have won for their author the title of founder of political science, as other of his works make him the true father of Eng. psychology. In 1640 he wrote a treatise in defence of the royal prerogative. H., who was besides a great stylist and one of the first to deem his native language worthy of expressing abstruse thought, taught that the end of philosophy was social, and that theology and transcendentalism did not come within its sphere; that the basis of all gov. is force and that, whereas to be effectual every gov. must be supreme, the spiritual must ever give way to the temporal, and the people must implicitly accept not merely the laws but the mode of faith which the king or his ministers have seen fit to ordain. Hobbes, like Bacon, asserts the practical value of knowledge and concentrates attention on nature and man to the exclusion of the supernatural; but he differs from Bacon on the appropriate method of inquiry. Bacon regarded induction as the chief means of investigation, whereas H. held that the deductive or synthetic method was superior to the analytic and, deeply impressed by the logical demonstrations of Euclid's *Ele-*

ments which he saw for the first time at the age of forty, always adopted the mathematical demonstration of his philosophic truths. He was fundamentally a materialist, seeking the basis of all knowledge in sensation, and from this material or mechanical conception of nature and man, he deduced his whole system of natural and civil philosophy. The latter, presented in his *Leviathan*, is the study in which his thought has had its most profound effect. The ethical and political philosophy of *Leviathan* may be briefly summarised: man in a state of nature is entirely motivated by appetite and desire and since all men are engaged in the attainment of their own objects of desire, altruism (a word, however, only invented by Herbert Spencer) has no place in their original nature—with the result that man's natural state is one of strife, enmity and war. Hence man must find a remedy by agreeing with his fellows to submit to a stronger power, and thus a commonwealth is estab. on the implied basis of a mutual covenant—a concept analogous to Rousseau's *contract social*, except that H.'s view of the natural man as a selfish being is remote from the ideal of Rousseau. See monographs by G. O. Robertson, 1886; Sir L. Stephen, 1904; A. E. Taylor, 1908; G. Catlin, 1922; and J. Laird, 1934.

Hobbs, John Berry ('Jack'), (b. 1882) Eng. cricketer; b. at Cambridge; eldest of twelve children of John C. Hobbs (d. 1902), professional cricketer on the ground-staff at Fenner's. As a boy, H. first batted in Jesus College Close with choir-boys of that college. As an amateur H. played for Cambridge. His first century was scored when he played for Alnsworth against Cambridge Liberals. This was in 1901; and in a charity match the same year his opponents included T. Hayward, who failed to bowl him out. In 1902 he was engaged professionally at Bedford Grammar School. The same year he returned to Cambridge as a professional. Through the influence of F. C. Hutt, he was tried at Kennington Oval, and taken on by the Surrey Club, April 23, 1903. He played for Cambridgeshire (2nd class) in 1904; and in 1905 went into the Surrey co. team—for them he scored 155 against Essex that year. Thenceforth he was continually in the eye of the cricketing world. With Sandham, made 428, for first wicket for Surrey, June 25, 1926—then a first-wicket record; also made highest record for Lords 316 runs, in Aug. 1926. Made 100th century for Surrey in 1927 and altogether made 197 centuries in first class cricket. In the season of 1925 he scored 3024 for 48 innings; from 1907 to 1930 he was prominent in the Tests against Australia, having played in 41 matches; and was also in those against S. Africa. He retired from first-class cricket after the 1934 season, his aggregate of runs being 61,221 (against W. G. Grace's 54,896). He made 15 centuries in Test matches. Other records to his name are: total runs v. Australia in test matches, 3636; with Rhodes made 323 for the first wicket

partnership for England v. Australia at Melbourne in 1911-12; with Sutcliffe, first wicket record partnership in Tests against S. Africa, 268 at Lords in 1924; took part in 168 partnerships of three figures for the first wicket; made two separate hundreds in a match on six occasions; 16 hundreds during one season—1925. His highest innings was 316 not out, v. Middlesex. Pub. sev. books and wrote cricketing news for the *London Star*.

**Hobby**, or *Falco subbuteo*, longwinged, short-tailed falcon, dull grey above and mottled underneath, which visits Britain in the summer, especially the S.-E. co's. In length the female bird, which is somewhat larger than the male, is 14 in. Larks are its favourite prey, but it has been known to feed on insects. Falconers once valued hobbies for the hunt.

**Hobgoblin**, see **Goblin**.

**Hobhouse**, John Cam, Baron Broughton (1786-1869), Eng. statesman, was educated at Westminster School and at Trinity College, Cambridge. His intimacy with Byron began in his undergraduate days and endured till the latter's death. Thus he was 'best man' at the poet's wedding, wrote the historical notes to the fourth canto of *Childe Harold*, and in his company visited Portugal, Spain, Italy, and Switzerland. He began his political career as Radical M.P. for Westminster, having been already in Newgate for a satirical pamphlet pub. anonymously. But when in 1846 he sat in Russell's cabinet as president of the (Indian) Board of Control he was regarded as a reactionary by the younger Radicals. The activities of the Gk. committee in London (1824) were largely the result of his enthusiasm. See M. Joyce, *My Friend II* 1948.

**Hobhouse**, Leonard Trelawny (1861-1929), Eng. sociologist and philosopher; son of Reginald H., archdeacon of Bodmin. Fellow of Merton College, Oxford, 1887; assistant tutor, Corpus Christi, 1890—Fellow 1894. On editorial staff of *Manchester Guardian*, 1897-1902; *Tribune*, 1906-07. Soc. Free Trade Union, 1903-1905. His philosophy, a dualism called Conditional Teleology, infers a correlating principle striving toward a universal harmony that can apparently never be complete. Works include *The Labour Movement* (1893), *The Theory of Knowledge* (1896), *Mind in Evolution* (1901), *Democracy and Reaction* (1904), *Lord Hobhouse: a Memoir* (with J. L. Hammond, 1905), *Morals in Evolution* (1906), *Development and Purpose* (1913, largely rewritten, 1927), *The Metaphysical Theory of the State* (1918), *The Rational Good* (1921), *Elements of Social Justice* (1921), *Social Development* (1924).

**Hoboken**: (1) seaport on the Hudson R., in the Hudson co. of New Jersey, U.S.A. To the S. and W. lies Jersey city, and across the riv. is New York, connected by ferry and tunnel. The termini of the Delaware, Lackawanna and Western railroads are here. It is an important station on the W. Shore railways, and is connected with all world ports. Many

lines of European steamers start from here. Pencils, silk and leather goods, etc., are manufactured, and the coal industry thrives. Two important buildings are Stevens Institute of Technology (1871) and the Hoboken Academy, founded in 1860 by the Gers., who to-day make up one-fifth of the entire pop. Pop. 50,100. (2) suburb of Antwerp, Belgium. It is situated on the Scheldt, 3 m. S.W. of the city, and has the most important ship-building yards of the country, also manufs. of silver-ware, woollen goods and sugar, and iron foundries and breweries. Pop. 31,700.

**Hobson-Jobson**, corruption of 'Ya Huan! Ya Huan!', the cry of the Shites during the procession of Mohurram, which is part of one of the great Moslem festivals. It originated from Brit. soldiers in India, who thus colloquially described the celebration. Yule and Burnell used it as the title of their Anglo-Indian glossary (1886).

**Hobson**, Thomas, Cambridge jobmaster, who let out horses on hire, the choice always being limited to the one next the door, the one that had been longest in, hence the saying 'Hobson's choice.' He was the subject of two humorous epitaphs by Milton.

**Hoccleve**, or **Oocleve**, Thomas (c. 1370-c. 1450), Early Eng. poet and lawyer, a clerk in the Privy Seal Office, London, for over twenty years. He knew Chaucer, the 'fount of eloquence' and his 'maister dere,' drawing in colours the well-known portrait on the margin of one of the MSS. of his chief poem *De Regimine Principum* (c. 1411), largely compiled from the Lat. of Aegidius Colonna (c. 1280). Other poems were: *The Story of Jonathan*, and *Moder God*. . . . See Dr. F. Furnivall's (d. of Works, 1892; *De Regimine*, 1897; W. Mason's ed. of six poems, 1796; T. Wright's ed., 1860 (Roxburghe Club); Philipps MS. 81.31 (at Cheltenham) (which contains his account of his disordered life); H. Morley, *English Writers* (vol. vi., 1861-94).

**Hoche**, Louis Lazare (1768-97), general of the Fr. Revolution, enlisted, 1784, joining the National Guard, 1792. Having repulsed the duke of York, he commanded the forces on the Moselle and drove the Austrians from Alsace, 1793. He helped to suppress the Vendean revolt, 1795-96, and then headed an expedition to Ireland, which failed owing to storms, 1796. H. won sev. victories over the Austrians again in 1797, but the armistice at Leoben checked his successes, and he d. suddenly at Wetzlar soon afterwards. See E. Guillon, *La France et l'Irlande sous le Directoire: Hoche et Humbert*, 1888; A. Chuquet, *Quatre Généraux de la révolution*, 1911.

**Hochelaga**, co. and vil. of Quebec, Canada. The vil. on the St. Lawrence R. forms a suburb of Montreal, 2 m. distant. Pop. about 16,000.

**Hochester**, see **Hoxton**.

**Hochheim**, vil. of Hesse, Germany, near R. Main, 4 m. E. of Mainz. The vineyards of its slopes produce the true hock. Pop. 4000.

Höchst, tn. of Hesse on R. Main, 10 m. W. of Frankfurt of which it has been a part since 1925. Tilly defeated Christian of Brunswick here, 1623. Noted for chemical industries (I. G. Farben) and the manuf. of tobacco, beer, machinery, and furniture. Pop 35,000.

Höchststadt, tn. of Swabia, Bavaria, Germany, on R. Danube, 30 m N.E. of Ulm. Here Frederick of Stauffen was defeated by Hermann of Luxemburg, 1081, and the Austrians by Marshal Villars, 1703. The victory won by Marlborough and Prince Eugene over the Franco-Bavarian forces in 1704, fought nearby, is better known as the battle of Blenheim. Pop. 2000.

is of a curved shape, and the object is the same as in football—to score goals. The Romans had a game very similar to H., which was played on frozen ground or on the ice. In some form H. has been known to most of the N. peoples of Europe and Asia. In Scotland the game was known as 'shinty,' and in Ireland a game called 'hurley,' was played on the sea-shore; the rules were simple, and the play usually very rough in character. Modern H. is played on turf during the same time as football—from Sept. to April; it owes much of its present vogue to the formation of the Men's Hockey Association in England in 1875. The rules drawn up by the Wimbledon Club in

## HOCKEY

The Universities inside left makes a shot in a match against the Weasels

Hock, strictly the white wine (sparkling or still), called in Germany 'Hochheimer,' produced at Hochheim. The Eng name 'hock' has been in use since before 1625, and is commercially extended almost indiscriminately to light white Ger wines, especially Rhenish wines. It is usually dry, but some brands are sweet. It has a distinctive flavour and bouquet and the alcoholic strength is from 9 to 13 per cent. Important brands are, Erbach, Nierstein, Rudesheim, Marcoobrunn (still), Johannisberg, Liebfraumilch, Rauenthal (sparkling). Good vintages were those of 1880, 1883, 1884, 1896, 1880, 1892, 1893, 1895, 1897, 1921, 1925, and 1929. The natural dry white wines of the Californian 'Riesling' or hock-grape slightly resemble the Ger varieties, but generally have more 'body' and are less acid.

Hockey (possibly derived from the 'hooked stick' with which the game is played; cf. *haquet*, O.F. for shepherd's crook), game played with a ball or some similar object between two opposing sides; the stick used to propel the ball

1883 still obtain in essentials. As regards the equipment and tools of a H. player the following are the more important points. A H. stick shall have a flat face on its left hand side only; there are no regulations as to length, but every stick must be of such size that it can be passed through a two inch ring. The head of a stick shall not be edged with or have insets or fittings of hard wood or of any other substance nor shall there be any sharp edges or dangerous splinters; the extremity of the stick must not be cut square or pointed but must have rounded edges. An india rubber ring of four inches external diameter may be used as a guard, but the total weight of the stick and guard and binding, if any, must not exceed 28 oz. The ball is a leather cricket ball, either, painted white or made of white leather. Boots very similar to football boots are usually worn; no dangerous materials such as spikes or nails, etc., must be worn. The rubber ring is not now much used, padded gloves being worn instead. Shin-guards are, from the

nature of the game, almost a necessity. The ground for H. is of a rectangular shape, 100 yds. long and not more than 80 yds. nor less than 55 yds. wide. The ground is marked out with white lines, of which the longer are called the side-lines and the shorter the goal-lines. Flag-posts are placed at each corner, and at the centre of each side-line, one yard outside the line. The goals are in the centre of the goal-line; their dimensions are 12 ft. wide by 7 ft. high. The posts are 2 in. broad and not more than 3 in. in depth. Nets are attached to the posts, cross-bars, and to the ground behind the goals. No shooting at goal can take place except in the striking circle, which is thus defined: In front of each goal shall be drawn a white line 4 yds. long, parallel to and 15 yds. from the goal-line. This line shall be continued each way to meet the goal line by quarter circles having the goal-posts as centres. The game is played between two teams of eleven players each, positioned as in association football. The game is started by one player of each team bullying the ball in the centre of the ground. To bully the ball, each player strikes the ground on his own side of the ball, and his opponent's stick over the ball, three times alternately; after which one of them must strike the ball and so put it in play. In all bullies the two players who are bullying shall stand squarely facing the side-lines. A player is offside if he is nearer to his opponent's goal-line than the person who last struck or rolled the ball in, unless there be at least three of his opponents nearer to their own goal-line than he is. No player can be offside in his own half of the ground, nor if the ball was last touched or hit by one of his opponents. The penalty for offside is a free hit. When a player strikes at the ball no part of his stick must in any event rise above his shoulders at either the beginning or the end of the stroke; the penalty for 'sticks,' as it is called, is a bully. In the case of breaches of the rules inside the circles a 'penalty bully,' or a 'penalty corner,' is awarded. When a penalty bully is played, all players, save the two taking the bully, shall remain beyond the nearer 25 yds. line in the field of play until the bully is completed. When a penalty corner is awarded, the player taking it shall have a hit from any part of the goal-line he may choose, at least 10 yds. from the nearest goal-post. At the moment of such hit all the defending team must be behind their own goal-line, and all the attacking team must be outside the striking circle in the field of play. A corner differs from a penalty corner only in that the hit is taken from a point within 3 yds. of the nearest corner flag. The game is in charge of two umpires, who each have charge of half of the field of play; if two umpires are not available one umpire and two linesmen take their place. Since 1895 International Matches between England, Scotland, Ireland, and Wales have been played, and Belgium and France now play England. There is an international championship, and H. is

one of the events in the Olympic Games. Co. matches are also played and Div. Association matches.

In America ice H. is so popular that the term 'hockey' is used for that variety, and the other game is called field H. The game differs from Eng. ice H. in several respects (see ICE HOCKEY).

Ice polo is a game very similar to ice H., played almost exclusively in the New England states. It is played with a rubber-covered ball and a heavier stick. Five men only play on a side, and there is no offside rule. The rink is 150 ft. in length. Ring H. is a variety of H. which can be played on the floor of any gymnasium or large room. The goals are 3 ft. high and 4 ft. in width; six men are on a side, a goal-keeper, a quarter, three forwards and a centre. A ring of 5 in. diameter, with a 3-in. hole in the middle, and weighing from 12 to 16 oz., is used instead of a ball. The stick is a light but tough wand, from 36 to 40 in. in length, 1 in. in diameter, and with a 5-in. guard at a distance of 20 in. from the lower end. The end of the stick is inserted into the hole in the ring; a goal from the field counts 1 point, and from a foul, ½ point. Roller polo is an adaptation of ice polo to roller skating rinks, and is very popular in the U.S.A. Five players form a side. See K. E. White, *The Hockey Player*, 1909; E. H. Green and E. E. White, *Hockey*, 1912; M. Pollard, *Hockey for Women*, 1931; E. Green, *The Arts of Hockey*, 1931; E. Ricketts, *Hockey Manual for Umpires and Players*, 1932; P. Robson, *A Manual of Hockey*, 1934; D. S. Milford, *Hockey*, 1938; T. S. Dagg, *Hockey in Ireland*, 1945.

**Hocking, Joseph** (1855-1937), Eng. novelist, b. in Cornwall, younger brother of Silas K. H. (q.v.). Educated at Owen College, Manchester, and became a land-surveyor in 1878; but left this profession in 1884 and entered the Nonconformist ministry (United Methodist Free Church) —for the next few years travelling in Egypt, Palestine, Greece, Turkey, and Syria. His pubs include:—*Jabes Easterbrook* (1891), *Story of Andrew Fairfar* (1893), *Fields of Fair Unknown* (1896), *The Scarlet Women* (1899, which caused some stir in Free Church circles), *The Purple Robe* (1900), *The Trampled Cross* (1907), *God and Mammon* (1912), *The Pomp of Yesterday* (1918), *Rosemary Carew* (1925), *The Eternal Challenge* (1929), *Out of the Depths* (1930), *The Man who Found Out* (1933), *The Squire of Zabulor* (1935), *Deep Callet Deep* (1936).

**Hocking, Silas Kitto** (1850-1935), Eng. novelist, b. at St. Stephen's, Cornwall; third son of James H. Educated for the ministry of the limited Methodist Free Church and ordained minister in 1870. He made his reputation as a writer in 1878 with a story *Her Benny*, and many others followed, most of them being very popular among readers who prefer plot to literary merit. Among his other stories, which number 90, are *Alce Green* (1878), *The Awakening of Anthony Ivier* (1901), *Pioneers* (1905), *The Third Man* (1911), *When He Came to Himself* (1915),

*Watchers in the Dawn* (1920), *My Book of Memory* (1923), *The Mystery Man* (1930), *Gerry Storm* (1934).

**Hocktide**, formerly a popular festival in England, kept on the second Monday and Tuesday after Easter. Hock Tuesday and Michaelmas were the rent-days in rural England. The derivation is uncertain; the term hock-day was in use by the twelfth century. The chief pastime was that of 'binding' members of the opposite sex (men on Monday, women on Tuesday) till a small payment was made for release. The money was used for church or par. purposes. 'The Old Coventry Play of Hock-Tuesday' was revived on Elizabeth's visit to Kenilworth (1575). See J. Brand, *Popular Antiquities*, 1777; W. Hone, *Every-day Book*, i., 1826.

**Hoddesdon**, par. and vil. of Hertfordshire, England, 4 m. S.E. of Hertford, 14 m. from Broxbourne Junction. Isaac Walton used to fish here on the R. Lea, whose waters fill the moat of the old Rye House 1 m. away, where, had the plot not gone astray, Charles II. and his brother James would have been assassinated in 1683. It was a coaching station on the Old North Road. Pop. 7000.

**Hodeida**, **Hodaida**, or **Hodidiah**, fort and seaport of the Yemen, Arabia, on the E. coast of the Red Sea, 100 m. from Mocha. A harbour is to be built at Ras-el-Ketib, 10 m. away. A railway connects H., Ras-el-Ketib, Sana'a, and Amran. The chief exports are: Coffee, skins, cotton, and some pearls, senna, myrrh, sesame, and jowar (a kind of millet). Other grains are imported. H. was bombarded and occupied by the Brit. in 1918. Pop. 40,000.

**Hodgkin, Thomas** (1831-1913), Brit. historian, b. in London, of a Quaker family. After graduating at the London Univ. he entered business as a banker, at the same time applying himself to historical study, and soon becoming a leading authority on the hist. of the early Middle Ages. His chief works are: *Italy and Her Invaders* (8 vols., 1880-99), *The Dynasty of Theodosius* (1889), *Theodoric the Goth* (1891), *Life of Charls the Great* (1897), and vol. i. of Longmans' *Political History of England* (1906).

**Hodgson, Brian Houghton** (1800-94), Eng. Orientalist, entered the E. India Company's College at Haileybury, 1816, becoming a servant of the company, 1818. He was resident in Nepal, 1820-43, returning to England, 1858. He wrote valuable papers on the ethnology, languages, and zoology of Nepal and Tibet, including *Miscellaneous Essays on Indian Subjects* (1880). The libraries of London, Paris, and Calcutta have his collections of Oriental MSS. See life by Sir W. Hunter, 1896.

**Hodgson, Ralph** (b. 1871), Eng. poet and prof. of Eng. literature at the Imperial Univ. of Japan. Mingles fantasy and actuality in his songs of innocence and of experience. A number of his poems are expressions of original happiness contrasted with something like the shock of disillusionment—contrasts not

in the way of philosophical opposites, but given as 'poetic apprehensions.' The poem *The Bull* is an illustration, and in this poem, and others like *The Bells of Heaven* and *Stupidity Street*, pity for dumb animals excites an all-too-impotent wrath. He has a peculiar ecstasy of his own, notably exemplified in *The Mystery*, *The Royal Mails* (an original fable), and *The Bells of Heaven*. Some of his lyrics are as fine as any in the language, notably *The Last Blackbird*, which appeared in 1907. His longest and most elusive poem, *The Song of Honour*, is a piece of virtuosity in doggerel metre; his *Ere* is notable for its word-colour, and *The Gypsy Girl* a short but striking dramatic poem. His *Poems* were pub. in 1917. Sev. of his poems appear in *Georgian Poetry*, 1911-17 (3 parts), ed. by Sir Edward Marsh. Awarded Pollignac Prize.

**Hodgson, Shadworth Hollway** (1832-1912), Eng. metaphysician; b. at Boston, Lincs.; son of Shadworth H. Educated at Rugby, and Corpus Christi College, Cambridge. First President of Aristotelian Society, 1880-94. He had tremendous erudition, but was handicapped by an involved style of expression. He claimed to have estab. a system, without ontological assumptions, on the lines of Hume. Works include *Time and Space* (1865), *The Philosophy of Reflection* (1878), *The Metaphysics of Experience* (1898).

**Hodmező-Vásárhely**, tn. of Hungary; connected by rail with Szolnok and Mako. Pop. 60,000.

**Hodograph**. If a point P (see diagram) be moving in any path, and from any fixed point O a vector  $OP^1$  be drawn parallel

and proportional to the velocity of P, then the locus of  $P^1$  is called the H. of the path of P. Let  $P_1$  and  $P_2$  be two consecutive positions of P, the time from  $P_1$  to  $P_2$  being very small. Then the tangents  $T_1T_2$  and  $P_1T_2$  at  $P_1$  and  $P_2$  to the path of P are the directions of motion at P, and  $P_1$ . Draw  $OP_1$  and  $OP_2$  parallel to  $P_1T_1$  and  $P_2T_2$ , and proportional to the

velocities at P, and P, respectively. Then by the triangle of velocities, P<sub>1</sub>P<sub>2</sub> represents, in magnitude and direction, the change of velocity of P during the small time, i.e. P<sub>1</sub>P<sub>2</sub> is proportional to the acceleration of P. As P traces out its path, so P<sub>1</sub> traces out the H. and the velocity of P<sub>1</sub> in the H. represents, in magnitude and direction, the acceleration of P in the original curve. In particular, if P moves with a uniform velocity in a circle, P<sub>1</sub> describes a circle with a uniform velocity. Hence P has a constant acceleration.

**Hodometer, see PYROMETER.**

**Hodson, Major William Stephen Raikes** (1821-68), Anglo-Indian soldier, leader of light cavalry in the Indian Mutiny, usually known as 'Hodson of Hodson's Horse.' Educated at Rugby and Cambridge, he joined the Indian army in 1845, fighting in the first Sikh war. Rising to be commander of the Punjab Corps of Guides, 1852, he was dismissed in 1855 for harsh administration and alleged errors in the regimental accounts. On the outbreak of the Mutiny he rode with despatches from Karnal to Meerut and back, and was allowed to raise his famous regiment of horse (Corps of Guides, Punjab Irregular Force) and became head of the Intelligence Dept. He helped in the reduction of Delhi, and afterwards brought in Bahadur Shah, the last of the Moguls, as prisoner, but shot the three princes down to overawe the mob. His conduct over this and over money matters has been severely censured, and he was even accused of 'looting.' He was killed in an attack on Lucknow. See G. Hodson, *Hodson of Hodson's Horse*, 1833; Bosworth Smith, *Life of Lord Lawrence* (app. to 6th ed.) 1885; T. R. Holmes, *Four Famous Soldiers*, 1889; and *History of the Indian Mutiny*, 1899; L. T. Trotter, *A Leader of Light Horse*, 1901; and Sir C. Chamberlain, *Remarks on Captain Trotter's Biography of Major W. S. Hodson*, 1901.

**Hodza, Milan** (1878-1944), Slovak statesman, son of a Protestant pastor. Entered the Hungarian Parliament in 1905 as the sole Slovak representative. Interned in 1914 for systematic criticism of the Hungarian gov. Was one of the leading advocates of co-operation between the different ethnical elements in the Czechoslovak State, of which he was the first diplomatic representative at Budapest. Afterwards he entered the first Czech Parliament and between 1919-35 was successively minister of unification, agriculture, education and, once again, agriculture. He was the champion of a policy based on Czechoslovak political support of the ideal of a commonwealth of sovereign independent Central European States, linked together by 'co-operative solidarity.' In his *Federation for Central Europe* (pub. 1942) he advocated a Federation of Danubian States for mutual protection against 'colossal neighbours.' In 1935, when the political horizon was growing black, he became Prime Minister. He hastened the realisation of Ruthenian home rule, which was

estab. in 1937. He resigned just before the Munich Pact for he foresaw only too clearly what terms would be imposed on his country. He became Vice-President of the Czechoslovak State Council in London, but controversies over his foreign policy and his peasant policy of agrarian democracy widened the breach between him and Dr. Benes and he preferred to migrate to the United States, where he died.

**Hoe, Richard Marsh** (1812-86), Amer. inventor, b. in New York City, son of Robert H., a mechanic. He estab. a manufactory of printing-presses, using steam to run the machinery, in New York City in conjunction with two brothers-in-law, and became head of his father's firm soon after. His prin. invention was the printing-machine known as the H. rotary or 'lichtuig' press, patented in 1846.

**Hoe** (Fr. *houe*, modern Ger., *Haue*), implement used in gardening and agriculture for extirpating weeds, singling out root crops, stirring the surface-soil, and such-like purposes. The ordinary garden H.

HOES

Swan-necked Hoe, Draw Hoe, and Dutch Hoe

has a flat blade set transversely in a long wooden handle, and the best one for agric. purposes is the swan-neck H., having a long curved neck joining the blade to the handle. There is also the Dutch or thrust H., with the blade fixed into the handle as in a spade. Besides these there are sev. types of horse-drawn Hs. used among root and grain crops, and capable of working one or sev. rows at a time.

**Hook van Holland, see HOOK or HOLLAND.**

**Hoenir**, lesser god of Norse mythology, found always in the company of (Odin) and Loki. Though fair in aspect and spoken of by the Vanir (gods of the atmosphere), to whom he was given as hostage by the Aesir, he plays no prominent part

as one of the triad. When consulted his invariable answer was 'Let others advise'; so Mimir had to be sent with him to the Vanir and the gods lost their chief counsellor. He is described as the lord of the Ooze, and is sometimes represented with long legs like a stork. II., with Odin and Lodhurr, gave life to the first human beings. He was the first to use the divining rod. Some identify him with Tyr. Uhlund calls him the singer. He played an important part when, after the last great battle and the destruction of the world, it rose afresh from its ashes.

Hof: (1) tn. in N.E. of Bavaria, Upper Franconia, 30 m. N.E. of Bayreuth, on the Saale. It was destroyed by fire in 1823, since when it has been almost entirely rebuilt. Before the Second World War H. was a noted seat of the textile industry, and had manufs. of calico, cloth, and hosiery. It has a hospital founded in 1262, and some interesting churches. Jean Paul's earlier years are closely associated with the tn. Pop. 45,000. (2) Tn. in Norway, 50 m. N. of Christiania. Pop. 5000.

Hofser, Andreas (1767-1810), Tyrolese patriot peasant-leader, b. at St. Leonard in the Passier valley, where his father was an innkeeper, which trade H. inherited, and in addition dealt in wine and horses with the N. of Italy. In 1809 he called the Tyrolese to arms to expel the Fr. and Bavarians, and they responded with ardour, and swept the latter out in seven weeks, overwhelming them at Sterzing. By this victory the Austrians temporarily occupied Innsbruck and H. was conspicuous amongst the insurgent leaders. By the treaty of Schönbrunn, the Tyrol was again ceded to Bavaria, and although H. again took up arms, he had to disband his followers and seek refuge in the mts., where he was betrayed, captured, and shot. See lives by K. T. Helgel, 1875; and A. von Bossi-Fedrigotti, 1935.

Höfding, Harald (1843-1931), Dan. philosopher: b. in Copenhagen where he was educated. School teacher, 1861-1871; then prof. in univ. of Copenhagen. He progressed, from the opinion of Kierkegaard with relation to the separateness of Faith and Knowledge, into Positivism with qualifications. Works include: *Den engelske Filosofi i vor Tid* (1874), *Den humane Etik* (1876), *Psykologi i Omrids paa Grundlag af Erfaring* (1882), *Etik*, (1887), *Psykologiske Undersøgelser* (1889), *Kontinuiteten i Kant's filosofiske Udviklingsgang* (1893), *Den nyere Filosofis Historie* (1894-95), *Det psykologiske Grundlag for logiske Domme* (1899), *J. J. Rousseau og Naars Filosofi* (1896), *Mindre Arbejder* (1899-1905), *Religionsfilosofi* (1901), *Modernere Filosofer* (1904, Eng. trans., 1914), *Den menneskelige Tanke, dens Former og dens Opvarer* (1910), *Bergson's Filosofi* (1914), *Oplevelse og Tydning* (1918), *Erkendelsesteori og Livsopfattelse* (1926), *Religiøse Tanketyper* (1927), *Erindringer* (1928), *Erkendelsesteoriens nærværende Stilling* (1930).

Hoffmann, August Heinrich, known as Hoffmann von Fallersleben (1798-1874), Ger. poet and philologist, b. at Fallersleben

in Lüneberg, his father being the mayor of the tn. He was educated at Göttingen and Bonn, his original intention being to study theology. He soon abandoned this for literature, and in 1823 became custodian of the univ. library at Breslau, and later on prof. of Ger. there. In consequence of his pub., *Unpolitische Lieder* (1840-41) in which was 'Deutschland, Deutschland über Alles' he was obliged to resign his chair, and then travelled for three years, returning to Prussia after the revolution of 1848. He wrote, *Horas Helgice* (1830-62), *Geschichte des Deutschen Kirchenlieds* (1832), *Soldatenlieder* (1869-70), *Mein Leben* (autobiography ed. by F. Gerstenberg 1892-94). A selection from his works was ed. by H. Benzmann (1924). See lives by J. M. Wagner, 1869-1870 and H. Reuter, 1921.

Hoffmann, Ernst Theodor Wilhelm (1776-1822), Ger. writer and composer, b. at Königsberg. He assumed the name Amadeus in place of Wilhelm in homage to Mozart. In 1792 he entered the univ. of his native city to prepare for a legal career, and in 1795 began to practise as a jurist at Königsberg, subsequently going to Berlin; but music interested him more than his legal duties. In 1796 he was appointed assessor at Posen; but his brilliant powers of caricature got him into trouble, and he was obliged to leave Posen. In 1804 he was transferred to Warsaw, where he made the acquaintance of Werner, but was forced to quit office in 1806, when Warsaw was occupied by the Fr. For the next ten years he led a precarious existence, supporting himself by composing and giving music lessons. In 1816 he was appointed councillor of the Court of Appeal. Some of his shorter tales appeared in the collection *Phantasie-stücke in Callots Manier* (1814), and were followed by the gruesome novel, *Die Elzmiere des Teufels* (1815-16). Two other collections are *Nachstücke* (1817) and *Die Serapionsbrüder* (1819-21) the latter of which includes pictures of Ger. life and incidents from It. and Fr. hist., as well as gruesome tales; indeed it contains *Das Fräulein von Scudéri*, generally considered his best work. Other books of his are *Klein Zaches* (1819), and the autobiographical *Lebensansichten des Katers Murr* (1820-22). His fairy tales, *Der Goldene Topf*, were trans. by Carlyle in *German Romance* (1827). He also wrote an essay on Mozart's *Don Juan*, and composed an opera on Fouqué's *Undine* (1816). Offenbach's opera, *The Tales of Hoffmann*, is founded on some of his tales. H. was one of the master novelists of Ger. Romanticism, and his works are remarkable for their humour and realism. His collected works, ed. by G. Ellinger, were pub. in 1894; his letters and diaries ed. by H. Müller, in 1812 and 1815 respectively. See studies by W. Harich, 1920; E. Kroll, 1923; K. Ochsner, 1936; and W. Hergengrün, 1940.

Hoffmann, August Wilhelm (1818-92), Ger. chemist, b. at Glessen. He first studied law and philology at Göttingen, but later turned his attention to chem., and in 1845 was appointed director of the

Royal College of Chem. in London. From 1866 to 1868 he was chemist to the Royal Mint, when he returned to Berlin as prof. of chem. and spent the rest of his life in that city. His work covered a wide range of organic chemistry—his contributions to the scientific journals were mainly on this subject. He also devoted much labour to the theory of chem. types. His chief works are: *Introduction to Modern Chemistry* (1865), *The Life-Work of Liebig* (1876), and *Chemische Erinnerungen* (1882). See *Memorial Lectures delivered before the Chemical Society, 1893-1900* (London).

Hofmann, Josef Casimir (b. 1877), Polish pianist, b. at Cracow. Pupil of his father (prof. at Warsaw Conservatory). Made his appearance before the public at the age of six, and three years later made a tour of Europe, becoming a celebrated musical prodigy. Visited the United States in 1887-88 and, after studying two years under Rubinowitz, made his debut at Dresden in 1894. Has pub. pianoforte compositions and is one of the leading modern pianists. Since 1898 has lived principally in America. Director and Dean of Curtis Institute of Music, 1926-33.

Hofmannsthal, Hugo von (1874-1929), Ger. poet and dramatist, b. at Vienna, where he was educated. Literary success came to him early, with the pub. of two or three books of poems before he was twenty. Later in his career he produced a number of romantic plays and also furnished the librettos for sev. of Richard Strauss's operas: *Elektra* (1909), *Der Rosenkavalier* (1911), *Aradne auf Naxos* (1912), *Die Frau ohne Schatten* (1919), *Die ägyptische Helena* (1920). His works (besides the above-mentioned librettos) include: *Gestern* (1891), *Des Tod des Trizian* (1892), *Des Tod und des Tod* (1893), *Der Abenteuerer und die Sängerin* (1899), *Elektra* (1903), *Kleine Dramen* (1907), *Prosaische Schichten* (1907), *Gedichte* (1910, 1922, 1925), *Christinas Heimreise* (1911), *Jedermann* (1912), *La Légende de Joseph* (1914), *Alkestis* (1916), *Der Schwelger* (1921), *Ideen und Aufsätze* (1921), *Die Hochzeit der Sobeide* (1922), *Das Salzburger Grosse Welttheater* (1922), *Florindo* (1923), *Der Unbestechliche* (1923), *Deutsche Epigramme* (1923), *Der Turm* (1925), *Drei Erzählungen* (1927). See studies by O. Heuschele, 1929; H. Tembrinus, 1932; K. J. Naef (with bibliography), 1938, and E. Brecht, 1916.

Hofmeister, Wilhelm Friedrich Benedict (1824-77), Ger. botanist, b. at Leipzig, where he was educated and entered business as a music-dealer, studying botany in his spare time. In 1863 he was appointed to a professorship in Heidelberg, and nine years later was transferred to Tübingen. In 1851 he pub. his prin. work, *Vergleichende Untersuchungen der Kennung Kinfaltung und Fruchtbildung höherer Kryptogamen und der Samenbildung der Coniferen* (1851), which stands in the first rank of botanical books, and is a typical work on plant-morphology. H. also contributed two notable parts to a handbook of physiological botany, never completed, under the titles of *Die Lehre*

*von der Pflanzenselle und Allgemeine Morphologie der Gewächse*.

Hofmeyr, Jan Hendrik (1845-1909), S. African politician, b. at Cape Town, where he was educated, leaving school at the age of sixteen and becoming a journalist. He joined the staff of the *Volkevriend*, which he bought in 1861 and amalgamated with the *Zuid Afrikaan*, under the title of *Ons Land*. In 1879 H. entered Parliament, where he remained for sixteen years, becoming leader and spokesman of the Dutch party in the colony. In 1887 he was one of the Cape delegates to the first colonial conference held in London. Until the Jameson Raid of 1895 he was a supporter of Cecil Rhodes.

Hofmeyr, Jan Hendrik (1894-1948), S. African statesman and historian. Came to Oxford as a Rhodes scholar and became principal of the Univ. of Witwatersrand at the age of twenty-five. His financial acumen attracted the attention of Gen. Smuts, and at the age of thirty he was appointed administrator of the Transvaal. In 1929 he entered Parliament as member for Johannesburg and took a leading part in the movement for the reconciliation of Gen. Smuts and Gen. Hertzog and the 'reunion' of S. Africans of Brit. and Boer stock, from which the United Party originated. In the coalition gov. of 1933 he was minister for the interior, education, and public health. But his sympathies for the Bantu pop. soon made him unpopular with many of the Afrikaners. In 1936 he strongly opposed the Bill to destroy the Cape native franchise, and in 1938 he resigned in protest against the action of Hertzog in appointing as a representative of native interests in the Senate a defeated colleague with no special qualifications in that respect. When the Second World War broke out H. rejoined the gov. as minister of finance. He was often called upon to deputise for Gen. Smuts and in 1943 was formally appointed Deputy Prime Minister. In the 1948 elections his liberal attitude towards the non-European races alienated many electors, but his party supported him, and it was generally understood that he would lead it when Gen. Smuts should retire; and he remained in the forefront of the opposition to Dr. Malan's policy of segregation. His *South Africa* (1931), a hist. of the country, is instructive on native policy, the author rejecting segregation, racial fusion, and equality alike, and treating the whole problem as a question not of politics so much as economics. See T. MacDowell, *Jan Hofmeyr: His Life to Smuts*, 1948.

Hofwil, estate some 6 m. to the N. of Bern in Switzerland, which was purchased by Fellenburg to start his educational institution. See FELLENBURG, PHILIP EMMANUEL VON.

Hog. Sheep still retaining its first fleece is known as a H. in Scotland, and a hogget is a two-year-old sheep. See also PIG.

Hogarth, David George (1862-1927), Eng. archaeological explorer, geographer, and author, b. at Barton-on-Humber; eldest son of Rev. George H., incumbent

of that place. He was educated at Winchester and at Magdalen College, Oxford, and was a tutor at Magdalen 1886-88. He explored Asia Minor in 1887, 1890, 1891, and 1894. Excavated at Paphos, 1888; Der el-Bahari, 1891; Alexandria, 1895; in Fayûm, 1896; Naukratis, 1899 and 1903; Ephesus, 1904-05; Assuit 1906-1907; and Jerablus, 1911. He was director of the Brit School at Athens, 1897-1900, and conducted excavation at Cnossus and the Dictæan Cave, 1900. In 1909 he became keeper of the Ashmolean Museum, a post he held till death. In the First World War, he was director of the Arab Bureau at Cairo. C.M.G., 1918. His pubs. include: *Devia Cypria* (1900), *Modern and Ancient Roads in Asia Minor* (1892), *Philip and Alexander of Macedonia* (1897), *The Nearer East* (1902), *The Penetration of Arabia* (1904), *The Archaic Artemis of Ephesus* (1908), *Ionian and the East* (1909), *Accidents of an Antiquary's Life* (1910), *The Ancient East* (1914), *Carchemish I.* (1914), *The Balkans* (1915), *Hittite Seals* (1920), *Arabia* (1922), *The Wandering Scholar* (1923).

Hogarth, William (1697-1764), painter and engraver, and founder of the Brit School of Painting, b. in London. He began to draw at an early age and was apprenticed to a silver-plate engraver,

WILLIAM HOGARTH

Engraving after a self portrait (in the National Gallery).

finishing his time at the age of twenty when he started engraving on copper. In 1724 he pub on his own account his plate 'Masquerades and Operas, Burlington Gate,' but he first became known as an engraver by his plates for Butler's *Hudibras*, of which the last two, representing the 'Burning of Rump at Temple Bar' and the 'Procession of the Skimmington,' are the best. He next turned his attention to oil-painting, executing 'small conversation pieces, from twelve to

fifteen inches high,' and in 1731 won reputation by 'A Harlot's Progress,' a series of pictures in which he portrays the enticement of his heroine into the paths of evil, her passage through a 'Martin's summer,' as the mistress of a rich Jew, to 'Captain Macheath' and Drury Lane, to Bridewell and beating hemp, to disease and death, to a shameful funeral, and a forgotten grave. This was speedily followed by 'A Rake's Progress,' which did not meet with equal success, owing to the fact that it attacked the vices of the man instead of those of the woman. 'The Fair,' or 'Southwark Fair,' depicts the carnival suppressed in 1762. In 1738 he attempted 'the great style of history-painting,' and produced on a staircase of St. Bartholomew's Hospital two Scripture stories, 'The Pool of Bethesda' and 'The Good Samaritan,' but these did not meet with the encouragement he expected, so he again turned his attention to his former work and painted the 'Scrolling Actresses dressing in a Barn,' 'The Enraged Musician,' 'The Distrest Poet,' etc. In 1745 H had a sale by auction of his pictures, and the ticket of admission was the etching known as the 'Battle of the Pictures.' The same year his masterpiece, the 'Marriage à la Mode' (now in the Tate Gallery), appeared, which represents a variety of 'Modern occurrences in high life' and in 1716 his portrait of 'Garrick as Richard III,' for which he received £200, as well as that of 'Simon, Lord Lovat.' In 1747 he produced 'The Stage Coach' and the series 'Industry and Idleness,' in 1758 'The Invasion,' and in 1761 'The Bathos,' his last work. He also painted a portrait of himself which resulted in the pub of *The Analysis of Beauty* (1733). He is principally famous as a satirist on canvas, and as such has never been surpassed; he represented the foibles of his time in a series of engravings which exhibit character, humour, and power. Until recently little attention has been paid to H's drawings, some of which are in the royal collection and others in the possession of the marquess of Exeter. There are some 85 known and surviving examples of these. H did not, it seems, make a practice of sketching from nature, nor did he usually make studies for separate figures, in pictures and prints. Preparatory drafts of whole compositions form the majority of the drawings and of those nearly all refer to prints rather than to pictures. None of the drawings, probably, was ever intended as an end in itself, or a final expression of an idea, yet the liveliness of H's mind, his sense of fun, horror, or disgust, his feeling for character, is nearly always present in them. H's house in Hogarth Lane, Chiswick, is now a museum where some of his works may be seen. See J. Nichols and J. Steevens, *The Genuine Works of William Hogarth*, 1817; J. B. Nichols, *Anecdotes of William Hogarth written by himself*, 1833; A. Dobson, *William Hogarth*, 1879; A. P. Oppé, *The Drawings of William Hogarth*, 1848.

Hogben, Lancelot (b. 1895), Eng. zoologist, educator, and writer; educated at

Trinity College, Cambridge; Mackinnon Student of the Royal Society, 1923. Between 1919-30 held various posts as lecturer in, or prof. of, zoology and experimental physiology. Prof. of social biology London Univ., 1930-37; Regius Prof. of natural hist., Aberdeen Univ., 1937-41; Mason Prof. of zoology, Birmingham Univ., 1941-47. Visiting prof. to Wisconsin Univ. Pub. include *Nature and Nurture* (1933), *Mathematics for the Million* (1936), *Science for the Citizen* (1938), *Dangerous Thoughts* (1939), and scientific memoirs on genetics, ductless glands and medical statistics to the Proceedings of the Royal Society and other scientific journals.

Hogg, Sir Douglas McGarel, see HALLSHAM, HALON.

Hogg, James (1770-1835), called 'The Ettrick Shepherd', poet, b. at Ettrick, Selkirkshire, was the son of a small farmer. He was entirely self-educated, but at an early age began to compose verses, though the setting of these to paper was at first a task of great difficulty. He first appeared in print in 1800 with the patriotic song, *Donald McDonald*, which became popular at once. Encouraged by his success, he, in the following year, pub. his *Scottish Pastorals, Poems, and Songs*. In 1802 he met Scott, and not long after became friendly with Allan Cunningham. His next pub. was *The Mountain Bard* (1807), and in 1810 he issued *The Forest Minstrel*, which was not a financial success. Three years later appeared the admirable work, *The Queen's Wake*, and in 1816 *Madoc of the Moor*. In that year he also brought out *The Poetic Mirror, or The Living Burds of Great Britain*, a vol. of parodies of the leading poets of the day, including Scott, Coleridge, Southey, Byron, and Wordsworth. Among his subsequent books are: *The Browne of Rodsbeck, and other Tales* (1817), *The Jacobite Relics of Scotland* (1819), *Winter Evening Tales* (1820), *The Private Memoirs and Confessions of a Justified Sinner* (a work of genius, anticipating the psychological 'thrillers' of the twentieth century, anonymously, 1821), and *Queen Hymie* (a poem, 1826). He contributed to *Blackwood's Magazine* many articles, some of which he collected in 1829 under the title of the *Shepherd's Calendar*, and in 1831, to the great annoyance of Lockhart, he printed *The Domestic Manners and Private Life of Sir Walter Scott*, a book that is now too seldom read. He has been described as the greatest poet after Burns, that has ever sprung from the common people, and it is certain that he attained to very great heights when dealing with local or legendary stories, while his gift of imagination was so great as lightly to be entitled genius. Much of his work was mediocre, but he had in a great degree the lyrical gift, and his poems, *When the Kye come Home* and *Flora MacDonald's Farewell* are exquisite. He wrote his *Autobiography*. See Mrs. Gordon, *Memoirs of James Hogg*, 1885; H. T. Stephenson, *The Ettrick Shepherd: a Biography*, 1922; E. O. Batho, *The Ettrick Shepherd*, 1927.

Hogg, Quintin (1845-1903), Eng. phil-anthropologist, seventh son of Sir James Weir H., b. in London. He was educated at preparatory schools and Eton, which he left in 1863 and entered business, being first with a firm of tea merchants and later with sugar merchants. Philanthropy, however, was the main concern of H.'s life, and in 1864 he started a ragged school for boys. In 1881 he purchased the Royal Polytechnic Institution in Regent Street for providing young men and women of the lower middle classes with instruction, recreation, and social intercourse, and thus successfully initiated the polytechnic movement in London.

Hogget, see under FIG.

Hogland, small is. situated in the gulf of Finland, 110 m. W. of Leningrad. In 1788 a battle took place here between the Russians and the Swedes. There are extensive quarries of granite and porphyry. It has an area of about 11 sq. m. Pop. 800.

Hogmanay, name applied in Scotland and a few parts of England to the last day of the year, viz. Dec. 31. It is also used for the cake given to the children who beg for gifts on the morning of that day. It marks the beginning of New Year holiday festivities in Scotland.

Hognose, N., Amer. colubrine snake (genus *Heterodon*) with a flattened head and a snout like a hog's. It is not poisonous.

Hog's Back, range of chalk hills, 600 ft. high, which extends from Guildford to Farnham, Surrey, England. It is traversed by an old coach road which affords a splendid view of the surrounding country.

Hogshead, liquid measure of capacity, varying with the nature of the contents, but equivalent for wine to sixty-three gallons, and for ale and beer to fifty-four gallons. In England it has now fallen into disuse, but the measure still obtains in the United States, and is equivalent to sixty-three Amer. gallons. The etymology of the word has been much discussed and its origin is uncertain.

Hogue, or Hougue, La, roadstead on the E. side of the N. part of Goutin Peninsula, France, dept. Manche, off a rocky and dangerous coast. Gives its name to the naval victory of the Eng. and Dutch over the Fr. in 1692.

Hohenelbe (Vrchlabi), tn. in Czechoslovakia on the Elbe, 17 m. N.E. of Gitschin. It is engaged in various branches of manuf., principally the textile industry. Pop. 22,000.

Hohenfriedberg (Polish Dobromierz), tn. in Silesia, 3 m. W.S.W. of Wrocław (Breslau) Poland. Noted for Frederick the Great's victory over the Austrians and Saxons in 1745. Pop. 2000.

Hohenheim, Philippus Aureolus Theophrastus Bombastus von, see PARACELSUS. Hohenheim, vil. in Württemberg-Baden, Germany, 7 m. S. of Stuttgart. A royal castle, built in 1785, is situated in the neighbourhood; this was, later, used as an agric. academy with botanical gardens. The succoees on the staircase are by Isopi.

**Hohenlimburg**, tn. of Westphalia, Germany, situated on the R. Lenne, 5 m. E. of Hagen. It is the seat of an iron industry and has textile manufs. Pop. 4000.

**Hohenlinden**, vil. in Upper Bavaria, Germany, 20 m. E. of Munich, Germany, celebrated for the victory gained there over the Austrians, by the Fr. and Bavarians under Moreau in 1800. The battle is described in Campbell's lyric of the name. Pop. 970.

**Hohenlohe**, former principality of Germany in Franconia, now comprised chiefly in Württemberg and Bavaria.

**Hohenlohe-Schillingsfürst**, Chlodwig Karl Viktor, Prince of (1819-1901), Ger. statesman, b. at Ragaz. Was appointed chief minister of Bavaria in 1866, and endeavored to bring about the union of S. and N. Germany, but was forced to resign. During the Franco-Ger. war he advocated the alliance between Bavaria and Prussia. In 1873 he was appointed, by Bismarck, Ger. ambas. in Paris, and in 1885 became governor of Alsace-Lorraine; he was imperial chancellor in 1894, and led the active Ger. colonial policy. He resigned in 1900. See J. Ziekursch, *Politische Geschichte des neuen deutschen Kaiserreichs*, 1930.

**Hohensalza** (Polish Jnowroclaw), tn. in the prov. of Poznan, 66 m. E.N.E. of Poznan. Until 1905 known as Jung-Breslau. Salt works and saline springs are in the vicinity, and there is a sugar-beet industry. Pop. 34,100.

**Hohenstaufen**, Ger. princely house, members of which were emperors or Ger. kings from 1138 to 1254. The earliest known member of the family was Frederick von Buren, who d. at the end of the eleventh century. His son, Frederick, built a castle at Staufen or H., and called himself by this name. He was a supporter of the Emperor Henry IV, who gave him the duchy of Swabia, and when Henry was absent in Italy acted as viceroy. In 1105 he was succeeded by his son Frederick II, the one-eyed, who, together with his brother Conrad, held S.W. Germany for their uncle, the Emperor Henry V. On the death of Henry in 1125, his estates fell to Frederick, but Lothair the Saxon being chosen emperor, a furious war broke out which ended in the submission of Frederick. In 1138 Conrad was elected emperor of Germany as Conrad III., and was succeeded by his nephew, Frederick Barbarossa, in 1152. Other emperors of this family were Henry VI. (1190-97), Philip I. (1198-1208), Frederick II. (1212-1250) and Conrad IV. (1250-54), the male line becoming extinct in 1268, when Conradin was put to death in Italy by Charles of Anjou. See HOLY ROMAN EMPIRE. See F. W. Schirrmacher, *Die letzten Hohenstaufen*, 1871. J. Bühler, *Die Hohenstaufen*, 1925.

**Hohenstein-Ernstthal**, tn. in Saxony, Germany, 12 m. N.E. of Zwickau. Textile manufs. and knitting are the chief industries. Pop. 17,500.

**Hohenzollern**, Ger. imperial dynasty, which traced its origin back to the ninth century to one Count Tassilo, who built

the castle of H. at Zollern in Swabia. A descendant of his, Frederick III., married Sophia, daughter of Conrad, burgrave of Nuremberg, succeeding his father-in-law as burgrave about 1192. When he d. about 1202 his sons Conrad and Frederick succeeded him, Conrad becoming burgrave of Nuremberg and founding the Franconian branch of the family, while Frederick received the co. of Zollern, and became the ancestor of the Swabian branch. On the death of Conrad, his son Burgrave Frederick III. was the representative of the Franconian branch, and he took a prominent part in Ger. affairs, securing the election of Rudolph of Hapsburg as Ger. king in 1273. In 1415 Burgrave Frederick, the son of Frederick V., received Brandenburg from King Sigismund, becoming margrave of Brandenburg as Frederick I., and in 1701 the elector of Brandenburg, Frederick III., became king of Prussia. (A learned survey of the H. dynasty in the eighteenth century is to be found in the introductory part of Carlyle's *Frederick the Great*.) In 1871 Wm., the seventh king, took the title of Ger. Emperor. The Swabian line was divided in 1576 into the branches of Hechingen and Sigmaringen. These continued unbroken until 1849, when they fell into the hands of Prussia. The proposal to raise Prince Leopold of Hohenzollern-Sigmaringen (1835-1905) to the Sp. throne in 1870 was the immediate cause of the war between Germany and France. Prince Charles of H.-Sigmaringen became king of Rumania in 1881. The Hs. reached the acme of their power after the estab. of the united Ger. Empire following Bismarck's wars of 1864, 1866, and 1870-71. The H. king of Prussia was thenceforth the Ger. Emperor, and Prussian traditions became the accepted order of things in place of the old cultural and cosmopolitan life of S. and Central Germany. The spirit of the house of H. sought its expression in militarist ambition, and its leading figure was the Kaiser, Wm. II., who aimed at world domination in the First World War, through the conception of *Mittel Europa*. After the military collapse of Germany in 1918, Wilhelm II. (d. 1941) fled to Holland and the H. dynasty came to an end. But the house of H. still hoped to return to the throne throughout the duration of the post-war Ger. republic and even subsequently, in spite of the opposition of the Nazis to the restoration of the monarchy. Potential candidates were the ex-Crown Prince Wilhelm and his second son, Louis Ferdinand. His elder son, Friedrich Wilhelm, was killed in Flanders in June, 1940, but, in any case, had forfeited his claim by marrying a woman of unequal birth.

See E. Berner, *Quellen und Untersuchungen zur Geschichte des Hauses Hohenzollerns*, 1901-11; J. Höffner, *Die Hohenzollern und das Reich*, 1918.

**Hohenzollern**, two united principalities of S. Germany. The modern Prussian prov. was formed in 1850, when H.-Sigmaringen and H.-Hechingen were united. It consisted of a narrow strip of

land bounded on the S.W. by Baden and on all other sides by Württemberg. Its area being 441 sq. m., and pop. of 78,000. The surface is mountainous, and the chief industries are agriculture and cattle-rearing. Iron, coal, gypsum, and salt are found, and there are also some mineral springs. The castle of H. was destroyed in 1423, but has been restored sev. times, the present one being built by King Frederick Wm. IV. H. is now included in the Land of Württemberg.

**Hohenzollern Redoubt**, very strong tactical point in the Ger. line during the First World War, situated just S.W. of La Basée. During the battle of Loos in the autumn of 1915 the Brit. operations included the attack against the H. Redoubt. Fighting here was of the most desperate nature and lasted from Sept. 27 to Oct. 13. At the first onslaught the Brit. gained it, but Ger. counter-attacks, carried out with great fury, were at once launched against it incessantly, and a see-saw situation ensued into the first week of Oct. The fiercest fighting raged round the trenches named 'Big Willie' and 'Little Willie,' in allusion to the ex-Kaiser and his son the ex-Crown Prince. On Oct. 3 the Ger. regained most of the position and on the 8th they launched an attack against both Brit. and Fr., which was repulsed heavily. A final Brit. assault was made by a div. of Territorial on Oct. 13, which at certain places carried the line beyond the redoubt. In this action the Territorial Battalions of the Sherwood Foresters gained great distinction, and Capt. C. Vickers of that regiment earned the Victoria Cross. Despite the great exertions of the Allies, the results of this offensive were far from satisfactory, as the Brit. alone had 50,000 casualties and reaped but small advantages.

**Holists**, see **LIFT**.

**Hokiang**, prov. of Manchuria, China, situated at the confluence of the Rs. Sungari, Ussuri, and Heilungkiang. It lies in a low, marshy plain, thus having great difficulty in cultivation and drainage. It consists of 19 cos. with Kiamusze as cap. Area 47,700 sq. m., pop. 1,936,000.

**Hokitika**, tn. in New Zealand, South Is., cap. of Westland co., on the N.W. coast about 24 m. S. of Greymouth. It is noted for its goldfields, but brewing and tanning are also carried on, and there are saw-mills and door factories. Greymouth is the port for the goldfields. Earthquakes are frequent. Pop. 3000.

**Hokkaido (Yezo) (Hoku, north, kai, sea, and do, road)**, N. Is. of Japan, separated in the N. from Sakhalin Is. by the La Perouse Strait and on the S. from Honshu by the Tsugaru Strait. Area 30,148 sq. m.

**Hokusai**, Katsuhika (Nakajima Tetsujiro) (1760-1849), Jap. painter, book-illustrator and teacher of drawing, b. at Tokyo of a family of artists. Practised early as a wood-engraver; then studied with Shunsho, a well-known designer and painter of colour prints; but he had to leave the studio because of his independent views on style, H. leaning to the classical Kano manner. H. became not only the leading representative of the

Ukiyo-ye or popular school but an artist of world-wide repute. His knowledge of technique and his draughtsmanship were alike extraordinary and his drawings and colour prints had considerable influence on art in foreign countries. His qualities are shown to great advantage in his 'River Bridge,' which strongly influenced Whistler's interpretation of moonlight effects. He devoted himself for the most part to the illustration of books or series and to industrial art as well as the teaching of drawing. His very many works include, particularly, the *Manga* or *Ten Thousand Sketches*, a pictorial encyclopaedia of all aspects of Japanese life (in 15 vols.; last pub. in 1836); and the *Hundred Views of Mount Fuji* (1835) (3 vols. in monochrome). His colour prints *Thirty Six Views of Fujiyama* prove him a master of colour, his combination of greens, blues and yellows being a striking innovation. Other notable works are 'The Wave' (Sir Edmund Walker Allerton, Royal Ontario Museum), 'Views of Famous Bridges,' 'Waterfalls,' 'Views of Lu-chu Islands.' See works on Hokusai by M. Revon, 1896; E. de Goncourt, 1896; C. J. Holmes, 2nd ed., 1900; F. Perzyski, 1904; E. F. Strange, 1906; also N. Brown, *Block Printing and Book Illustration in Japan*, 1924.

**Holacanthus**, name of a genus of teleostean fishes belonging to the family Chetodontidae. The species are marine and carnivorous, and are particularly abundant near volcanic rocks and coral is. They are remarkable for their beautiful colouring, *H. imperator*, a native of the E. Indies, being deep blue with bands of orange. The flesh is highly esteemed as diet.

**Holbach**, Paul Henri Thyry, Baron d' (1723-89), Fr. philosopher, b. at Kidesheim in the Palatinate. He spent most of his time in Paris, and, having great wealth and being of hospitable disposition, entertained and was intimate with the most distinguished men of his day, among them, Diderot, Grimm, Hume, Gericke, Wilkes, Sterne, Rousseau. He wrote a large number of articles on chemistry and mineralogy for the *Encyclopédie*, and in 1767 pub. his *Christianisme dévoilé*, in which he attacks Christianity and religion. In 1770 his famous book, *Le Système de la Nature*, appeared, and in it he denied the existence of the Deity and asserted that happiness is the end of mankind. The book evoked much criticism, and was answered by Frederick the Great and Voltaire. In philosophy H. was a follower of Diderot and his portrait appears in the character of the virtuous atheist Wolmar of the *Nouvelle Héloïse* of Rousseau.

**Holbeach**, very ant. mkt. tn., Lincolnshire, England, 8 m. E. of Spalding. It was once on the shore of the Wash, but is now 6 m. inland. H. is the bp. of the antiquary, Wm. Stukeley. Pop. 6100.

**Holbein**, Hans (c. 1465-1524), the Elder, Ger. painter, was a native of Augsburg. His early works bear the impress of the schools of Van der Weyden and Memling, while his later pieces, e.g. the basilica of St. Paul (1502) in the gallery of Augsburg,

show Flemish influence. He was a prolific artist, and devoted his energy mainly to religious subjects, his crowning work being the altar piece of St Sebastian in Munich with the picture of the Annunciation, and the graceful figures of St Barbara and St Elizabeth on the wings. See monograph by C. Glaser, 1908.

Holbein, Hans (1497-1543), the younger great German painter, b. at Augsburg. Little is known of his early years, but in 1515 he went to Basel with his brother Ambrosius, and while there drew illustrations for Erasmus's *Praise of Folly*, which were as popular as the work itself. Besides this he painted the portraits of the burgomaster, Jacob Meyer, and his wife, and the exquisite skill of the artist is shown in the elaboration of every detail in the rich embroidery of the latter's attire. In 1517 he was in Lucerne, and was employed by the mayor of Lucerne to decorate his house with wall paintings, but he soon returned to Basel, and executed in 1519 the portrait of Bonifacius Amerbach, which is one of the most perfect of his works. Here, too, he was greatly occupied with mural decoration, his celebrated 'Peasants' Dance' being a wall painting on a house at the corner of the *Küesengasse*. He also decorated the town hall, and executed many original designs for glass paintings, as well as for woodcuts, among which his book entitled the *Dance of Death* is the most famous

THE ABHOR AND DEATH  
From 'The Dance of Death'

This series is most original, and represents every class of humanity terrified by Death. He also designed a title page for More's *Utopia*, as well as for Luther's German translation of the N.T. Of his sacred pictures the most celebrated perhaps are the 'Solothurn Madonna' and the 'Meyer

Madonna'. The former was only discovered in the middle of the nineteenth century. But marvellous as his paintings were, his fame in his own day rested on his portraits, and among these his portrait of Erasmus at Longford Castle is worthy of mention, as well as his portrait of himself, both of which were executed before his visit to England. In 1527 he came to London, and was introduced to Sir Thomas More, whose portrait he painted as well as that of Warham archbishop of Canterbury, and Bishop Fisher, besides eighty-seven portraits on tinted paper in Windsor Castle. In 1528 he produced 'The Family of Sir Thomas More,' a group of portraits which has unfortunately been lost, and on his return to Basel painted a lifelike picture of his own family, which is now in the Museum of that town. In 1531 he was again in London, and executed portraits of the German chancellor of the Steelyard, the most valuable of which is that of Jörg Gyze (Kühn), much praised by Ruskin. In 1533 he painted 'The Ambassadors.' Soon after this he came under the notice of Henry VIII., and painted for him the picture containing Henry VII., Henry VIII., Jane Seymour, and Elizabeth of York. This masterpiece, noticed by van Mander, and mentioned in the account of the duke of Saxony's visit to England in 1613, was destroyed by fire in 1698. Besides this he painted a portrait of Jane Seymour, now in Vienna, and one of Moret in the Dresden Gallery. He also executed designs for ornament, his drawing for the 'Jane Seymour Cup,' in the Bodleian Library at Oxford being perhaps the most beautiful example of this class of art in the world. In 1537, on the death of Jane Seymour, he went to Brussels to paint the young duchess of Milan, a proposed candidate for the king's hand (National Gallery), and in 1539 to Cleves to paint the Princess Anna (Louvre). Among other portraits of this period may be mentioned that of the duke of Norfolk, Martin Luther, Prince Edward, and another portrait of himself. The importance of Hans Holbein's work cannot be over-estimated before his time portrait painting was scarcely known and it was he who first raised the art of painting to perfection in England; indeed, it may be questioned whether in many of the finest requirements of portraiture his work has ever been surpassed. See R. N. Wornum, *Some Account of the Life and Works of Hans Holbein* 1967; A. Voltmann, *Holbein und seine Zeit*, 1971-76; J. Cundall, *Hans Holbein*, 1879; A. M. Brooks, *From Holbein to Wölfflin*; *Notes on Drawings*, 1920; U. Christoffel, *Hans Holbein*, 1926; A. Chamberlain, *The Art of Holbein* 1940; H. Koegler, *Die Bilder zum Gibelbuch Hortulus Animae*, 1943; Holberg, Ludwig, *Baron* (1684-1754), creator of modern Danish literature, b. at Bergen in Norway. He was educated at Bergen and at the university of Copenhagen. In 1704 he came to England and spent two years amongst the libraries at Oxford, and in 1711 printed his first work, *An Introduction to the History of the Nations*

of Europe. Soon after this he received the Rosenkrantz grant, the holder of which was expected to travel, and spent the years 1711, 1715, and 1716 visiting the various countries of Europe. On his return to Denmark he pub. his *Introduction to Natural and Popular Law*, and in 1718 became prof. of metaphysics at Copenhagen. In 1720 he was promoted to the chair of public eloquence, and in 1730 to that of hist., becoming quæstor of the univ. in 1737, and a baron in 1747. Up to about 1716 his writings had been concerned with law and hist., but after that date he began a new class of humorous literature, and his *Pædar Paars* (1719), the earliest of the classics of the Dan. language, is a satire of the pedantic stiffness and stupidity of contemporary life and thought. In 1721 the first Dan. theatre was opened at Copenhagen, and Holberg produced in 1722 a Dan. trans. of *L'Avare* (before this no plays had been acted in Denmark except in Fr. and Ger.). This was followed by numerous original comedies between 1722 and 1728, amongst which may be mentioned *Den Vegelesindede*; *Jean de France*; *Jeppe paa Bjerget*; *Gert the Westphalian*; *Den politiske Kandestøber*; and *Henrik and Pernille*, his most famous piece (produced in 1724). After the closing of the theatre he turned his attention to historical and philosophical writings, and produced in 1726 *Metamorphosis*, a poetical satire; *Epistolæ ad virum perillustrem* (1727); *Description of Denmark and Norway* (1729); *History of Denmark* (1732-35); *Description of Bergen* (1737); *Universal Church History* (1738); *Biographies of Famous Men* (1739-1745); *Moral Reflections* (before 1744); *A History of the Jews*. In 1741 appeared another classic in his famous poem, *Niels Klim's Subterranean Journey* and from 1743-51 *Epistles*, his last pub. work. He also wrote his *Autobiography*, which, together with *Pædar Paars* and the *Subterranean Journey*, has been trans. into Eng. The importance of H. cannot be overestimated. He was the first writer in Europe of his time (outrivving Voltaire), surpassing both Pope and Swift in genius, and created a literature for a country up to his time without books; indeed it is said that before H. went to Denmark the Dan. language was seldom heard in polite society. See G. Brandes, *Ludvig Holberg et Fæstskrift*, 1881.

**Holborn**, metropolitan bor. of London, bounded on the N. by St. Pancras and Finsbury, on the S.E. by the city of London, and on the S. and W. by the city of Westminster. 'Holebourne' means the stream in the hollow and alludes to the H. Fleet, over which a bridge was built in early times, now replaced by the Viaduct, built in 1869. H. contains some interesting buildings, among which may be mentioned the chapel of St. Etheldreda in Ely Place (so called from the bishops of Ely who held land here as early as the thirteenth century); the par. church of St. Giles in the Fields dating from 1734, originally the site of a leper's hospital founded by Matilda in 1101; the church of St. Andrew built by Wren in 1686

(burnt out in 1941), which numbers Sacheverell among its rectors; Lincoln's Inn, with its Tudor gateway, upon which Ben Jonson is said to have worked as a bricklayer; Gray's Inn, with its fourteenth-century chapel (a great part of which Inn of Court was destroyed in air raids); the half-timbered houses of Staple Inn and the Brit. Museum. H. has an area of 406 acres and a pop. of 22,400.

**Holbrook**, Norman Douglas (b. 1888), Eng. naval officer; b. at Southsea; son of Col. Sir Arthur R. Holbrook. When in command of submarine *B.11*, on Dec. 31, 1914, he dived under five rows of mines in the Dardanelles and torpedoed the *Messoudieh*, a Turkish battleship. Although fired on and pursued by anti-submarine craft he regained the parent ship without mishap. This, however, necessitated being submerged for nine consecutive hrs. The first news the crew received on joining the parent ship was the official Turkish confirmation of the sinking of the *Messoudieh*. For this exploit he was awarded the Victoria Cross.

**Holbrooke**, Josef Charles (b. 1878), Eng. composer, b. at Croydon, son of a Bristol musician. His orchestral works include *The Raven* (1900), *Queen Mab* (1904), *The Bells* (1906), *Apollo and the Seaman* (1908). His operas include a Brit. legend trilogy: *Children of Don* (1912), *Dylan* (1914), and *Bronwen* (1916), under the general title, *The Cauldron of Awenyn*, with libretti by T. E. Ellis (pen-name of Lord Howard de Walden).

**Holcroft**, Thomas (1745-1809), dramatist and author, b. in London. He was successively stable-boy, shoemaker, tutor, and actor. In 1780 he pub. his first novel, *Alwyn, or the Gentleman Comedian*, in which he describes his own experience as a strolling actor. In 1781 his first comedy, *Duplicity*, appeared, and in 1783 he visited Paris as correspondent of the *Morning Herald*. He trans. *Marriage de Figaro* from memory, and produced it at Covent Garden in 1784, himself playing the title-role. In 1792 *The Road to Ruin*, his best and most successful play, appeared, and in 1802 his musical adaptation *A Tale of Mystery*, was acted at Covent Garden. H. pub. numerous comedies and comic operas, besides novels and trans. also *Human Happiness* (a poem). He was praised by Lamb, and was intimate with Wm. Godwin and Hazlitt, who ed. his *Memoirs* (1816).

**Holda**, Goddess of Teutonic mythology. Represented as a kindly goddess, figuring prominently in fairy lore. Regarded as the goddess of spinning and agriculture and often depicted as making her bed when it snows, the fakes bring the bed-faithers flying about.

**Holden**, Sir Isaac (1807-87), inventor, b. at Hurlst, near Paisley. After working in a cotton-mill, he became a mathematical teacher and it was then that the idea occurred to him of applying sulphur to the explosive material that was necessary to produce instantaneous light. In 1830 he became book-keeper in the firm of Townsend Brothers, worsted

manufacturers, but he soon left the counting-house for the mill, and conceived the application of machine power to the various operations of wool-combing. In 1846 he became associated with Lister, and with him brought out a patent for a new method of carding and combing and preparing genappe yarns. In 1848 he opened a large fabrique at St. Denis, and in 1864 concentrated his business at Bradford, which soon became the largest wool-combing concern in the world.

**Holdenby House**, see under HOLMBY.

**Hölderlin, Johann Christian Friedrich** (1770-1843), Ger. poet, b. at Lauffen on the Neckar in Württemberg. Son of the chamberlain to a monastery, he became an orphan at an early age, and was a contemporary of Hegel and Schelling at Tübingen Univ. Became a tutor and a private coach at Jena, Frankfurt-on-Main and Homburg. In 1801 he took up a teaching appointment at Bordeaux. In 1802 he became mentally deranged and was in an asylum at Nürtingen. Discharged in 1804 he became a librarian at Homburg but in 1806 was admitted to the Tübingen asylum. For the rest of his life he suffered from severe melancholia with brief intervals of normality. In his early years was much under the influence of Klopstock and Schiller, for whose *Neuer Thalia* he wrote the first fragments of his great novel *Hyperion*. He was also a friend of the philosopher Fichte. An enthusiast for the ideals of classical Greece as they were then understood, he translates the *Antigone* and the *Oedipus Rex* (1804) of Sophocles and wrote a fragment of a tragedy entitled *Empedokles*. Apart from the idealistic novel *Hyperion* (1793-99) he wrote lyric poetry which is melodious, rich in imagery, and of great verbal dexterity, often on classical models in Gk. metres. His collected poems were pub. in 1826, and his complete works in 1846. See W. Dilthey, *Das Erlebnis und die Dichtung*, 1906 and 1939; F. Zinkernagel, *Entstehungsgeschichte von Hölderlins Hyperion* 1907; Fr. Gundolf, *Hölderlins Archipelagus*, 1911; C. Victor, *Die Briefe der Helmina*, 1921; *Die Lyrik Hölderlins*, 1921; M. Montgomery, *Hölderlin and the German Neo-Hellenic Movement*, 1923; S. Zweig, *Der Kampf mit dem Dämon*, 1925; W. Boehm, *Hölderlin als Verfasser des Ältesten Systemprogrammes des deutschen Idealismus*, 1926; J. Hoffmeister, *Hölderlin und die Philosophie*, 1942.

**Holderness**, flat and fertile dist. of the E. Riding of Yorkshire, England, between the N. Sea and the estuary of the Humber. A parl. div. of 216,551 acs. Pop. 19,500.

**Holdich, Sir Thomas Hungerford** (1843-1929), Eng. explorer; b. Feb. 13 at Dingley, Northants. Entered Royal Engineers, 1862. Afghan war, 1878-80. Supt. Indian frontiers survey, 1892-98. In 1899, one of three Brit. commissioners on boundary of Chile and Argentina: made survey for King's award, 1902. Pubs.: *The Indian Borderland* (1901), *India* (1904), *The Countries of the King's Award* (1904), *Tibet the Mysterious* (1906), *The Gates of India* (1909).

**Holding**, in Scots feudal law, denotes the tenure subsisting between the feu superior and his vassal. A feu-farm H. is one by the terms of which the vassal had to pay the superior a yearly rent in money or in corn. A blench H. is one under which the vassal pays a nominal yearly duty, e.g. a rose, a pair of gilt spurs, the object being merely to acknowledge the superiority. A burghage H. is that by which burghs-royal hold lands of the sovereign specified in their charters of erection (see BURGH). A H. by a church, monastery, or other religious or charitable society is called a mortification (cf. Eng. Mortmain or H. 'in the dead hand'). See J. Erskine, *Principles of the Law of Scotland*, 1895.

**Holdsworth, Sir William** (1871-1943), Eng. jurist, educated at Dulwich and at New College, Oxford, where he lectured on law from 1895-97. Elected Fellow at St. John's, Oxford, 1897, and taught law there for twenty years. Elected Vinerian Prof. of Eng. Law at Oxford, 1922, being in many ways the most distinguished occupant of the chair since Blackstone. From 1903-1908 he was also Prof. of Constitutional Law at University College, London and in 1910 he was appointed All Souls Reader in Eng. Law. At Oxford he wrote the first three vols. of his work *A History of English Law*, which gave him a world-wide reputation. As Vinerian Prof. he brought out a new ed. of his hist., the first 3 vols., appearing in 1922, the ninth in 1926. Meanwhile he had written *Sources and Literature of English Law*, *An Historical Introduction to Land Law* (a lucid elementary book on a difficult subject), and many articles in legal periodicals, Eng. and Amer. His works, *The Historians of Anglo-American Law* (1927), *Some Lessons from our Legal History* (1928), and *Charles Dickens as a Legal Historian* (1928), were the outcome of his lectures in America in 1927. On his return from America he was appointed a member of the Indian States Inquiry Committee, constituted to help the Simon Commission, and in 1928 he went out to India.

From 1930 to 1932 he sat as a member of the Ministers' Power Committee. In 1937 he pub. three more vols. dealing with the public law, the enacted law, and the professional development of the law in the eighteenth century. In 1934 he was awarded the Swiney Prize of the Royal Soc. of Arts, and in 1938 he went out to India again, this time as Tagore Prof. at Calcutta: the result was the pub. of *Some Makers of English Law* (1938). Made a member of the Order of Merit, 1943. His hist. is a great monument of learning, industry and good sense, and in it he digested and harmonised all the results of the latest Eng., Fr. and Amer. research: and the immense amount of detail in the vols. never obscures his good judgment or perspective nor blinds him to general tendencies.

**Holguin**, tn. in Oriente prov., Cuba; in a healthy, hilly region, 60 m. N.W. of Santiago de Cuba. Sugar and tobacco centre. Pop. 135,000.

**Holiday Fellowship (Ltd.)**, The, venture in social service founded in 1913 by T. Arthur Leonard (q.v.), whose objects are to provide for the healthy enjoyment of leisure; to encourage love of the open air; to promote social and international friendship; and to organise holiday making and other activities with these objects. Starting with two Guest Houses—one in North Wales and the other in the Lake District—it developed steadily, and by the summer of 1939 was providing more than 90 guest houses, walking tours, and other forms of community holiday in various parts of this country and abroad. Activities on the Continent took parties of guests into various countries where special endeavour was made to establish contact with the inhabs. of the places visited, and people from other countries were welcomed at Fellowship Centres in this country, both as guests and as members of the staff. A principal feature of Fellowship holidays is the daily excursion, under competent leadership, so organised as to introduce guests as fully as possible both to the beauties and to the historical, literary, and other interests of the dist. Tramping on mountain, moorland, and footpath is particularly encouraged. Members of the Fellowship have also organised, in various parts of the country, some 80 rambling and social clubs, under the title of 'Local Groups.' For legal and business purposes, the H. F. is registered under the Industrial and Provident Societies Act, 1893, with registered office at 142 Great North Way, Hendon, London, N.W. 4. The capital required for its operations is subscribed in the form of £1 shares, the holding of one or more of which, up to a maximum of ten, constitutes membership of the organisation. The work of the organisation is controlled by a General Committee, elected by the shareholding members.

A kindred organisation to the H. F. is the Co-operative Holidays Association, Fallowfield, Manchester.

**Holidays**, see BANK HOLIDAYS.  
**Holinshed (or Hollingshead), Raphael** (c. 1520–80), chronicler, is said to have been a native of Cheshire. He came to London early in Elizabeth's reign, and was employed as translator in Wm. Wolfe's printing-office, rendering great assistance to Wolfe in the compilation of his *Universal History*; indeed H. wrote most of the description of the Brit. Isles. Wolfe, however, died before the work was completed, and it was consequently abridged, and appeared in 1578 as the *Chronicles of England, Scotland, and Ireland*. A second enlarged ed. was pub. in 1587, but did not meet with the approval of Queen Elizabeth, and in 1808 a reprint of the original was pub. in six vols. The *Chronicles* are valuable for their historical information, and are interesting as being the source from which the Elizabethan dramatists drew their plots. Indeed, nearly all Shakespeare's historical plays, as well as *Macbeth*, *King Lear*, and *Cymbeline* are based on H.'s work.

**Holism** (from the Gk. *śōs*, whole) name given to the philosophy which holds that

there is a fundamental factor operating in the universe towards the creation of wholes. H. embraces biology, psychology and physics, and claims to be necessary to the proper understanding of evolution. H. is something akin to the naturalistic conception of physical science, but that from beginning in realism it ends in idealism. See J. O. Smuts, *Holism and Evolution*, 1926.

**Holkham**, vill. of Norfolk, England, near the N. coast, 2 m. from Wells. It is famous for its hall, seat of the earl of Leicester, built in the eighteenth century in the Palladian style. The estate was bought in 1659 by John Coke, son of Sir Edward Coke, and here the earl of Leicester, known as Coke of Norfolk, carried out experiments of great benefit to agriculture.

**Holl, Francis Montague** (1845–88), Eng. portrait painter, b. in London. He became a student at the Royal Academy schools in 1861, and first exhibited in 1864. After this date he was a regular contributor to the Royal Academy, but he did not begin portrait-painting until 1876, when he undertook a portrait of Mr. G. C. Richardson. This picture was exhibited in 1878. Among his best portraits are the Prince of Wales, the duke of Cambridge, Sir George Stephen, and Mr. W. E. Gladstone. R.A. 1883.

**Holl, Karl** (1866–1926), Ger. theologian and church-historian; b. at Tübingen. Assistant in Berlin Academy of Sciences, 1891; lecturer, univ. of Berlin, 1896. Prof.: Tübingen, 1900; Berlin, 1906. Rector of Berlin Univ. 1925. His *Gesammelte Aufsätze zur Kirchengeschichte* (1927–28) contains a remarkable study of Luther.

HENRY FOX, FIRST BARON  
HOLLAND

**Holland, Henry Fox, first Baron** (1705–1774), Eng. statesman; after a riotous youth entered Parliament in 1738. In 1743 he became a lord of the Treasury, and three years later was promoted to the office of secretary-at-war, in which position he.

remained until 1755, when he was appointed secretary of state. He resigned in the following year, but in 1757 became Paymaster-General of the Forces, and in this lucrative office he amassed a vast fortune, by methods, it is said, not the most scrupulous. He took no active part in politics after 1763, when he was created a peer.

Holland, Henry Richard Vassall Fox, third Baron (1773-1840), Eng. statesman, b. at Winterslow House, Wiltshire, only son of Stephen, second Lord H., and of Mary Fitzpatrick daughter of John, Earl of Upper Ossory. He was brought up by his maternal grandfather, and uncle, Charles James F., to whom he was indebted for his love of classical literature, also his strong Whig principles. He was educated at Eton and at Christ College, Oxford. After doing the *grand tour*, he returned to England in 1796; took his seat in the House of Lords, and made his maiden speech in the debate on the question of the Assessed Taxes Bill. He pub. *Life and Writings of Lope Felix de Vega Carpio* (1806), and *Three Comedies from the Spanish* (1807). In 1814 he visited Murat at Naples, and in 1816 strongly opposed the Bill for the detention of Napoleon as a prisoner of war. In 1830 he was chancellor of the duchy of Lancaster, which post with two short intervals, he held until his death. He wrote *Foreign Reminiscences*, and *Mem. of the Whig Party during my Time*, both ed. by his son, Henry Edward, fourth Lord Holland. See T. Macaulay, *Essay on Lord Holland*, 1848.

Holland, Sir Henry Scott (1788-1873), Eng. physician and writer, b. at Knutsford, Cheshire. He was appointed physician-in-ordinary to the Prince Consort in 1840, and to Queen Victoria in 1852. His pub. include: *Travels in Albania* (1815), *Medical Notes and Reflections* (1839), *Chapters on Mental Physiology* (1852), and *Recollections of Past Life* (1871).

Holland, Henry Scott (1847-1915), clergyman of the Church of England. Educated at Eton and Balliol College, Oxford. Took holy orders in 1872; Canon of Truro, 1882-4; of St. Paul's, 1884-1910; of Christ Church from 1910, and at the same time Regius prof. of divinity at Oxford. Editor of the *Commonwealth*. His pub. include: *Logic and Life* (1882), *Creed and Character* (1887), *Personal Studies* (1905), *Vital Values* (1906), and *Fibres of Faith* (1910).

Holland, Philemon (1552-1637), called 'the translator-general of his age,' b. at Chelmsford, Essex. Having obtained his M.D. degree at Cambridge (1591), he practised medicine at Coventry, and became headmaster of the Free School there (1628). His fame rests on his trans. of Pliny's *Natural History* (1601), Plutarch's *Morals* (1603), Xenophon's *Cyropaedia* (1632) and other classical works. He also pub. an Eng. version of Camden's *Britannia* (1610).

Holland, Sir Thomas Erskine (1835-1926), Eng. jurist, b. at Brighton; son of Rev. Thomas Agar H., rector of Poyning, Sussex. Educated at Balliol and

Magdalen colleges, Oxford. In 1874 he was appointed Vinerian reader in Eng. law, and prof. of international law and diplomacy at Oxford. He sat on the Royal Commission of 1903-05 to inquire into the supply of food in time of war, and was sent as plenipotentiary to the Geneva Conference of 1906. His pub. include: *Elements of Jurisprudence* (1880), *Institutes of Justinian* (1873-81), *Studies in International Law* (1898), *Laws of War on Land* (1908), *Proposed Changes in the Law of Prize* (1911), and *Zouche's Jus Feudale* (1911). Knighted 1917.

Holland, or The Netherlands (the name 'Holland,' properly speaking, covers only two of the provs.), kingdom with a long coast-line lying between 50° 43' and 53° 36' N. lat., and 3° 22' and 7° 16' E. long. It is bounded on the N. and W. by the N. Sea, on the S. by Belgium, and on the E. by Germany. Its greatest length for N. to S. is 195 m., and greatest breadth, 110 m. Its land area is 12,868 sq. m. and total area 15,765 sq. m. Pop. 2,542,600. It is the most densely populated major state in Europe.

The provs., with area and pop. are: Groningen (898 sq. m., pop. 447,400); Friesland (1325 sq. m., 436,600); Drenthe (1029 sq. m., 269,700); Overijssel (1301 sq. m., 833,500); Guelders (1939 sq. m., 1,019,700); Utrecht (526 sq. m., 544,600); N. Holland (1081 sq. m., 1,759,400); S. Holland (1130 sq. m., 2,256,100); Zeeland (690 sq. m., 258,500); N. Brabant (1920 sq. m., 1,168,500); Limburg (816 sq. m., 677,600); Noordostelijke Polder (183 sq. m., 1800). Inhab. without fixed residence, 48,400. The prin. tns. (over 25,000 pop.) are: Amsterdam the commercial cap. (798,300), Rotterdam (637,100), The Hague, seat of gov. and the official cap. (523,700), Utrecht (183,200), Haarlem (155,700), Eindhoven (132,500), Groningen (131,200), Tilburg (113,000), Nijmegen (105,900), Enschede (100,100), Arnhem (96,000), Leyden (86,400), Breda (81,400), Hilversum (84,200), Apeldoorn (82,600), Leeuwarden (75,600), Maastricht (75,800), Schiedam (69,000), Dordrecht (67,500), Delft (61,000), Heerlen (56,300), Amersfoort (55,400), Emmen (53,500), 's Hertogenbosch (53,400), Zwolle (46,800), Hengelo (45,500), Deventer (43,900), Vlaarding (42,900), Ede (42,300), Zaandam (41,100), Venlo (40,900), Velsen (40,700), Kerkrade (40,372), Zeist (40,200), Almelo (39,000), Alkmaar (37,400), Gouda (36,900), Voorburg (35,600), Haarlemmermeer (35,600), Bussum (33,300), Helmond (32,500), den Helder (31,500), Rheden (30,400), Rosendaal (29,300), Bergen op Zoom (28,200), and Beverwijk (25,900).

In a small space it is difficult to give an adequate idea of the hist., so rich in events that strike the imagination, as that of the people of the Hollow-land, for that is the significance of the name, Holland. 'Here, within a half-submerged territory, a race of wretched cannibals dwelt upon tepal or mounds which they had raised, like beavers, above the almost fluid soil. Here at a later day, the same race chained the tyrant ocean and his mighty streams

into subserviency, forcing them to fertilise, to render commodious, to cover with a beneficent network of veins and arteries and to bind by watery highways with the furthest ends of the world a country by nature disinherited of its rights. A region outcast of ocean and earth, wrested at last from both domains their richest treasures. A race, engaged for generations in stubborn conflict with the angry elements, was unconsciously educating itself for its great struggle with the still more savage despotism of man. In these words Motley sketches the cosmo- and techno-drama of

the Zuider Zee. The resulting polder being 523,000 aca. of land. By 1946 the following work had been completed: the Noordholland-Wieringen Burrage of 2 km. (1925), the Wieringmeer polder of 50,000 ac. (1930); the Wieringen-Friesland Burrage of 30 km. (1932) and the Noordsteiljke (N.E.) polder of 120,000 ac. (1942). The polders still to be completed (1948) are those of the S.E. and S.W. When completed the only remaining part of the Zuider Zee will be the Yasselsee, equalling 300 000 ac., retained as a fresh water lake. The maintenance of the

the Dutch folk. The features of the low-lying Dutch landscape are too well known to need description: but the placid aspect of the waterways, studded with the peculiar windmill with pumps for regulating the supply of water gives no indication of the unmitigated toil that is represented by the dykes and embankments which hold the sea in check and keep canals and rivers from overflowing their banks. Mechanical drainage, however, has now practically ousted wind power. The people have a saying that 'God made the sea, but the Hollander made the land,' and as far as their own land is concerned, that is perfectly true. They have turned the marshes formed by the delta of the Maas, the Rhine, and the Scheldt, into arable land and have reclaimed vast tracts from the sea. The lands thus reclaimed are called polders, and are highly valued. In 1818 an Act was passed to form a new prov. by damming and draining parts of

canals which run like a network all over the country, linking up riv. and lake, and the reclamation and drainage of the land are the work of a special public dept. called the Waterstaat, and involve the country in an expenditure of considerably more than £500,000 a year. Locks were in use on canals early in the fourteenth century. The largest lock in the world, that at Ymuiden, on the canal connecting Amsterdam with the sea, was opened by Queen Wilhelmina in 1930. The people of Holland have many characteristics in common with the Brit. The Dutch are a freedom-loving people, inventive and industrious. They have all the courageous qualities of seafaring folk, and have proved themselves as a nation and as colonists willing to make great sacrifices to gain or retain liberty. Among her illustrious explorers are Hudson, Heemskerck, Schouten, Lemais and Tasman. Their colonial possessions, like those of

Great Britain, are vastly out of proportion to the size of the mother country. Their E. Indian possessions include Java and Madura, Sumatra, the Moluccas, Celebes, Timor, parts of Borneo, and New Guinea; in the W. Indies, Surinam and Curaçao are their prin. possessions. After the defeat of the Jap. in 1945, however, the Indonesians rose in revolt against their Dutch overlords, demanding complete autonomy (see below under *History*); and DUTCH EAST INDIES; INDONESIA; JAVA. The Boer nation are descendants of sixteenth-century Dutch colonists in S. Africa.

**Communications.**—The favourable situation of Holland, half-way between the North Cape and the straits of Gibraltar, on the most navigated sea of the world at the mouths of excellently navigable rivers, communicating with the whole of Central Europe by a system of canals, makes the country a natural gateway, as well as an emporium and centre of commerce. In this way two seaport towns, came into existence which play a very important part in the world's trade—Rotterdam and Amsterdam. The equipment of docks, quays, store-houses, loading and unloading installations in both harbours is completely adapted to world shipping. Rotterdam, before the Second World War, depended for 75 per cent of its trade on land traffic to Germany and Switzerland and today the capacity of its docks exceeds the demands upon it because of the decline in the Rhine trade. In 1939 the number of Dutch vessels navigating the Rhine was over 6500, being 51 per cent of the total Rhine navigation. The country itself is intersected by a number of rivers, and canals, linked to the water and railway transport system leading to the heart of Europe. The other Dutch ports, although smaller, have very modern equipment and good communications with Central Europe. N. of Amsterdam lies Zaandam, the port of the highly industrialised Zaan dist. The N.E. port of Delfzijl specialises in coastal trade, notably to Scandinavia and England, as does Harlingen in the N.W. from which a number of regular services to England are maintained. Terneuzen, on the estuary of the R. Scheldt, is important chiefly in that it serves as a port to the local industries. On the map, it is observed that Holland is situated at the junction of important high roads of economical significance. England lies across the N. Sea. Belgium and France meet Holland in the S., Switzerland and Czechoslovakia are also easily attainable. Central Europe begins on her E. frontier and in the N. are the Scandinavian countries. The international airport of Schiphol near Amsterdam, is the central station for airlines flying in all directions of the compass even as far as New York, Rio de Janeiro, Cape Town and Batavia. Sev. important international airlines use the well-equipped landing-field at Schiphol, while it plays an important part also as a night-mail airport. The Royal Dutch Airlines (K. L. M.) have regular services to the most important towns in Europe.

**Railways.**—In Holland the system of railways is not as congested as in some other W. European countries, as a great share of the conveyance of merchandise is by inland navigation. As the railway traffic is mainly a passenger traffic, its speed surpasses that of neighbouring countries. A great part has been electrified. During the Ger. occupation in the Second World War the Dutch railways suffered much by the war operations. After the liberation the situation of the railways was chaotic: hardly any locomotives were left, whereas the few that remained were so badly damaged that at first they could not be used. Passenger-carriages and goods-vans had been transported to the East, rails had been taken away as well as the overhead wires of the electric railway system.

**Industry** in Holland absorbs about 40 per cent of the working pop., which is rather a curious fact, taking into consideration that the country itself is short of raw materials. Iron-ore, wood and oil must be imported from overseas, only in the S. is coal obtained in considerable quantities, which covers part of the home requirements. Potential oil-fields are being exploited in the E. part of the country. The output of the salt-mines in the E. can completely meet the inland requirements and even allows a considerable export of this commodity. The favourable location of Holland makes it possible on the one hand for raw materials to be easily imported, and on the other hand for the industrial products to be as easily exported to all parts of the world. Consequently coupled with the experience and skill of the workers, Dutch industry is primarily one of refining, in which the raw materials are processed into products for export as may be exemplified in its superphosphate and oil-works. In normal times 70 per cent of the superphosphate production was exported. The oil factories either delivered the oil obtained from cupra and seeds to the margarine- and soap-works, or they exported the final product directly to foreign countries. Blast furnace works are estab. in Ymuiden. Here imported ores are processed, the greater part of the iron being again exported. Before the war Java furnished about 90 per cent of the world's production in cinchona, which for the greater part was used by Dutch industries. This was also the case with cocoa, rice and tin production. For non-tropical products, Holland was an important world supplier. The various breweries, the margarine- and soap-works as well as the gin and liqueur distilleries may be mentioned in this respect. The great labour productivity of the Dutch people has caused industries to be developed which demanded specialised labour, such as the diamond industry, ship- and machine-building, china and earthenware manuf. as well as the radio, electrical, textile and chemical industries. Agriculture and cattle-breeding, practised widely and scientifically, founded the dairy industry, one of the first industries in Holland. Dutch butter, cheese, condensed and evaporated milk and milk-

powder are known everywhere. About half of the products from the dairy industry were destined for foreign markets.

Agriculture and farming brought into existence the important industries of canned foodstuffs, potato flour and straw board. Besides the manufacturing industries, handicrafts have flourished. The fine handiwork of gold and silver smiths and other artificers, as well as the products of the furniture maker's, glazier's and industrial arts find their way to both the home and foreign markets together with industrial products.

**Mining**—In the N., Holland possesses 12 mines all with modern equipment four the property of the gov. In the years preceding 1940, the coal production amounted to about 13 million metric tons, per annum. The Dutch mines supply a type of coal best suited to industrial purposes. Before the Second World War part of the coal destined for industrial use was exchanged abroad for house hold coal. After the liberation the production of coal from the mines decreased considerably owing to various causes such as under nourishment of the miners, lack of material enlistment of mine workers into the services, the departure of foreign labourers, and labour conflicts which arose all over the world. Through shortage of shipping space the elimination of the Ruhr as a supplier, the decline in the output of foreign collieries and miners' strikes abroad, the imports of coal were not sufficient to cover the requirements of the industries and private use. However, the production rose from 326,000 tons per month in 1945 to 840,000 tons per month in 1947.

As a secondary by product to coal mining reference can be made to coke and briquette factories, chemical factories for the production of nitrogen, hydrochloric acid, chloride of lime, coal tar products, etc. The chemical works which manufacture secondary products of coal have an important share in the industrial production of Holland. Thus, important industries have been created such as those of artificial manure, plastics, dyes, pharmaceutical products, alcohol, lubricants, soap, artificial silk, perfumes, road covering materials, insecticides, saccharin and disinfectants. These articles form an important part of Holland's export. It can be expected that this young industry, which is so closely linked up with coal mining, will considerably expand in the future.

**Agriculture and Horticulture**—Owing to the dissemination of excellent agrarian information, and extensive research work, Dutch agriculture has succeeded in gaining, qualitatively, an important place in the world. Because of the density of the agricultural population Dutch agriculture had to specialise in the production of fine agric. produce, such as valuable seed crops, vegetables and fruit, bulbs and decorative plants. In addition Holland has the advantage of having neighbouring countries which have developed gradually into industrial countries. Consequently their demand for agric. products has increased considerably in the course of

years. The communications between Holland and her neighbours are short, which makes it possible to bring the above mentioned products fresh on the foreign markets. Even aeroplanes are sometimes used for this purpose. The importance of the export of agric. products is shown by the following figures before the Second World War Holland exported from 200,000 to 350,000 tons of potatoes; in no other country in Europe did the export of potatoes exceed 100,000 tons. As for cheese, about 60,000 tons were exported against a bare 20,000 tons from other countries. The export of condensed milk amounted to 170,000 tons. Denmark only once reached a quantity of 20,000 tons and the exports of other countries were even far below this amount. The importance of Holland's export is also shown by the fact that of the total production of bulbs, trees, shrubs, vegetables and fruit, 90, 90 and 70 per cent respectively (according to their values) were exported. In 1938, 64 per cent of the total value of butter, cheese and milk powder produced was exported. In the same year export figures for poultry (for consumption purposes) and egg production amounted to 28 per cent and 50 per cent respectively of the total value, although fertilisers and fodder had to be imported. Seen from this point of view it can be easily understood why Holland takes the fifth place among the wheat importing countries, fourth place for the import of barley and third place for corn. This implies therefore that Holland is an important buyer for grains on the world market. The high standard of Dutch agriculture is also evident by harvest results, these being considerably above the average for Europe in 1939.

**Fisheries**—Fishing is one of the oldest Dutch trades which throughout the ages has made important contributions towards the national income. The herring industry is intensively developed and before 1940 Holland had a very modern herring fleet. In 1938 the herring catch amounted to 100,000 tons in weight which represented a value of over £800,000. Many ships were lost through war operations or were rebuilt by the Germans for war purposes. In May, 1946, however, thanks to the initiative of shipping companies and fishermen, a herring fleet again sailed from Scheveningen for the first time since the beginning of the war.

A remarkable activity has developed in the exploitation of modern refrigeration ships. The whaling industry which in former centuries used to be of great importance in Holland, but declined in later years, has been reorganised. There is also oyster culture in the prov. of Zeeland.

**Defence**—The pre 1940 Army was composed partly of volunteers and partly of men drawn by lot for five years' service, and kept on a peace footing of nearly 400,000. The colonial army numbered nearly 40,000, of whom about 14,000 were Europeans. The *schutterij* are a kind of soldier policeman who, in times of war, can be mobilised. The armed forces are in the process of being re-organised. The

Dutch Navy consists of an escort aircraft carrier, *Karl Doorman* (13,800 tons), 2 cruisers of 3350 tons displacement and an armament of 4-in. and 6-in. guns; 7 destroyers, 12 submarines, 4 minelayers and other craft. Many of the ships of the pre-war Navy were assigned to the E. Indies Fleet. Both Army and Navy have their own separate Air Force.

**Government and Justice.**—The gov. of H. is a limited and hereditary constitutional monarchy. The executive power of the State belongs exclusively to the sovereign but is exercised by a responsible council of ministers. The legislative

power is vested in the States-General and confirmation of the Bill by a two-thirds vote of the new States-General.

Justice is administered by the High Court of the Netherlands (Court of Cassation), by five courts of justice (Courts of Appeal), by nineteen district tribunals, and by sixty-two cantonal courts. Trial by jury is unknown. The Cantonal Court, which tries minor offences, is constituted of a single judge; the more serious cases are tried by the district tribunals, formed, generally, by three judges; the courts are constituted of three and the High Court of five judges. All judges are appointed

D. McLeish

## AMSTERDAM

The Voorburgwal Canal and the Church of St. Nicolaas

rests conjointly in the sovereign and States-General. The latter, or Parliament, is bi-cameral: the first or upper chamber is composed of fifty members, elected by the Provincial States; and the second chamber of 100 deputies elected directly. There is universal suffrage and the system of election is by proportional representation. Deputies are elected for four years and retire in a body, whereas the first chamber is elected for 6 years, one-half retiring in rotation every three years. The gov. and the second chamber only may introduce new Bills, the functions of the upper chamber being restricted to approval or rejection, without power of amendment. The meetings of both chambers are public, though each may, by majority decision, form itself into a private committee. The ministers may attend the meetings of the States-General, but unless they are members, they have only a deliberative vote. Alterations in the Constitution can be effected only by a Bill giving reasons, followed by dissolution

for life by the sovereign (the judges of the High Court from a list prepared by the Second Chamber). They can be removed only by a High Court decision.

**Culture, Education, and Religion.**—In practically every domain of art and science the Dutch have contributed a signal share. Although comprising only a small percentage of the European population, the Dutch people have on the whole an honourable share in European culture and in some instances, have even made a preponderate contribution. In New York and Paris, in the National Gallery in London as well as in the Hermitage in Moscow, the pictures of Rembrandt, Frans Hals, Ruysdael, and Johannes Vermeer bear witness to the glory of Dutch painting in the seventeenth century. Of the painters of a later period Van Gogh and Breiter have especially become famous. The Amsterdam Symphony orchestra (Conzertgebouw) is among the best orchestras in the world. Amsterdam, having been constructed from

anct. times onwards according to a definite scheme, is from an architectural point of view one of the most beautiful cities in the world. The seventeenth-century buildings and the modern quarters vie in beauty and stateliness, thereby giving an excellent example of Dutch architectural taste. The numerous monumental churches all over the country within whose walls an intensive spiritual life flourishes, also form a lasting reminiscence of the skill of Dutch architects (see further under Dutch Art). The names of Erasmus, Huig van Groot (Grotius), Spinoza, are well-known names in hist.; Stevin, Huygens, Swammerdam and Van Leeuwenhoek excelled in the technical sciences. At the many technical institutes and laboratories scientific pioneering labour has been effected and continuous research work is being done to find new methods and improve results. Since the 'Nobel' prize was instituted, it has been awarded on sev. occasions to Dutchmen: the scientists Van 't Hoff and Debye for chemistry, Lorentz, Zeeman, Van der Waals and Kamerlingh Onnes for physics, Einthoven and Eykman for medical science and Asser for peace.

H. has a well-founded reputation for a superior system of education. It is compulsory under National Law (since 1920) for students to attend school up to their fifteenth birthday. Most students however avail themselves of an excellent system of secondary schools.

The anct. univs. of Amsterdam, Leyden, Utrecht, Groningen have been supplemented by the Rom. Cath'olic Univ. of Nijmegen and the Calvinist Univ. of Amsterdam; there are also three univs. specialising in agriculture, technical subjects, and economics. There are naval and military colleges at Breda, and technical colleges at Delft.

Entire liberty of conscience is granted to the members of all religious confessions. The royal family and a great part of the people belong to the Reformed Church. By the census of 1930, the adherents were: Dutch Reformed Church, 2,732,000; other protestants, 877,000; Catholics, 2,890,000; Jansemits, 10,000; Jews, 112,000; other creeds or those of none, 1,314,000 (other, 169,600, no religion, 1,144,400).

The language of H., though akin to both Eng. and Ger., has yet a separate identity. In the eleventh century the anct. Dutch dialects were spoken in a wider area than that now occupied by the present H. and Flanders, and old Dutch (or Flemish) is still to be heard among villagers in the N. of France. Early in the fifteenth century literary clubs were founded by the Rederijkers, or lovers of letters, who met together to study literature and plays. To these clubs modern Dutch owes its origin. From the twelfth to the sixteenth century there was no unity either in the written or in the spoken language. A trans. of the Bible ordered by the Dutch Gov. in 1619 and carried out by the best Dutch and Flemish philologists further laid the foundation of modern Dutch. A uniform mode of writing was achieved in all provs.

during the eighteenth century, but uniform speaking of the 'Standard' Netherlandish is still one of the aims of Flemish teaching in particular. In 1946 the spelling of Dutch was simplified after decades of discussion led by the fervid promoter, Dr. Kolloewijn.

The liberty of the Press brought much foreign printing to H., and the *Gazette de Leyde*, which distributed news to all parts of the world, was in existence from 1680-1814. Illiteracy hardly ever occurs in H. Knowledge of foreign languages is customary rather than exceptional a fact common in small countries with export m'rks, and forced on the Dutchman by the fact that their own language is unknown to most of his customers. Long-wave radio stations have been estab. at Hilversum and Huizen, and a shortwave station at Zoelen, which is used largely for transmitting news to the Dutch colonies.

*Literature.*—During the late middle ages literary activity was concentrated almost entirely in the Flemish part of the country. Towards the end of the sixteenth century, the Dutch language proper was perfected, owing this in part to national consciousness aroused by the religious persecutions in the S. Netherlands, dominated by Spain. With the Reformation in H., the young independent country, owing something also to the migration of many Flemish Protestant families to the N., became the centre of literary life. The most brilliant writer of this period, generally called 'De gouden eeuw' (The golden century), was Joost Van den Vondel (1587-1679), an outstanding poet, whose successful tragedies are still regularly performed. Important contemporaries are the popular allegorist and moralist Jacob Cats (1577-1660) and the more satiric humanist C. Huygens (1596-1687). P. O. Hooft (1581-1647) is the author of beautiful erotic poems and of one of the best comedies of that time and G. A. Brødere (1583-1618) depicted in his moral pieces vice in rude terms. This rich classical period of the Dutch literature ended in the last decades of the seventeenth century. J. Luyken (1619-1712), a melancholic mystic, may be considered to be the last important poet of the 'golden century.' In the eighteenth century literature declined, being mostly imitative of Fr. models, but a major exception is W. Langendijk (1683-1756), writer of numerous and good farcical comedies. The first decades of the nineteenth century witnessed the rise, of romanticism. Willem Bilderdijk (1756-1831), A. C. W. Staring (1747-1840) and H. Tollens (1780-1856) are the most characteristic figures of this transitional period. I. da Costa (1798-1860) trans. and introduced Fr. and Eng. romantic poets to Dutch readers. The romantic movement in H. was encouraged by a literary periodical *De Gids* (The Guide), ed. by Bakhuizen van den Brink (1810-65) and E. J. Potgieter (1808-75). The latter was a successful poet and novelist as well as a critic, and his influence was strong towards the encouragement of a

national literature. Van Lennep (1802-1868) who first trans. Walter Scott into Dutch and wrote some remarkable historical novels, enjoyed great esteem, while important contemporary novelists were Limburg-Brouwer (1795-1847), Anna Bosboom-Toussaint (1812-86) and Alberdingk Thijm (1820-89). At this time a group of brilliant writers, including especially N. Beets (1814-1903) and P. Hasebroek (1812-96) were founding their work on Eng. models but revealed their native originality in their observation of Dutch life. In 1860 the *Nederlandse Spectator* appeared, a weekly review associated especially with M. P. Lindo (1819-1877), an Englishman by birth and translator of Fielding and Sterne, and C. Vosmaer (1828-88), an artist and poet. In 1860 also was pub. *Max Havelaar*. This book was an indictment of Dutch colonisation written by Eduard Douwes Dekker (1820-87) under the pseudonym 'Multatuli.' It was undoubtedly the most important book of the century, and Dekker had a great influence on the succeeding generations, who greeted in him their pioneer. Those who derived from Dekker and his sensational work were the poets W. Kloos (1859-1938), F. van Eeden (1860-1932), A. Verwey (1865-1937) and the sensitive Van Deyssel (b. 1864). They were fervent adherents of 'art for art's sake' and associated in a periodical *De Nieuwe Gids* (*The New Guide*), opposing them to the superannuated *Guide*. His first publication in 1887 marked another literary event in the second half of the nineteenth century, inaugurating a prolific movement in which the poet H. Gorter (1864-1927), the novelists L. Conperius (1863-1923) and J. van Looy (1855-1930) and the dramatists H. Heyermans (1864-1924), and Jan Fabrikus (b. 1871) stand out as pre-eminent. Later writers are I. Querido (1873-1932), author of naturalist novels and the poets P. C. Boutens (b. 1870), J. H. Leopold (1865-1927) and Henriëtte Roland Holst (b. 1869) and the novelist A. van Schendel (b. 1874). Among the poets of the latest decades should be noted Adama van Scheltema, G. Gosswaert, J. G. Bloem, J. Ghesloot, Wernicus Buning J. Slanerhoff, H. Marsman, J. Engelman and A. Donker. Among the novelists are mentioned: A. Van der Leew, N. Van Suchtelen, A. Coolen, S. Vredijk, J. Fabrikus Jr., F. Bordewijk, A. Den Doolaard, A. Holman, and T. de Vries. See also FLEMISH LITERATURE.

*History*—The inhabs. of the Netherlands are descendants of a people called by the Romans the Batavi, who lived on an is. between the two branches of the Rhine, and the Frisians who dwelt further N. They are described as a hardy, hospitable, faithful folk, who hunted fish and, or led a pastoral life. Their religion was simple, and they were chaste and honourable. The Rom. rule lasted until the fourth century, when the Franks overran the country. Charlemagne's dominion in the eighth century extended to the Netherlands, and he built a palace at Nijmegen on the Waal. Upon the establishment of the

feudal system the country was divided into small sovereignties. In the year 922 Kirk became count of H. and the other Netherlands provs. such as Namur, Hainault, Limburg, and Zutphen, were divided between various barons and counts, autocratic rulers, owing allegiance to the dukes or earls of Lorraine, Brabant, and Flanders. Holland, Zeeland, Utrecht, Overijssel, Groningen, Drenthe, and Friesland, which were afterwards to form the United States of the Netherlands, were chiefly under the rule of the counts of Holland and the bishop of Utrecht. It was during the 'five dismal centuries of feudalism' that cities began to spring into importance and the rise of a world-wide commerce began. In 1381 the Netherlands became the property of the duke of Burgundy, and a little more than a century later were united to Spain under Charles V. The struggle for freedom and for civic and religious independence that was to last so long had already begun and came to a crisis in the reign of Philip II of Spain in the middle of the sixteenth century, the immediate causes being the imposition of the Inquisition with all its horrors upon the people, and the maintenance of a standing army. Wm. prince of Orange, known as Wm. the Silent, was the king's lieutenant in Holland, Zeeland, and Utrecht, and to his devotion to the cause of the rights and liberties of the people the republic ultimately owed its existence. It would cover too much space to give even an outline of the story of the war waged by the burghers against political and religious tyranny. By the capture of Briet in 1572 Spain received the first reverse, and the people who had been ground into dust began to hope. In 1579 the Union of Utrecht was formed, by which the N. provs. banded themselves together to resist Spain, and in 1581 the Netherlands declared their freedom. Wm.'s assassination 1584 did not prevent the continued success of the people against the efforts of Philip to regain the lost provs. He was beaten again and again at sea, and his successor was obliged to sue for a cessation of arms for twelve years. These years enabled the Dutch to regroup themselves for losses by attention to trade. The war, renewed after the armistice, was continued until 1648, when, by the treaty of Munster Spain recognised the independence of the Netherlands.

While this protracted struggle was in progress, the Dutch were making themselves masters of the sea. Their ships were in every ocean. The E. India Company, which led to the foundation of their Indian empire, was started in 1602. Amsterdam, which instituted the first Stock Exchange or Bourse, in 1532, had become one of the richest cities in the world. Trade brought rivals, and two great naval wars were fought against England in 1622-54, and again in 1664-76 in which the Eng. admirals found themselves about equally matched by De Ruyter, Van Tromp, and others—the former, inflicting upon England the indignity of sailing up the Medway and the Thames,

destroying ships, in 1667. Then followed the war in which France and England were united against the republic; and which but for the Dutch prowess at sea, might have ended disastrously for the Netherlands. The political struggle between the De Witt faction and that of the prince of Orange ended with the terrible death of the brothers De Witt and the triumph of Wm. of Orange, who secured the friendship of England by his marriage

were formed into the kingdom of the Netherlands. This union was not satisfactory; there were temperamental and religious differences between the people that were not easy to harmonise. In 1830, therefore, the S. provs. seceded and Belgium was formed into a separate kingdom. The decline of H. as a world-power after the seventeenth century would seem to have been due to some extent to the diverse Celtic and Ger. elements in the

THE PEACE OF MÜNSTER, MAY 15, 1648, BY GERARD TERBURG

The scene in the Rathaus, Münster, Westphalia. Left to centre, raising the right hand, are the six delegates of the Dutch United Provinces: W. Ripperda for Overijssel, F. de Doffa for Groningen, G. van Reede for Utrecht, A. Pauw for Holland, J. van Matenesse for Friesland, and B. van Ghent for Gelderland. Centre right, their right hands on the Gospels, are the plenipotentiaries of Philip IV. of Spain.

with Mary of York. This led to his subsequent elevation to the throne of England, under the title of Wm. III. Eng. and Dutch then fought side by side in inflicting defeat upon Louis XIV. of France. The treaty of Utrecht in 1713 concluded the war, and also the period of Holland's greatness as a world power.

The close of the eighteenth century saw the Netherlands overrun by Napoleon's troops and paying tribute to France. Louis Bonaparte was made king of Holland in 1806, but resigned four years later and the country was attached to the Fr. empire. During these changes the Orange family had been obliged to make their escape, but on the fall of Napoleon they were recalled, and the N. and S. provs.

pop.—elements dissimilar in their tendencies and always difficult to reconcile. The prin. events in the hist. of the kingdom since 1830 are, briefly, the following: In 1810 Wm., for political reasons abdicated in favour of his son, who, in 1848, granted a new constitution to the people. The question of the duchy of Luxemburg (from 1815 a title of the king of H.) was settled in 1868 by making it an independent state. In 1887 the Dutch obtained from their sovereign a new constitution by which the electorate was largely increased. In 1890 Queen Wilhelmina, then only a child, came to the throne. Her husband was Prince Henry, duke of Mecklenburg-Schwerin (d. 1934) and her daughter Princess Juliana (b. 1909) became heiress to the throne to

which she succeeded in 1948 (*see below*). The Palace of Peace, to which many nations contributed, was opened in 1913. It is situated at The Hague. H., after the Belgian secession from the joint kingdom set up in 1814, played little part in European hist.

In the last decades of the nineteenth century there arose a vigorous movement of material and intellectual expansion, a movement which had by no means spent its force even after the shocks of the First World War, which naturally affected H.'s overseas trade. In the inter-world war period, new industries were still coming into existence, as e.g. the Phillips electrical works at Eindhoven, the rayon industry at Breda; while, at the same time, agriculture, particularly cattle breeding dairy farming, and horticulture, all of which industries in the previous decades had begun to make good use of new methods of organisation and scientific research, greatly prospered. Again, the coalfields of S. Limburg, which owed their later development to the fact that during the First World War the supply of Ger. coal became restricted, were exploited with considerable success; while the great scheme for the reclamation of the Zuider Zee, so as to add a new prov. to the country, was launched (1924). (*See supra*). During the First World War H. remained neutral and consequently was not so seriously affected by it as the belligerent countries. The ex-Kaiser Wilhelm and the ex-Crown Prince found refuge at Amerongen when they fled from Germany in Nov. 1918. The ex-Kaiser settled at Doorn. Although faced with the problems arising out of the war (1914-18), the Dutch Gov. persevered with the policy of political and educational reform to which it was committed by the previous Liberal and Radical govs. of Kuyper and Bos. Probably the quickened sense of national solidarity accelerated the rate of social reform: for in 1917 the gov. had carried out its programme. Universal suffrage and proportional representation were introduced: at the same time, the principle of absolute equality with regard to the public exchequer of 'public' undenominational education and 'private' denominational education, was conceded in full and incorporated in the Constitution.

*History during the Second World War.*—Ger. planes bombed Dutch ins. before dawn on May 10, 1940 and then land forces crossed the frontier. This attack had been expected, but its exact direction and timing were partly a surprise. The Dutch had no experience of modern warfare. It was five generations since the last hostile troops had entered their ter. They were now to receive the rudest awakening, and their situation was aggravated by an immense Fifth Column (q.v.): for there were 100,000 Gers. living in Holland and a great many belonged to the National Socialist movement led by A. A. Mussert, a Dutch engineer in charge of the roads of Utrecht, who consistently followed the line of propaganda of Dr. Goebbels (q.v.). Later, on May 10

numerous Ger. paratroops were landed, especially on the big aerodrome of Waalhaven. The strategic situation in the vital S. of H. was weakened by the fact that the Dutch and Belgian defence-systems did not really supplement each other and to some extent it may even be said that the Belgian system was based on a Ger. occupation of the Netherlands, whereas the Dutch system envisaged the possibility that the Ger. forces would pass through the S. of the country and leave the heart of H. alone. On May 11 a Ger. armoured column entered Brabant and violent fighting occurred in the Hague. In the S. of the country Ger. armoured forces now constituted the gravest menace and, on the next day, they reached Dordrecht, thus cutting communications with Belgium and France. In the N. the Dutch succeeded in beating off a heavy attack when the Gers. tried to cross the Zuider Zee. The following day the Queen left on a Brit. destroyer for England and later that day was followed by the Dutch cabinet. The Dutch troops, forced back on the *Grothe Linie*, retired to the *Water Linie* but their reserves were fully occupied against paratroops and fifth columnists. On May 14 the Ger. armoured column reached Rotterdam and heavy fighting took place between the Gers. on the S. and the Dutch on the N. of the riv. The Gers. now decided to destroy the centre of Rotterdam by air bombardment in order to force the Dutch to surrender, and within four hrs. 25,000 dwellings were destroyed and the entire centre of the city became a blazing inferno. In that single afternoon 30,000 persons perished and another 80,000 were homeless. The city was still burning a fortnight later, for the water mains were damaged. Without doubt thousands of people suffered lingering deaths under the burning ruins with no hope of rescue. Whole vills., too, were wiped out in a few hrs. In the face of this, one of the worst crimes of human hist., there was no course open to the Dutch commander but to surrender and the Dutch troops laid down their arms, though some continued to fight for some days in Zeeland. Thus ended the brief and tragic Five Days' war in the Netherlands (*see further under* WESTERN FRONT IN SECOND WORLD WAR). The Ger. vanguard entered Amsterdam on the 15th. Ordinary life came to a standstill. Thousands of people committed suicide, most of them Jewish or non-Jewish refugees from Germany. To make a good impression on the Dutch Hitler appointed Dr. Seyss Inquart to be Ger. Commissioner for the occupied Netherlands. His supposition was that the Dutch would like an Austrian better than a Prussian, but the people had not forgotten Seyss Inquart's betrayal of Austria. As in Belgium so in H. the Gers. tried to win the people by propaganda and cajolery. They announced that the New Order would leave things as much as possible in the hands of the Dutch themselves. Dutch prisoners of war were speedily returned—but only to swell the ranks of the unemployed after

a 'reconstruction scheme' had proved a failure. The Nazification of H. was to be organised so gradually that the Dutch would be hardly aware of the process. A Council of Secretaries-General was to be the nominal gov., but the real gov. consisted of the Reichskommissioner and his assistants, while a group of Ger. officers were appointed to supervise Dutch provincial and municipal life. The Ger. order was characterised by its financial organisation under which Berlin was the centre of a European system of multi-lateral clearing, which made it easy for the Reich to sap the economic resources of the countries occupied by their troops. Dutch factories which fitted into the Ger. war-machine had orders forced upon them. The Dutch wharves were used for constructing Ger. U-boats. Dutch engineering industry was soon working to full capacity on Ger. army orders. High prices were paid for agric. produce, but in reality the Dutch farmer was paid with the financial reserves of the Dutch people, of which his own reserves necessarily formed part. The damage of the Five Days' war was put at £200,000,000 or half the national income; but the Dutch State had to pay the usual costs of occupation, which were calculated at £6 per head of the pop., i.e. £48,000,000 a year or half the State's yearly expenditure. Thus H. was crushed under its financial burdens and the standard of living rapidly declined. Produce was carried away into Germany. Supplies, whether ample or scarce, were in the first place destined for consumption by the Ger. troops. The people were reduced to the role of mere drawers of water and hewers of wood for the Ger. overlords. Everything was done by Seyss Inquart to impregnate Dutch institutions with the 'Nordic culture'. A Council of Enlightenment was created to supervise the activities of the Press. The Dutch trade union movement was taken over by the Dutch Nazis and a 'Strength-through-Joy' movement was organised under the Labour Trade Union. All Dutch artists, who refused to join a Nazi 'guild', were excluded from official commissions. A special body was set up to examine all school-books and hundreds of thousands of books were destroyed. Public libraries were ruthlessly mutilated in the interests of 'friendly relations between Germans and H.'. The fact that the Dutch people proved to be immune against Nazi cultural infiltration was largely due to the Churches, which developed into a stronghold of patriotism. All Jews were dismissed from the Civil Service. But if the Gers. were able to close all schools and univs. and to fill the papers with propaganda and broadcast Nazi speeches all day, they were not able to turn the Dutch themselves into Nazis. This is the more creditable to the Dutch in view of the careful preparations from 1933 onwards by A. A. Mussert to secure the destruction of the independence of H. in the interests of the Nazis who, as early as that year, placed large funds at his disposal for purposes of subversion. Seyss Inquart declared that it was forbidden to speak

about national independence under the House of Orange. The programme of the new 'Nederlandsche Unie' seemed at first to involve a compromise with the Nazis. Final judgment about the Unie must be reserved, but at least the organisation rendered service as a rallying-point of Dutchmen who refused to be browbeaten by Dutch Nazis. Queen Wilhelmina remained more than ever the symbol of the will to resistance. There was active resistance too and the Ger. military commander found himself forced to issue warnings against all kinds of sabotage.

H. did not again figure in land operations until late in 1944 when the Anglo-Amer. chiefs of staff decided to use the newly-constituted Brit. and Amer. Airborne Divs. on Sept. 17, to assist in seizing the Rhine crossings at Nijmegen and Arnhem after the rapid advance by the land armies. It seemed probable that through rapidity of exploitation both the Siegfried Line (q.v.) and the Rhine might be crossed and strong bridgeheads established before the Gers. could recover sufficiently to make a definite stand in the Arnhem area. Had this been accomplished it might well have shortened the war by several months and the attempt would appear to have been justified for from the time when the allied armies first crossed the Seine in force to the employment of the Airborne Army in H. on Sept. 17, the ground forces made prodigious strides. The first landings of the airborne troops were made on Sept. 17 and reinforcements followed on successive days. Eindhoven soon fell to the allies but heavy Ger. resistance slowed down the follow-up of the Brit. Guards Armoured Div. Nijmegen was still held by the Gers. as too was the extremely important concrete and steel bridge crossing the Waal, and even when this bridge had been crossed the Brit. forces found that the Gers. had had time to oppose a strong anti-tank screen. There was confused and heavy fighting in the area between Nijmegen and Arnhem during the ensuing few days and the position of the First Airborne Div. became so precarious that on Sept. 25 orders were given for the withdrawal of all forces across the Lower Rhine (for full details see WESTERN FRONT IN SECOND WORLD WAR.—*Battle of Arnhem*). After this the Allies turned their attention to opening up Antwerp, for though the great port had fallen to them on Sept. 4, the harbour was useless until the Scheldt estuary was cleared of mines and S. Beveland and Walcheren Is. commanding the sea lane to the harbour had been reduced. The operation to achieve this involved the employment of amphibious forces, but by Sept. 30 the whole of S. Beveland had been cleared by Brit. and Canadian forces and the troops then continued their attack against the causeway connecting the S. Beveland Isthmus with Walcheren. Against Walcheren the Canadians attacked from the W., while amphibious forces, landed (Nov. 1) at both Westkapelle and Vlissingen, converged on the strategic points of the Is. Much help was given to the forces by the support craft of the Brit.

Navy, which, in the highest traditions of the service, 'attracted to themselves the point blank fire of the land batteries, thus permitting the commandos and assault troops to gain the shore with much lighter casualties than would otherwise have been the case'. The three converging ground forces, attacking over terrain made extremely difficult by flooding and suffering heavy casualties advanced with great gallantry against stiff enemy resistance to capture the strong points of Veere and Middelburg and wipe out enemy opposition. By Nov 9 all resistance had ceased and some 10 000 troops had been captured. After this the line

economical way to free the country was to complete the destruction of the enemy forces elsewhere. In N.E. Holland and along the coastal belt eastward, the Canadians continued their operations to clear the area, taking Oldenburg on May 2. In W. Holland, however, no further ground advances were made across the flood barriers behind which the Ger. Twenty-fifth Army lay entrenched. The situation confronting the Allies in W. Holland was difficult. Civilian conditions there had deteriorated steadily for some months, and after the advance of the Allied armies to the F. had isolated the area from Germany, the position of the

*Netherlands Naval Tourist Office*

#### HORTICULTURE IN HOLLAND NARCISUS FIELDS AT LISSE

at Nijmegen westward to the sea was held by the Canadians so that, after the Rhine had been crossed into Germany, a thrust to the Baltic would isolate the Ger. forces in H. Early in April the first Canadian Army was probing into H. Resistance in North Holland collapsed in the first week of April and the ex. was reached on April 15. By the 21st the whole area apart from a small tip in the N.E. was cleared as far as Harderwijk and the E. shore of the IJssel Meer. To the W. the IJssel R. line was stubbornly defended at Deventer and Zutphen but the former fell on April 10. In the S. part the Canadian first Corps attacked from Nijmegen, and Arnhem was taken on the 15th. The Gers. now withdrew into 'Fortress Holland' behind the Grebbe and New Water lines, protected by floods, beyond which no further Allied advance was made in this sector. It was felt by Field Marshal Montgomery that an advance into H. would occasion great additional suffering for that unhappy country and that the quickest and most

pop. became desperate. It was essential, therefore, that steps should be taken by the allies to relieve the growing distress before wholesale starvation took place. The strength of the Ger. defences was such that an operation on a great enough scale to ensure success would have meant a serious weakening of the main allied armies in Germany just when it was all important that they should press home the attacks which were bringing about the final collapse of the enemy there. Moreover, even had the allies been able to launch an offensive against W. Holland at that moment, the Gers. would have opened the dykes to flood the whole country, ruining its fertility for many years to come. The Allied commanders therefore warned Gen. Blaskowitz, the Ger. commander, that such a course would constitute an indeble blot on the honour of the Ger. army and that the retention of Holland could not impede the coming collapse of Germany. Seyss Inquart recognised the hopelessness of the Ger. situation. With the relief of the

Dutch thus assured, no useful purpose was to be served by attempting inroads into 'Fortress Holland' at this time and the liberation of the country soon followed on the final collapse of all Ger. resistance in Europe.

The task of reconstruction was begun immediately after liberation. Of the twenty-five big bridges on the main roads all but six were either wrecked by bombing or blown up by the retreating Gers. and of the twenty-six important railway bridges only three were undamaged. By the spring of 1947 the rebuilding of all the main road bridges had been completed either with permanent or temporary structures and nearly all the railway bridges had been replaced. The main communications having been re-established and the most important harbour installations repaired, constructional energies were next directed to the dual task of house building and rehabilitating the flooded agric. areas (more than 8 per cent of the agric. land was flooded and more than 2 per cent land waste by Ger. fortified zones, minefields and aerodromes), much of the latter task being achieved by the end of 1947. The serious housing situation in which the country found itself after the war is indicated by the fact that nearly one-fourth of the total number of dwellings were damaged and nearly 1.75 per cent totally destroyed. The Gers., however, permitted civil building during the first two years of occupation and some towns damaged in 1940, such as Rhene and Middelburg, were partly rebuilt and a start made on reconstruction elsewhere; but in 1942, when the Gers. concentrated labour and materials on building their 'Atlantic Wall,' all civil building was stopped. By 1949 there were still four years of housing arrears to be made up or about 250,000 houses, a task rendered the more difficult by the fact that the normal rate of increase of pop. has risen from 100,000 per annum before the war to 170,000, and also that temporary houses of prefabricated construction have not been utilised in H., brick being preferred even for small houses as that commodity is the one indigenous material produced in sufficient quantity. Rents are restricted to the 1940 level, although building costs have risen by 300 per cent. The gap between costs and rental values has now been bridged by a gov. subsidy. The city of Amsterdam was the first in Europe to adopt a regional development plan and other Dutch cities have followed its pre-war example encouraged by fresh legislation which gave to a board of commissioners for reconstruction control over the disposal and utilisation of land. Nijmegen has taken emergency measures to rebuild its devastated commercial centre lest it forfeit its position to Arnhem, its rival. Arnhem, where destruction was more widespread, is concerned particularly with traffic access and has a reconstruction plan which provides a ring road round the old centre of the town, links it with a residential suburb S. of the Rhine, and gives new industrial facilities. Un-

like these battlefield towns, Amsterdam did not suffer large-scale damage and has pursued unchanged its progressive pre-war town-planning policy. Open planning of flats in parallel blocks now take the place of the closed court-yard type of plan that prevailed from the beginning of this century almost up to the war. Work has started on a new residential neighbourhood W. of the city, which promises to be a model of its kind and will include a large lake, the Slotervaart, to be formed as the earth required to build up the surrounding ground above polder level is excavated. Amsterdam has, in addition, a planning project for the congested Jewish quarter of the city where the old houses were demolished by the Dutch to provide fuel for the rigorous last winter of the occupation. Here tree-lined boulevards are being laid out for the narrow streets facing the canals. War damage in The Hague was largely confined to two areas, one near the centre and the other to the N. by the suburb of Scheveningen. The rebuilding plan provides a large new square surrounded by gov. offices, which latter are now inconveniently crowded, and a new graded road system within the city. Of all Dutch cities Rotterdam has the most ambitious plans for reconstruction (see under ROTTERDAM).

On Jan. 25 1945 the first special tribunal for the investigation of collaboration charges was opened at 's Hertogenbosch. It was estimated that about 2 per cent of the pop. had collaborated with the Gers. Over 90,000 persons were detained in the course of 1945. On Dec. 12 the leader of the Dutch Nazis, Mussert, was sentenced to death by a special court at The Hague. On May 3 Queen Wilhelmina returned to H. and invited Prof. Schermerhorn, a leader of the newly-formed Netherlands People's Movement, to form a new gov. in combination with W. Drees, a Socialist member of the second chamber. Following the elections for the Lower House (May 17) in which the Catholic People's party and the Party of Labour obtained respectively thirty-two and twenty-one of the 100 seats, the Schermerhorn gov. resigned. Elections for the Provincial States (which in their turn elect the members of the Senate or upper chamber of the States-General) also saw an increase in the representation of the Catholic people's party and Dr. L. J. N. Beel became Prime Minister. The first joint session of the two newly elected chambers was opened by the Queen on July 23.

The dominating question was the Indonesian problem, and, in view of the importance to the metropolitan country of its Indonesian Empire, it is not surprising that the question continued to agitate public opinion both in H. and in the Dutch East Indies and to dominate parl. discussions for sev. years. In July 1946 a bill was introduced for the appointment of a Commission-General to be sent to Java in order to facilitate further negotiations, the conferences between Indonesian representatives and the Dutch cabinet in H. having proved abortive. The Bill,

which delegated wide governmental authority to the Commission-General, was passed by the States-General in the autumn. The Commission (with Prof. Schermerhorn as Chairman) left H. in time to resume the interrupted negotiations in Java at the end of Sept. and returned after the initialling on Nov. 15 of the Cherbon draft agreement (see *INDONESIA*). At once the agreement became the subject of fierce controversy throughout H., Labour and other Left wing parties supporting the proposals while the Calvinist Anti-Revolutionary and other Right wing parties were in determined opposition. The Cabinet eventually announced its intention of adopting the agreement as the foundation of more detailed plans to be worked out by further negotiation. In the parl. debate the final vote (Dec. 20) resulted in sixty-five votes against thirty in favour of the proposals, and the Commission-General, thus strengthened by public opinion in H., then left again for Batavia. The difficulties implicit in the problem of reaching a settlement of this question was the main preoccupation in H. throughout 1947. One major difficulty was that the Indonesians had up till now refused to accept the Dutch interpretation of the Lingradjati agreement, but this agreement was signed on March 25, giving *de facto* recognition to the Indonesian Republic in Java, Sumatra and Madura and envisaging the formation of a sovereign nation—the United States of Indonesia—by Jan. 1, 1949. Discussions that followed with the Indonesian leaders on economic matters revealed differences which could not be adjusted and the gov. then gave the leaders fourteen days in which to make up their minds to take action for the foundation of the United States of Indonesia within the Dutch Empire; but it was obvious that they had next to no control over, or perhaps no real wish to control, the extremist elements in Java and frequent violations of the agreement continued to occur. In July (1947) the Prime Minister (Dr. Beel) in a message to the Indonesians, emphasised that it was imperative that they should cease hostilities if the agreement were ever to become a reality. At the same time a message was sent to the Secretary-General of the United Nations explaining that the action being taken by the Dutch Gov. in Java consisted of police measures only and indicated no change in the decision to carry out the agreement; but later, when the Security Council had the case before them, the Dutch Gov. decided to call off all military action, and when the Council offered to mediate the gov. accepted the offer while always refusing to admit that the Council was competent to adjudicate in the case. But at the end of 1948, fighting again commenced between the Dutch troops and the Indonesians. See further under *INDONESIA*; *JAVA*.

A Conference of Belgian, Netherlands and Luxembourg ministers was held at The Hague, April 17-18, 1948 to discuss economic questions affecting those countries and on April 18 it was announced

that they had decided to complete at once the common customs tariff contemplated by the Customs Convention concluded in London on Sept. 15, 1944, to bring the Customs Union into being before the end of 1948 and to prepare the technical arrangements for the final abolition before the end of 1947 of the collection of customs duties at the common frontier of H., and the Belgo-Luxembourg Union (see *BENELUX*).

As the outcome of negotiations in London and The Hague (Dec. 1947-Feb. 1948) an Anglo-Dutch trade and financial agreement was signed on Feb. 27. This was followed in July 1948 by a cultural agreement, covering a wide field of intellectual, artistic and scientific exchanges.

On the occasion of the national celebrations in honour of the fiftieth year of her reign and of her sixty-eighth birthday, which fell on Aug. 31 1948, Queen Wilhelmina on Aug. 30 resumed for a period of one week the royal authority which she had relinquished the previous May in favour of her daughter, Princess Juliana, who had since then acted as Princess Regent. On Sept. 4 Queen Wilhelmina formally signed an Act of Abdication at the Royal Palace, Amsterdam, in which she declared that she had 'completely voluntarily and irrevocably' abdicated all her royal dignities and prerogatives and transferred them to her daughter, Queen Juliana, the fifth monarch of the Netherlands and of the Royal House of Orange-Nassau, who was formally inaugurated on Sept. 6 in the Nieuwe Kerk in Amsterdam. Queen Wilhelmina after abdication took the title of Princess of the Netherlands, living in complete retirement.

Holland, city in Ottawa co., Michigan, on the S. bank of the Black R., 25 m. S W of Grand Rapids. It is the seat of Hope College (1867), and of the W. Theological Seminary. The tn. was founded by Dutch settlers in 1817, and received its charter in 1867. The pop., in which the Dutch element predominates is 13,000.

Holland, coarse variety of linen, unbleached, and often dyed brown. Its texture is strong and it washes very well. It was formerly fine linen manufactured in the Netherlands; hence its name.

Holland House, historic London residence, between Kensington Road and Crayford Road, Kensington, property of the earl of Chester, heir of the Fox family. In the Jacobean style, its centre building and turrets were built about 1608-10 by Sir Walter Cope. At the time of the third Lord Holland (1800-15) it was a social and political centre of the Whig Party. Its circle included Fox, Sidney Smith and Macaulay.

Holland Park, dist. of W. London, between Kensington and Notting Hill. In H. P. Road is Leighton House, the property of the nation.

Holland, New, seaport in the estuary of the Humber, Lincolnshire, England. There are docks, and a steam ferry to Hull, which is opposite.

Holland, North, prov. of the Netherlands, comprising the peninsula between the Zuyder Zee and the N. Sea and the is on the N. side, and bounded on the S. by the prov. of S. H. and Utrecht. Area 1150 sq. m. The inhabs are chiefly engaged in cattle-raising, agriculture and gardening. There is considerable trade in dairy produce, and linen is manufactured in the tns. Much of the land is below sea level, and there are sev. canals, notably the N. Holland Canal and the N. Sea Canal. The chief tns are Haarlem (cap.) and Amsterdam. Pop. 1,646,000.

Holland, Parts of, administrative div. of Lincolnshire, which includes most of the fens in the S.E. Area 268,992 ac. Pop. 102,300.

Holland, South, prov. of the Netherlands, bounded on the N. by N. Holland, on the E. by Utrecht and N. Brabant, on the S. by Zealand, and on the W. by the N. Sea. Area 1166 sq. m. The chief industry is agriculture and there is considerable shipping trade. The chief tns are Rotterdam (cap.), The Hague, Dordrecht and Leyden. Pop. 2,256,400.

Holland-America Line, shipping line, estab. at Rotterdam in 1873, which maintains a regular passenger and freight service between Holland, Great Britain, and

the U.S.A.; also between the U.S.A. and the Dutch East Indies. The flagship of the fleet is S.S. *Nieuw Amsterdam*, 36,667 tons.

H. Kumpke

THE VOORSTRAATSHAVEN  
DORDRECHT, SOUTH HOLLAND

Hollander, Bernard (1864-1934) physician, b. in Vienna; came to England, 1881, and was naturalised as a Brit. subject in 1899. Attempted to formulate a scientific phrenology; was medical officer under the Mental Deficiency Act, for the co. of London; wrote treatises on the brain, insanity and crime.

Hollands, see GIN.

Hollar, Wenceslaus or Wenzel (1607-1677), Bohemian etcher, b. at Prague, and d. in London. He studied at Frankfurt, Strasburg, and Cologne, and in the last-named city attracted the notice of the earl of Arundel, who brought him to England (1637). During the Civil war he took refuge for eight years in Antwerp but afterwards returned to London. He worked with unceasing industry for his publishers, who took advantage of his poverty and his ignorance of the country to underpay him. He illustrated Ogilvy's *Homer* and *Fergil*, made etchings of the works of Holbein, Titian, and Van Dyck, and executed some beautiful 'Views of London.' See study by Parthey (1853-1858), with catalogue of his plates.

Hollerith, mechanical calculating method, see under ELECTRIC ACCOUNTING MACHINE.

Holles, Denzil, Lord (1599-1680), Eng. statesman, is conspicuous among a host of good and true men, and, at a time which

was politically a period of *Sturm und Drang*, for his public spirit and his single and high-minded aims. An aristocrat by birth, he was always a staunch Whig in principle, and accordingly averse from Cromwell and his rough-riding over time-hallowed institutions. As member of Parliament he supported the impeachment of Buckingham (1627), forcibly held the speaker in his chair till Sir John Elliot's protestations were passed (1629), assisted in the impeachment of Laud (1641), endeavoured to impeach Cromwell as an incendiary (1644), and tried to compass the dissolution of the parl. troops (1647). Thus, as a Presbyterian and a moderate, he bravely spoke for freedom; in 1639 he suffered a year's imprisonment, and in 1649 only escaped formal expulsion by Col. Pride by fleeing to France. After the Restoration he served King Charles.

Holles, Thomas Pelham, see NEWCASTLE, DUKE OF.

Holleschau, tn. 40 m. E.N.E. of Brno, Moravia, Czechoslovakia. The chief industry is in cloth and linen. Pop. 6000.

Hollingshead, Raphael, see HOLMESHEAD.

Holloway, dist., par. of Islington, N. London, England. The old Copenhagen Fields have been occupied by the cattle mkt. since 1855. At the N. end of Camden Road is the City Prison (for women), a castellated edifice of 1850. Pop. (Upper H.) 36,000, (Lower H.) 10,000.

Holloway College, The Royal, situated at Mt. Lee, Egham, Surrey, England. It was founded in 1883 by Thomas Holloway (q.v.), the proprietor of the noted pills and ointment. Its object is to supply a suitable education for women of the middle class. The students are prepared for univ. degrees and must read for honours. The building, which is constructed in the style of the Fr. Renaissance, was opened by Queen Victoria in 1886, and contains a fine collection of paintings by Constable, Landseer, Millais, Frith, and other famous artists.

Holloway, Thomas (1800-83), Eng. ointment-and-pill vendor; b. at Plymouth Dock (Devonport); son of a baker, afterwards landlord of the Turk's Head Penzance. After his father's death, he kept a grocery; removed to London about 1828. In 1837, he began to advertise an ointment, and made over half a million sterling by unprecedentedly lavish advertising. Founded Holloway College, Egham.

Holly, or *Ilex aquifolium*, species of Aquifoliaceae, found very commonly in Britain. It is cultivated both as an ornamental evergreen tree and as a hedge-plant on account of its dense and prickly foliage. The timber is fine-grained, heavy and compact, and is valued by both the turner and the mathematical instrument maker; the flowers are small and white; the berries are scarlet and glossy, giving the plant a brilliant appearance in late autumn. They are very poisonous, producing purgative and violent emetic effects.

Hollyhock, popular name for the species of Malvaceae, known botanically as *Althaea rosea*, a near ally of the marsh-mallow.

It is a hardy perennial, herbaceous in habit, and is frequently cultivated in Britain especially in the gardens of country cottages.

Hollywood, dist. in the city of Los Angeles, California, U.S.A., situated amidst beautiful surroundings and with an ideal climate, famous as the headquarters of the Amer. film industry, its chief buildings being the film studios. H. has injured the Amer. stage by depriving it of its mkt. outside New York and attracting to itself much of the best writing, acting, directing, and organising talent; while the Amer. vaudeville has also suffered by its failure to cope with the competition of the screen. Over two-thirds (2 billion dollars) of the cinema investment of the world is in the U.S.A. and nearly two-thirds of the world's films are made in H., while it requires a rigorous system of quotas, prohibitions, subsidies and publicity campaigns to keep other countries from being even more dependent on the H. film industry than they are. Nearby is Culver City, also a suburb of Los Angeles and a centre of the Amer. film industry.

Holman, James (1786-1857), 'The Blind Traveller', native of Exeter. Being compelled through total loss of sight to quit the navy, he travelled alone through the greater portion of Europe (1819-24) and round the world (1827-32). He pub. interesting journals of his travels.

Holmby House, more correctly Holdenby House, 6½ m. N.W. of Northampton, a Tudor mansion of which Sir Christopher Hatton was the architect. It was bought by James I., and Charles I. was imprisoned here for four months in 1647. In 1652 it was dismantled.

Holmes, Sir Charles John (1868-1936), Eng. landscape painter; b. at Preston; eldest son of Rev. Charles Rivington H., of Stratton, Cornwall. Educated at St. Edmund's Canterbury, Eton, and Brasenose College, Oxford. His works are in many art-galleries, and in the Ashmolean, Fitzwilliam, Brit. and Victoria-and-Albert Museums; National Gallery of Brit. Art ('the Burning Kiln'). Kt., 1926; K.C.V.O. 1928. Ed. *Burlington Magazine* (1903-09); Slade prof. of Fine Art, Oxon. 1901-10; director National Gallery, 1916-28. Pub. *Constable* (1902), *Notes on the Science of Picture-Making* (1909), *The National Gallery* (1923-27).

Holmes, Nathaniel (1815-1901), Amer. jurist and author, b. at Peterboro', N.H.; graduated at Harvard, and was judge of Missouri Supreme Court (1865-68). From 1868-73 he was prof. of Law at Harvard. He wrote extensively on the Shakespearean question. In *The Authorship of Shakespeare* (1875) he credits Bacon with the dramas.

Holmes, Oliver Wendell (1809-94), Amer. poet and essayist, b. at Cambridge, Massachusetts. He graduated at Harvard Univ. in 1829, studied medicine for two years in Paris, and took his M.D. degree in Cambridge, Massachusetts (1836). He continued to practise as a doctor till 1849, and from 1847 till 1882 lectured at Harvard on anatomy and wrote essays on

homeopathy, etc., which were conspicuous for their vivacity, unflinching freshness, and humanity. Collaborated with James Russell Lowell in the issue of a new magazine, the *Atlantic Monthly* (1857). To this he contributed *The Autocrat of the Breakfast Table* (1858), a book of sweet and guileless merriment and informed with the spirit of New England. There followed *The Professor at the Breakfast Table* (1860) and *The Poet at the Breakfast Table* (1872).

OLIVER WENDELL HOLMES (1809-94)

In these is displayed the best of his prose and poetry. His novels the best of which are *Elsie Venner* (1861) and *The Guardian Angel* (1867) though they have been described as merely monologues of himself, tell, in the most intimate and charming manner the New England life of the day, and likewise the author's gift for picturesque description and the elasticity and force of his temperament. His *Life of Emerson* appeared in 1883. From boyhood he enjoyed all the blessings of good fellowship and fortune. See J. T. Morse, *Life and Letters of Oliver Wendell Holmes*, 1896, also studies by W. H. Schroeder, 1909, S. M. Crothers, 1910 and Catherine D. Bowen, *Yankee from Olympus*, 1918.

Holmes, Oliver Wendell (1841-1935), son of the famous author of the same name, b. at Boston, Mass., U.S.A. Graduated from Harvard Univ. and, as a youth, was serving during the Civil war with the 20th Massachusetts Volunteers, rising to the rank of lieutenant-col. He was retired with the rank of captain, was admitted to the Bar in Massachusetts in 1867, and started the practice of his profession in Boston. In 1870-71 he became instructor in constitutional law at Harvard, and was professor of law there in 1882. He was associate justice 1882-99 and chief justice 1899-1902 of the Supreme Court of his state. In 1902 he was made an associate justice of the U.S. Supreme Court. As such he

became famous for his dissenting judgments, which were almost invariably supported by his colleague, Justice Brandeis. In 1931 many of these famous dissenting opinions, constituting a sort of American magna charta or real democracy, were ed. in book form by Prof. Felix Frankfurter of the legal faculty of Harvard Univ. His masterpieces in legal literature were the 12th ed. of Kent's *Commentaries* (1873), and *The Common Law* (his Lowell Lectures, 1881). See F. Frankfurter, *Mr. Justice Holmes and the Constitution*, 1927; also Catherine D. Bowen, *Yankee From Olympus*, 1948.

Holmfirth, tn., 6 m. S. of Huddersfield, W. Riding, Yorkshire, England. There are cloth and wool mills and stone quarries. The Bilberry reservoir here burst in 1852; eighty-one people were drowned and much damage to property was done. Pop. 1) 100.

Holmium, chemical element of atomic number 67 and atomic weight 163.5, its symbol is Ho. It is a member of the group of rare-earth metals and occurs in gadolinite, euxenite, polycrase and other minerals. It was discovered in 1878-79 by P. T. Cleve and J. L. Soret, independently of each other.

Holm Oak, *Quercus Ilex*, shrub like tree of the natural order Fagaceae (beeches and oaks) with holly-like leaves. Found in Mediterranean countries, yields a useful timber, and its bark is used for tanning. In Britain it occurs as an ornamental evergreen bush 20 to 30 ft. high.

Holm Thrush, see MISKITT THRUSH.

Holocephali, see under CHIMERA.

Holofernes, called in Judith II 4, 'the chief captain of the army of Nebuchadnezzar'. The book of Judith (apocryphal) tells the story of how the Jewish maiden saved her nation by assassinating H. before the walls of Bethulia, i.e. Jerusalem. The story is a legendary one, and it is quite evident that H. cannot be connected with the historical accounts of Nebuchadnezzar's reign. His identification is extremely difficult, a large number of suggestions having been made. Many would connect him with Croesus, who in 548 B.C. was king of the Cappadocians.

Holograph, in Scottish law, a H. deed or will is one written wholly in the grantor's own hand. Such an instrument is admissible in evidence without proof of attestation, because it is unquestionably the strongest proof and a document least capable of imitation. But the presumption of authenticity may, of course, be rebutted by proof to the contrary. H. deeds bind the grantor as effectually as if executed with the statutory solemnities essential to other deeds, but such effect endures only for twenty years. Deeds in which all the material parts are in the grantor's handwriting, or in which what is not in his handwriting is by the deed formally adopted by the grantor, have the same effect as H. deeds. H. wills, even if unattested, are presumed to have been executed at the date upon which they are expressed to have been made, but it is otherwise with H. deeds. See J. Erskine, *Principles of the Law of Scotland*, 1754.

**Holothurian** (Gk. ὅλος, whole, and θύρα, like a door), name given to any individual of Holothuroidea, a class of Echinodermata commonly called the sea-cucumbers. It is an elongated, worm-like animal with a ring of about twenty large retractile tentacles surrounding the mouth; these tentacles are modified tube-feet, and contain an extension of the water-vascular system. The ambulacral feet are furnished with a suctorial disc, and the ambulatory papillae are pointed at the ends, with elementary or no calcareous plates. The water-vascular system consists of a circular vessel with two appendages, the polian vesicle and the stone canal, and five radial vessels. Holothuroidea are divided into two orders, Actinopoda, in which tentacles are always present but feet and papillae may be absent, and Paractinopoda, in which tube-feet, ambulacral papillae, respiratory trees and curvierian organs are absent. The former contains the family Holothuriidae, with the Brit. genus *Holothuria*; Syngnathidae, whose species have a flattened body; Elasmobranchii, with a more or less ventral mouth and elongated body; Pelagothuridae, pelagic forms with a cylindrical body; Molpadidae, burrowers in mud or clay; Cucumariidae, with the familiar Brit. genera *Cucumaria*, *Thyon*, *Psolus*, and *Phyllophorus*. The order Paractinopoda contains the single family Synaptidae, whose typical genus *Synapta* is known on Brit. coasts, *S. inhaerens* and *S. digitata* being the commonest species.

**Holroyd, Sir Charles** (1861-1917), Eng. painter-etcher; b. at Leeds; eldest son of Wm. H., merchant. Educated: Leeds Grammar School; Yorkshire College of Science; Slade School, London—assistant teacher 1885-89. Fellow, Society of Painter-Etchers, 1885. In Italy with travelling scholarship, 1889-91. Sent seven pictures to Royal Academy, 1885-1895. His etchings are much better than his pictures. He also executed some portrait-etchings and excellent drawings of trees. First keeper, National Gallery of Brit. Art, 1897-1906. Director, National Gallery, 1906-16. Knighted 1903.

**Holroyd, John Baker**, see SHEFFIELD, EARL OF.

**Holst Gustav Theodore** (1874-1934), Eng. composer, b. at Cheltenham, of Swedish extraction on his father's side. Like his father, he was an organist, and he early became choirmaster in Gloucestershire, where he laid the foundations of his skill in choral effect. In 1895 he obtained a scholarship at the Royal College of Music, learning under Stanford and Sharpe. Three years later he decided to earn his living as a trombonist, and so acquire experience of the orchestra from the inside. In 1903 he was music master at Edward Alleyn School, at Morley College in 1907, and later worked in a similar capacity at other well-known colleges. He had to wait long for recognition. His chief works are *The Planets* (1915-16), orchestral suite; *Hymn to Jesus* (1917), choral; *Ode to Death* (1919), choral work produced at the Leeds Festival in 1921; *The Perfect Fool*, an opera, produced at Covent

Garden by the Brit. National Opera Company, in 1923; and *At the Boar's Head* (1925), a Shakespearean opera, in which he aimed at making Falstaff move to genuine folk-tunes. In the same year he was producing his *Choral Symphony*—to words by Keats; and, in 1928, his music for John Massfield's mystery-play, *The Coming of Christ*. See monograph by C. B. M. Dyer, 1931 and Imogen Holst, 1938.

**Holst, Hermann Eduard von** (1841-1904), Ger. historical writer, b. in Fellin, Livonia. He became prof. of hist. at the Univ. of Strasburg and later of Freiburg. From 1892-99 he was prof. of hist. at Chicago Univ. His books include *Constitutional and Political History of the U.S.A.* (1873-91), and *French Revolution Tested by Mirabeau's Career* (1894).

**Holstein**, see SCHLESWIG-HOLSTEIN.  
**Holston**, riv. of the United States. Rising with two branches in S.W. Virginia. It flows with a S.W. course into the N.E. of Tennessee, where the forks unite at Kingston. At a spot some 4 m. E. of Knoxville is the confluence of this riv. with the Fr. Broad, after which their united streams are called the Tennessee. Length 350 m.

**Holsworthy**, urban dist. and mrkt. tn. of Devon, England, 46 m. from Exeter. An ann. horse fair is held there in the summer. In the first quarter of last century a canal was made connecting it with Bude, but the canal has long fallen into disuse. Pop. 1500.

**Holt**: (1) Mrkt. tn., 9 m. W. by S. of Cromer, in Norfolk, England. Here is Gresham's School founded in 1555, with endowments managed by the Fishmongers Company. Pop. 2500. (2) Vill. on the Dec. 5 m. E.N.E. of Wrexham in Denbighshire, Wales. Pop. 1200.

**Holt, Sir John** (1642-1710), a lord chief justice of England, seems to have sown his wild oats at Oriel College, Oxford. Called to the Bar in 1663, he appeared as counsel for the defence in a series of state trials, and William III. rewarded his ability and zeal by making him lord chief justice (1689). He was noted in court for his courtesy towards prisoners, his aloofness from all party prejudice, and his exceptional moral courage.

**Holthby, Winifred** (1898-1935), Eng. novelist; educated at Queen Margaret's school, Scarborough and Somerville College, Oxford. Director *Time and Tide*, 1926. Author of the novels *Anderby Wold* (1923), *The Crowded Street* (1924), *The Land of Green Ginger* (1927), *Poor Caroline* (1931), *Mandao Mandao* (1933), *Truth is not Sober* (1934), *Take What You Want* (U.S. title, *South Island*) (1936), awarded the James Black Prize), *Pavelements at Anderby* (1937); Pamphlets: *Kutuchus or The Future of the Pulpit* (1928), *Criticism* (1930), and *Virginia Woolf: a critical study* (1932).

**Holst, Karl Eduard von** (1798-1880), Ger. actor and author, was a man of versatile talent and varied experience. Having volunteered in the Prussian army and studied law in Breslau, he became an actor, and appeared as Mortimer in Schiller's *Maria Stuart*. His popular

vaudeville *Die Wiener in Berlin* was produced in 1824, and his successful play *Lenore* in 1829. Meanwhile, he toured with theatrical companies at home and abroad, conducted theatres at Vienna and Riga, and won golden opinions by truly dramatic recitals from Shakespeare and his own poems. These latter reveal his natural gift for lyrical outpouring; his *Schlesische Gedichte* (1830) had reached their twentieth ed. in 1893. H. left behind him three novels and eight vols. of fascinating autobiography (1843-50).

Holtzendorff, Henning von (1853-1919), Ger. admiral; b. in Berlin; son of Otto von H., vice-president of the Court of Appeal. His early naval life was spent chiefly in Far E.: he attained flag-rank in 1905; vice-admiral, 1907; admiral, 1910—in command of Grand Fleet. Retired from sea-duties, 1913; in Sept. 1915, chief of Naval Staff. Gave orders for 'unlimited' U-boat warfare, Dec. 22, 1916. Relieved of office on account of ill health, July, 1918.

Holtzendorff, Joachim Wilhelm Franz Philipp von (1829-89), Ger. criminologist, attended the univs. of Bonn and Heidelberg, and finally graduated in law at Berlin (1852). Privat docent in 1857, he was three years later appointed prof. extraordinary, but his advanced and enlightened political opinions long hindered his preferment. In 1873, however, he became head of the faculty of jurisprudence at Munich Univ. and held this chair until his death. An authority on criminal law, he is esteemed also as the editor of many invaluable legal compendia, to wit, *Handbuch des deutschen Strafrechts* (1871-1877) and *Handbuch des Völkerrechts auf Grundlage europäischer Staatspraxis* (1885-1890), and as the author of a series of independent treatises, such as *Die Prinzipien der Politik* (1889).

Holtzmann, Heinrich Julius (1832-1910), Ger. theologian, son of the eminent philologist, Adolf H., prof. of theology at Heidelberg from 1861 to 1874, he afterwards accepted the same chair at the univ. of Strasbourg. His reputation as a critic and scholar rests on his exegetical works on the N.T., and especially on the Johannine books (1890), the synoptic gospels (1889), and the Acts of the Apostles (1901). He upheld the theory that both Matthew and Luke based their narratives on that of Mark. At first somewhat conservative of older theories, he later became a leading representative of the advanced and modern school. Another of his critical publs. was the *Lehrbuch der protestantischen Theologie* (1897).

Holub, Emil (1847-1902), African traveller, b. at Hottitz, Bohemia. He took his M.D. degree at Prague Univ., and went out to S. Africa in 1872. He travelled over various parts of the country, collecting valuable natural hist. specimens. His books are: *Die Kolonisation Afrikas* (1881-82), *Stehen Jahre in Südafrika, 1872-79* (1881, Eng. trans. 1881), and *Von der Kapstadt ins Land der Maschukulumbé* (1888-90).

Holy Alliance, league ratified at Paris in 1816 after the downfall of Napoleon.

Alexander I. of Russia and the sovereigns of Austria and Prussia made a solemn covenant that in all matters both of domestic and foreign policy, they would be guided by the principles of Christian ethics. The main issue of the alliance, one of whose first aims was the preservation of peace, was, ironically enough, the suppression of the popular movement for freedom and equality, which was at that time a growing menace to royal prerogative and despotism in every W. nation. The league, which was discountenanced in this country as an insidious check on true liberty, soon died a natural death. At the time of its formation, Alexander was under the sway of Madame de Krüdener, the mystic.

Holy Coat of Trèves, famous relic of the eleventh-century cathedral of SS. Peter and Helena in Trèves, Rhenish Prussia. Legend says that it was brought by the Empress Helena from Palestine, but the first reference to it is on a tablet dating from the sixth century. It is reputed to be the 'seamless coat' of Christ, but is now little more than 'connected fragmentary particles' of cloth. In 1512 the pope sanctioned its exhibition once in seven years, and ever since it has been a source of income to the church. This relic, like others, is believed to work miracles, and in 1891, when it was on view for the first time since 1844, was the object of pilgrimage for almost two million people.

Holycross, par. and vil., co. Tipperary, Ireland, 20 m. N.W. of Tipperary; much visited for its magnificent ruins of a Cistercian abbey. The dist. is very fertile and there are good pastures. Pop. 1000.

Holy Cross Mountain, peak, 14,000 ft. in height, of the Sangre de Cristo range and branch of the Rockies, Colorado, U.S.A., in Eagle co., 15 m. N.W. of Leadville. Its name is taken from two huge snow-filled ravines which have the appearance of a cross.

Holy Ghost, see HOLY SPIRIT.

Holy Grail, The, see GRAIL, HOLY.

Holyhead, seaport and mkt. tn. on Holy Is., Anglesey, N. Wales. It is the most important mail-packet station for Ireland and is the starting point of the L.M.S. steamers for Dublin and Greenore. It has extensive railway and steam-boat traffic. It possesses a fine harbour, with an area of 267 acs., begun in 1846 and finished in 1873, and a breakwater 1½ m. long. This refuge is extended by 400 ac. of roadstead. There are a wireless station and a fine old embattled church (St. Cybi). Pop. 10,700. (See illustration p. 202.)

Holy Island (1) (auct. *Lindisfarne*), is off the coast of Northumberland, England, connected with the mainland at low tide. It is 3 m. long and 1½ m. broad. The N. part is mostly sandy but the rest is fertile. It is chiefly noted for its ruins of sacred edifices. St. Aidan founded here a priory in 631 with which later St. Cuthbert was connected. This was destroyed in 893 and in 1093 its remaining materials were used to build a Benedictine priory. There is also a sixteenth century castle the property of the National Trust. The

is, was sev times ravaged by the Danes, and this, added to the increasing importance of the see of Durham caused it to be ultimately abandoned. To the S W is a small fishing vil with harbour. Area 1050 acs Pop 586 (2) Rocky is off the E coast of Arran rising steeply in the firth of Clyde Scotland, it has a light house (3) Or Holyhead is rocky and barren is 8 m long by 3½ m broad, W of Anglesey N Wales separated from it by a sandy causeway Tro Arddur on Penrhos Bay is a seaside resort

Holy Land, see PALESTINE

Holyoake, George Jacob (1917-1906), agitator the son of a Birmingham

'the most holy place,' contained the Ark of the Covenant and the 'mercy seat, and was separated by a veil from the outer chamber, 'the holy place. It was, in deed, Jahveh's throne he appeared there attended by adoring Cherubim, and there the High Priest on the Day of Atonement presented the blood by which the Sins of the nation were 'covered up' or 'wiped away'. In reading in *Exodus* the minute and elaborate descriptions of priestly narrative when describing this wilderness tent sanctuary and all that appertains to it, with the mathematical symmetry of its arrangements and the fine gradations of sanctity it is in

SOUTH STACK LIGHTHOUSE HOLYHEAD

engineer was very early in life inspired with notions of reform and at the age of fifteen became a Chartist. He was a workman until 1810 when he became a teacher of the Owenite movement at Worcester. Later he went about the country lecturing and having decided that the exigencies of Christianity were insufficient he made remarks in public for which he was charged with blasphemy and imprisoned for six months. Subsequently his energies were mainly devoted to social reform and the persistent advocacy of co-operation. He wrote a *History of Co-operation in England* (1871) and biographies of Tom Paine, Richard Carlisle, Robert Owen and John Stuart Mill, as well as many pamphlets on controversial subjects. His autobiography is entitled *Sixty Years of an Agitator's Life* (1892). See C. W. Gosse, *A Descriptive Bibliography of the Writings of G. J. Holyoake* 1908 and J. McCabe *The Life and Letters of Holyoake*, 1908.

Holy of Holies, inner chamber of the Jewish tabernacle (Ex xxvi), and of Solomon's Temple (1. Kings vi). It was

possible not to recognise how greatly the picture has been influenced by certain dominant religious ideas. The unapproachable majesty of Jahveh's holiness and beauty of his attributes are reflected in the arrangements of his earthly sanctuary. By ascending stairs of sanctity—through out holy place and holy of holies corresponding to laymen, priests, and High Priest—the central shrine of holiness is reached. All this has naturally lent itself to an elaborate development of religious symbolism from early to modern times and has also exercised a profound influence on the religious symbolism of certain parts of the N.T. These considerations help to explain the relation of the priestly description of the sanctuary to historical fact for the priestly writers did not make it their aim to present history as it was but to substantiate traditions and often to supplement them under the dominance of religious ideas (McNelis). Priestly narrative, in fact, presents an *ideal tabernacle*, in which the developed institutions of a later age are reflected in a mosaic environment with

the necessary modifications; and to judge the authors of such writings by the canons of modern historical science is misconceived and unjust.

**Holyoke**, city on the r. b. of the Connecticut R., 8 m. N. of Springfield in Hampden co., Massachusetts, U.S.A. An insignificant vil. till 1849, it rapidly became a thriving industrial centre when a huge dam was constructed so as to utilize the power of Hadley Falls on the Connecticut R.; a second and larger dam was built in 1900. The first tn. in America to manuf. paper, H. is noted also for its cotton goods and silk mills. Many other manufs. are carried on on a large scale, the prin. being blanket, felt and braid factories, boilers, trucks, tyres and tobacco. Pop. 57,000.

**Holy Orders**, see **ORDINATION**.

**Holy Places**, localities in and close to Jerusalem associated with the life of Christ. They include the church of the Holy Sepulchre (see **SEPULCHRE**, **CHURCH OF THE HOLY**); Bethlehem, whose outstanding monument is the Basilica of the Nativity, shared by sev. communities. Orthodox, Lat. Armenian, Jacobite, Abyssinian and Coptic; the Garden of Gethsemane, belonging, in shares, to the Franciscans, the Orthodox Patriarchate of Jerusalem, the Russians, and the Armenians; and other sacred sites on Olivet or the M. of Olives such as the fifth-century octagonal church of the Ascension. The Pope entrusted the custody of the H. P. in 1230 to the Franciscans and later this custody passed to France, the position, however, being complicated by the fact that the Turkish sultan was in possession of the Holy Land. Difficulties over the custody as between France and Russia, representing respectively W. and E. Christianity was one contributory factor to the outbreak of the Crimean war. Under Art. 13 of the Mandate for Palestine granted by the League of Nations to Great Britain all responsibility in connection with the H. P. and religious buildings or sites in Palestine, including that of preserving existing rights and securing free access, and the free exercise of worship, while ensuring public order and decorum, was assumed by the mandatory, who was, under the Mandate, made responsible solely to the League of Nations in all matters connected with the mandatory obligations. The mandatory, however, was empowered to arrange with the Palestine administration for carrying the provisions of this Article of the Mandate into effect. The same Article also provided that nothing in the Mandate might be construed as giving the mandatory authority to interfere with the fabric of purely Muslim sacred shrines. Under Article 14 of the Mandate the mandatory was enjoined to appoint a Commission to define and determine the rights and claims in connection with the H. P. and the rights and claims relating to the different religious communities in Palestine. The council of the League was to give its approval to both the composition of the Commission and the performance of

its functions. The duties of the former Mandatory have now passed to the United Nations (see **further under PALESTINE**).

**Holy Roman Empire**. This name is usually applied to the empire founded by Charles the Great in the year 800, and which was regarded as the revival of the W. Rom. empire. It did not include all the ter. of the latter organisation, but nevertheless it typified the ideal. The W. Rom. empire had come to an end in 476, when Odoacer had finally taken possession of Italy, and had signified to Zeno, the ruler of the E. empire, that henceforth he alone should rule as emperor of a Rom. empire, and he, Odoacer, should rule as patrician and, in all but name, king of Italy. Since those days the face of Europe had changed considerably. Odoacer had been deposed, exalted, and succeeded by Theodoric, the leader of the Ostrogoths; and the death of the latter (526) had witnessed the break up of the power of the Ostrogoths, and for a time Italy became the scene of constant wars. Justinian and his great general, Belisarius, had conquered much of Italy, but had usually been held in check, and then the N. part of the peninsula passed into the hands of the Longobards (Lombards). In another part of W. Europe the power of the Franks had been constantly on the increase. The line of Clovis had passed away with the last of the *rois fainçants*, the Mayors of the Palace had usurped the kingly powers, and finally, in 752, the greatest of the Mayors of the Palace, Charles Martel, had held in check the inroad of the Saracens, and had, according to one great authority, saved W. Europe for Christianity. The victory at Poitiers, according to Gibbon, prevented the Moslem from establishing his faith to the uttermost isles of the W. Charles Martel also helped the papacy in the struggle against the Lombards, and commenced the long alliance of Carolings and papacy. In the meantime the growth of the power of the bishops of Rome had been equally great. By the beginning of the eighth century the papacy had declared itself the spiritual head of the world, and had prepared the way for that union of the spiritual and temporal power which was to rule the world, acknowledged by all.

The accession of Charles the Great in 768 marks the beginning of the closer unity of papacy and empire. Twice Charles the Great crossed the Alps to rescue the papacy from the clutches of the Lombards. Finally, during his second expedition, he wrested for himself the Iron crown of Lombardy. Henceforth the papacy was to be protected by its most helpful ally. The gratitude of the pope was speedily seen: as Charles knelt in prayer in the great church of St. Peter's on Christmas Day in the year 800, he was saluted and crowned by the pope as emperor. Henceforth the Middle Ages were to be practically one long quarrel between the nominal heads of Christendom. Had Charles foreseen the results of his coronation by the pope, and the claims which the later successors to the chair of St. Peter founded on it, he

probably would have, as in later days Napoleon did, crowned himself. The arrogant pretensions of the later papacy were based on the fact that the pope had raised a mere king to the empire.

It must be borne in mind particularly that, as H. W. C. Davis points out in his *Medieval Europe*, the Carolingian empire was based upon the model not of Augustus but of Constantine, from whose forged donation the papacy claimed for itself all the power of the W. empire. The empire did not, save as an ideal, outlive its founder. The reign of his son witnessed the beginning of the end, and the treaty of Verdun (843) estab. a potential France, Germany, and Italy. Only once again, under Charles the Fat (841-887), were the three portions of the empire of Charles the Great united. The later Carolings were as weak as the *rois fainçants*, and the invasions of the Norsemen gave greater power to the local nobility, and this was aided by the rise of feudalism. In Germany the power concentrated in five great duchies, Saxony, Swabia, Franconia, Bavaria, and Lotharingia. In 918 the dukes refused to recognise the Caroling line, and elected Henry the Fowler of Saxony as king. The Carolings continued in France until 987, when they were superseded by the Capetian line. The year 918, although it does not seem to have affected contemporary historians to any great extent, marks the final separation of France from the empire. Henry the Fowler concentrated his attention upon extending towards the E., conciliating the other duchies, and preparing the way for his son Otto. The value of his work is seen best in the reign of his son Otto the Great (936-973). In Germany he put down two civil wars in the duchies, first giving them into the hands of his relatives, then seeking active alliance with the church to produce unity. His greatest success was the victory over the Huns on the Lechfeld (955) and his policy of 'Marks' (Marches) along the E. border. The alliance with the papacy led to the request to interfere in it, politics, which he did in 951 and 962. The second intervention led to his coronation as emperor of the W.

Otto regarded himself as the successor of Charles the Great, and appointed and deposed popes from 963 till his death. Otto II. (973-983) began to split the great duchies, but still extended towards the E. The ideal of Otto III. (983-1002) were more universal, and he wished to make Rome and not Aachen his centre. On the death of Henry II. (1002-21), the last of the Saxon house, the empire passed to the Salian house, the first emperor of which was Conrad (1024-1037), who concentrated upon ensuring the hereditary succession of his house. To this end he made feudal benefices hereditary in Germany and Italy. The reign of his son, Henry III. (1037-50), is usually regarded as the most glorious period of the medieval empire. Hungary, Poland, and Bohemia became fiefs of the empire. There was comparative peace, and the development of almost a national feeling in Germany.

During this period the papacy had been gradually developing its resources. In 918 there had been estab. the monastery of Cluny, whose members were now aiming at the purification of the church and its release from lay interference, and the exaltation of the papacy. Henry III. showed deep interest in their work, but in his actual relations with the papacy appointed and deposed popes. Henry IV. (1056-1106), in his struggle with the papacy, was faced with the 'noblest figure' in hist., Gregory VII. (Hildebrand). The papacy was exceptionally powerful, having for its support the Cluniacs, the Normans of S. Italy, Matilda, countess of Tuscany, and all discontented nobles in Germany. In 1075 Hildebrand at a synod formulated the claims of the papacy by stating that no lay prince must interfere with the election and investiture of clerics. Henry defied the pope, and the pope excommunicated the emperor, who at once found himself in great difficulties, because his nobles refused to recognise an excommunicated king. He was forced to cross the Alps, and in 1077 to undergo the dramatic humiliation at Canossa. But Hildebrand's severity defeated his own ends by alienating the Ger. princes, and in 1091 he was driven from Rome, and found a refuge in Apulia with the Normans. In the same year he died. Henry IV. was deposed by his son (1106), and also died in the same year. Henry V. (1106-25) concluded his phase of the struggle by the Concordat of Worms (1122). By this concordat the spiritualities were to be conferred by the papacy, whilst for the temporalities of the bishopric homage was to be done to the reigning prince (compare Anselm and Henry I., 1106).

After Lothair another dynastic change took place with the election of the Hohenstaufen candidate, Frederick I. (1152-90), who combined the claims of Salia and Saxon. He again was drawn into a long struggle with the papacy, whose ally now was a new organisation, the Lombard League, formed by the tns. of N. Italy. He was, however, defeated at Legnano (1176), and again an emperor made submission to a pope in 1177. But Frederick had succeeded in establishing a conditional supremacy over the important tns. of N. Italy. By the marriage of his son to Constance, heiress of the Norman dominions, it seemed that the dream of an empire from Sicily to the Baltic would be realised.

Henry VI. (1190-94) had greater promise than any previous emperor. The brevity of his reign, however, prevented any great developments, and his death left the throne to a child. The power of the papacy is well illustrated by the events of the next few years. Innocent III. took Constance and her son under the protection of the papacy, giving them the two Sicilies. The empire was granted to Otto IV. on condition of alliance with the papacy. Otto proved recalcitrant, and in 1211 the papacy offered the empire to the young Frederick. John of England allied himself with Otto, his nephew. Frederick found support in Philip Augustus,

and defeated the allied forces of John and Otto at Bouvines, a battle which influenced England, in that it led to the granting of Magna Charta; France, in that it removed fear of Eng. interference and helped the Capetian monarchy. In the last phase of the great medieval struggle, the cause of papal enmity seems to have lain chiefly in fear of the position of the emperor, Frederick II. who now held both Sicily and N. Italy. But with the death of Frederick the papacy gathered itself together for a final attack on the Hohenstaufen. His direct successor was 'the little Conradin,' but he did not gain election in Germany. Various candidates appeared, among whom were Alfonso of Castile, Richard of Cornwall, and Wm. of Holland. But none were actually recognised as emperor. Therefore the period from 1250-73 is known as the Great Interregnum, so that the death of Frederick II. marks the end of the great period of the medieval empire. In 1273 Rudolf of Hapsburg was elected emperor, but he never ruled over Italy. Henceforth the H. R. E. does not include Italy, and may to a very great extent be regarded as the personal and private possession of the house of Hapsburg.

Most of the later emperors were chosen from the house of Hapsburg, whose chief possessions were in Austria, acquiring Bohemia by marriage. In 1361 the granting of the Golden Bull by Charles IV., which settled the method of choosing the emperor, restricting the number of electors to seven, and naming them, lessened the power of the emperor in favour of the princes. During the fourteenth and fifteenth centuries, the elected emperor often paid more attention to his hereditary domains than to his imperial claims, because the empire was becoming so weak and poor. Therefore the emperor was chosen from the most powerful house, Austria, so that his private possessions would lend dignity to his position. During the sixteenth century, Maximilian added Burgundy to the possessions of Austria; his son, Charles V., held Spain, the Netherlands, Burgundy, Milan, the two Sicilies, Austria, Hungary, the Sp. dominions in S. America, and the empire. But the empire itself was purely Ger., and had little to do with affairs outside. The Reformation and the Counter Reformation, however, affected it greatly. There is no clear line of demarcation, and by the settlement of the peace of Augsburg, 1555, the two religions were placed on an equality, each state setting up its own religion (*cuius regio, eius religio*). Out of this unstable situation there developed the Thirty Years war, fought with the empire as a battleground. In 1648 the peace of Westphalia was concluded, Protestantism and Catholicism were put on a level again, but the empire was ruined by the war. From this time Germany was a mere lax confederation of petty despotisms and oligarchies; Switzerland received its independence, as did also the Netherlands. Sweden and France received theirs within the empire. There could be no national feeling in such circumstances; the power

of the emperor had departed, and interest must centre in the rising power of Prussia and its rivalry with Austria, shown especially in the wars from 1740 to 1763, in which Frederick opposed Maria Theresa.

But as a result of the world schemes of Napoleon Bonaparte the empire found itself in grave difficulties. First the Austrian Netherlands and all Germany W. of the Rhine were added to France. When Bonaparte in 1804 crowned himself emperor of the Fr., Francis II., who was emperor elect of the Romans, and king of Germany, changed his title to Hereditary Emperor of Austria. In 1805, at the treaty of Pressburg, he again changed it to emperor of Germany and Austria. Many of the Ger. princes now seceded from the empire, and formed themselves into a Confederation of the Rhine under the protection of Napoleon Bonaparte. In the same year, 1806, Francis resigned the empire; since then, there has been no other emperor of the H. R. E. See J. Bryce, *The Holy Roman Empire*, 1904; T. F. Tout, *The Empire and the Papacy*, 1906; J. Haller, *The Epochs of German History*, 1925; L. Ziegler, *Heiliges Reich des Deutschlands*, 2 vols., 1925; *Cambridge Medieval History* (1050-1485), vols 5-8, 1926-36; J. W. Thompson, *Feudal Germany*, 919-1190, 1928; H. Pinnow, *A History of Germany* (Everyman's Library), 1939; A. J. P. Taylor, *The Course of German History*, 1945.

Holyrood, name of the royal palace of the Scottish kings. David I. founded an abbey in Edinburgh (1128), and dedicated it to the Holy Rood or Cross with reference to the shape of a beautifully-wrought casket which Margaret, wife of Malcolm, the king, brought to Scotland in 1070. The monastery, which was built in the Norman and early Gothic styles, was dissolved in Henry VIII.'s reign, when the chapel became a par. church, until James II. (of England) made it a chapel royal (1687). Since 1768 it has been left a ruin. Begun by James IV. in 1501, the palace was a residence of the Scottish Kings till the Union, and is now open to the public, who are shown where Mary Stuart and Rizzio was murdered. Bonnie Prince Charlie danced in the picture gallery (1745). Robert Bruce convoked a parliament within the abbey precincts, and De Quincey once took refuge in the debtors' sanctuary.

Holy Sepulchre, Church of the, see SEPULCHRE.

Holy Spirit, The, or Holy Ghost, or Paraclete, in orthodox Christian theology, the Third Person in the Blessed Trinity. Foreshadowings of the Christian doctrine are found in certain parts of the O.T. writings, as, for instance in Gen. i. 2, 1 Sam. xvi. 13, and Joel ii. 28 ff., quoted as a prophecy of the descent of the H. S. at Pentecost in Acts ii. 17 ff. It becomes much clearer, however, in the N.T., where the H. S. is spoken of in a way that makes His Divinity distinct in such passages as 2 Cor. iii. 16 ff., 2 Tim. iii. 16, Gal. v. 22, etc. From other passages still more may be gathered. Matt. xxviii. 19 and 1 Pet. i. 1-14, speak of the H. S. as distinct from

the Father and the Son, while His Personality is insisted on in the important passage beginning John xiv. 16, as also in John xv. 26. 'But when the Comforter is come whom I will send unto you from the Father, even the Spirit of truth, which proceedeth from the Father, He shall testify of me.' In this text we have also a reference to the question of the Procession of the H. G., which caused such serious misunderstandings between the E. and W. churches in later centuries. The E. condemned the churches of the W. for the addition of the Filioque clause in the Nicene Creed, and they further denied that the procession of the H. S. was 'from the Father and the Son.' It must be pointed out, however, that there is probably no real doctrinal difference involved, as the W. has never held that this rather unfortunate addition to the Oecumenical Creed teaches a Dual Procession, but rather a procession from the Father through the Son. This doctrine E. theologians would endorse. Many questions relating to the H. S. are bound up with the controversies as to the Holy Trinity which occupied the mind of the church in post-Nicene times. The most important results, embodied in the Athanasian Creed and the additions to the Nicene Creed, lay stress on the personality of the H. S. See H. Swete's article in the *Dictionary of Christian Biography*, 1877, and the same writer's *Holy Spirit in the New Testament*, 1909, and *Holy Spirit in the Ancient Church*, 1912, also any systematic works on Christian theology.

**Holytown**, tn., Lanarkshire, Scotland, 14 m. N.N.E. of Lanark. Situated in the most productive region of the Lanarkshire mineral deposits, its coal mines and steel works are valuable. Pop. 13,000.

**Holy Water**, water blessed by the bishop or priest for ceremonial purposes. Water is naturally used as a symbol of spiritual cleansing, and that the habit of using H. W. was common very early in the Christian church we are told by Tertullian. In the Rom. Catholic Church there is a solemn blessing of H. W. on Saturday in Holy Week; this water, for the blessing of which special ceremonies are used, is called Easter Water, but the blessing of water by a simpler rite may be performed by the priest at any time. Stoups with H. W. stand at the entrance to Rom. Catholic churches, and before High Mass the priest sprinkles the congregation with blessed water. It is also used at funerals, in blessings, etc. Salt is mixed with the water when it is blessed.

**Holy Week**, week immediately preceding Easter in which the events of the last week of our Lord's life on earth are commemorated. It is observed by all Catholics with strictness and penitence, all the offices and devotions bearing this note. It begins with Palm Sunday, on which the palms are blessed in commemoration of Christ's entry into Jerusalem. On Maundy Thursday white is used at the Mass, because on that day Christ instituted the Blessed Sacrament, but immediately afterwards the altars are stripped and washed. No Mass is cele-

brated on Good Friday. During the last three days of Holy Week, the offices of Matins and Lauds (Tenebrae) are sung with impressive ceremonial, generally on the previous evening.

**Holywell**: (1) Markt. tn., 4½ m. W.N.W. of Flint in Flintshire, N. Wales. It is served by the railway, and besides lime quarries has zinc, lead, and copper ores. Close by are the ruins of the Basingwerk Cistercian abbey; but H. is named after St. Winifred's Well, long a Mecca for pilgrims and invalids in search of a miraculous cure. A Gothic structure now covers the spring. Pop. 7900. (2) Vill., 4½ m. N.W. by N. of N. Shields in the Wansbeck div. of Northumberland, England. Pop. 3400.

**Holywell Street**, part of old London, since done away with to widen the Strand between St. Mary's and St. Clement's churches. It was named after a holy well near by. In early times the residence of silk merchants, it was latterly notorious for the number of booksellers who made a livelihood by selling coarse and obscene literature.

**Holywood**, picturesquely situated seaport, co. Down, Ireland, 4½ m. N.E. of Belfast. Here took place (1644) the signing of a solemn league and covenant for the defence of the kingdom. The church dates from the twelfth century. Pop. 4000.

**Holzminen**, tn. on the r. b. of the Weser, 29 m. N.W. of Göttingen, at the base of the Sollinger Mts. in Brunswick, Germany. It is an agric. centre, and before the Second World War had iron and steel and weaving industries, also a school for builders founded in 1831. Pop. 12,900.

**Homa**, see SOMA.

**Homage**, in feudal times, the formal expression (*homo vestre devotio*, I become your man) of allegiance of a vassal to his lord. Noblemen at a coronation and bishops on appointment do H. to the sovereign.

**Homburg**, tn. of the Rhineland, Germany, 8 m. W.N.W. of Mulheim. There are collieries and engineering works. Pop. 30,000.

**Homburg vor der Höhe**, or **Bad Homburg**, tn. and watering-place in Hesse, Germany, situated on a spur S.E. of the Taunus Mts., 8 m. N.W. of Frankfurt-on-Main. Before the Second World War it was one of the most fashionable spas in Europe, and was yearly visited for its saline and chalybeate springs by some 12,000 people. Machines, hats, and white-lead were manufactured. Its pre-war pop. was 16,800. The tn. was almost completely destroyed in the war.

**Home**, Earls of, belong to an historic Scottish border family. Sir Alexander Home (d. 1391) was created a peer by James III., but afterwards joined the nobles against the king and was present on the field of Sauchieburn (1488), where the latter died. His great-grandson, Alexander, the third Lord H. (d. 1616), was chamberlain to James IV.; he actually escaped with his life from Flodden, and was finally enticed to Holyrood

by specious offers from Albany, the regent, and summarily executed for treason Alexander, the sixth Lord H. and the first earl (died 1805), carried on endless feuds with the Hepburns whom he was Warden of the Marches. His father Alexander the fifth Lord H. (d. 1575) had fought against the queen at Carberry Hill and Lumside, probably because Bothwell was the head of the Hepburns his literary foe. The ninth earl (d. 1756) from whom the present earl traces his descent succeeded his brother who fought against the Pretender at Prestonpans.

Athelstaneford, but in 1757 he retired from his charge. He made many acquaintances with literary folk, and was introduced to Lord Bute soon after he resigned his clerical duties, and for some years served as his private secretary. In 1802 he pub. a *History of the Rebellion of 1745*, but it is as a dramatist he is best known. His prin. plays were *Agis* (1758), *The Siege of Iquileia* (1760), *Alonso* (1773), and *Alfred* (1778). His last drama, *Douglas*, produced at Covent Garden in 1757, with Barry and Peg Wollington in the cast was his greatest

A HOME GUARD MARCH PAST IN AN ENGLISH VILLAGE YARDING, KENT.

**Home Counties**, term used to denote the cos. of Berkshire, Buckinghamshire, Essex, Hertfordshire, Kent, Middlesex, and Surrey. They are so named as being the nearest to the Metropolis.

**Home, Daniel Douglas** (1833-96), Scottish spiritualist, was brought up by an aunt in America, where, in 1850, he was already known as a spiritualistic medium. His life was spent in giving "ances" in England and on the Continent, especially in Russia, where he had an audience with the Czar. Browning, who was present at his meetings, records his unfavourable impressions in *Studge the Medium*, 1861. It was his table turnings and traffic with ghosts which led to his expulsion from the Rom. Catholic Church. See Jean Burton, *Heyday of a Wizard*, 1948.

**Home, John** (1723-1808), dramatist, served as a volunteer in the risings of '45 and two years later became minister of

success, and it is still remembered for the speech beginning 'My name is Norval,' which was long a favourite recitation. Then hailed as a second Shakespeare, he has since taken his place as a very mediocre writer, and his works no longer hold the stage. See A. J. Gipsou *John Home, a Study of his Life and Works*, 1917.

**Home Guard**, or Local Defence Volunteers, volunteer defence force, recruitment of which began officially in May 1940, in response to the War Minister's call in the emergency of that time, when it was becoming obvious that Britain was not immune from possible invasion. While not providing a parallel to the speed and enthusiasm of its recruitment, the muster of all men between 17 and 55 in 1940, under a *Law of the Vase Act* was in fact a precedent. The inception of the 1 D V or H G was a spontaneous movement based on this and other historic

precedents, including the musters of 1545 and 1588, the train bands of 1642, 1667, 1719, and 1759, the volunteer movement of 1859 and the volunteers of the First World War. The chief difference between the H.G. and any other form of military force raised in the Brit. Isles since 1803 was that, whereas the others, e.g. Sir John Firebrace's Horse, the Militia, the Wemyss Volunteers and the Territorial Force or Army, had been kept away from the front line until they were deemed sufficiently trained to meet the enemy, the H.G. was expected, and themselves expected, to meet the enemy wherever he might show himself in the country. But, of course, a great number of those who joined had seen service in the First World War, a fact which in all probability had its due effect in restraining the ardour of the Ger. forces which were reported to be available for manning the invasion barges. Men liable to be conscripted in the ordinary way were of course ineligible for the H.G. At first the H.G. was hardly an effective force at all, for no arms were available for their equipment other than a few thousand rifles and shot guns, old pikes and sabres and some Army revolvers and long barrelled Amer. revolvers used for clay-pigeon shooting. The formation of the H.G. at that moment in the nation's dilemma has been not inaptly called a gigantic bluff but, in view of the possible descent of Ger. paratroops armed with grenades and tommy-guns at vital spots such as factories, railway bridges, petrol dumps and Ordnance depots, the muster of H.G., albeit crudely armed, was better than no force at all for the purpose of supplementing the relatively few regular troops—the bulk of the regular divs. being in France or in the Middle E. On May 11 the General Staff accepted, in principle, the proposals for the formation of a defence force on a tn. and vil basis, giving the utmost lat. to local enterprise so as to launch the scheme with the minimum of delay and this indeed was the scheme on which the force was subsequently founded. In fact, even before Mr. Eden on May 14 broadcast his call for volunteers, the civilian pop. in certain parts of the country were forming themselves into bands to deal with hostile paratroops and the aim of the military authorities was to get this valuable movement on a regular footing as quickly as possible. It was on May 11 at a conference at the War Office that the name 'L.D.V.' was chosen but the popular name, 'Home Guard' was adopted two months later. The military authorities agreed on May 14 that the H.G. would form part of the armed forces of the Crown and would be subject to military law. The salient features of the scheme were simplicity, decentralised control and the minimum of formalities. There was to be no estab. and no pay, though travelling allowance was given. Nor were there to be an officers or n.c.o.s in the ordinary Army sense. Volunteer organisers were to elect and nominate to the Area Command individuals for appointment as company commanders. Arms, ammunition and uniforms were to

be issued under Command arrangements. It was on this incomplete and tentative basis that Mr. Eden's appeal was made and it was fully justified by its results. The equipment originally envisaged for the H.G. consisted of a rifle, bayonet, steel helmet, and arm brassard to be worn with civilian clothes. In fact even this equipment was beyond the actual possibilities at the time and it is said that when the official appeal was made the stock of rifles available in Britain was no more than 70,000 in all. The actual numbers of the H.G. in the early summer of 1943 approached 2,000,000. But by that time men could be compulsionarily directed to serve if they were of an age and condition that justified that course. There were about 1,000 battalions, some of which were sev. thousand strong. The number of H.G. anti-aircraft batteries—for in the intervening years many had been directed to this role—was large and there were 43,000 officers in the H.G. General Service units and A.A. Batteries. It is stated on good authority that, by 1943, only 7 per cent of the men were ex-servicemen, this reduction being due to the elimination of the elderly and unfit and the average age of the H.G. was by that time slightly under thirty. They were now fully armed and trained, able to use their weapons which ranged from the bayonet to the 3 7 gun and yet remained the most inexpensive of military forces, a fact largely due to the patriotism and generosity of private individuals. The H.G. was disbanded on Dec. 31, 1945. Parades, however, had ceased in Sept. 1944 and orders were issued for the H.G. to stand down on Nov. 1, 1944. Delay in the formal disbandment was due to the necessity of facilitating the recall of arms and equipment. Officers were given honorary rank in the highest rank they held for an aggregate period of six months. See C. Graves, *The Home Guard of Britain*, 1943.

**Home Laundry, see under HOUSEHOLTERY.**

**Home, see COMEL.**

**Home Office.** The Home Secretary is, as regards home affairs, the constitutional channel of communication between the king and his subjects, and all petitions or addresses to the king must be addressed to him through the Home Secretary. The powers and duties of the H. O. are of the widest and most varied kind, but perhaps the most important relate to the control of the Metropolitan Police, the exercise of the prerogative of mercy, the administration of the Factory Acts (see FACTORY LEGISLATION), extradition proceedings, the carrying out of the provisions of the Aliens Act and the Naturalisation Acts, and the general superintendence and control over prisons, criminal lunatic asylums and approved schools once called 'reformatories.' The Home Secretary appoints recorders, stipendiary magistrates, factory inspectors, and inspectors under the Explosives Acts under the Anatomy Acts, and the Cruelty to Animals Act (or Vivisection Act). He sanctions by-laws of municipal boards, so far as they relate to 'order and

good governance.' He advises the crown (*q.v.*) as to pardoning convicted persons or commuting or otherwise reducing their sentences, and he can license prisoners under sentence of penal servitude either conditionally or unconditionally. He inspects the country police forces and can advise the Treasury to withdraw exchequer contributions if he finds such forces inefficient. All extradition proceedings pass through the hands of the Home Secretary, who makes the final order for extradition. He may refuse a certificate of naturalisation to an alien, and need give no reasons for so doing. He grants licences to scientific bodies to experiment on animals. He has power to authorise the exhumation and removal of bodies. He performs the routine work in respect of the licensing, the making of a canon law, and its subsequent promulgation. He prepares patents of nobility for peers and formal proceedings for the bestowal of honours also pass through the H. O. During the Second World War a great deal of work fell on the H. O. in connection with the provision of air raid shelters for the public and other measures of public security, there being set up in the H. O. for these purposes a ministry of Home Security. The Home Secretary is assisted in his duties by a paid under-secretary, a permanent under-secretary, three assistant *liaison* secretaries and a large clerical staff.

Homer, great epic poet of Greece. The date of his birth is quite uncertain. Herodotus declared that Hesiod and *H.* were contemporaries and lived 400 years before his own time. Most scholars now assign the *Iliad* and the clearly somewhat later *Odyssey* to some date from the tenth to the eighth century B.C. Many then claimed to be his *bp*—Smyrna, Chios, Argos, Athens, Salamis. His poems were regarded as the basis of Gk. literature, and every educated Gk. had learnt them in his schooldays. No real records of his life existed, but many legends grew up around his name. There are extant eight lives, included in the Oxford text of *H.* One of these, which is probably a literary forgery belonging to the second century A.D., was falsely ascribed to Herodotus, and contains the most popular legends with regard to his life. The biographer declares that *H.* was the illegitimate son of Cretheus, and that he was born near Smyrna on the banks of the Meles. He was subsequently adopted by his mother's husband Phemius, and travelled extensively in Egypt, Italy, and the *Is.* of the Mediterranean, collecting materials for his epics, which he wrote on his return to Smyrna. During the course of his travels he had become blind, and spent the rest of his life as a wandering minstrel, singing his songs in the *tas* of Asia Minor and the *Is.* of the Archipelago.

The tradition that the poet was blind probably arose out of two references to blind bards in the *Odyssey*, in which a personal allusion was traced. Demodocus, the blind harper who sang his lays in the halls of King Alcinoüs, is spoken of with great sympathy. He was beloved of the Muses,

who, having deprived his eyes of light, endowed him with the divine gift of song. If *H.*'s blindness is accepted, it must be assumed that he became blind in later life for the two epics show a keen perception of an exuberant delight in line and form and motion. The claims of Smyrna as his *bp* were supported by Pindar, Scylax, and Stesimbrotus. But Chios had equally strong if not stronger, claims. In that *Is.* there was worship of an anct. hero, Homeros, and an existing tradition of a family of Homerids. Its claims were also supported by Thucydides, Simonides, Acusilaus, and Hellanicus.

HOMER

It might be thought that the *Iliad* and the *Odyssey* were composed during the epochs which they describe, but it is now generally considered that *H.* drew on old sources and archaized to exclude anachronisms. His heroes belong to the bronze age, iron being hardly mentioned, yet the poet betrays himself by quoting a proverb that 'iron draws a man on (to quarrel)', showing that iron weapons in his own day were in common use. As has been said, the tenth to the eighth century is now the date assigned to *H.*, although some modern authorities put him even later.

The works of *H.* were studied critically in very early times. Theophrastus of Rhegium (*c.* 330 B.C.) regarded the epics as allegories, so that he might reconcile its principles with the morality of his own time. His theory was accepted by Anaxagoras and Metrodorus. Xenophon, Plato, and Aristotle carefully studied the structure and meaning of the poems, while Antimachus paid attention to the text. The great textual critic of anct. times was Aristarchus. Other Alexandrian critics of

importance in this connection were Zenodotus and Aristophanes. The critical emendations and suggestions of Aristarchus are preserved in the *Codex Venetus* in the library of St. Mark, Venice (pub. by Villoison, 1788). The unity of *Iliad* and *Odyssey* as poems was almost unquestioned down to the eighteenth century. By his pub. of the *Prolegomena ad Homerum* in 1795, F. A. Wolf opened the controversy which is known as the 'Homeric question.' Wolf held that the *Iliad* and the *Odyssey* consisted of a series of songs which were not put together until about 500 years after they were composed. He argued that writing must have been unknown to H., that therefore the songs were passed on from one generation to another orally by the Rhapsodists; that since poems of such length could not be transmitted through centuries without any recourse to writings, the present form of the poems could not be the original form, and that, according to the 'voice of antiquity,' Pelsistratus 'first committed the poems of H. to writing and reduced them to the order in which we now read them.' It is now generally admitted that the poems were certainly unwritten, whereas it is also agreed that it is possible for poems, even of such length, to have been memorised by the professional trained singers and minstrels of the Grecian courts. There may, at the same time exist in the text many interpolations or deviations from the original form of the poems. Wolf's statement about Pelsistratus's collection of the poems has no earlier authority than Cicero (*De Oratore*, iii. 34). The controversy raised by Wolf was hottest during the first half of the nineteenth century. Gottfried Hermann, in *De interpolationibus Homeri* (1832) and *De iteratis Homeri* (1840), maintained that he was able to distinguish three elements in the *Iliad*, a pre-Homeric element, a Homeric, and a post-Homeric. Lachmann went so far as to divide the *Iliad* into eighteen lays, and declared that the original lays had been broken up by interpolations and finally put into shape by Pelsistratus. The Wolfian theories were strongly opposed by Nitzsch in his *Maletemata* (1830) and *Die Sagenperiode der Griechen* (1852). Weicker, in *The Epic Cycle*, showed the early cyclic writers had been influenced in the structure and substance of their epic poems by the *Iliad* and the *Odyssey*; and that the latter in their present unity of form must be dated before the cyclic writers.

The question as to whether the *Iliad* and the *Odyssey* were written by the same author was first raised by Xeno and Hellanicus, called ο χωρίζοντες, the Chorizontes or Separators. The chief arguments which have been raised in favour of a sole authorship of the two poems are as follows: It is wonderful enough that in a primitive age there should have arisen a supreme genius near whom none can be placed in the world's literature save Dante and Shakespeare; but that two poets of such greatness should have lived then seems improbable indeed. It is also argued that though there must be some

difference in style between the *Iliad*, a poem of war, and the *Odyssey*, a poem of peace, the great outlines and essential styles of the two poems are similar, whereas each is wholly different from anything else produced by the writers of ancient Greece. The early Chorizontes argued in favour of two authors, by pointing out certain discrepancies between the two poems, such as the fact that the wife of Hephaestus in the *Iliad* is Charis, while she is Aphrodite in the *Odyssey*. Modern scholars have based their arguments in favour of a later date for the *Odyssey* (and, therefore, a different author) on differences between the two poems of vocabulary, grammatical forms, of treatment of the heroic legends, of institutions, political and social, and of religious or moral outlook. (See also GREEK—Greek literature.) See EDITIONS: D. B. Monro and T. W. Allen, 1912-19 (Oxford text); *Iliad*: W. Leaf, 2nd ed., 1900-02; T. W. Allen, 1931; *Odyssey*: W. W. Merry, J. Riddell, and D. Homer, Winslow (1836-1910), Amer. landscape painter, b. at Boston, Mass. During the Civil war he painted war pictures, among which was 'Prisoners from the Front.' Elected National Academician, 1865. Among his best known works

are: 'Life Line' (1884), 'Launching the Boat' (1884), 'The Look-out' (1897), 'The Maine Coast.'

**Home Rule.** The demand of Ireland for H. R., which was defined by John Redmond, the leader of the movement, as the rule of a local Irish parliament created specially to deal with Irish affairs, was for some fifty years the stumbling-block of Brit. politics. The demand was first put forward as a definite policy in 1871, but it was not till 1885, after the extension of the franchise, that Ireland returned a majority for H. R., when 85 members out of 103 were pledged to support H. R. From that time down to 1893 the Liberal party's adherence to the policy of self-gov. for Ireland was associated with the name of Gladstone, who introduced Bills in 1886 and in 1893. The latter Bill was carried in the Commons by a narrow majority, and promptly thrown out by the House of Lords. It set up a legislature and executive in Ireland to control Irish affairs, subject to the supremacy of the Imperial Parliament; and there were further safeguards to that supremacy in the shape of provisions analogous to those of the Colonial Laws Validity Act (see COLONIAL LAW), an express prohibition from dealing with the land question for three years, and a reservation of some thirteen important topics of legislation to the exclusive consideration of the Imperial Parliament. The depression in the fortunes of the Liberal party which endured thereafter for a period of seventeen years left the question dormant until after they were returned to power in 1906. The election of 1906 was generally understood to have been contested on the fiscal issue, the nominees of the Liberal party expressly undertaking not to introduce a H. R. Bill, but in 1907 the Irish Council Bill for the estab. of an Irish body to expend in Ireland the proceeds of Irish taxation was introduced and withdrawn. At the two later elections they made no such declarations of intention, and in April 1912, Asquith introduced his H. R. Bill. This Bill, which passed its second reading by a majority of over 100, was based on the model of the first Bill; but the financial provisions were more explicit. It estab. an Irish Exchequer and an Irish Consolidated Fund, and provided that the whole of the cost of Irish gov., with the exception of the expenditure on the reserved services, should be borne by the Irish Exchequer. Asquith's Bill passed the House of Commons in Jan., 1913, but was thrown out by the House of Lords. It was passed thereafter in three successive sessions by the Commons and so by the operation of the Parliament Act, 1911, became law irrespective of the assent of the House of Lords (see PARLIAMENT ACT, 1911). The Bill included Ulster and, in its earlier stages, was followed in 1912-1913 by stout resistance in that quarter, where the controversy incited by it rose almost to the brink of rebellion. Two of the chief protagonists in the resistance were Sir Edward (later Lord) Carson and F. E. Smith (later Lord Birkenhead); but this campaign suddenly died down and

the Bill passed the House of Commons in May 1914. The Lords excluded Ulster, and the King then made an attempt to bring the parties together, but without success. The outbreak of the First World War, however, changed the whole face of things, and the Bill thereafter became law without further resistance for the whole of Ireland in Sept. 1914. Its operation, however, was postponed by the Speaker until after the War, and the sequel to this postponement was that the Bill never came into operation at all (see further under EIRE; IRISH FREE STATE).

**Home Rule Movement, Scottish, see SCOTLAND.**

**Homestead**, hor. in Allegheny co., Pennsylvania, U.S.A., on the R. Monongahela, 6 m. S.E. of Pittsburgh. It was founded in 1871, and was incorporated in 1880. Here are the famous iron and steel works of the Carnegie Co., which rank with the largest in the world. At these works in 1892 occurred a tremendous strike, the rioting in connection with which had to be quelled by state troops. Pop. 19,000.

**Homicide**, see MANSLAUGHTER; MURDER; and INFANTRY.

**Homildon Hill**, one of the Cheviot peaks, near the vil. of Homildon or Humbleton, 20 m. S. of Berwick, Northumberland, England. It was the scene of the battle (1102) in which Hotspur and the earl of March defeated the Scots under earl Douglas.

**Homily**, discourse addressed to the congregation in a church. It was customary in the Jewish synagogues after the reading of the law for an explanatory discourse to be given, and this practice was early adopted by the Christian Church. The Alexandrian school was particularly rich in such exegetical expositions, the most famous anct. collection of Hs. being that of Origen in the third century. The Hs. of the Church of England are a collection of sermons (see ARTICLE XXXV.) for the use of unlearned preachers. The first part was pub. in 1547, the second in 1563.

**Homocyclic Compounds**, organic ring compounds in which all the atoms composing the ring or rings are atoms of carbon. Examples are benzene, naphthalene, and anthracene.

**Homœopathy** (Gk. *homoeos*, like, *πάθος*, disease), name given to a system of medicine introduced by a Ger. physician, Samuel Hahnemann, who was b. at Leipzig in 1755 and d. in 1843. In his *Organon of Medicine*, Hahnemann set forth the principles on which his system was based. These were: (1) That morbid conditions are cured by the same medicines which would produce the disease in healthy bodies, in accordance with the old belief expressed by the Lat. phrase '*similia similibus curantur*' (like is cured by like). (2) That drugs administered should be simple and not compounded. (3) That in most cases only very small quantities of the drug should be given, on the theory of dynamisation, or increase of force with diminution of matter, such dynamisation, it is alleged, being produced by trituration (i.e. grinding to a fine powder) and by extreme dilution.

There are very few followers of H. at the present-day. In contradistinction to H., the ordinary method of treating disease is described as *heteropathy* or *allopathy*. See also HAHNEMANN and MEDICINE. See T. L. Bradford, *Life and Letters of Hahnemann and Paracelsus*, 1923, and *Constitutional Medicine*, 1926; E. A. Neatby and T. G. Stenham, *A Manual of Homoeopathic Medicine*, 1927.

**Homogeneous and Heterogeneous** are two mathematical terms. The former is applied to magnitudes which are commensurable, and in algebra to all terms of the same degree, as for instance  $x$  and  $y$ . The word is Gk. for 'of the same kind.' 'Heterogeneous,' which is Gk. for 'of a different kind,' is the opposite of 'homogeneous,' and describes a group of incommensurables, e.g. spheres and plane circles.

**Homolousian**, theological term, which became a party word at the time of the Arian controversy. It is derived from the words *ὁμοι*, 'same,' and *οὐσία*, 'substance,' and denotes the consubstantiality of the Father and the Son in the blessed Trinity. The more moderate Arians, unwilling to say that the Son was of a different substance from the Father, wished to use the phrase 'of like substance.' See ARYAN; ATHANASIUS.

**Homologation**, in Scots law, denotes an act by which a person signifies his approval of a deed so as to make it obligatory upon him in spite of any defects in it. A common instance of H. occurs where a person capable of consenting approves a deed granted by him at a time when he was legally incapable of giving his assent to its terms, as e.g. by a minor on his attaining majority in respect of a grant made during minority without the consent of his curator. But to be valid H. must be an act from which it may be clearly inferred that the person homologating both knew and approved the contents of the instrument. See G. Bell, *Commentaries on the Law of Scotland*, 1810; J. Erskine, *Principles of the Scotch Law*, 1754.

**Homologous Series**, in chem., a series of similar organic compounds, any two consecutive members of which differ in molecular constitution by 1 carbon atom and 2 hydrogen atoms. There are sev. such series, and owing to a certain amount of similarity of constitution the substances forming them are conveniently studied by reference to their particular series. For example, the paraffins comprise the following bodies: methane,  $\text{CH}_4$ ; ethane,  $\text{C}_2\text{H}_6$ ; propane,  $\text{C}_3\text{H}_8$ ; butane,  $\text{C}_4\text{H}_{10}$ ; pentane,  $\text{C}_5\text{H}_{12}$ , etc. It is seen that each member contains one atom of carbon and two atoms of hydrogen more than a molecule of the preceding member, and the series as a whole may be represented by the algebraic formula  $\text{C}_n\text{H}_{2n+2}$ . The homologues, or members of a H. S., may usually be obtained by similar methods, and they are alike in their general properties. Other H. S. are the olefines, general formula  $\text{C}_n\text{H}_{2n}$ ; the acetylenes, general formula  $\text{C}_n\text{H}_{2n-2}$ ; the monohydric alcohols, general formula  $\text{C}_n\text{H}_{2n+1}\text{OH}$ ; the aldehydes; fatty acids, etc.

**Homology**, conformity of type which is suggestive of development or inheritance from a common ancestor, and is used as one of the morphological arguments which support the Darwinian theory. H. may be indicated by members of the same class, resembling one another in their general plan of organisation, as in the case of the mouth parts of insects, though these show innumerable varieties of form and use, or as in the case of the general structural resemblance of the arm of man, foreleg of horse, wing of bird, flapper of seal. *Serial homology* (also called metamerism or metameric segmentation) is that unity of type found on comparing the different parts or organs in the same individual, e.g. the segments or rings and their appendages which comprise the body of a worm.

**Homology**, see also under MORPHOLOGY. **Homoptera**, name given to one of the two sub-orders of Hemiptera (bugs) (q.v.), whose members differ from those of the Heteroptera in that their wings cover the abdomen in a rooflike manner and both pairs of wings are alike (hence H. = similar wings; Heteroptera = different wings). The basal and apical parts of the wings are generally of the same consistency, and sometimes all four wings are transparent; the head is furnished with three ocelli (simple eyes) placed triangularly on the summit, and the front of the head is bent over, touching the coxae (basal joints) of the front legs. This sub-order includes the Cicadidae, Ginkgoideae, Membracidae, Coreopidae, Jassidae, Psyllidae, Aphidae (green flies), Aleocharidae, and Coccidae (e.g. the cochineal insect).

**Homs**, (1) tn. in Libya, pop. 30,000. (2) tn. and sanjak of Syria, see HEMS.

**Honan**, one of the Central Provs. of China, bounded on the N. by the Hwangho, on the S. by Hupeh, on the E. by Nganhui, and on the W. by Shensi. The country is traversed by the Funiu Shan Mts., running E. and W. It is very densely populated, largely owing to the fertility of the soil. The chief products of the prov. are cotton, wild silk, cereals, and fruit. Coal is found near Honanfu, Juchow, and Lushan; other minerals are iron, sulphur, and salt-petre. Some opium is grown, the traffic in this being very extensive, especially the morphia pill traffic in the N. part of the prov. To the N. of the Hwangho, there is a beautiful fertile plain, with bamboo plantations and groves of cypress. There are good roads and the Peiping-Hankow Railway traverses the prov., having branch lines to Honanfu and Kaileng (the cap.). During the civil war much fighting was carried on in H. The area is 64,500 sq. m. Pop. 28,473,000.

**Honanfu**, city in Honan, China, situated on Lo R., a trib. of the Yellow R. Under the Chon and following dynasties, it was the cap. of China and was called Lo-yang. Coal mines are in the vicinity. During the civil war Marshal Wu fled to H. on the fall of Chongchow in 1927.

**Honawar**, or Honore, seaport on W. coast of India, N. Kanara dist., in the Presidency of Bombay. It was visited by Ibn Batauta (1342). Pop. 59,900.

Honda, tn. (alt. 690 ft.) of Colombia, S. America, on the Lower Magdalena R., 60 m. N.W. of Bogota. The riv. is navigable up to this point. The tn. is an old Sp. settlement with picturesque narrow streets Pop. 12,000.

Hondecoeter, Melchior d' (1630-95), Dutch painter, b. at Utrecht, Holland, a pupil of his father, G. de H., and uncle, Jan Baptist Weenix. He was a skillful painter of poultry, depicting the feathered families with great sympathy. His most famous painting, 'The Floating Feather,' hangs in the Amsterdam gallery. Hondecoeter's paintings may be seen in the National Gallery, London, and in the Liverpool, Berlin, Dresden, Hague, Paris, Leningrad, Florence, Venice, and Vienna galleries.

Hondo, see JAPAN.

Honduras, republic of Central America, lying between the Caribbean Sea on the N., Nicaragua on the S. and E., and Guatemala on the W. Area about 41,300 sq. m. The country is mountainous, forming an elevated tableland of an average height of 8000 ft., rising to 10,120 ft. in the case of Montana de Selague. The Cordilleras are continued from Nicaragua into the S. portion of the country. The highlands of H. are not so high as those of Guatemala, to which they are closely related geologically. The volcanic plateau, with its flows of dark-coloured lava and its beds of ash, faces with the steep escarpment toward the Lempa Valley of Salvador. The highest elevations are in S. H., near La Esperanza and Tegucigalpa, where there are sev. peaks about 8000 ft. high. There are a few inter-montane basins composed of gently rolling, hilly surfaces which lie at elevations between 3000 and 4500 ft. Block ranges, similar to the central highlands of Guatemala, are found in N. H. The chief valleys are the plain of Comayagua, and those formed by the rivs. Humuya and Gonsoran. The former is a trib. of the Ulua, the largest riv. in the country, which flows N. into the gulf of H. Other important rivs. are the Segovia, forming the boundary with Nicaragua, the longest riv. in Central America; the Nacaome, Aguan, Rio Negro, and Choluteca. The chief ls. belonging to H. are the Bay Is., and Tigre, Sacate Grande, and Gueguand in the bay of Fonseca. The climate along the Atlantic coast is oppressively hot, but on the highlands the temp. is mild. Cattle-rearing is the chief industry of the inhabs., but breeding is not carried on scientifically. The woods yield valuable timber, H. has an abundance of hard and soft woods. Mahogany and other hardwoods grow in the N.E. part of the country, in the valleys and near the S. coast. The most important hardwoods, other than mahogany, are grenadino, guayacan, walnut and rosewood. Stands of pine occur widely in the interior. Bananas, coconuts, oranges, lemons, maize, tobacco, cocoa, indigo, and sugar are cultivated. The chief culture is that of bananas, which are grown on the Atlantic coast. In 1943-45 over 9,000,000 stems were exported, mostly to the

United States. Panama hats, footwear, cigars and soap are the chief manufs. The mineral resources of the country—which comprise gold, silver, platinum, copper, antimony, zinc, etc.—have not been developed on a large scale; only gold and silver are now mined. Brown coal seams have been found. There are rich fisheries as yet undeveloped, and Turneese sponges are the finest in the world.

Cape H. was discovered by Columbus in 1502, and became a Sp. colony. Comayagua, in the rift valley, was for a long time, the leading tn. of the highlands of H. Founded in 1540 on the road between the silver mines and Guatemala, it became the political centre of this part of the Sp. domain, and continued to perform the functions of local administration until Tegucigalpa was selected as the cap. of independent H. in 1827. The settlements, which are grouped in the rift valley around Comayagua, like those farther W., grow maize for local subsistence, and produce coffee and cattle for sale. In 1821 it threw off the Sp. yoke and joined the Federation of Central America. In 1839 it became an independent state, and was subsequently involved in frequent wars with Guatemala. It has suffered from internal strife, particularly during the civil wars of 1883 and 1903. In 1907 war was declared against Nicaragua in which Bonilla, the Honduran president, was defeated. In 1911 that general was re-elected president. There was a rising in 1931 in the N. due to unrest among the banana plantation workers led by General Ferrera, who was killed by Govt. troops. A Congress of Deputies composed of thirty-eight members is elected for six years by popular vote and is in session for some two months of the year. The executive power is vested in the President, who is nominated and elected for four years. When Congress is not sitting, affairs are directed by a permanent Commission of some five members—a modification of the Constitution which dates from 1924 and further modified in 1936. The administration is in the hands of a council of ministers. The National Univ. is at Tegucigalpa, the cap. (pop. 66,000). Other tns.: San Pedro Sula (22,100), La Esperanza (11,000), Nacaome (10,000), Santa Rosa de Copan (8000), Choluteca (5000), Comayagua (5000). Ports: on the Atlantic coast, La Ceiba (12,100), Tela (10,400), Puerto Cortez (8000), and Trujillo (7500); on the Pacific coast, Amapala (3000). The port of entry for the bay Is. is Roatan. The total pop. (1945) was 1,200,500, including aboriginal tribes, 35,000 (chiefly Mosquito and other Indians all speaking different languages). The Sp. speaking inhabs. are chiefly *mesizos*, i.e. Indians with an admixture of Sp. blood. On the N. coast there is a considerable proportion of negroes, working for fruit-trading companies; some 3000 of these are Brit. subjects and their immigration is now forbidden.

By the completion in 1943 of the Inter Amer. Highway, H. is connected with the highway system of Guatemala, El

**Salvador and Nicaragua.** An Inter-Ocean Highway linking Tegucigalpa with both the Caribbean Sea and the Pacific Ocean, is under construction. There are only three railways and these are confined to the N. coastal region, where they are used mainly for the carriage of bananas. Tegucigalpa is not served by any railway and there are no international rail connections. The total railway mileage is 650. The road service, generally unsatisfactory, has been improved. There is an air service and telephones and telegraphs. There are seven gov. wireless stations and four broadcasting stations. See H. Jallay, *La République de Honduras*, 1898; E. M. Lopez, *Geografía de Honduras*, and *Historia de Honduras* (Tegucigalpa) 1919; A. B. Quinones, *Geografía e Historia de Honduras* (Choluteca) 1927; G. B. Reyna, *Honduras* (Tegucigalpa), 1930; C. M. Wilson, *Central America*, 1941; Preston E. James, *Latin America*, 1941.

**Honduras, British,** see BELSIZE and BRITISH HONDURAS.

**Honduras, Gulf, or Bay of,** broad basin of the Caribbean Sea, skirting Honduras, Guatemala, and Brit. Honduras in Central America.

**Hone, William** (1780-1812), pamphleteer, set up in 1817 as a bookseller, and soon became notorious as a publisher of political lampoons, for the issue of one of which he was unsuccessfully prosecuted. He became yet better known when he issued sev. satires written by himself, with illustrations by George Cruikshank. The best of these are *The Political House that Jack built* (1819), and *The Man in the Moon* (1820). Perhaps he is to-day best remembered by his *Leery Day Book* (1827), and his *Table Book* (1819), which are still obtainable in modern eds.

**Honegger, Arthur**, Swiss composer, b. at Le Havre, France, 1892. He possesses great technical ability, and has evolved a modernist style through contrapuntal methods. Especially important are his oratorio *King David* (1922) and his 'mimed symphony' *Honore Victorien* (1922); and he is the composer of the popular 'programme' piece, *Pacific No. 237* (1923), which was inspired by a modern Ainer. long-distance locomotive (and closely imitates its noise by the means available in a symphony orchestra), and *Rugby*. H. is one of the group of composers known as 'les Six.' See studies by A. Roland-Manuel, 1925; A. George, 1926; and W. Tappolet, 1938.

**Honesty, or Lunaria biennis**, species of Cruciferae, grown in Brit. gardens, is a native of Europe. It is a hardy plant bearing racemes of lilac-coloured flowers which have no scent, and the fruit which follows them is a silicle.

**Honey**, thick syrup collected by bees and also by a few species of wasp and by honey- or pouched-ants. The bees suck nectar from flowers and empty it from their crops into the cells of their hives. H. is most plentiful where flowers luxuriate and when the weather is dry and warm. The ants, vaunted the H. of Mt. Hybla in Sicily, and the aromatic, highly-

granulated H. of Narbonne is famous to this day. Virgin-H., gathered by young bees before they have swarmed, is finer than the H. of old hives. The colour varies with the source: heather-H. is a deep golden-yellow, and the H. from white clover a greenish-white. The Koran refers to H. as a liquor 'wherein is a medicine for men,' and in India and elsewhere its value as a gentle laxative has long been recognised. It was a favourite article of food among the ancient Gks., and was an ingredient in such popular beverages as mead, the 'claire' of Chaucer's day, and the Rom. 'mulsum.' Chemically, H. is composed of levulose (36.45 per cent.), dextrose (36.57), water, mineral matter, pollen, and wax. On an average H. contains over 70 per cent. of invert sugar (q.v.). Starch, water, glucose, and gypsum are common adulterations. In normal years, Hungary and Poland are among the chief H. producing countries, in favourable years Hungary can produce 9000 tons. It is also imported from California, New Zealand, and Australia. It is a minor colonial product. There are small bee-keeping industries at Mauritius, Cyprus, Palestine, Brit. Honduras, Brit. Guiana and various W. Indian colonies. The only colony with a substantial trade is Jamaica—averaging 800 tons annually.

**Honey-buzzard**, popular name of *Pernis ptilorhynchus*, a species of taloniform bird belonging to the family Buteoninae. It is occasionally found in England and is common in the wooded districts of W. Europe, from whence it migrates in winter to Africa. Its food consists of insects, small mammals, birds, etc., which it devours upon the ground; it derives its name from the habit it has of plundering the nests of bees and wasps for the sake of the honey. The plumage is variously coloured and is often indistinguishable from the dense foliage in which it H. prefers to nest.

**Honeycomb-moth**, popular name given to members of *Galleria*, a genus of lepidopterous insects belonging to the family Pyralidae. Certain of the species infest beehives, where they deposit their eggs; the larvae feed on the comb, through which they make tunnels. There are two broods in the year, the first appearing in May and the second in full summer. *G. mellonella* is the largest and best-known species.

**Honey-dew**, sweet and sticky exudation found, especially in warm, dry weather, on the leaves and stems of many trees and plants. Some hold that it is invariably associated with Aphides (Cocci), as, for instance, *Coccus mannifera*, and other insects. For it is known that Aphides excrete from the abdomen a fluid indistinguishable from H., the theory being that they prick a hole in the leaf or stalk and so suck the excess of sugar from the flowing sap. Others believe that without these insects H. would still form whenever the tissues of plants are broken. H., which is also called manna, has been known to fall in showers. As it closes the pores when it dries, and thus hinders the natural growth of a plant, gardeners use a syringe to wash it away.

**Honey-eaters**, name given to the species of *Meliphagidae*, a large family of passeriform birds found in the Australian region. They are small birds with beautifully coloured plumage, long curved beaks, and long tails. Their habits are active and pugnacious, and they are constantly hopping from tree to tree in search of honey and insects which constitute their food. The species of *Meliphaga* are among the most brilliantly plumaged of all birds. *M. auricoma* being one of the best known. *Anthornis* the New Zealand bell birds and *Manorhina melanophrys* the bell bird of Australia are remarkable for their clear tinkling voice.

**Honey Flower**, see *METASTANTHUS*.

**Honey-guide**, name given to the species of *Indicator* and *Prinodius*, two genera of coraciiform birds which constitute a sub-family Indicatorinae. They were formerly placed among the cuckoos but are more nearly related to the woodpeckers and barbets. Most of the species are found in Africa but *I. archipelagus* and *I. minor* inhabit the Malay Peninsula and Borneo. Their name is derived from their curious habit of conducting travellers in the direction of beehive nests by means of a shrill cry or hiss, and they will flutter round until they are sure that they are being followed. *P. regulus* is a native of Natal and *P. insig.* is a Equatorial Africa.

**Honey-locust Tree**, or **Three-horned Acacia**, for its name of the leguminous plant *Gleditsia trianthus* a native of the Carolinas and Virginia. The trunk and branches of the young tree are covered with prickles, the foliage is of a light shining green and the seeds are covered with a sweet pulp.

HONEYSUCKLE

**Honeysuckle**, or *Lonicera periclymenum*, species of *Caprifoliaceae* found in hedgerows of Britain, often known by the name of woodbine. It is a shrub of climbing habit, bearing heads of white flowers which yield a sweet fragrance, at night hawkmoths are attracted to the plants by their scent, fertilisation takes place and

the flowers change to a yellow colour. The fruit of the H. is a bright red berry. The term Fr. H. is applied to the leguminous herb *Hedysarum coronarium*, which grows in Spain and Italy. It is a hardy perennial which bears deep red or white flowers, and in Calabria is given to horses and mules as food.

**Honeysuckle Tree**, see *BANKSIA*.

**Honfleur**, seaport on the N bank of the Seine estuary, 8 m S E of Havre, in the dept of Calvados, France. It is a railway terminus, controls a brisk fishing-trade and exports agric. produce to England. There are antiquities of interest. Pop. 8300.

**Hong Kong** (from *Hiang-Kiang*, fragrant stream), is in the China Sea, separated from the coast of China by the Laimun or Lymoon (Carpenter) Pass, a strait less than half m in width. H. K. is a Brit. colonial dependency and lies S of Kowloon Prov. and N of the Pearl R. estuary. The colony includes the two of Hong Kong, which has an area of 32 sq m with a length of 11 m and a breadth varying from 2 to 5 m. The S tip of the mainland peninsula of Kowloon with an area of 44 sq m, and Stonecutters Is., 4 sq m as well as the New Territories which consist of an area of hinterland with many is. (area 300 sq m). The New Territories stretch northwards to the Shum (Lun) R. and include the seabeds of Deep Bay to the W. and Mira Bay to the E. The total area of the colony is thus about 36 sq m, most of which is steep and unproductive hillside. H. K. rises steeply from the N shore to a range of treeless hills of volcanic rock of which the highest point is Victoria Peak (1823 ft). The scenery, especially along the coast, is indented shores is superb. Between the hills and the N water front lies the city of Victoria. Most of the urban area of the is. is flat unreclaimed land. There is almost land locked natural harbour, varies in width from 1 to 3 m and is entered from the E by a deep water channel through Laimun Pass and protected from the W. by a cluster of is. through which a shallower channel gives access to the coastal vessels. H. K. harbour has become the gateway to S. China, lying, as it lies half way between Haiphong and Shanghai. The Kowloon Peninsula which is flat and has been extended in area by reclamation has grown greatly as a residential suburb and besides, contains the chief industrial area of the colony, on the W. shore are wharves for ocean-going ships and at the S end of the peninsula is the terminus of the Kowloon-Canton Railway. Between Kowloon and the New Territories to the N is the Unicorn range of hills. The New Territories are steep and barren, the highest point being the Peak Laimoon (1110 ft), 7 m N W of Kowloon, N W of which peak is the colony's largest area of cultivable land stretching to Deep Bay. The E half of the New Territories mainland, mountainous and unproductive, extends to the rocky and indented coastline of Mira Bay. Where cultivation is possible vines exist and crops are grown; intricate terracing brings as

much land under cultivation as possible and the traditional methods of Chinese farmers have changed as little in H. K. as in China. Few of the 75 adjacent is. included in the New Tera. show traces of the impact of W. civilisation and many are uninhabited. The largest is. is Lantau, rugged and beautiful, lying W. of the harbour. It is more than twice the size of H. K. is. and its highest peak is 3000 ft. Wooded ravines and scrub-covered spurs, where may be found plenty of wild boar and barking deer, slope steeply upwards. The other is. are much smaller, the smallest inhabited is. being Ngai Ying Chau (8 ac.). The total estimated pop. of the New Tera. is 60,000.

**Climate.**—The climate of H. K. is sub-tropical and conditioned largely by the monsoons, the winters being cool and dry and the summers hot and humid. The climate is unfavourable to Europeans owing to the rapid alternations of heat and cold and the chief tn. retains the violent heat of the sun long after sunset, being hedged in by rocks which keep off the cool evening breezes; but for six months of the year the weather is cool and dry with long periods of sunshine daily. The summer is the rainy season, three-quarters of the ann. rainfall falling between May–Sept. Fog and very low cloud are common in March and April when S. winds may temporarily displace the cool N.E. monsoon, which sets in during Oct. and lasts till April. The S.W. monsoon prevails from May to Aug. From June to Oct. H. K. may be affected by typhoons, but they are sometimes experienced before and after this period. A typhoon whose centre is over or near H. K. is accompanied by hurricanes, which may result in much damage and loss of life. The mean monthly temp. ranges from 59° F. in Feb. to 82° F. in July, the yearly average being 72° F. The temp. rarely rises above 95° F. or falls below 40° F.

**Commerce and Industry.**—The main primary product of H. K. is fish, deep-sea fishing being an important occupation. **Agriculture** is limited by reason of the rugged and mountainous terrain and **mineral resources** are believed not to be great. A new Dept. of Agriculture was set up very soon after the colony was retaken in 1945, which not only did much to restore the farming industry to what it was before the war but also to establish it on a much sounder basis with a view to steady development on scientific lines. Some progress was also made towards the organisation of co-operative production and collective marketing was estab. in a few areas among tomato-growers. A small Gov. experimental station which existed in the N. Tera. before the war was restarted after the Brit. re-occupation. Before the war there was a Botanical and Forestry Dept., which took charge both of the Botanical Gardens and gov. grounds and of the afforestation of the hill-sides. After the war it was decided to have two independent depts., one for forestry and one for gardens. What little **mining** is done is entirely in the New Tera. Only five small mines are at present being

worked: one produces lead and silver, two are working wolfram deposits with indifferent success, and the other two produce kaolin and magnetite respectively. **Local industry** includes shipbuilding, ship repairing, engineering and a wide range of light industries, the main products of which are textiles, rubber goods, buttons, leather goods, cigarettes, matches, preserved ginger and confectionery, tinned goods, glassware and paint. The majority of H. K.'s working pop. is engaged in occupations connected with commerce rather than production but enterprise and cap. are not lacking when an economic demand arises which can be satisfied by the expansion of local industry. H. K.'s industrial production is almost entirely in Chinese hands, most of the factories being Chinese-owned and managed. The number of factories registered in 1941 was 1200; at the end of 1946 36° were re-registered and a further 537 had applied for registration. The outbreak of war with Germany had a stimulating effect on the colony's industries, particularly on the larger dockyards and on local factories producing war equipment; but during the war against Japan industrial activity in the colony was brought virtually to a standstill. By the end of 1946 the recovery of production capacity varied from twenty to fifty per cent of pre-war levels. On the whole little direct war damage was done to factories except to the shipbuilding and repair yards and to a sugar refinery; machinery was in many cases removed by the Jap. and could not be recovered. Before the war more persons were employed in the textile industry than in any other single industry, there being 25,000 engaged in cotton weaving in 150 factories—making cheap shirts and prints for export to Malaya, Ceylon, and E. and W. Africa; and 15,000 in 450 knitting factories. At the end of 1946 there were 90 cotton-weaving factories in operation and practically no knitting factories. The manu. of electric torch batteries gave work before the war to 2000 or 3000 workers in twenty factories. During 1945–46 ten resumed operation, but production in 1946 was restricted to about twenty per cent of pre-war. There were also eleven factories engaged in the manu. of preserved ginger, all of which resumed operation in 1946, but the total of employees amounted only to 500 as against 3000 in 1911 and production was far below pre-war level.

The chief tn. of H. K. is Victoria, the seat of gov. and of trade, which stretches for 5 m. along the N. coast. It is built in three layers, the Praya or Esplanade, which is given up to shipping, the Chinese quarters being beyond the commercial portion; the second layer which contains gov. house and other public buildings; and the Peak, or third layer, which is reached by a cable tramway. Before the war frequent scheduled passage and cargo services connected H. K. with the world. Ships of many nations were to be seen in the harbour, the most frequent callers, apart from the Brit. F. and O., Blue Funnel, Ben Line, Bank Line, Ellerman's and

Canadian Pacific Lines, being Amer., Scandinavian and Fr. ships. In addition to ocean-going tonnage, there was a large traffic in cargo and passengers between H. K. and Chinese ports; this was largely carried on by sailing and motor junks, but riv. steamers, Brit. and foreign, also accounted for a fair proportion. The port facilities were seriously impaired both as a direct result of hostilities and also through neglect during the Jap. occupation. The total shipping entering and clearing during 1946 was 45,484 vessels of 11,244,311 tons; this, compared with 1939, showed a decrease of 29,133 vessels and a decrease of 19,653,637 tons. Some 37,922 vessels (10,988,170 tons) were engaged in foreign trade, compared with 23,881 vessels (29,196,466 tons) in 1939. But throughout 1946 there was a steady quarterly increase in the number of vessels using the port, the tonnage rising from 492,189 in the first quarter to 1,403,021 in the last. Over 1946 food-stuffs headed the list of imports (about H. K. \$210 million) followed by oils and fats (\$114 million) piece goods (\$100 million) and metals (\$10 million). The largest item of exports in 1946 was oils and fats (\$143 million), followed by piece goods and textiles (\$128 million), food stuffs and provisions (\$116 million), Chinese medicines (\$60 million), metals (\$39 million) and paper-ware (\$31 million). Trade returns do not differentiate between re-exports of overseas commodities and those produced in the Colony, but exports of those goods in which local factories are interested show that singlets, shirts, etc., (value \$13 million), electric torches and batteries (\$9 million) and rubber shoes (\$31 million) were exported.

**Government.**—H. K. is administered by a governor assisted by an executive council and a legislative council. The executive council, which is consulted by the governor on all important administrative matters, includes the senior military officer, the colonial secretary, the attorney general, the secretary for Chinese affairs, the financial secretary (who are members *ex officio*), and such other members, both official and unofficial, as may be appointed. At the end of 1947 there were eight official members (including the five *ex officio* members) and seven unofficial members, two of whom were Chinese. The legislative council consists of not more than nine official members, including the same five *ex officio* members listed above, and not more than eight unofficial members. At the end of 1948 there were nine official members and seven unofficial members. The procedure of this Council, with the advice and consent of which all legislation is enacted and by which all expenditure from public funds has to be approved, is based on that of the Brit. House of Commons. There are three standing committees of the legislative council—the finance committee, the law committee and the public works committee—and select committees are from time to time set up to advise on matters before the council. In 1947 the secretary of state for the colonies approved pro-

posals for a revision of the constitution, providing for the estab. of a municipal council (to which many of the functions of the present gov. would be delegated), and consisting of fifteen members representing the Chinese, and fifteen the non-Chinese sections of the pop. At the resumption of civil gov. in 1946 the normal *judicial system* of H. K. was restored. The Supreme Court of H. K. has the same jurisdiction as the English Courts of Kings Bench, Common Pleas and Exchequer have or had in England, and is a Court of Over and Territor and Gaol Delivery, Assize and Nisi Prius, with jurisdiction in Probate, Divorce, Admiralty, Bankruptcy and criminal matters; and it is also a Court of Equity with such and the like jurisdiction as the Court of Chancery has or had in England.

**Education.**—H. K. has a voluntary system largely in the hands of gov. and of missionary bodies. The present system may be said to have started in 1913 when the Education Ordinance, from which the director of education derives his legal powers came into operation. The medium of instruction in schools varies from one category of school to another. In some, Eng. is the sole language; in others, Chinese; and a number of schools have classes in both languages. The grant-aided schools mainly use Eng. The military schools cater for the children under the age of eleven of serving officers and men and the staff is recruited from the Army Educational Corps and the Queen's Army schoolmistresses. Normally secondary education in Eng. is to a great extent in the hands of gov. and grant-aided schools. Within the urb. area in 1941 there were 649 schools, 529 of which were private schools (i.e. those not in need of, or which do not merit gov. subsidy) 91 subsidised, 9 gov. and 20 grant-aided. Education in H. K. is not free although 10 per cent of the pupils in gov. schools are awarded free places. The univ. was incorporated in 1911 and opened formally in 1912. In 1941 a new science building was opened a few weeks before the outbreak of war. The supreme governing body of the univ. was the Court, with life, *ex officio* and nominated members, the governor as chairman and a Council or executive committee, and a senate composed of the vice-chancellor, the director of education and the profs. and readers. There were four faculties, medical, engineering, arts and science; and the total number of students was a little over 500. Early in 1946 the secretary of state for the Colonies appointed a committee to advise on the future of the univ. An immediate effect of the fall of the Colony was the grievous damage wrought on the univ. buildings by wholesale looting. The only buildings to escape serious damage were the main floor in which was housed the main library and the Fung Ping Shan Chinese library and the Fung Chi Ngong School of Chinese Studies. Matters of public health are the responsibility of the Medical Dept., the functions of which are separated into different divs., e.g. hospitals, health, investigation and relief.

**Communications.**—An electric tramway with 19 m. of track and new motorizing roads were opened before the war. Over 400 m. of roads are maintained, 173 m. of which are on the Is. of H. K., 106 on Kowloon and the remainder in the New Ters. About ninety per cent of these roads are of modern metalled construction. The road system suffered considerably from neglect during the Jap. occupation. Two new roads, both in the New Ters., were built during the Jap. occupation: one to the top of Tai-mo-shan built to serve as a Jap. early warning radar station, whilst the other, leading to Saikung vil., was designed to facilitate Jap. military operations against the Chinese guerrillas. Kowloon is the S. terminal of the railway system extending to Hankow. From Shum-chun on the border of the New Ters. N. to Canton the route is now operated by the Canton-Hankow Railway, from Shum-chun S. to Kowloon (a distance representing 36 km. out of a total of 183 km. from Kowloon to Canton) the railway is operated by the H. K. gov. and is known as the Brit. section of the Kowloon-Canton Railway. At the present time, pending the conclusion of a new agreement, the Brit. section is receiving a share amounting to 20 per cent of the receipts and a terminal charge of 20 cents per ton on all traffic originating at Kowloon. H. K. is a most important link in the net-work of post-war aviation but to retain its place it requires a first-rate modern aerodrome. A weekly flying-boat service to the United Kingdom was set up by B.O.A.C. in Aug. 1946 (a six-day journey) and the colony is connected by the services of Chinese air transport companies with Shanghai, Nanking, Chungking, Kunming, Hainan Is., and Canton. The colony's only airfield, Kai-tak, is to the N.E. of Kowloon, a fifteen min. drive from Kowloon's chief hotel. Situated under a steep range of hills rising at one point to 1400 ft. it is an airfield which by modern standards leaves much to be desired. The Jap., during their occupation, carried out a considerable extension of this aerodrome, doubling its size at the expense of adjacent Chinese houses and fields and of the former civil airport buildings; but despite these improvements the aerodrome remained inadequate for heavy aircraft.

**History.**—Prior to 1841 the Is. now known as H. K. was inhabited by a few fishermen, stone-cutters and farmers, and provided a notorious hiding-place for smugglers and pirates. In that year it was occupied by Brit. forces partly as a reprisal for the treatment of Brit. merchants in Canton, and partly to provide a secure basis for trading with S. China merchants. The cession of the Is. to the Brit. Crown was confirmed by the treaty of Nanking in Aug. 1842. The convention of Peking of 1860 added the Kowloon Peninsula and Stonecutters Is. to the Crown Colony and under a later convention of Peking, concluded in 1898, the area known as the New Ters., including Mile Bay and Deep Bay, was leased to Great Britain for 99 years. Nearly a century of unbroken peaceful development fol-

lowed the treaty of Nanking. One of the world's greatest harbours grew up naturally in the colony's enclosed waters; the freedom of the port and the freedom of entrance and departure for all persons of Chinese race were preserved in accordance with a policy which ensured for the colony the rôle of entrepôt both for the trade of and for the labour of China's S. provs.; afforestation, extensive reclamation of foreshore, cultivation of the lower slopes, and a net-work of motor roads cut into the hills, combined with the steady and natural growth of Victoria itself, to present to the ocean-going ships which lay in the harbour in 1941 a picture very different from that which met the first merchantman who watered off the S.W. coast of the Is. or the first pioneers who explored the hostile hills in quest of pirates; besides which sanitation, anti-malarial work and public health administration combined have removed all evidence of the 'plague spot' which the new colony was thought to be a century ago. The rich interior of the mainland was linked by railway with the wharves and warehouses of H. K.; schools and a univ. were estab.; Chinese, European and Amer. air-lines met in the colony's airport; shipyards and docks able to accommodate the world's largest liners were constructed; light industries were started and prospered. Also, if of doubtful benefit to H. K., the colony became known as an impartial refuge during the inter-racial strife which ensued in China after the inauguration of the Chinese Republic in 1911 and, later, when China was attacked by Japan. In H. K. the shadow of Jap. aggression was scarcely perceptible when Manchuria was attacked; it darkened somewhat with the fall of Shanghai in 1937 and lay over the colony, heavy and menacing, after the fall of Canton at the end of 1938. The colony's pop. increased to over one and a quarter million, swelled by homeless refugees from S. China, who could be neither housed nor turned away. In ascertaining, before Japan entered the Second World War, how many persons would have to be fed and sheltered during air raids a census taken in 1941 showed that 709,291 persons were living on the Is.; 381,431 in Kowloon, and 151,000 in boats, giving a total of 1,441,725. There were then just under 8000 Britons exclusive of the garrison. This census showed that so great was the congestion that at least 20,000 people were habitually sleeping in the streets.

When Japan suddenly entered the Second World War on the side of her Axis (g.v.) associates, her forces at once bombed H. K. (Dec. 7). The defences of the Is. and of Kowloon had been much strengthened and these, supplemented by the mountainous nature of the colony, were apparently believed to offer every probability of successful resistance. It is, however, to be borne in mind that under the Washington Treaty of Limitation of Naval Armaments, 1922, the contracting parties agreed to maintain the status quo in regard to fortifications and naval bases. The Jap. gov. denounced the treaty at the

end of 1934 and, in consequence, the treaty lapsed on Dec. 31, 1936. Until the latter date, therefore, the Brit. Gov. were precluded from erecting additional fortifications at H. K. But apart from this, it was always obvious to the authorities that the position of H. K. would become very precarious, lying as it does so near to the homeland of Japan, in the event of war with that country. The garrison, aided by the Navy, made a desperate fight against huge odds. By mid-Dec. Kowloon was in Jap. hands and the garrison of that peninsula prepared to withdraw into H. K. is. Jap. land artillery,

commanders. The garrison consisted of Regular and local Volunteer elements, Brit., Indian and Chinese, and a fine contingent of Canadian troops. But air force activity was necessarily restricted nor could Brit. ships operate effectively in such narrow waters. Thus the tiny Canton gunboat, *Hobbs*, was destroyed by her own crew after fighting to the last moment, while her sister ship, the *Cicala*, was sunk by bombs and all the small harbor craft were set on fire. Ashore, everything which could be of service to the enemy, including wharves, docks, equipment and stores, was wrecked or burned.

SHOPS IN A HONG KONG STREET

as seen from the sea

naval forces and bombers were now ceaselessly bombarding the colony and trying to disrupt the retirement from Kowloon by plunging shells into the narrow stretch of water separating Kowloon from H. K. All Brit. troops were also withdrawn from the 300 sq. m. of leased ter. on the mainland. Air raids on the is. were not remarkably effective owing to the fact that rocky Victoria peak was honeycombed with first-rate shelters and supplies were protected by the hills. Victoria itself, built partly in a solid block on the Kowloon Peninsula on the mainland, partly on reclaimed land or steep hillside on the is. opposite, was now, together with its naval yard, under enemy fire from the mainland; while the less densely inhabited S. side of the is. could now be bombarded by long range heavy guns of the Jap. fleet lying near the is. of the S. On Dec. 17 Sir Mark Young, governor of H. K., rejected a Jap. proposal to enter into negotiations for surrender and refused to accept any further communications from the Jap.

in accordance with the "scorched earth" policy, in the closing days of the siege. Civilians were remarkably steady under fire, but by this time (Dec. 18) the spectre of thirst was haunting the people. Yet the next day the Brit. guns silenced no fewer than five Jap. batteries, while anti-aircraft fire brought down a mass Jap. bombers. But on that day the Jap. made landings in considerable force and also cut telegraphic communications with H. K. Later in the day after stiff fighting they gained possession of Victoria City and most of the is. By now the enemy had more than 20,000 men on the is. alone and were using their undisputed command of the air to full advantage. The moment Jap. troops landed, small units, armed with Tommy-guns, mortars and grenades, made for the strong points marked on their detailed maps. Others penetrated the A.R.P. tunnels and, by using connecting passages, with which they appeared to be familiar, began to sow confusion among the defenders. Although

the enemy indulged in their usual indiscriminate bombing before the final assault, civilian casualties never exceeded 150 a day. Indeed civilian casualties, both European and Chinese, seem to have been surprisingly light, possibly because no fighting occurred in the teeming central dists. of Victoria City. Gov. House was badly damaged by bombs. The Military Hospital was hit 29 times. Many fine houses on the Peak were wrecked; but the splendid new building of the H. K. Bank stood up well to shelling. The Gloucester Hotel was only slightly damaged and the Queen Mary Hospital was neither bombed nor shelled. The gallantry of the garrison was beyond praise and the Indian troops showed magnificent bravery. But the colony was literally rocked from the repeated explosions when the last relentless measures were taken before shortage of water compelled the defenders to ask for terms. In the interests of humanitarianism the garrison was at last forced by the horror of thirst if not of actual want to negotiate a surrender. Among the many examples of courage in the battle for H. K. was the heroism of an officer, who, having defended his munition store with great tenacity blew himself up with the store rather than allow it to fall into the enemy's hands. Another gallant episode was an all night fight for the Repulse Bay Hotel on the S. side of the Is., during which the defenders, using an old archery set found in one of the rooms, fired flaming arrows into the underground where the Jap. were lurking. The garrison of 'Tai-pans', consisting mainly of over-age business men, holding the N. Point Power Station, resisted for days, firing rifles from every window at the oncoming enemy. A force of Indians fought a remarkable rearguard action down the entire length of Nathan Road. Kowloon kept their fire up while embarking, and continued to fire as they moved off. But the odds were always against the defence and while the mainland was being evacuated, the whole 32 sq. m. colony shook from many explosions, including the blowing up of a ferry boat loaded with dynamite, which shattered every window of the Is. On the 23rd Canadian troops suffered and inflicted heavy casualties, their commander, Brig. Lawson and his chief of staff, Col. Hennessy, both being killed. The actual date of surrender was Christmas Day and one Brit. party succeeded in escaping from the Is. in speed boats on Christmas night. Thus ended, temporarily, the hundred years of Brit. rule of the colony of H. K.

The colony remained in Jap. hands for some three and a half years. The pop. quickly fell from 1½ million to less than half that number. In the face of increasing oppression and brutality the fundamental loyalty to the Allied cause of the Chinese who remained was never in doubt: parts of the New Terr. remained in the hands of Chinese guerillas throughout the war, in spite of the most vigorous punitive measures which the Jap. could invoke; passive resistance to every Jap. enterprise was adroitly calculated; Allied subver-

sive organisations had no difficulty in securing the help of every class of Chinese resident in the colony. H. K. was eventually liberated by units of the Brit. Pacific Fleet on Aug. 30, 1945. The Jap. forces were taken prisoner and a military administration was set up under Rear-Adm. Harcourt as commander-in-chief. The military administration lasted until May 1, 1946, considerable headway having been made in the previous seven months with the work of reconstruction, a result largely due to the cheerfulness and resilience of the Chinese pop. Civil gov. was restored on the above date when Sir Mark Young resumed the governorship of the colony and the legislative and executive Councils were reconstituted. In June 1946 the gov. (as in other colonies) set up a committee to consider the relative merits of various schemes for the development and welfare of the colony under the provisions of the Colonial Development and Welfare Act, 1945. War crimes trials during 1946 were set up in H. K. by royal warrant. Up to the end of that year some fifty Jap. had been tried, nine condemned to death, nine to imprisonment for ten years or longer, twenty-six to shorter terms and six acquitted; some seventy-eight prisoners were then still awaiting trial. The trials included those of Col. Noma who was head of the Jap. Gendarmerie during the occupation and Col. Tokunaga, who was in charge of all prisoner of war camps; while amongst those awaiting trial were Adm. Sakonjo, accused of ordering sixty-nine prisoners of the Brit. motor vessel *Hehar*, sunk in the Indian Ocean, to be butchered on the deck of a Jap. cruiser, and Col. Kogi, the public prosecutor at the 'bloody trials' of 1943 as a result of which forty local residents of H. K. lost their lives.

In anticipation of the fall of Shanghai (May 24-25, 1949) and the implicit threat to H. K. from a further Communist advance southward, the cruiser *Janataca* arrived on May 29 to strengthen the colony's defences, while a curfew of three months' duration was imposed in the frontier dists. Later Mr. A. V. Alexander, minister of defence, paid a visit to H. K. to inspect its defences and, subsequently, the Brit. Gov. sent strong reinforcements.

Pop. (estimated, 1917) about 1,750,000, the great majority being of Chinese race. There were in the Colony, excluding Services personnel, about 6000-7000 Brit. subjects from the United Kingdom and the Dominions, 2500 Indians, 870 Portuguese citizens, 3000 Brit. subjects of Portuguese race, many of whom had spent the war years in Macao, and also 250 Amers.

Honiton, mkt. tn. on the Otter, 16½ m. E.N.E. of Exeter by rail, in Devonshire, England. It is famous for its lace-making, an industry introduced by the Flemish in Queen Elizabeth's reign. Pop. 600.

Honnell, health resort, with a mineral spring, beautifully situated on the Rhine, 8 m. S.E. of Bonn in the Rhineland, Germany. Pop. 8900.

Honolulu, city, port, and co. of Hawaii, Pacific Ocean (belonging to U.S.A.), situated on the S. coast of the island of Oahu. It is the cap. of Hawaii. In 1907 an Act was passed by which the ls. and co. of Oahu, and the small ls. adjacent became the 'city and co. of H.'. The chief industries are the manu. of machinery and carriages, rice-milling, and shipbuilding. The city, too, has a plentiful water supply, and hence the vegetation is luxuriant. There is a natural harbour which is formed by a lagoon within the coral reef which has 22 ft. of water at the entrance at high tides, and can hold a large number of ships. This and Pearl Harbour (q.v.) are the only safe ports in the archipelago. Extensive naval works have been constructed here and military works at Honolulu. From 1820 to 1893 the city was the residence of the sovereign, and is now the seat of gov. and the foreign consuls. It is an entrepôt for European and Indian goods, and has communication by steamship with San Francisco, Seattle, Vancouver, Victoria, Sydney, and Chinese and Jap. ports. The univ. of Hawaii is situated at H. The city has electric transp. Pop. of city and co. 268,900. See HAWAII.

Honors, see HONAWAR.

Honorius (reigned A.D. 381-423), emperor of Rome, b. at Ravenna. Three things notably characterise his reign namely, the inroads of barbarians, the energy of Stilicho, and the pusillanimity of the emperor. Stilicho was appointed H.'s guardian during his minority, and it was he who quelled the revolt of Gildo in Africa (397) and thrice drove the Goths and Huns from Italy. In 400 he defeated the combined forces of Alaric and Radagaisus; in 402 he defeated Alaric alone at Pollentia, and a year later he put Radagaisus to death near Frécula. H. executed Stilicho in 408, and so was powerless to repulse Alaric, when he captured Rome a second time in 410. Ataulphus,

Alaric's son, married Placidia, H.'s sister, but neither he nor H., nor any of the host of usurpers could maintain even a semblance of imperial power. See Gibbon, *The Decline and Fall of the Roman Empire*, 1766-1788.

Honorius I., pope (625-37), succeeded Boniface V. He wrote a letter to Edwin, king of Northumbria, urging him to be true to the new faith, and at his request conferred the pallium on the bishops of York and Canterbury. The Celtic Church was a source of continual anxiety to him, as it failed first of all to acknowledge his supremacy, and secondly continued to observe Easter according to a rule for fixing the time that Rome had discarded, and in its own way. H. also corresponded with Sergius, patriarch of Constantinople, who maintained that the twofold nature of our Lord was animated by a single will. H. supported this heresy, which was called Monothelism and was anathematised, with the Monothelite heretics, by the Council of Constantinople in 638. See J. Chapman, *The Condemnation of Pope Honorius I.*, 1907.

Honorius II., pope (1124-30), was Cardinal Lambert Scannabecchi, bishop of Ostia, before his election to the papal chair. Boleseged by Roger, count of Sicily, in Benevento, H. afterwards countenanced his investiture as duke of Apulia and Calabria. He excommunicated Conrad, Lothair's rival for the throne of Italy.

Honorius III., pope (1216-27), was Cardinal Cencio Savelli before he succeeded Innocent III. A zealous supporter of St. Dominic, he failed to induce Frederick II. to lead a crusade against the Muslims, and was so unpopular at Rome that he was repeatedly driven beyond that city's gates. See monograph by J. Clausen, 1895, and A. Keintner, *Papsttum und Krieg unter Honorius III.*, 1935.

Honorius IV., pope (1285-87), was Cardinal Giacomo Savelli. He favoured Charles of Anjou, and actually proclaimed his expedition against the men of Aragon a 'holy war'. See M. Prou (ed.), *Les Registres d'Honorius IV.*, 1889.

Honour, legal description of a seignior of two or more manors under the control of one baron and subject to a single jurisdiction. See MAJOR.

Honour, Maids of, see HOUSEHOLD, ROYAL.

Honourable (from Fr. *honorable*, and Lat. *honorabilis*, deserving honour), title of honour prevalent in the United Kingdom and her colonies and also in the United States. In the United Kingdom marquesses should be addressed as 'most H.'; earls, viscounts, barons, and privy councillors as 'right H.'; whilst the title of H. is reserved for maids of honour, judges of the high court, and the sons and daughters of peers. Formerly the style was loosely applied. Major-gen. Lowther, whose father was a merchant, is described on his tomb in Westminster Abbey as 'The Hon.' (1746). In America and the colonies judges and members of state legislatures or the executive councils have a right to the distinction.

**Honourable Artillery Company (H.A.C.).** As a military force this is one of the most ancient in the world, having been granted its Charter by Henry VIII. in 1537. At this time 'artillery' included every kind of missile, and this company was a Guild of Archers. This Guild became a training school for the London Train Bands, and was always in the forefront of military training units. Many famous people have served in its ranks at various periods, including the poet Milton, Marlborough, Wren, and the great Fr. engineer Vauban. The Corps served in the S. African war 1899-1902, and during the First World War it raised three infantry battalions and seven batteries of artillery, which served in France, Flanders, Italy, Palestine, and Aden. Its King's Colour is unique, in that it is the only King's Colour in the Brit. Service which bears all the battle honours, these being usually on the Regimental Colour. The headquarters of the H.A.C. are at Artillery House, Finsbury, London. An Amer. off-shoot of this Company is the present 'Anc. and Honourable Artillery Company of Boston, Massachusetts, founded in 1683 by four members of the H.A.C. who emigrated. In the Second World War the 12th (H.A.C.) Regiment, Royal Horse Artillery took part in many battles on the It. front, 1944-45. See Maj. G. Gould-Walker (ed.), *The Honourable Artillery Company in the Great War 1914-19*, 1930.

**Honshu, see under JAPAN.**

**Honthelm, Johann Nikolaus von (1701-1790),** Ger. historian and theologian, educated by the Jesuits. From 1732-79 he was dean of St. Simeon's in Trier, his native place, and from 1738-47 represented the interests of the archbishop-electoral at Koblenz. From 1748 he was suffragan bishop of Trier, and he was also pro-chancellor of the univ. Under the pen-name of 'Febronius,' he discussed the limits of papal authority in what became a famous treatise. His three hist. of Trier are in the highest degree erudite.

**Honthorst, Gerard van (1590-1656),** Dutch painter, has left many pictures which are now to be found in many galleries of Europe. B. in Utrecht, he studied under Albrand Bloemaert, migrated to Rome, where he executed his masterpiece 'Christ before Pilatus.' In Whitehall, as in the Palace of the Hague, etc., he painted allegorical subjects, and there are still in existence many excellent portraits from his hand, as, for example, the 'Countess of Bedford' in Woburn Abbey. He is noted specially for his night studies.

**Hontrop, coal mining vil. of Westphalia, Germany, in the dist. of Arnsberg.**

**Hooed (Land-defenders),** term first used under the early monarchy of Hungary to describe the national champions. During the revolution of 1848 it was used of the patriotic party, and after independence was established (1848) was applied to the *Landwehr*. In 1918 it was applied to the whole army.

**Hooch, Pieter de (1632-81, or later),** Dutch painter, b. near Rotterdam, worked at Delft. Like Hobbema and Cuyp, he

was held in small esteem by his contemporaries. A pupil, perhaps, of Rembrandt, whose style has left an impress on his work, this artist has left a few, but, in their way, exquisite pictures of native interiors. His clean and cheerful scenes intimate an earnest appreciation of the joys of domestic life and a warm love for sun and light. See Von Hofstede de Groot, *Catalogue raisonné* 1907; E. Fromentin, *Masters of Past Time* (trans.), 1910.

**Hood, Sir Alexander, see BRIDPORT, VINCOUNT.**

**Hood of Avalon, Arthur William Acland, Baron (1824-1901),** Eng. admiral, entered the navy in 1836. During the Crimean war he was with the naval brigade before Sebastopol, and in the China war participated in the action of Fatsan Creek (1857) and in the seizure of Canton (1858). Director of Naval Ordnance (1869-73), he finally rose to the rank of First Sea Lord of the Admiralty (1885), when his conservatism proved a formidable obstacle to crying reforms.

**Hood, Sir Horace Lambert Alexander (1870-1916),** Brit. rear-admiral; b. in London; 3rd son of 4th Viscount H. Cadet at age of twelve. Lieutenant, 1890; on the *Trafalgar*, 1891-92. Until 1895 studied gunnery ashore and performed staff duties. His first experience of war was under Egyptian gov. in gunboat on Nile, 1897. At Athara and Omdurman. Commander, 1898. Captain, 1903. Shore-light, Somaliland, 1904. Commanded college, Osborne 1910-13. Rear-admiral, 1913. In command of Dover flotilla that secured Eng. Channel on outbreak of the First World War. While ably assisting Beatty with a battle-cruiser squadron in Jutland fight, perished in wreck of his flagship the *Invincible*, whose magazine was exploded by a Ger. shell, May 30. See J. S. Corbett, *History of the Great War, Naval Operations*, 1923.

**Hood, John Bell (1831-79),** Amer. soldier, graduated from the military academy at West Point in 1853. On the declaration of Civil war he joined the Confederates, and after the battle of Gaines's Mill (1861) was promoted to major-general. At Gettysburg (1862) he was wounded and after the battle of Chickamauga (1863) lost one of his legs by amputation. Disaster attended him on winning the temporary command of the Tennessee army, and at the battle of Nashville his forces were utterly overwhelmed (1865).

**Hood, Robin, see ROBIN HOOD.**

**Hood, Samuel, Viscount Hood of Whitby (1724-1816),** Brit. admiral, son of a clergyman and brother of Alexander Hood, first Viscount Bridport (q.v.), entered the navy in 1741. From 1780 to 1783 he was fighting in the West Indies, at first under Rodney, but afterwards as commander-in-chief. In 1781 he made an unsuccessful attempt to prevent the Fr. admiral, De Grasse, from blockading Chesapeake Bay, and the following year sailed likewise, in spite of adroit manoeuvres, to dislodge the Fr., again under

De Grasse, from the is. of St. Christopher. The tactics he adopted in extricating him self from this engagement have again and again been commended by naval experts. Finally, he assisted at the discomfiture of his old enemy in the action off Dominica (1783). In 1784 he was returned to Parliament, the unsuccessful candidate being none other than Fox. During the

SAMUEL, FIRST VISCOUNT HOOD

Napoleonic wars he succeeded in occupying Corsica (1794). He was created viscount in 1796 and made governor of Greenwich Hospital. See J. H. Rose, *Lord Hood and the Defence of London*, 1922.

**Hood, Sir Samuel** (1762-1814), Eng. vice-admiral. Joined the navy in 1776, and from that year till his death was an active service almost without remission. He took part in the action off Ushant (1778); for the next two years he was fighting in the W. Indies, and in 1791 effected a brave rescue of some shipwrecked sailors outside the harbour of Jamaica. As commander of the *Zetland* he distinguished himself for his intrepidity and promptitude at the battle of the Nile (1797). In 1802, being promoted to commodore, he almost drove the Fr. out of the West Indies, and in 1805 seized four Fr. frigates near Rochefort, but this action unfortunately cost him an arm. Commander of the *Centaur* in 1808, he was publicly decorated by the king of Sweden for his brilliant seizure of the Russian gun-ship *Senulud*. Useful reforms followed his promotion to commander-in-chief of the East Indies (1812).

**Hood, Thomas** (1790-1815), Eng. poet, b. in London of Scottish descent, ultimately began his literary life by contributing to the *London Magazine* at the age of twenty-two, and through this connection

he made acquaintance with many of the leading writers of the day. He pub. *Whims and Oddities* (1826), and began to publish his *Comic Annual* four years later. He was abroad from 1835, but returned to England in 1840, and in the following year took up the editorship of Colburn's *New Monthly Magazine*. In the year before his death he started *Hood's Magazine*, and issued *Whimsicalities*. His works were collected by his son and daughter (1862-51). He is best known as a humorist and as such he occupies a very high place in Eng. letters. He was unduly addicted to the use of the pun, a now discredited form of wit, but he had a happy way of playing upon words that redeems his jokes from the charge of silliness. Though primarily a humorist, he could write in other veins. *The Dream of Eugene Aram* (1839) is one of his most famous poems, second only to the pathetic and beautiful *Bridge of Sighs*. *The Song of the Shirt*, pub. anonymously in *Punch* in 1843, attracted as much attention to the lot of the worker as *Oliver Twist* did to the abuses of the workhouse system. The *Memorials of Thomas Hood*, by his daughter, appeared in 1860 and biography by W. Jerrold in 1907 and W. H. Hudson in 1915. See also W. Jerrold, *Thomas Hood and Charles Lamb, the story of a friendship*, 1930.

**Hood**, part of academic dress. It is a development of the monk's cowl, and indicates by its colour, material, and shape, the faculty in which the owner has graduated, the status to which he has attained, and the university to which he belongs.

THOMAS HOOD

**Hood, Mount**, extinct volcano, 11,225 ft. high, belonging to the Cascade Range, in the N. E. of the Clackamas co. of Oregon, U.S.A. is situated 30 m. E. of Portland. Pines and fir cover its lower slopes. On one side is a sheer descent of 7000 ft. Its summit is glaciated.

**'Hood,' The**, Brit. battle-cruiser and till the Second World War, the show ship

of the Royal Navy. She carried a heavier armament than any other ship in the Fleet with the same speed. Begun in 1916, launched in 1918, and completed in March, 1920. Her displacement was 42,100 tons and her speed was over 30 knots. The original cost was about £6,025,000 but a further £987,474 was spent on repairs and reconstruction when she was taken out of commission in 1929. She was again refitted in 1939. Her outstanding features were the huge area covered by heavy armour, strong framing and the general scheme of protection. Her eight 15-inch guns fired a shell of nearly 2,000 lb., their extreme range being 17 m. In addition there were twelve 5.5 inch guns, as well as lighter armament. The ship was sunk off Greenland by a shell from the new Ger. battleship 'Bismarck' at 13 m. range, the shell penetrating a magazine so that she blew up and sank in a few minutes (May 24, 1941). The end of the H. was an almost unbelievable nightmare to the Brit. public and an almost inexplicable disaster in naval hist. Of her complement of over 1300 only 3 were saved. See further under 'BISMARCK', THE, and NAVAL OPERATIONS IN SECOND WORLD WAR.

HOOF

Hoofs are horny boxes which protect the sensitive parts of the foot of an animal. The possession of H. is a distinction on which the large order Ungulata is based. They are equivalent to the claws and nails of other mammals, and are renewed from the superior to the inferior border like the human nail. The flexibility of the H. is promoted by a fluid secreted by the keratogenous (horn-producing) membrane. The so-called cloven H. has been evolved for walking and climbing on irregular surfaces by the formation of separate digits on the foot, each bearing its own distinct H. The horse's H. is too brittle for road wear, and the art of shoeing was practised as early as 333 B.C.

Hook, Pieter Corneliszoon (1581-1647), Dutch dramatist and historian, is, perhaps, after Vondel, the greatest literary genius Holland has so far produced. Born in easy circumstances—his father was for some time burgomaster of Amsterdam—H. spent over three years travelling in Italy and Germany, and after studying law and hist. at Leyden Univ. (1606-09), received a highly remunerative appointment from the prince of Orange. The value of his European culture is manifest in his fine

pastoral *Granida* (1605), his tragedy *Geeraardt van Velsen* (1612), and his monumental *Nederlandische Historien 1555-58* (1642-54). See G. Brandt, *Leven van P. C. Hooff*, 1677; Sir E. Gosse, *Northern Studies*, 1879; and P. Prinsen, *P. C. Hooff*, 1922.

Hooge, tn. Just E. of Ypres in Flanders. Its situation caused it to be involved in most of the operations around Ypres in the First World War. In May 1915 heavy Ger. attacks were launched against the E. and N.E. fronts of the Ypres Salient, and by the 9th the Brit. line had been pushed back to Hooge on the E. Later in the month the Gers. gassed the place and secured a footing in it. During the Ger. offensive of April 1918, H. was again the scene of much fighting, but the Ger. main effort was against the S. portion of Ypres more than the E. In the Allied counter-offensive the Ger. positions at H. were overrun by the Brit. (See also FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGNS IV.)

Hoogezand, tn. in Holland, 18 m. E.S.E. of Groningen. Up to 1650 the dist. in which this tn. is situated was a waste, but by successive toll it has been transformed into fertile fields. Pop. 11,000.

Hoogly, or Hooghly, see HUGLI.

Hoogstraten, Samuel D. van (1627-1678), Dutch painter, b. at Dordrecht, studied in the school of Rembrandt. He became provost of the mint at Dordrecht, 1671. Good examples of his rare works being in Amsterdam and Vienna.

Hook, James Clark (1819-1907), Eng. painter, studied at the Royal Academy, and in 1846 set out on his foreign tour, as the Academy had awarded him the travelling studentship for his 'Rizpah watching the Dead Sons of Saul' (1846). So far he had mostly chosen romantic or historical subjects, like 'The Finding the Body of Harold' (1845). But after his return from Italy and Paris, he embarked on his splendid series of Eng. sea and land scenes, among them being: 'A Rest by the Wayside' (1854), 'Luff Boy' (1859), which Ruskin so much admired; and 'Sea Urchins'. See A. J. Hook, *Life of J. C. Hook, R.A.*, 1932.

Hook, Theodore Edward (1788-1841), Eng. dramatist, journalist and novelist, b. in London, son of James H., a musical composer and composer of *The Lass of Richmond Hill*. Educated at Harrow; but his father, having discovered his son's precocious gifts as an author and composer, took him away from school so that he could practise them at home. This occupation was interrupted for a term or two at Oxford, but univ. discipline proved un congenial and H. returned to London to embark on a series of practical jokes, which are described in his autobiographical novel, *Gilbert Gurney* (1836), a novel which brought him fame and fortune. These pranks to-day seem remarkable only for their fatuity and they invariably involved the victims in physical suffering or pecuniary loss; but they delighted his contemporaries, and the Regent was so charmed with H., that he obtained for him the post of accountant-general and

treasurer at Mauritius at a salary of £3,000. This windfall was H.'s ruin. After five years of brilliant social success, he was accused of peculation and sent home under arrest. The attorney-general, however, ruled that there were no grounds for criminal proceedings and H. was released. He found employment in starting and editing a high Tory weekly paper, *John Bull*, in which disgraceful attacks, written by himself, were made on Queen Caroline and her Whig adherents. When his identity became known the Whigs were not slow to take vengeance: for, though the peculation in Mauritius was the work of a subordinate, H. was found by a board of enquiry debtor to the Crown for £12,000 through gross neglect of duty and he was imprisoned for debt from 1822 till 1825. In the last sixteen years of his life, besides journalistic writing, he pub. 38 novels. These attained a popularity second only to Scott's: now, unread and well-nigh unreadable, they are of interest only to the literary historian for their considerable influence on the early work of Dickens. Wrote *The Soldier's Return* (a comic opera, 1805), *Catch Him who Can* (also an opera, 1806), *Sayings and Doings* (3 series, 1826-29), *Maxwell* (1830), *Jack Brag* (1836). He was editor of *The New Monthly Magazine* from 1836 until his death and had the honour of being satirised by Disraeli and Thackeray. Though making a large income he was always in difficulties and, after a long struggle with broken health and spirits, he died at Fulham. By the testimony of all who knew him, from Coleridge to Barham, the charm of his conversation was irresistible and unfeeling, and his powers of memory and improvisation phenomenal. See R. H. Barham, *The Life and Remains of Theodore Hook*, 1819; M. F. Brightfield, *Theodore Hook and his Novels*, 1928, and A. Repplier, *The Laugh that Failed*, 1936.

**Hookah** (from Arabic *hugga*) or **Nargileh**, water tobacco-pipe popular in India, Persia, Turkey, and other countries of the E. The tobacco bowl is connected by a wooden tube with a water vessel so that the smoke is cooled in the liquid before passing through a flexible tube up to the smoker's mouth.

**Hooker, Robert** (1635-1703), Eng. physicist, b. at Freshwater, in the Isle of Wight, was a pupil of Dr. Busby at Westminster; and at Christ Church, Oxford, worked in the laboratory of Robert Boyle. In 1661 he taught geometry at Grusham College, and in 1677, after being surveyor to the City of London, became secretary to the Royal Society. From a paper read before the Royal Society in 1681 it is evident that H. had brought the theory of the telegraph to a much more advanced stage than the Frenchman, Guillaume Amontons (q.v.), and nearly twenty years sooner. Yet although the method of accomplishing telegraphic communication was clearly explained by H. and its practicality demonstrated by Amontons, it continued to be regarded as of no practical value and was only applied to useful purposes a century later. The range of his invention was

phenomenal. Among his contrivances were a double-barrelled air-pump, the spirit-level, anerometer, marine barometer, the balance-spring of watches, the anchor-escapement of clocks, and a sea-gauge. He was one of the earliest workers with the microscope; his *Micrographia* (1667) contained the first description of plant cells, as well as many other accounts of microscopical anatomy. H.'s Law in physics is named after him. His regrettable quarrel with Newton arose out of the fact that he believed, rightly it seems, that he had already discovered certain of his rival's principles, especially as to gravity and the laws which rule celestial motions.

**Hooker, Sir Joseph Dalton** (1817-1911), Eng. botanist: b. at Halesworth, Suffolk; son of Prof. Sir W. J. Hooker; took his M.D. degree at Glasgow (1839), and as assistant-surgeon accompanied Sir James Ross to the Antarctic in the *Erebus*. His foreign tours were all fruitful in scientific and especially botanical discoveries, which were fully described in his *Flora Antarctica* (1841-47), *Flora of British India* (1874), etc. In 1865 he succeeded his father, also an eminent botanist, as director of Kew Gardens. A friend of Darwin, he championed his theories in his presidential address to the Brit. Association, 1868. President of the Royal Society, 1872-77. Other pubns. were a *Himalayan Journal* (1841) and *Genera Plantarum* (1862-83). Awarded O.M. in 1907. See monographs by L. Huxley, 1918, and F. Bower, 1919.

**Hooker, Richard** (1554-1600), Eng. theologian, was, through the patronage of two bishops, able to take his M.A. degree at Corpus Christi, Oxford, in 1577. For some time he was tutor to George Cranmer, grand-nephew of the archbishop, and Edwin Sandys, son of the bishop of London, and later became master of the Temple, whence his more popular rival, Travers, the Puritan, was eventually expelled. The eight books of the *Laws of Ecclesiastical Polity* were composed within the quiet of a country vicarage. Five books only were pub. in his lifetime, and considerable mystery attended the pub. of the last three during the half century following his death. The standard ed., is that of Kibble (1836), to which the inimitable life by L. Walton (1666) is fitly appended. In spite of its quaint and somewhat archaic flavour, H.'s work, by reason of its stateliness and charm, its lucidity, even where the thought is most profound, and its noble expression of a lofty intellect and unswerving religious enthusiasm, is justly deemed the fountain-head of modern literature in prose. His theory, which he gradually unfolds from book to book, is based first on the unity and omnipotence of law, 'whose seat is the bosom of God,' and secondly on the supremacy of calm and temperate reason, to which all things, even divine revelation, are finally referred. See V. Stanley, *Richard Hooker*, 1907, and L. S. Thornton, *R. Hooker, a Study of his Theology*, 1921.

**Hooker, Thomas** (c. 1580-1647), Amer. divine, b. in Marlfield, Leicestershire, Eng.

land. Preached in London and Chelmsford (1829); at the latter tn. Laud, bishop of London, dismissed him for nonconformity. He went to Holland (1830) and in 1833 emigrated with John Cotton and Samuel Stone to Boston, U.S.A., appointed pastor at Newtown (now Cambridge, Massachusetts); and in 1836 he founded Hartford, which he named after the bp. of his assistant, Samuel Stone. Some of his works include *A Survey of the Sum of Church Discipline* (1812), *The Soul's Implantation* (1827), *The Application of Redemption* (1836). See life in C. Mather, *Magnalia Christi Americana*, 1792; and M. Tyler, *American Literature*, vol. 1, 1878.

Hooker, Sir William Jackson (1785-1865), Eng. botanist, pub. his *Tour in Iceland* (1811). It was written from memory, as all his notes and drawings were accidentally burned on his way home. Other of his scientific works were *British Jungfermannia* (1816), *Muscologia Britannica* (1818), in which Dr. Faylor collaborated, and *Flora Scotica* (1821). From 1820 he held the chair of botany in Glasgow Univ., and from 1841 till his death was director of Kew Gardens. He collected an invaluable herbarium, and ed. three botanical journals besides numerous treatises on botany. See life by his son, Sir J. D. Hooker, 1903.

Hooker, Mount, peak of the Rocky Mts., between Brit. Columbia and Alberta, Canada, S.E. of Mt. Brown, about 32° 27' N. Its altitude is computed at 10,500 ft.

Hook of Holland (Hoek van Holland), vil. at the mouth of the Nieuwe Waterweg on a small peninsula in S. Holland. It is an important port for passengers and mail steamers from England.

Hookworm, parasitic worm found in warm climates, especially in Egypt, Ceylon, India and the W. Indies. It often lodges in the bare feet or in cracks in skin in human beings, producing 'ground itch'; thence, it enters the bloodstream, reaching the heart and lungs, and finally the intestines, where its eggs are produced and discharged to begin anew the life sequence. This painful disease is called ankylostomiasis, uncinariasis (q.v.), or 'miner's' anemia.

Hoole, John (1727-1803), Eng. poet and translator, b. in London. Was a friend of Dr. Johnson, and for forty years was a clerk in the E. India House. He is chiefly remembered as the translator of Tasso's *Jerusalem Delivered*, Ariosto's *Orlando Furioso*, and other It. poems; he also wrote sev. tragedies.

Hoopa, see HUPA.

Hooper, John (c. 1195-1255), Eng. divine, b. in Somerset. He was educated at Oxford, but on leaving the univ., and entered the Benedictine monastery at Gloucester, where he was ordained. He became an ardent reformer, and after a dispute with (a)rdiner had to flee from England in 1249 to avoid persecution. On his return he was made bishop of Gloucester in 1250, suffering imprisonment for some weeks. In 1252 he received the bishopric of Worcester in commendam, but in 1253 he was deprived of his office by

Queen Mary, and burnt for heresy at Gloucester. See J. Carr (ed.), *Writings of John Hooper*, 1843-52.

Hooping Cough, see WHOOPING COUGH.

Hoopoe, bird celebrated in literature, and conspicuous by its plumage and its large erectile crest. The common H. (*Upupa epops*) is about the size of a thrush, with a long, pointed and slightly arched bill. Its head and neck are of a golden buff, the former being adorned by the crest which begins to rise from the forehead and consists of broad feathers, gradually increasing in length, tipped with black, and having a subterminal bar of yellowish-white. The upper part of the back is of a vinous grey and the flight-feathers and tail are black broadly barred with white. This bird visits Britain during the spring and autumn migration, but seldom breeds in any part of the is. Besides the *U. epops*, there are *U. indica*, which frequents India and Ceylon, *U. longirostris*, common in the Indo-Chinese countries, *U. africana*, which inhabits S. Africa, and *U. marginata*, found in Madagascar.

Hoorn, tn. and seaport, Holland, prov. N. Holland, W. coast, Zuider Zee, 23½ m. N.N.E. of Amsterdam. It is a picturesque tn. with most interesting old buildings. There are noted cheese and cattle mktks., besides shipbuilding and saw-milling yards. Willem Schouten, who doubled Cape Horn and named it after his bp. was b. here. Pop. 11,000.

Hoosick Falls, vil. of Rensselaer co., New York, U.S.A., 24 m. N.E. of Troy. It manufs. paper, making, reaping and mowing machines, woolen and cotton goods, and flour. Pop. 5,000.

'Hoosier State,' see INDIANA.

Hoove, Hoven, or Tympanites, common derangement in ruminants due to the accumulation of gases in the rumen or first stomach. Is most frequent when animals are allowed to eat immoderately of clover. Before turning for the first time into luxuriant pasture, they should be well fed on dry stuff. Too much wet grass or frosted turnips or too many potatoes are other causes. The usual treatment is one wineglassful of turpentine in one pint of raw linseed oil. Failing this, the stomach is punctured with a trocar and cannula, or even a pocket knife, to liberate the gas. Stoppages due to foreign bodies, or to rupture or stricture, also cause H., and are very rarely cured. Small doses of chloride of lime sometimes give relief.

Hoover, Herbert Clark, thirty-first President of the U.S.A. b. at West Branch, Iowa, 1871. Descended from Andrew H., who was b. at Ellerstadt in the Palatinate and emigrated to the U.S.A. in 1788, settling in Pennsylvania. His own father, Jesse Clark H., was the vil. blacksmith of W. Branch. On both sides of his family he is of Quaker ancestry, and himself belongs to that faith. In 1896 he entered upon his career as mining engineer, became famous in his profession, and made a competence. At the outbreak of the First World War he was in London in furtherance of the Panama Exposition,

and was appointed chairman of the Committee for Relief in Belgium. When the U.S.A. declared war on Germany, President Wilson summoned H. home to become the food administrator. As such H. had none of the dictatorial powers with which similar officials were clothed in England and Germany. What he had to do was mainly by persuasion to induce people to save meat, flour and sugar principally so that the U.S.A. might send these things to the Allies. President Wilson later made him a member of the War Council, and as such he took part at

B. Chasch

HFBIRI HOOFVR

Paris in the negotiation of the Versailles Treaty. Also after the armistice, he was entrusted with the formidable task of directing the Amer. Relief Administration whose function it was to supply food and clothing to many of the needy countries of Europe. In 1920 Harding appointed H. to his cabinet making him secretary of commerce. H. held the same post under President Coolidge. The Republicans nominated him for President in 1928, and the Democrats nominated Governor Alfred Smith who was not only a 'wet' in his attitude on the prohibition laws, but also a Roman Catholic. The Protestant dry elements were therefore, bitterly opposed to him. H. was elected by an almost unprecedented majority of the electoral votes receiving 444 to Smith's 87. Immense hopes were reposed in him. But soon the clouds began to gather. In the Senate, Radical Republicans united with the Democrats in attacking his policies. The farmers were disaffected on account of the low prices their products were fetching. The Republican partisans in Congress passed a new tariff Bill which was the highest on record, and against which many economists, Republican papers, and even manufacturers protested. Nevertheless, H. signed the Bill. Then came the Stock Exchange crash of the autumn of 1929, followed by universal depression in

business and nation-wide unemployment. To all these troubles was added acute suffering in the farming states in 1930, caused by drought. In the Congressional elections of 1930 H.'s party suffered enormous reverses. New York state re-elected the Democrat Franklin Roosevelt as governor by the largest majority in the list of the commonwealth. The Republican majorities in both houses of Congress were wiped out. The seventy-first Congress ended its existence in bitter fighting with the President. It passed over H.'s veto, a law giving early payment of bonuses to soldiers of the first World War. It wrangled with him over measures for relief for the farmers and the unemployed. The popularity of the President which in the autumn of 1929 was at its zenith now seemed at the opposite end of the scale. But in June 1931, by one statesmanlike stroke he temporarily recouped his fortunes. He proposed that all war debt and reparation payments be suspended for one year dating from July 1, 1931. But in 1932 he was heavily defeated in the presidential election by Franklin D. Roosevelt and his term of office ended in 1933. In 1946 he was appointed chairman of the U.S. Gov.'s Lamine Emergency Committee. Publications: *The Challenge to Liberty* (1934), *American Road* (1938), *America's First Crusade* (1942), and *The Basis of Lasting Peace* (1941). See monograph by W. Irwin, 1921 and J. Hamill *The Strange Career of Mr. Hoover under two Phases* 1931.

Hope, Queen's Hope, or Estyn, par. and vii on R. Alyn, Flintshire, Wales, 7 m. N.W. of Wrexham. Pop. 3000.

Hope, Anthony, see HAWKINS, SIR ANTHONY HOPE.

Hope Thomas (c. 1770-1831) English novelist and antiquarian b. in London. A great lover of architecture, paintings, and statues, he formed a fine collection of works of art, and in 1807 pub. a work on *Household Furniture* which produced a marked improvement in public taste. He also wrote *Costume of the Ancients* (1800), *Modern Costumes* (1812), *Anastasis* (London 1819), and an *Historical Essay on the Literature* (1831).

Hope Diamond, beautiful 44-carat stone of a fine sapphire colour which for long was supposed to bring misfortune to its owners. Its history began about 400 years ago when it was reputed to have been stolen from a Burmese temple, where it had formed the eye of an idol. It was sold to Louis XIV. and Louis XVI is said to have given the diamond to Queen Marie Antoinette. Later the diamond turned up in Amsterdam, where it was bought by a member of the Hope family to which the duke of Newcastle belonged, and so became known as the Hope Diamond. It was afterwards sold to a New York jeweller and after passing through the hands of several people was bought in Paris in 1911 by Edward Beale McLean for £60,000. Shortly after the purchase his son was killed, and when Mrs. McLean died in 1947, the Russian Gov. opened negotiations for the purchase of the diamond.

Hopei, formerly Chih, Chih, or Fehih,

prov. of China, in the extreme N.E. bordering on Mongolia on the N., Manchuria and the gulf of Pechili on the E. Area about 60,000 sq. m. The greater part of the prov. is a fertile alluvial plain, watered by the rvs. Potho Hunho Lwanho, Hutoho, and Shangho, and traversed by the Imperial Canal. Millet, maize, wheat, cotton, sugar, indigo, tobacco, and fruit are grown. It has many tanning factories. The climate is moderate, but much damage is occasionally caused by floods in the plains and by violent dust storms. There was a severe famine in the prov. in 1842, and it suffered considerably during the Taiping revolt. Paotingfu is the seat of administration. Tientsin and Chinwangtao are treaty ports. There is fair railway communication. In 1914 the part of the prov. beyond the Great Wall was transferred to Inner Mongolia, and Peking and the country round formed into a separate dist. Pop. (including many Muslims) 28,529,000; area, 34,140 sq. m. The gulf of Pechili is an extension of the Yellow Sea, lying between Korea and the prov. of Shantung, and receiving the waters of the Pitho.

**Hope Islands**, cluster in Van Diemen's Gulf, N. Territory, Australia.

**Hopeoun**, Earl of, see LINLITHGOW, MARQUIS OF.

**Hopeoun**, John Hope, fourth Earl of (1765-1823), Brit. general, b. in Linlithgowshire, served with distinction in the W. Indies, Holland, Egypt, and Spain. Also saw service in the Walcheren expedition, and in the Peninsular campaign, where he was wounded and taken prisoner.

**Hopeoun**, div. of Cape Prov., S. Africa. The tn. of this name near the Orange R. is 70 m. S.S.W. of Kimberley. There are diamond fields and ostrich farms in the vicinity. The discovery of the Kimberley diamond mines is traced to the incident of Erasmus Stephanus Jacobs picking up the first diamond in the region on his father's farm, De Kalk, near Hopeoun, in 1866. Pop. (div.) 8000, (tn.) 2215.

**Hopkins**, riv. of W. Victoria, Australia. It rises in the Pyrenees Mts and flows in a generally southern direction to the Indian Ocean at Warrnambool. Only about 5 m. are navigable. Length, 110 m.

**Hopkins**, Essek (1718-1802), Amer. naval officer, b. in Setautte R.I.; appointed by Congress, 1775. First Commander-in-Chief of Amer. navy with title of admiral. He was dismissed for allowing the *Mangou* to escape.

**Hopkins**, Sir Frederiek Gowland (1861-1947), became prof. of biochemistry (1914) in the univ. of Cambridge, and Sir Wm. Dunn prof (1921). For his brilliant work in biochemistry he has received sev. awards, including part of the Nobel prize for medicine in 1929. In 1892, H. devised a reliable and comparatively simple method, still in general use, for the estimation of uric acid in urine. H. had not been long at Emmanuel College, Cambridge (which made him a supervisor of its medical students), when he made in 1901 the first of his great discoveries: in collaboration with S. W. Cole he isolated and identified the amino-acid tryptophane.

In 1902 a univ. readership in Chem. Physiology was created for him; and he only gave up his posts at Emmanuel College in 1910 when Trinity College elected him to a readership in Physiological Chem. with a fellowship. In 1914 a professorship of Biochemistry was created for him, to terminate with his tenure of office: in 1921 he became the first Sir Wm. Dunn Prof. of Biochemistry. The results obtained by H., working first with Fletcher (1905-06) and later with Dixon (1921), revolutionised the conception of the source of muscular energy and oxidation of tissues. The earlier work, showing the formation of lactic acid during muscular contraction in the absence of oxygen, and the presence of mere traces of this product in the resting muscle and during contraction in the presence of oxygen, led to the abandonment of the theory of storage of intramolecular oxygen. Later, H. and Dixon isolated glutathione, a constituent of plant and animal tissues, and showed that other cell products reduced this substance immediately it was oxidised. Glutathione was therefore regarded as the centre of autoxidation in the cell. H. was the first to show that life could not be maintained on protein, fat, and carbohydrate alone, but that 'accessory' food factors were essential. He thus initiated the research on vitamins and helped to show their importance in bone formation. (See VITAMINS.) In addition to these important contributions to physiology and dietetics, H. discovered and investigated the biological rôle of many other compounds including pterins, a chemical group identified with the pigments of butterfly wings, of importance in biochemistry. He received the Royal Medal of the Royal Society in 1918 and the Society's Copley Medal in 1926. In 1931 he was elected President of the Royal Society. In 1933 he was President of the Brit. Association. Awarded the Baly Medal of the Royal College of Physicians in 1915 and in 1921 was Vice President of the Chem. Society. In 1928 he was given the Society of Apothecaries Medal and in 1931 was awarded the Albert Medal of the Society of Arts. O.M. 1935.

**Hopkins**, Gerard Manley, (1844-1889), Eng. poet and one of the most original of the poets of the second half of the nineteenth century. Went to Balliol College, Oxford, his tutor being Walter Pater, and entered into the Rom. Catholic Church, but, on the advice of Cardinal Newman, he finished his studies at Oxford. In 1866 he joined the Society of Jesus and eleven years later was ordained priest. Before entering on his religious vocation H. decided to eschew poetry, but after seven years, at a hint from a superior, he resumed his muse by writing a commemorative poem on the Franciscan nuns lost in the wreck of the *Deutschland*—the poem being rejected by the *Month* (1876). If the poem was considered 'advanced' forty years later, it is small wonder that it was rejected. His poet friends, Bridges and Patmore, felt some estrangement from his style: but despite the doubts of his friends, he clung to his alliterative metres

and his artificial compounds—the 'lovely-asunder starlight,' and the 'silk-sack clouds.' The background to most of his poems was his missionary life spent in seartries and tins in England. Yet he was more concerned with being a preacher than a poet, and his letters show how much his poetry was an overcoming of fatigue. His last poems belong to the few remaining years of his short life, when he taught Gk. and Lat. in Dublin after his election as a Fellow of the Royal Univ. in 1884. But his health was then declining and his imperfect sympathy with Irish politics added to his unhappiness. He was nearly thirty years dead before his poetry was pub. In 1918 the single vol. that contains it was brought out by his Oxford friend, Robert Bridges. But the first ed. of under one thousand copies took twelve years to sell and whether he will ever be widely read is much to be questioned, though fame has not failed him and he is a poet who should eventually receive his due place in the hierarchy of England's major poets. The poetry of H. in metrical form and imagery, shows the influence of Keats. This is evident in the beautiful poem *A Vision of the Mermaids* (1862). More mature, but not more inspired than this remarkable effort of his youth, are *Ad Mariam*. In the style of Swinburne *Winter with the Gulf Stream*, *Line for a Picture of St. Dorothea*, *Margaret Clitheroe*, *Wind Loosens Heaven-Heaven*, *Pied Beauty*, *I have desired to go, Felix Randal* and the *Habit of Perfection*—the last six being among his best poems. His name figures in every study of contemporary verse as that of a major poet, but nonetheless a poet's poet. An excellent analysis of his poetry is to be found in the chapter 'The Craftsman' in G. F. Lahey, *Gerard Manley Hopkins*, 1930. See also R. Bridges (ed.), *Poems of Gerard Manley Hopkins* (with introduction by C. Williams), 1930. Eleanor Ruggles, *Gerard Manley Hopkins*, 1947, and W. A. M. Peters, *Gerard Manley Hopkins: a critical essay towards the Understanding of his Poetry* 1948.

Hopkins, Harry Lloyd (1890-1946) Amer. social reformer politician and administrator, b. at Sioux City, Iowa, U.S.A., of comparatively humble parentage. Educated at Grinnell College, Iowa. While still at college he decided on a social service career and, in 1914, was put at the head of the New York City Board of Child Welfare. Defective eyesight precluded military service in the 1914-18 war and he joined the Red Cross, leaving it in 1922 to become assistant director of the New York Tuberculosis and Health Association, in which capacity he attracted the notice of Franklin Roosevelt then Governor of New York State. Roosevelt made him acting director of the New York State Temporary Emergency Relief Administration and, after his election as President, Federal Relief Administrator, in which capacity H. spent \$9 m. in relieving unemployment, especially by building public works on a nation-wide scale. It was during these years at Washington that H., who was in close touch with the White House, became the close friend of

Roosevelt. In 1938 the President appointed him Secretary of Commerce and when in 1940, ill health compelled his retirement from the post, H. had won a wide measure of confidence among business men. By the time of the Democratic Convention of 1940 H. had sufficiently recovered to work at the White House, becoming a resident there and a member of the Roosevelt household. Later, as virtual secretary to the Inner War Cabinet, H. became personal assistant to the President and his closest confidant. In Jan. 1941, Roosevelt sent him to London as his personal emissary and later to Stalin in Moscow. In the same year the President made him head of Lend Lease Administration. When the U.S.A. entered the war, H. was appointed an adviser on strategy and war supplies and, soon afterwards, chairman of the Munitions Assignment Board. Member of the Pacific War Council, 1942. After Roosevelt's death, H. again went to Moscow as President Truman's envoy and was instrumental in the partial solution of the difficulty on the veto which had arisen at the San Francisco Conference (q.v.). The strain of the Moscow journey, however, on his health prevented him from attending the meeting of the representatives of the three major allies in Berlin in July, 1945, and from Nov. he was a patient in the New York Memorial Hospital, dying on Jan. 29, 1946. His was truly a remarkable career. From an earnest and single-minded social reformer he became one of the leading administrators of the New Deal (q.v.) and a trusted emissary on diplomatic missions of the highest importance. Despite ill health he accepted in the early stages of the war, the most onerous responsibilities, instilling a confidence in the goodwill and power of his country which was a source of immense inspiration to its allies. In Sept. 1945 he received the Amer. Distinguished Service Medal, the citation speaking of the exceptional ability he had shown in 'welding our allies to the common purpose of victory over aggression.' See R. Sherwood (ed.), *The White House Papers of Harry L. Hopkins* (vol. 1), 1948.

Hopkins, John (d. 1570), Eng. hymn writer, was part translator with Thomas Sternhold of the famous metrical version of the Psalms. Of the completed ed. which appeared in 1562 sixty psalms bore the name of H., and forty that of Sternhold. H. also contributed some commendatory verses to Foxe's *Acts and Monuments*, and is often credited with the authorship of the 'Old Hundredth.' He was rector of Great Walsingham, Suffolk (1561-70).

Hopkins, Johns (1795-1873), Amer. philanthropist, b. in Anne Arundel co., Maryland. His Quaker parents educated him for a farmer, but at the age of seventeen he went to Baltimore and became a grocer, eventually founding the house of Hopkins & Brothers, and amassing a large fortune. This he devoted to various philanthropic purposes, he presented Baltimore with a public park, founded the Johns Hopkins Univ., and gave money towards a free hospital.

**Hopkins, Mark** (1802-87), Amer. educationist, b. at Stockbridge, Massachusetts. He was appointed prof. of moral philosophy at William College in 1830, becoming president of the college in 1836. His publs. include: *Lectures on the Evidences of Christianity* (1846), *Lectures on Moral Science* (1862), *Outline Study of Man* (1873), *Teachings and Counsels* (1884). See life by F. Carter, 1892; and the anonymous ed. of *Early Letters of Mark Hopkins*, 1930.

**Hopkins, Samuel** (1721-1803), Amer. theologian, b. at Waterbury, Connecticut. He studied under Jonathan Edwards, and in 1743 was ordained at Housatonic, now Great Barrington, Mass., where he continued until 1769 when he became minister of Newport, Rhode I. He was an opponent of slavery, and in 1776 pub. *Dialogue showing it to be the Duty and Interest of the American States to emancipate all their African Slaves*. His *System of Doctrines contained in Divine Revelation, Explained and Defended* (1793), sets forth his theological opinions, which differ from orthodox Calvinism in their opposition to the doctrines of original sin and of the Atonement. The pub. of his views was the cause of the famous 'Hopkinsian controversy.' H. is the central figure in Mrs. Stowe's novel, *The Minister's Wooing*, (1859). See life by S. West, W. Walker, *Ten New England Leaders*, 1901; and B. Dexter, *Biographical Sketches of Yale College*, 1907.

**Hopkins, William** (1793-1866), mathematician and geologist, b. at Kingston in Derbyshire. He entered Peterhouse, Cambridge, in 1822, and became seventh wrangler in 1827. He settled at Cambridge as a tutor, and was so successful in his work that he was called 'the senior wrangler maker'; indeed, in 1849 he had nearly 200 wranglers among his pupils, amongst whom may be mentioned such distinguished men as Todhunter, Tait, Fawcett, Stokes, and Clerk-Maxwell. About 1833 he began to study geology, and in 1830 received the Wollaston medal for his researches in the application of mathematics to physics and geology. In 1851 he was elected President of the Geological Society, and in 1853 became President of the Brit. Association. His publs. include *Elements of Trigonometry* (1833), and *Theoretical Investigations on Motion of Fluxes* (1842).

**Hopkinson, François** (1737-91), Amer. author, b. in Philadelphia, U.S.A. He was educated at the univ. of Philadelphia, and then studied law. In 1775 he was elected representative of New Jersey in the Amer. Congress, and was a signer of the Declaration of Independence. He was appointed Judge of the Admiralty in Pennsylvania (1779), and Judge of the Dist. Court of the United States. H. was a versatile writer and was very popular during the revolution, when he wrote his famous ballad *Battle of the Clouds*. His writings include: *The Treaty* (1761), *An Evening Hymn*, *Science* (1762), *A Camp Ballad*, *The Typographical Male of Condemning a Quaker*, *The Pretty Story* (1774), *The Prophecy* (1776), *The Political*

*Catechism* (1777), *Essay on Whiteness and Modern Learning* (1784). See G. E. Hastings, *Life and Works of Francis Hopkinson*, 1926.

**Hopkinson, John** (1810-98), Eng. electrician, b. at Manchester and educated at Trinity College, Cambridge, where he graduated as senior wrangler. He then took up electrical engineering, and made many important investigations; in 1890 being awarded a royal medal for researches in electricity and magnetism. He was prof. of electrical engineering at King's College, London, at the time of his death. He pub.: *Dynamic Electricity* and *Original Papers on Dynamic Machinery and Allied Subjects* (1893), and other papers on similar themes. He was killed with a son and two daughters ascending the Dent de Veisvi in the Alps.

**Hopkinson, Joseph** (1770-1842), son of Francis H., b. at Philadelphia and educated at the univ. there. He studied law and practised at Easton and Philadelphia. H. was a member of the national House of Representatives from 1815-19, and judge of the Dist. Court of the U.S.A. in 1828; he was also vice-president of the Amer. Philosophical Society and president of the Philadelphia Academy of Fine Arts. He pub. some of his addresses which he delivered before various societies, but he will be chiefly remembered for his song, *Hail, Columbia* (1794). See life by Francis Wharton, R. Griswold, *Poets and Poetry of America*, 1832; and B. A. Konkle, *Joseph Hopkinson*, 1931.

**Hopkinsville**, city of Kentucky, U.S.A., 60 cent of Christ in co., 71 m. S. of Henderson. It is important principally for its tobacco; it trades also in agric. produce, live stock, coal, and timber. There are also flour mills. The Bethel Women's College is situated here. Pop. 11,700.

**Hoppner, John** (1758-1810), portrait painter, b. in Whitechapel, London. He was admitted as a student to the Royal Academy in 1775, and in 1782 gained the gold medal for an original painting of a scene from King Lear. In 1783 he exhibited portraits of the youngest three princesses, Sophia, Amelia, and Mary, and in 1789 was appointed portrait painter to the Prince of Wales. In 1795 he was elected R.A. H. acquired some reputation in his own day, especially for his portraits of women and children. His figures were graceful and natural, and his colouring brilliant and mellow. Some of his best pictures are the group of 'Lady Catherine Smith and Children' (belonging to the duke of Wellington), the fine portrait of 'Mrs. La Belle' (the property of Lord Harewood), both of which were exhibited at the Royal Academy, 'The Countess of Oxford' (National Gallery, London), 'William Pitt' and 'Lord Grenville' (National Portrait Gallery). See W. Mackay and W. Roberts, *Life and Paintings of J. Hoppner*, 1909.

**Hops** (*Humulus lupulus*), perennial herbaceous plant belonging to the order Cannabinales, which has long twining stems which climb freely over hedges and bushes. Its leaves are stalked and three to five lobed and very rough to the touch, the

plant being of luxuriant growth and abundant foliage. The male flowers consist of a small five parted perianth enclosing five stamens, and grow in loose allary panicles. The female flowers are in strobilos, or cones, and it is these ripened cones which are sold under the name of H. so that female plants are most generally planted a few male only being necessary to fertilize the female flowers. The H. is first mentioned by Pliny as being a garden plant of the Romans who were in the habit of eating the young shoots as we eat asparagus (indeed in Belgium the young tender tops are even now cut off in spring and used as food the plant being forced from Dec to Feb for that purpose), and as early as the eighth and ninth centuries H. gardens (*humularia*) were cultivated in France and Germany for the making of beer, but up to the sixteenth century the plant seems only to have been grown in a dital manner. It was introduced into England from Flanders in 1225 but did not become sufficient for the supply of the kingdom till the end of the seventeenth century. The chief coas concerned with H. production in England are Kent, Hereford, Sussex, Worcester, Hants, and Surrey, and of these Kent has always taken the lead, and includes about two thirds of the H. acreage of the Brit Isles indeed out of 41' pers in the country 31 have H. plantations. These are prepared in Oct and Nov the earth is ploughed dug and manured (for a rich soil is required) and the plants put in in rows 6 ft apart. Later they are pold and dressed, the former being done in various ways and at various times. Some owners pold their plants the first year to produce H. in the first season, but as a rule planters nurse their young plants for twelve months as they make very little growth the first year. When the cones are ripe i.e. have become amber coloured and firm, they are picked and conveyed to the oast house to be dried, great care is required to prevent over heating, by which the essential oil would be volatized. The cultivation of H. is very precarious as the plant suffers from various pests, both insect and fungoid parasites of the former the red spider, *Tetranychus telarius*, is most destructive in very hot summers, and of the latter the fungus, *Podospheara costagani* does much mischief to the cones. See D. Skillock, *Hops*, 1931. See also BRIT WOOD.

Hoquiam, tn., Washington, U.S.A., a seat of Chhalls co., 13 m W. of Montesano. It is surrounded by timber lands. It has large lumber and shingle mills, also plywood and veneer plants. It ships lumber, fish, and furs. Farming and dairying are also carried on. There are shipyards and a fine harbor. Pop. 10,800.

Horace, Quintus Horatius Flaccus (83-8 B.C.), Rom poet, b. at Venusia in Apulia. He was of servile descent but his father had acquired the status of freedman, and from his profits as an auctioneer's collector had been able to purchase a small farm at Venusia. One of the most endearing traits in the character of H. is his reverence for his father. H.'s father recognised the genius of his son and, comparatively

poor though he was, he contrived to give him the best education obtainable by a Rom youth. He therefore declined to send the boy to a prov. school, and had him educated in Rome at the school of Orbilius, where the sons of knights and senators were trained. The father himself acted as attendant on the boy accompanying him to school. In H.'s time many Rom. youths received their univ. training at Athens, and thither H. repaired about the age of twenty. When Brutus went to Athens to levy forces against Octavian, H. enlisted in his service and was given the rank of military tribune in command of a legion. He was on the field at Philippi, and his depreciation of his own valour must be regarded as an imitation of Archilochus and Alcaeus, and not as serious information (*Odes*, II. vii. 9; *Epistles* II. n. 46-50). In the land settlements after the war, H. a paternal property at Venusia was confiscated and he became a scribe in the quaestor's office at Rome. Varius and Virgil introduced the young poet to Maecenas, who became his life long patron and friend. Maecenas, in turn introduced him to Augustus, who soon to the glory of Rome and the fama of his protégé, enlisted his services to voice the ideals of his new empire. From this time H. became a court poet, but his genius was strengthened rather than cramped by the guiding influence of his patrons. In the year 31 B.C. Maecenas presented to the poet the Sabine farm, which throughout the remainder of his life satisfied his deep seated love of country life and scenery. Though towards the closing years of his life, H. was drawn into the most bosom of the court he never forgot his former patron. To his fervent love of Maecenas the seventeenth ode of the second book and the thirteenth ode of the fourth book bear speaking testimony. Maecenas himself, on his deathbed, thus commended the poet to the emperor, *Ut tibi illud ut mihi esto nomen* (*Suet.*, *Jul.*), but H. only survived his patron a few weeks. H. died suddenly and without making a will, and to Augustus he left the entire control of his affairs. H.'s earliest pub. was the first book of the *Satires* (c. 30 B.C.), followed by a second book c. 30 B.C. These follow the didactic aims and semi-dramatic setting of the early *Satires* of Lucilius, but they are less personal in attack than the work of the early master. Unlike the fierce invectives of Juvenal, the satiric vein in H. is for the most part kindly in tone. The *Epodes* appear to have been written between 41 and 31 B.C. They are based on the works of Archilochus but are sometimes coarse in sentiment and immature in expression. The *Epistles* are also didactic in theme, but the sentiment is mellow, and the workmanship perfect. In subject and style the *Epistles* are a metrical treatise on the art of poetry, is closely allied to the second book of the *Epistles*. This work is somewhat desultory in treatment and capricious in judgment, its standpoint is uncompromisingly mechanical, yet it throws valuable light on H.'s own poetic methods, and the state of literary criticism at Rome.

But H.'s great work was the *Odes*. These do not stand high on account of any startling originality of thought or depth of feeling, but in finish and technique they are perfect. The finest odes are, perhaps, those which deal with Rome's expansion and conquests; the love lyrics, although charming and graceful, are sometimes insincere and insipid, and are much inferior to the flaming lyrics of Catullus. The philosophy of H. is eclectic, but, if he inclines to any sect, he is Epicurean and *carpe diem* is his guiding precept. As a Rom. poet he is generally held to rank second only to Virgil.

EDITIONS: E. C. Wickham, 1903-04; *Odes and Epodes*, T. E. Page, 1895; J. Gow, 1906; *Satires*, A. Palmer, 1896 and J. Gow, 1901-09; *Epistles*, A. S. Wilkins, 1892. TRANSLATIONS: J. Conington, 1863-70; W. S. Morris, 1912; H. Macnaghten, 1926; H. E. Butler, 1929; and A. S. Way, 1936; and E. Marsh, 1941. BRUNES: W. Y. Sellar, *Horace and the Elegiac Poets*, 1899; J. F. D'Alton, *Horace and his Age*, 1917; A. Y. Campbell, *Horace, a new Interpretation*, 1924; T. R. Glover, *Horace*, 1932; T. Zieliński, *Horace et la société romaine*, 1938; L. P. Wilkinson, *Horace and his Lyric Poetry*, 1945; A. Noyes, *Portrait of Horace*, 1947; also Concordance by L. Couper, 1916.

**Horæ** (Lat. *hora*, hour), Gk. mythology, the personification of the seasons. They are weather-goddesses; the children of Zeus and Themis, whose function, it is to regulate the order of nature, superintend agriculture, etc. They are companions of the nymphs and graces, and are represented as goddesses of youthful bloom and grace, typical of the springtime. They are sometimes indicated as being three in number, with parents as above mentioned; but under Alexandrian influence they became the four daughters of Helios and Selene. See J. H. Krause, *Die Museen, Grazien, Horen und Nymphen*, 1871.

**Horapollo**, or **Horus Apollo**, Gk. grammarian who taught at Alexandria and Constantinople in the reign of Theodosius. He is often confounded with the Egyptian Horapollo, who lived in the time of Zeno. There is still extant a work by him on hieroglyphics.

**Horatii**, three Rom. brothers, chosen by the king, Titus Hostilius, to fight against the Curiatii (three Alban brothers) in order to decide the contest between Alba Longa and Rome. Two of the Romans quickly fell in the combat, but the surviving Horatius was victorious and was led back in triumph to Rome.

**Horatius Cocles**, Publius, descendant of the survivor of the three Horatii, who, according to tradition, along with Titus Bernininus and Spurius Lartius, held the bridge over the Tiber against Lars Porsena, king of Latium, in 507 B.C. H. sent back his two companions when the fight was almost finished and defended the bridge single-handed. He then escaped by swimming the Tiber, though enfeebled by wounds, and was overwhelmed with honours by his compatriots. See T. Macaulay, *Lays of Ancient Rome*, 'Horatius', 1842.

**Hordaland**, co. of Norway, on the Atlantic coast, with Buskerud and Telemark cos. to the E. Chief town, Bergen. Area 6,643 sq. m. Pop. 186,900.

**Hörde**, tn. of Westphalia, Germany, in gov. of Arnsberg, 3 m. S.E. of Dortmund, in which it is now incorporated. Pop. 36,000.

**Hordeolum**, see STYE.

**Horde of Ashford**, Sir Thomas Jeeves Horder, first Baron (b. 1871), Eng. physician, son of Alfred H., of Wiltshire. Trained for the medical profession at St. Bartholomew's Hospital, of which he became assistant-physician. Physician-in-ordinary to King George VI. Consulting physician to the Royal Orthopaedic Hospital; to the Royal N. Hospital; and Honorary Consulting Physician to the Ministry of Pensions. Ex-President, Harleian Society of London; and of the Medical Society of London. Member Executive and Chairman, Advisory Scientific Committee, Brit. Empire Cancer Campaign. President of Fellowship of Medicine. Has written on *Ulcer Pathology in Practice* (1907), *Cerebro-Spinal Fever* (1915), and with A. E. Gow *Essentials of Medical Diagnosis* (1928); *Health and a Day* (1937), *Health and Social Welfare* (1945); *The Philosophy of Jesus* (with H. Roberts, 1945). He was created a baron in 1933.

**Horeb** (Arabic, *Jebel Musa*, Mt. of Moses), mt. in the N. part of Arabia, traditionally known as the sacred mt. of the Heb. law-giving, on the same ridge as Mt. Sinai. The monastery of St. Catherine lies at its foot, in a ravine, and near by is the chapel of St. Elias (Ilijah). The rock on H. from which water is said to have issued at Moses' blow is pointed out by the monks to sight-seers.

**Horshound** (O.E. *harhune*, Ger. *Andorra*, Fr. *marriabe*), species of perennial herbs, belonging to the family Labiate, growing about 1 ft. high, with thick stems and a short rootstock. Most of the species are herbaceous plants occurring in Europe, N. Africa, and W. Asia. Common or white H. (*Marrubium vulgare*) is found throughout Europe, and occurs in Britain on sandy or chalky ground, but is not at all common. Black H. (*Ballota nigra*) a perennial herb, is also a native of Britain, S. of the Forth and Clyde, and occurs also in Europe and N. Africa. H. has likewise been naturalised in parts of America; it is used widely as a cough medicine.

**Horgen**, tn. of Switzerland on Lake Zürich in canton of and 10 m. E.S.E. of Zurich; amidst vineyards, orchards, and fine walks. Manufs. cotton, silk, and chems. Pop. 8900.

**Horizon** (from Gk. *ὁρίζων*, dividing or bounding), circular line round which the earth and sky seem to meet, most clearly defined at sea, where it is called the sea H. This is known in astronomy as the *sensible* H., while the name *rational* H. is given to the circle whose plane passes through the centre of the earth. The sea H. is depressed by a dip which varies according to the height of the observer's eye from the water, this being due to the roundness of

the earth. See treatises on Spherical Astronomy.

**Horley**, par. and residential vil. in Surrey, England, 5 m. S.S. E. of Reigate, and situated on the R. Mole. It possesses an Early Eng. church (St. Bartholomew). Pop. 6000.

**Hormayr, Joseph, Baron von** (1782-1848), Ger. historian, b. at Innsbruck. In 1815 he was appointed historiographer of Austria, and in 1828 became councillor for the foreign dept. of Bavaria, holding the position of Bavarian minister to Hanover in 1832. He wrote widely, among his works being *History of Tyrol* (1817), *General History of Modern Times* (1817), *Vienna, Its History and Curiosities* (1823), etc. See life by T. von Helgel, 1881.

**Hormones** (Gk. *hormao*, I excite) term applied by E. Starling to those juices prepared by organs, which pass directly into the blood stream, they are transported to some other parts of the body where they exert a controlling and regulating effect on some vital activity. They are often referred to as the 'chemical messengers' of the body. The most highly complex inter relations appear to exist between the glands, so that the effect of a drug on one of them is very far reaching. W. Baylis and E. Starling prepared an extract, *secretin*, by digesting duodenal mucous membrane with hydrochloric acid. The product is soluble in alcohol, and is not destroyed by boiling. If secretin be injected into the blood, it leads to active stimulation of the pancreas. This it is apparently naturally formed by the action of the acid chyme on some pro secretin in the intestine. It passes to the pancreas, which it stimulates to produce pancreatic juice. Many its besides secretin are now known, most of them produced in ductless glands (endocrine organs). The study of these glands, and of their Hs., forms the important branch of medicine known as endocrinology. We may mention thyroxin, formed in the thyroid gland of the neck; adrenalin, secreted by the adrenal glands near the kidneys, and 'pituirrin,' a mixture of many hormones manufactured by the pituitary gland of the brain. The sex organs (testes or ovaries) are also the site of hormone production, as is demonstrated by the striking consequences of castration. Insulin is the H. of the pancreas. See D. Paton, *Hormone Therapy*, 1922. J. Cunningham, *Hormones and Heredity*, 1922; B. Harrow, and C. Sherwin, *Chemistry of the Hormones*, 1931; G. F. Walker, *The Status of Enzymes and Hormones in Therapy*, 1935.

**Hormones, Plant, see PLANT HORMONES**

**Hormuz**, or Ormuz, anc. city on the Persian Gulf on the N. E. extremity of the Is. of Ormuz. It sprang up in the latter part of the Middle Ages, and became a great emporium of the trade between Persia and India. In 1591 the Portuguese captured it and held it till 1622, during which time it served as a great depot for the products of India and China. In little more than a century, on the rise of Shah Abbas, its trade was transferred to the new tn. of Bender Abbas. The ruins of

the Portuguese fort still remain at the vil of H.

**Horn**. A brass wind instrument with its tube bent in a circular form. In its early stages it could produce only the natural harmonics and was used mainly for hunting fanfares. When composers began to write for it they could use only those notes, usually in the key of F, in which it was pitched as a rule; but after the invention of a series of crooks which could be inserted, the length of the tube could be altered and the instrument played in a variety of keys. Some extra notes, of rather uncertain quality, could also be obtained by inserting the hand into the bell. It was only by the introduction of valves about the 1430s that the full chromatic scale could be played on a single instrument. The compass is c. 3½ octaves from (on the Fr. H.) B flat below the stave in the brass clef. Also an 8-ft. reed organ stop of powerful tone.

**Horn (animals)**, see HORNS.

**Horn, Cape**, generally considered the southernmost point of S. America, at the S. of a small is. to the S. of Tierra del Fuego. Discovered in 1616 by the Dutch navigators, Lemaire and Schouten, and named after the Dutch tn. Hoorn, the bp. of the latter.

**Horn, French**, see FRENCH HORN.

**Horn, Arvid Bernard, Count** (1664-1742), Swedish statesman, b. at Vuoren-taka, Finland. He served in the Swedish army against France and gained rapid promotion, being sent in 1704 as Swedish ambassador to Warsaw, and assisting in the deposition of King Augustus of Poland. In 1705 he became councillor to the new King Stanislaus, and as head of the party of 'Bonnets' practically ruled Sweden, converting it into a limited monarchy. His party remained in power till 1738, when it was ousted by the Habs. Under his leadership the country prospered, and the year when he was marshal came to be spoken of as the time of Arvid Horn. See Gustav Horn, *Arvid Bernhard Horn*.

**Hornbeam**, or *Carpinus betulus*, species of *Putulaceae*, found in N. climates and a

HORNBEAM

native of Britain. It greatly resembles the beech in habit, but its leaves are rough and elm like. The timber is extremely rough, but is not very often used. In April it bears male and female catkins, and the latter precede a number of one-seeded nuts with a three-lobed wing on one side.

HORNBILL

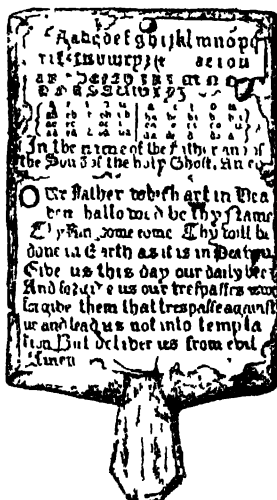

Hornbill, name given to the many species of coraciiform birds belonging to the family Bucerotidae. They are of considerable size, and derive their name from their immense dentated downward-curved beak, with the horn-like casque at the base. The species range from Africa, India, to the Malayan region, and are remarkable for their slow and heavy flight, which, however, is counter-balanced by the pneumatic nature of their bones. The members of *Bucerus* are omnivorous and feed chiefly on the ground, their food consisting of roots, insects, tortoises, etc. During breeding the female is imprisoned by the male in the hollow of a tree which he plasters up, leaving only a small slit for the admission of food. *B. abyssinicus* is the best known species, other genera being *Rhinoplax*, *Aceros*, *Lophoceros*, and *Anorhynchus*.

Hornblende, commonest member of the amphibolic group of rock-forming minerals. It is of all colours, but the name is generally restricted to the black or very dark green varieties. It is similar to augite, from which it can only be distinguished by its cleavage angle ( $q.z.$ ). The monoclinic crystals are prismatic in habit with a six-sided cross-section; the angle between the prism faces, parallel to which there are perfect cleavages, is  $55^{\circ}49'$ . In metamorphic rocks it generally forms irregular masses without definite crystalline form. The dichroism is always marked. H. occurs as an essential constituent of many kinds of igneous rocks, and many crystalline schists are almost entirely formed of it.

Hornblende Schist, mineral commonly associated with gneiss and, less frequently, with mica schist. It follows the contortions of gneiss and is traversed like it by granitic veins.

Hornbook, primer, formerly used by children in England to learn the elements of reading, prior to the days of printing. It consisted of a piece of paper or parchment on a tablet of wood, with a slice of transparent horn in front, hence the name. It contained the alphabet, large and small, the Lord's Prayer, and the Roman numerals, and was prefaced with figures of the Cross. There was a handle attached to it. By means of a hole bored for a string, the book could be fastened to the scholar's girdle. At one time Hs. were quite common but they have now become very scarce.

Hornbostel, Erich von (1877-1935), Austrian musicologist, b. at Vienna. Studied physics and philosophy at Vienna and Heidelberg, and in 1906 became head of the gramophone archives in Vienna for the recording of the music of primitive peoples, on which he wrote several learned works. In 1921 he went to Berlin in 1931 to New York and the following year to London and Cambridge.

A SEVENTEENTH-CENTURY HORNBOOK

Horncastle, mkt. tn. of Lincolnshire, England, 130 m. N. of London. The church of St. Mary is, in part, Early Eng., and Queen Elizabeth's Grammar School dates from 1562. The great horse fair, described by George Borrow in *Romany Rye*, is still held annually in the second week of Aug., but has lost much of its importance. The chief industries are

brewing and matting. Pop. 3680. See J. C. Walter, *History of Hornchurch*, 1903.

Hornchurch, vil. and par. in Essex, Eng. land, 2 m. S.E. of Romford. It has manufs. of agric. implements, cycles, tiles and bricks, and there are iron foundries. There is an R.A.F. aerodrome. Pop. 81,400.

Horne, Henry Sinclair, Lord (1861-1929), Brit. general b. in Caithness. Educated at Harrow and Sandhurst. Began his military career in the Royal Artillery in 1880. Served in the S. African war (1899-1902) with distinction. Served throughout the First World War (1914-1918), being mentioned repeatedly in despatches. For his distinguished services at Mons and the first battle of the Marne (1914) he was promoted to the rank of major-general. Later he was appointed to the command of an army corps and after the battles of the Somme he received a knighthood (Oct. 1916). In the house fighting at Vimy Ridge and the battle of Arras (1917) he gained further distinction and was placed in command of the 1st Army. In the Arras area his army took nearly 20,000 prisoners and 200 guns (Aug. 26-Sept. 3). In conjunction with the 3rd and 4th armies his army group won the three great battles of Cambrai at Quentin (Oct. 8-11), at St. Quentin (Oct. 17-20), and at Valenciennes (Nov. 11), 1918. After the War he received a peer's grant and a barony.

Horne, Richard Henry, or Hengist (1804-94) Eng. author b. in London. He became a midshipman in the Navy and served in the war against Spain. His literary career began in 1824, when he contributed a poem *Heads Impaled* to the *Athenaeum*. He was a talented and versatile writer, but is chiefly known by his epic poem *Orion*, which appeared in 1847. He was a correspondent of Miss Barrett (afterwards Mrs. Browning) from 1839 to 1841.

Horne Tooke, John, see TOOKER.

Horned Screamer, popular name of *Palmacera cornuta*, a species of anseriform birds belonging to the family *Palmacidae*. It is found in certain parts of S. America and has glossy black plumage with a white abdomen. Its most remarkable feature is the long slender, yellowish horn which adorns the head.

Horned Toad, popular name given to the species of *Crotaphytus*, a genus of amphibians, belonging to the order Anura and the family *Cystignathidae*. The name is derived from the triangular upright horny appendage above each eye. The head and mouth are huge, and the general appearance is toad-like. *C. cornuta* of N. Brazil is beautifully coloured, as also is *C. ornata*, a species found in Uruguay, Paraguay, and N. Argentina.

Horned Viper, popular name of *Cerastes cornuta*, a species of reptiles belonging to the family *Viperidae*. It is found in N. Africa, and is remarkable for the possession of a large spiky scale above each eye. See CERASTES.

Hornell, city of Steuben co., New York, U.S.A., 70 m. S.E. of Buffalo. It is an agric. centre, and has large car shops of the Erie Railway. Pop. 13,600.

Hornemann, Friedrich Konrad (1772-1801), Ger. explorer in Africa, b. at Hildesheim. In 1796 he was engaged by the African Association in London as an explorer, and in 1797-98 penetrated from Cairo through Fezzan to Murzuk, whence he returned across the Libyan Desert to Tripoli. From Tripoli he forwarded his journals to London, where they were pub. as *Travels from Cairo to Mourzuk* (1802). From Tripoli he returned to Murzuk with the intention of penetrating to the Hausa country, but nothing further is known of him.

Hornet, or *Vespa crabro*, hymenopterous insect belonging to the sub-order *Pterobates* and the family *Vespidae*. It is the largest of all Brit. wasps, measuring about 1 in. in length and is not found N. of the Midlands. The predominant colour is red, with some yellow on head, abdomen and wings. The colonies include not more than 200 individuals, and nest in hollow trees or other sheltered places. The H. is common all over Europe.

Horn-fly, see under DIPTERA.

Horniman, Anne Elizabeth Fredericks (1864-1977), Eng. theatrical producer b. at Forest Hill, London, and educated privately and at the Slade School. Was a pioneer in modern dramatic production. Her first essay in the dramatic world being in 1881 at the Avenue Theatre, London. That he will be chiefly remembered for her work in founding the Abbey Theatre, Dublin, and in the reorganisation of the Gaiety Theatre, Manchester (opened under her management in 1908). She was the parent of the repertory movement in the theatre. The parallel movement in the United States is the Little Theatre movement, and it may be gathered from such Amer. books as Sheldon Cheney's *The New Movement in the Theatre* that the two chief and antagonistic influences on that movement have been the work of Gordon Craig and the visit of Miss H.'s Company in plays by Shaw, Galsworthy, Bennett, and Massingale. See P. P. Howe, *The Repertory Theatre*, 1910.

Horniman Museum, situated in London Road, Forest Hill, S.E., and is under the control of the London City Council. It is open free to the public every week-day and also on Sundays in the afternoon and evening. It deals principally with botany, zoology, and ethnology, and has a library which is also open to the public.

Horning, Letters of, term used in Scots law to signify a writ issued to compel a debtor to pay under the penalty of being considered a rebel. Originally, these writs were very common and the only means of securing the desired end, but they have now practically fallen into disuse. Their name was derived from the practice of making three blasts with a horn to declare the man a rebel if he neglected to pay.

Hornpipe, musical instrument originally used in parts of England, made from an animal's horn. The name is now applied to a lively kind of dance which was used to accompany the music and which was, as a general rule, written in common time, though this was occasionally departed

HORNPIPE OR  
PIBCORA

The upper horn is raised to reverse the reed — From a modern reproduction

from. The best known dances of the kind at the present day is the college H. and the sailor's H.

Horns, weapons that occur on the heads of various animals. They differ in substance; the H. of the deer are made of bone and are processes of the frontal bone, while those of the giraffe are bony prominences covered with hair and are entirely separate from the bones of the skull at first, but afterwards join on to them. Those of sheep, oxen, and antelopes are developed from the frontal bones of the skull, and are covered by a corium and by a horny sheath; but the prong-horned antelope has H. which consist at their basis of bony processes covered by hairy skin, and are covered by horny sheaths elsewhere. The H. of the rhinoceros alone are made of horn, and this occurs in fibres, growing from the skin like a mass of coarse bristles. H. are weapons of defence, and occur in both male and female animals, except in the case of antelopes, when they are generally confined to the male sex.

Hornsea, seaside tn. of the E. Hiding of Yorkshire, England, about 15 m. N.E. of Hull. It is now popular on account of its bathing facilities. Pop. 4900.

Hornsey, municipal bor. and suburb of N. London, situated in the co. of Middle-

sex, 5 m. N.W. of St. Paul's. Pop. (1939), 72,400.

Horn-silver, see CERARGYRITE.

Hornstone, variety of stone which resembles flint very closely. It is exceedingly brittle and splintery, and is sometimes identified with chert, these two being practically undistinguishable from flint.

Hornu, tn. in Belgium, in Hainaut, 6 m. W. of Mons, engaged in coal mining and manuf. of shoddy, machinery, ropes. It has copper-foundries and breweries. Pop. 10,800.

Hornung, Ernest William (1866-1921) Eng. novelist, b. at Middlesbrough; youngest son of John Peter H. Married a sister of Conan Doyle. Educated: Uppingham. In Australia, 1881-86; his early work deals chiefly with that country. Wrote on many themes, but he owed his popularity to *The Amateur Cracksmen* (viz. the elderly-gentleman-cricket-burglar, Raffles, 1899), with its sequels; and *Singapore* (name of a moon-occluded Dundreary-whiskered bushranger, 1905). Though he dealt in 'sensational', H.'s style was refined.

Horology, science which deals with the construction of contrivances for telling the time. It is well to point out in the first place that exact measurement of either space or time is impossible, as no distance can be shown as a multiple or sub-multiple of any particular unit, nor can any period of time be said to contain another period or definite number of times. The problem of measuring time, therefore, resolves itself into an attempt to attain a near approximation to the definition of a unit and the nearest possible measure of a given period in terms of that unit. The particular phenomena which have been recognised as dividing time into regular periods are those associated with the revolution of the earth about the sun, and its rotation about its own axis. The recurrence of seasons due to the earth's revolution has given us the conception of the year, and the problem of calendar-making has involved the measurement of the year in terms of the period of the diurnal rotation of the earth. Machines for telling the time are, however, concerned only with latter unit. The rotation of the earth about its axis is uniform, and occupies the same period every day. The period of rotation is measured by observing the successive returns of a 'fixed' star to the meridian. Such a period constitutes the sidereal day, and is used only by astronomers. The sidereal day is divided by universal consent into twenty-four hrs., and the day is said to begin at noon. For most practical purposes, however, the time between two successive passages of the sun over the meridian is taken as the unit, and the day is divided into twenty-four hrs., commencing at midnight. The solar day is not a uniform quantity, owing to variations in the velocity of the sun, and to the inclination of the equator to the plane of the ecliptic. It is, therefore, necessary to imagine the sun moving at an average rate every day, thus giving us the measure of a 'mean' solar day. It is possible, therefore, to assign three different times to any given instant: sidereal time, mean solar time, and true, or apparent, solar time. The sidereal day is shorter than the mean solar day by about four min. on the average, or, to be more exact, twenty-four hrs. of mean solar time = 24 hrs. 3 min. 56.5551 sec. of sidereal time. The div. of the day into twenty-four hrs. is a relic of the sexagesimal system of notation, as also are the div. of the hour into sixty min. and that of the minute into sixty sec.

Early methods of time measurement.—The div. of the day into recognised periods is a natural consequence of any attempt at the proper conduct of affairs. The Egyptians used a horoscopus consisting of a tapering palm-branch with a slight slit in the broader end, and provided with a handle from which hung a plummet. With this apparatus the transit of a star over the meridian could be observed, and the hour fixed. Later on, we find the use of the clepsydra (q.v.), or water clock, and the sand clock fairly universal in Greece and Rome and Hellenised and Romanised countries. The waterclock consisted of a

vessel of known capacity, whose base was perforated in such a way that the water leaked away slowly, and at a fairly uniform rate. Some instruments were provided with floats pointing to the hrs. inscribed on a vertical scale. The water clock and the sand clock (which was constructed on the same principle) were used to assign a limit to the duration of speeches in courts of justice, a use which has persisted in the form of the hour-glass estab. in certain churches to this day.

*Sun-dials.*—The most exact instrument known to the ancients was the sun-dial. Mention is made of a sun-dial in Isaiah xxxviii. 8, which would refer to about 700 B.C. The hemisphere of the Chaldean Berosus (c. 300 B.C.) was half a hollow sphere with its rim horizontal, and a small sphere fixed at the centre. The shadow cast by this object on the inner surface of the hemisphere, traced out a circular arc during the time the sun was above the horizon. The Greeks adopted the use of the sun-dial from the Babylonians, and mention is made of one placed in Rome in 290 B.C. The science pertaining to the construction was called *gnomonics*; the Arabians were chiefly responsible for its development. The essential parts of a sun-dial are the dial itself and the style, a piece of rigid metal which casts its shadow on the dial. The dial may be fixed horizontally, vertically, or inclined to the horizon. In the horizontal dial, which is the commonest type, the plane of the style must lie along the meridian which may be found by observing the successive shadows cast by a vertical rod and plummet and bisecting the angle formed by shadows of equal length. This gives the direction of the shortest shadow, and consequently indicates twelve o'clock noon on the dial. The other hrs. are obtained by calculating the angles on either side of the twelve o'clock shadow. It is obvious that sun-dials only tell the time during the day, and then only when the sun casts a distinct shadow. The time, moreover, is true solar time, which has to be corrected by the 'equation of time' to give mean solar time. Portable dials were made and were commonly set in the meridian by the aid of a compass. Ornamental dials formed a feature of many country houses, but the growing perfection of clocks and watches rendered their employment unnecessary after the seventeenth century.

*Clocks.*—A clock is said to have been constructed by Pope Sylvester VII. in A.D. 996, with weights as motive power. Many of the early church clocks were simply striking instruments, with no dial to show the time. In 1288 a clock supplied with bells was put up in Westminster Abbey, and many cathedrals possessed clocks as early as the fourteenth century. The famous clock at Strasbourg Cathedral was constructed in its original form between 1352 and 1370. The regulating mechanism of these clocks consisted of a verge escapement with a balance. The pendulum was adapted to clock mechanism in the seventeenth century, and corrections for temp. were introduced by John Har-

ri-son (1693-1776), and Matteo Campani-Ailmenia; the latter also invented the illuminated dial plate. Many modifications of the general structure of clocks have been introduced from time to time. Clocks which do not strike the hrs. are usually differentiated as timepieces; many play chimes or tunes in addition to striking the hrs. and 'alarm' clocks have a special bell-ringing arrangement which is put into operation by previously adjusting the Time on a separate hour indicator.

*General construction of clocks.*—All clocks made on the usual principles contain their own motive power, which may be a coiled steel spring or a weight suspended by a chain or wire; a train of wheels, by which the motion is communicated to the hands on the dial; a pendulum or other device for regulating the motion of the wheels; an escapement by which the motion of the pendulum is applied to the wheels; there is often a striking mechanism. In the case of a clock actuated by a suspended weight, the motion is first of all communicated to a barrel around which the cord holding the weight is coiled. The axis of the barrel and the arbors of the other wheels are socketed in two parallel plates kept at a constant distance by rigid pillars. Having the same axis as the barrel is the great wheel of the clock, which drives the centre pinion on the arbor of the centre wheel. The arbor of the centre wheel is produced through the front plate to the dial and to it is attached the min. hand. The centre wheel engages with the pinion of the second wheel, and the second wheel with the pinion of the escapement wheel. The pallets of the escapement oscillate on an arbor which joins a lever or crutch at right angles, having at its other end a fork by which the motion of the pendulum is communicated to the escapement. In front of the front-plate of the clock the prolonged arbor of the centre wheel is socketed into a spring pressing against a wheel communicating with the min. hand. The contact is sufficient to ensure the proper motion of the min. hand, but is not strong enough to prevent the adjustment of the hands from the front. Engaged with this wheel is another wheel with the same number of teeth, but bearing on its arbor a pinion which engages with the hour-hand wheel, which has twelve times the number of teeth of the pinion, and is concentric with the minute-hand wheel, though it is surmounted on a hollow tube surrounding the arbor of the minute-hand wheel.

*Pendulum.*—The biggest advance in H. is that due to the introduction of the pendulum. The mechanics of a suspended body had been investigated to some extent by Galileo, but there is some doubt as to the horologist responsible for its adaptation to clock mechanism, though the honour is usually ascribed to the Dutch physicist, Christiaan Huygens. In theory, a pendulum consists of a small heavy mass concentrated at the end of a light string or rod which is free to move about a fixed point. When the arc of oscillation is large, the period of the oscillation depends upon the amplitude of

the swing, but this is not so when the arc of oscillation is small. The forces acting upon the bob of the pendulum are its weight acting vertically downwards, and the tension of the string acting in the direction of the swing. At a given moment the motion of the bob is along the tangent to the arc, and as this is at right angles to the direction of the string, the tension of the string cannot be resolved along the

Victoria and Albert Museum  
AN ENGLISH CLOCK IN SILVER CASE  
c. 1650. BY D. BOUQUET

tangent. The motions of the bob constitute simple harmonic motion, so that the vibration is isochronous, that is, whatever the amplitude of the vibration the periodic time is the same. This result is of the utmost importance in considering the pendulum as a time regulator. It means that whatever the power of the driving mechanism, whether the pendulum is moving strongly or feebly as long as the angle is small, the time taken for it to complete each double oscillation is the same. In clocks, the pendulum is a bob fixed to the end of a rigid bar; the bar itself has weight, so that the centre of oscillation is somewhat above the centre of gravity of the bob. The great desideratum is that the length of the pendulum from point of suspension to centre of oscillation should remain constant.

**Compensation.**—As metals expand on increase of temp., the length of a pendulum tends to increase in hot weather, with the result that the period of oscillation is increased and the clock loses. It is, therefore, necessary to make some contrivance so that the centre of gravity and the whole pendulum shall be moved upwards to the same extent as the expansion due to heat moves it downwards. One of the earliest devices for this purpose is demonstrated in Graham's mercurial pendulum. The bob consists of two glass cylinders containing mercury. By adjusting the quantity of mercury in the glass vessels, the moving upwards of the centre of gravity of the mercury can be made to compensate for the lowering of the centre of gravity due to the increased length of the rod. Another compensation device is that invented by John Harrison in 1726, and commonly known as the grid-iron pendulum. It consists of a framework of metal rods of two different metals, iron and brass being generally used. The rods are so arranged that the steel bars lengthen downwards in expanding, while the brass rods are fixed at the bottom and lengthen upwards. By adjusting the lengths of the respective metals in the inverse ratio of their coefficients of expansion, the expansion upwards can be made to counteract exactly the expansion downwards. An improvement in these methods of compensation has now been effected by the use of 'invar,' an alloy of nickel and steel.

**Escapements.**—The function of an escapement is to apply an impulse to the pendulum to cause it to vibrate and to lock the escapement wheel until the pendulum has completed a vibration. In this way the clock mechanism proceeds in jerks, one tooth of the escapement wheel being advanced for each single vibration of the pendulum. Soon after the introduction of the pendulum, the anchor escapement was invented by R. Hooke. It consists of two claw-shaped convex pallets mounted on two limbs oscillating about an axis at the junction of the limbs. Each pallet is driven in turn into a notch between two teeth and as it is being withdrawn, it receives an impulse from the turning wheel which serves to keep the pendulum oscillating. The pendulum is, therefore, never free, and a recoil is occasioned at the end of the vibration. This disadvantage is obviated in the deadbeat escapement, in which the serrations of the wheel point in the opposite direction. The advantage of this escapement is that there is no recoil so that it is well adapted for clocks in which great accuracy is required. Many escapements are constructed on the 'remontoire' system, in which the escapement has a driving power of its own, supplied either by separate winding by the clock train, or by allowing the pallets to drop on to the pendulum by the action of gravity.

The wheels of a clock are usually made of hard brass and are cut by a wheel-cutting machine adapted to the pitch of the wheel. By pitch is meant the number of teeth to each inch of circumference (for-

cumferential pitch) or to each inch of diameter (diametral pitch). Pinions are sometimes made in lantern form, and with specially-shaped cogs give satisfactory results. It is necessary to have some arrangement in a clock by which the motion of the clock train is not interfered with by the action of winding. This is effected by such a contrivance as Harrison's going ratchet. The great wheel has on its face a ratchet wheel with a click set in the clock frame. Upon this ratchet wheel is set another with its teeth pointing in the opposite direction, and its click set upon the larger ratchet wheel. The winding of the clock, therefore, does not cause the revolution of the larger ratchet, as that is prevented by the click set in the clock frame. Striking is effected by a somewhat complicated mechanism at the front of the clock. The essential part is a small wheel round the hour wheel. The wheel has a step for each hour, so that a lifting piece is allowed to fall into a position along a rack from which the number of notches to the end determine the hour to be struck. A pin on the min. wheel sets the striking mechanism in readiness for going a few min. before the hour. Other additional mechanisms are 'alarm' arrangements, 'tell-tale' contrivances, etc. The alarm is set by turning an indicator upon a small dial; the indicator is attached to a wheel set upon the hour-hand wheel by means of a friction spring. A form of watchman's clock is that in which a set of spikes project round the dial in such a way that when a handle is pulled, the spike which happens to be opposite is pulled in. In the morning the spikes pushed in indicate at what hrs. the watchman operated the clock.

The perfecting of the electric clock, first invented by Alexander Bain in 1843, is a recent development. In one type electricity is used to wind the clock by means of a simple direct current motor, operated from a battery. In others the clock is a simple synchronous motor running in step with the alternators of the power station which supplies the electricity. The frequency of the current generated is constant, being 50 cycles per sec. and (in United Kingdom) is constant for all electricity stations. Clocks are manufactured on a large scale in the United States, particularly in Connecticut and New York. In England the chief centres of the industry are London and Handsworth near Birmingham and there is a recently established industry in S. Wales. Many cheap but excellent clocks are made in the Black Forest region in Germany while the industry also flourishes in Switzerland, France and Italy.

Until very recently the oscillating quartz crystal was the most accurate standard of time measurement. If a constant temp. is maintained, the oscillations in a piece of quartz at its natural resonance frequency can be held to a constancy of one part in a hundred million. The frequency of the oscillations is reduced until they are capable of driving an electric motor. Atomic physics has now provided a further refinement of accuracy; the new primary standard of time and

frequency is the constant natural frequency of the vibrations of the atoms in the ammonia molecule. The oscillations of the quartz crystal are compared with the ammonia absorption line, and corrected when necessary, achieving stability against drift. An immediate benefit may result in radio communication, by obviating the necessity of wide frequency bands.

Smith's English Clocks, Ltd

#### AN ELECTRIC CLOCK, 1950

The clock is finished in walnut and gilt, or padouc and bronze. It is also manufactured with an 8 day level movement.

*Musical Clocks.* — Elaborate musical clocks first made their appearance in England in the early part of the eighteenth century, the name of Charles Clay, official clock-maker to His Majesty's Board of Works, being most prominent. In 1716 Clay, a Yorkshireman of the W. Riding, petitioned Parliament for a patent in respect of a repeating and musical watch or clock of his invention. A formidable rival, Daniel Quare, ex-master of the Clockmakers' Company, produced a watch alleged to answer the same end as Clay's; but though the attorney-general reported in Clay's favour, the opposition of the Clockmakers' Company finally defeated Clay's petition. This set back however did not deter Clay from coming to London, where he eventually acquired so great a reputation as a craftsman that he could count on the co-operation of eminent artists and musicians in making his clocks. One clock, which Clay exhibited before the Royal Family in 1736, is described (R. J. Britten, *Watch and Clock-makers of the World*, 1894) as resembling a large table-clock on a rectangular pedestal, being 84 in. high. In the arch above the dial are a subsidiary dial showing the age of the moon and the day of the month, and the names of the musical pieces played by the clock. These are (i.) *Orlando Corelli's Twelfth Concerto*, (ii.) *Adagio*, (iii.) *Allergo*, (iv.) *Saraband*, (v.) *Allegro*, and (vi.) *The Fugue in the Oratorio of Ariadne*, i.e. the second movement of the overture in Handel's opera (first pub. in 1734). The musical machine consists of a barrel 12 in.

in diameter working on a chime of twenty-one bells, and is contained in the pedestal. Corelli's concerto is in F major, and Handel's overture in the relative D minor, which suggests that the chime was based on an F major scale. Clay's choice of music was of a higher quality and far more elaborate than that supplied by most eighteenth-century makers, whose repertory is usually confined to the fashionable dances, marches and hymn-tunes of the day. There is a direct relationship between Clay and Handel in this connection, for in the index to a vol. of his 'pieces' for a musical clock 'one set is named by Handel *Ten Tunes for Clay's musical clock*, six being original compositions, and five being arias from Handel's own operas. For the making of his musical clock called *The Temple of the Four Grand Monarchies of the World*, Clay had the co-operation of Jacopo Amigoni (or Amigoni), the painter, Louis François Roubiliac, baroque sculptor, John Michael Ræbrack, silver worker, Handel, and Geminiani, the violin virtuoso. This remarkable clock, which was not completed in C.'s lifetime, subsequently passed into the possession of the Princess Augusta, wife of Frederick, Prince of Wales, and mother of George III. Another typical musical clock of Clay's is that in the Royal Palace at Naples. The music of this clock was provided by a little pipe-organ, worked by a barrel, but there was no list of tunes. Tradition has it that this clock was given to Maria Carolina, Nelson's Queen of Naples, by Sir John Aulton, Eng. born Primo Minister of Naples. (See E. Croft Murray, 'The ingenious Mr. Clay,' *Country Life*, Dec. 31, 1948.)

*Watches.*—Early watches were really portable clocks. They were driven by a mainspring, and the motion was regulated by a small balance escapement as in the clocks of the same period. Such instruments were often too large to be carried in the pocket, and were suspended from the girdle by a chain or cord. Frequently they were globular in form, and gained the name of 'Nuremberg eggs' on that account. Early in the sixteenth century an arrangement called the fusee was adopted. This consists of a mainspring enclosed in a barrel on which is wound a piece of catgut or a chain which is also wound upon a spiral drum in such a manner that when the mainsprings weakens as it relaxes, the leverage on the spiral increases, so that the force remains fairly uniform. The form of the watch lent itself to a high degree of ornamentation, and the watches of Tudor times are remarkable for the delicacy of the engraving on their cases. Many of them contained a striking mechanism, and when this was dispensed with a decrease in size and weight became possible. Thomas Tompion (1639–1713) invented a dead-beat escapement for watches, which was afterwards improved upon by George Graham (1673–1751). The next great development was the invention of the curb-compensation for the hairspring by John Harrison (1693–1780), who himself constructed chronometers of marvellous efficiency. In 1713 the Brit. Gov.

offered rewards of £10,000, £15,000, and £20,000 for chronometers which would determine long within an error of 60, 40, and 30 geographical m. respectively. In 1761 John Harrison sent his son on a voyage to Jamaica with a watch of his own construction. It lost one min. fifty-four and a half sec. on the double journey, which was equivalent to a determination of long. within an error of 18 m., according to the terms of the Gov.'s offer. On a subsequent voyage of four months duration to Barbados, one of Harrison's chronometers showed an error equivalent to only ten geographical miles. The reward offered was tardily paid by the Gov. who did not sympathise with the principles upon which Harrison constructed his watches. A modern watch possesses a case for containing the mechanism, a mainspring and winding-up mechanism, a balance wheel and hair spring, and an escapement. The mainspring is a thin strip of tempered steel, and in most modern watches tapers very gradually from one end to the other. The fusee is now little used, and inequality in the driving force is compensated for in other ways. The mainspring was formerly wound up by a separate key, but this is now avoided by connecting the mainspring barrel with the pendant. A push button is also provided by which the wheels connected with the pendant can be thrown out of gear with the barrel wheel and connected up with the hand wheels to set the hands when required. The driving power of the mainspring is communicated to the train of wheels as in ordinary clock mechanism. The function of the pendulum in regulating the speed of the train of wheels is taken up by the balance wheel. This consists of a small brass wheel to which is attached the hairspring, a fine spiral spring with centre of gravity on the axis of the balance wheel. The elasticity of the spring causes the wheel, when impelled from its normal position in either direction, to return beyond its normal position, and the time of oscillation is the same for different impulses within certain limits. The impulse is supplied to the balance wheel by the escapement, which also communicates the rate of oscillation to the train of wheels. The commonest escapement in Eng. made watches is the lever escapement. This device, invented by Thomas Mudge in the latter part of the eighteenth century, is an adaptation of the dead-beat escapement applied to clocks. The pallets are fixed to a lever pivoted at a point midway between the pallets, and furnished with a notch which engages with a small pin on the balance wheel near its axis. The motion is so adjusted that when a tooth of the escape wheel escapes from one of the pallets the pin slips out of the notch and enters it again on the return of the balance wheel, moving the lever sufficiently for the next tooth to escape. The pallets of the lever and the pivots of lever and escape wheel are usually jewelled, and undue motion of the lever is prevented by safety pins. What is called the chronometer or spring-detent escapement (sometimes called the 'detached' escapement) pro-

vides for one impulse only in a double oscillation and the unlocking occurs every other vibration. It is too delicate for use in ordinary portable watches, and is specially adapted for chronometers which are maintained in a horizontal position by gimbals. Compensation for changes due to difference of temp is necessary for two reasons. The expansion of the balance wheel increases the moment of inertia of the wheel so that it requires a greater force to turn it in a given direction. The ordinary compensated balance wheel has a circumference consisting of two or more sections, each of which is composed of an inner bar of steel molded upon an outer bar of brass, this compound bar carrying a

velocity of light. See T. Reid, *Treatise on Clock and Watch Making*, 1849. E. J. Wood, *Curiosities of Clocks and Watches*, 1866. E. B. small weight. The inequality of the expansion of the two metals results in a bending of the bar inwards thus carrying the weight towards the centre of the wheel. Such a contrivance requires careful adjustment. Secondary compensation is necessary on account of the weakening of the elasticity of the hairspring through rise of temp. Apparatus designed to record very small divisions of time with great accuracy are called *chronoscopes* (q.v.), and when they are arranged so as to preserve a more or less permanent record, they are called *chronographs* (q.v.). Such mechanisms are often dependent upon the breaking and establishing of electrical contacts and are brought to a high pitch of perfection. Greater and greater degrees of accuracy are constantly being achieved, but it must be remembered that absolute accuracy is not only impossible by the nature of time, but also through the fact that no physical process can be said to be ultimately instantaneous. For instance, if two clocks are supposed to be exactly synchronous, they are not so when viewed from each other their difference being a function of the

After studying at Cambridge he returned to his native place and there began his astronomical observations. In 1639 however he was ordained curate at Hook in Lancashire and there made his observation of the transit of Venus. Among his writings are *Venus in Sole vista*, printed by Hevelius in 1662 and portions of his writings pub. by the Royal Society under the title *Jeremiae Horroccii Opera Posthuma* See J. E. Bailey, *Pilgrims Notebook*, 1852.

**Horsa**, see HENGIST AND HORSAS.

**Horsa**, Brit troop carrying glider, with a wing span of 85 ft. and carrying capacity of three tons of freight or fifteen men with arms and equipment. The fuselage was of box shape, and a wooden frame work ensured easy production. Large numbers were used in the Normandy invasion, at Arnhem and at the crossing of the Rhine.

**Horse**. *History*—There is abundant evidence of the existence in Caesar's time of Brit or Celtic ponies throughout the greater part of the Brit Isles. Some of these breeds, notably the Shetland, have very little altered in the intervening period, and, except as a result of the introduction

of Arabian or thoroughbred blood, show no tendency to increase their size. The large H. was probably unknown until the Norman invasion. Then animals of the Andalusian or Chestnut type were introduced, and from these and the large Belgian or Flemish H., the war H. ridden by knights in armour and later the modern heavy cart H., were evolved. Although the evidence of the oldest writings, sculptures, and frescoes goes to show that Hs. were driven long before they were ridden, the H. was probably employed and bred almost solely for war purposes for a long period. As far back however, as the time of Henry II., the tournament was introduced and H. racing first captivated the Eng. people. But wars, civil and foreign, seriously depleted the H. supply, and in 1493 Henry VII. forbade the export of any H. without royal permission, and of any mare whose value exceeded 6s. 8d. It was Henry VIII. who made H. stealing a cap. offence. During his reign, the weight of armour reached its maximum, and in consequence, large and strong Hs. were in heavy demand. By this time the value of the H. in agriculture had been realised, and the pack H. was in extensive use for transporting goods. The use of state chariots by noblemen virtually originated the present road system and modern methods of travel. Coaches were introduced in the reign of Queen Elizabeth, and the importation of Arabs and other foreign stock laid the foundations of the modern race H. or Eng. thoroughbred. With the improvement of the roads, and the use of coaches, carriages, and lighter vehicles, great attention was paid to the development of the harness H., and the Hackney or Norfolk Trotter was evolved from a foundation stock of Scandinavian Hs., and the Cleveland Bay and the Yorkshire Coach H. were developed.

**BREEDS.**—The majority of Hs. in use in Great Britain belong to no distinct breed, being of a general utility character, such as those used in tradesmen's carts. With the development of motor traction, however, the number of such Hs., formerly much used for omnibuses and cabs, has declined rapidly, and the percentage of pure bred animals has increased. The following are the distinct breeds: the Racehorse, or Thoroughbred, and the Hunter, the Hackney, the Yorkshire Coach H. and Cleveland Bay, the Shire H., the Clydesdale, and the Suffolk Punch; while among ponies are the Polo pony, the Hackney pony, the Welsh, the New Forest, the Highland, the Shetland, the Dartmoor, the Exmoor, the Fell, and Connemara.

The *Thoroughbred* is said to have developed an inch in height in every seven or five years since 1700, and for considerably more than a hundred years has been kept absolutely pure. While it owes much to the Arab all authorities agree that it would not benefit by further introduction of Arab blood. The majority of thoroughbreds are bay in colour, and their number appears on the increase. Chestnut is a fairly frequent colour, blacks and browns are rare, and grey thoroughbreds are practically extinct.

*Hunters* are bred from at least one thoroughbred parent, excellent animals for the purpose being produced by crosses with small Clydesdale or Suffolk mares. Irish hunters have long been considered the best here. A mahogany-brown colour is preferred, black, bay, or dark chestnut coming next in favour. Grey, roans, and light chestnuts are not fashionable. A hunter should be thick and strong on the back and loin, with long powerful quarters and muscular thighs and neatly-shaped and clean hocks. Size, stamina, action, and reliability at fences are essentials in a good hunter.

The *Hackney* H. is the beautiful harness H. of high action, arched neck and fast pace. A Hackney must be over 14 hands high, i.e. exceeding 56 in., but the average height is about 15.3 hands. Hackney-bred carriage Hs. of 17 hands can be obtained. The distinguishing feature of the breed is its very high and free action. It is a powerfully built, short-legged, big, broad H., with an intelligent head, neat neck, strong level back, powerful loins, flat-boned legs and good feet.

The *Cleveland Bay* with its offshoot, the *Yorkshire Coach H.*, which tends again to amalgamate with the parent stock, is the general utility H. There is no better base or foundation for crossing to obtain hunters, cavalry Hs., and harness Hs. The *Cleveland Bay* is about 16 hands 2 in. in height, has a short back, powerful loins, and long quarters. Black zebra-like stripes above the hock, which occasionally occur, are supposed to denote special purity of breeding. The colour of the *Yorkshire Coach H.* is usually dark bay or brown. The mane and tail are black and thick. A fine head, sloping shoulders, strong loins, lengthy quarters, high stepping action, and abundance of bone and muscle characterise the breed which undoubtedly owes something to the Thoroughbred.

The *Shire* is the largest draught H. in the world, commonly attaining a height of 17 hands, weighing as much as 2000 lb. Though immensely strong, it is very docile and intelligent, and has a good free action. The prevailing colours are black, bay, and brown. The short stout legs have a plentiful covering of long hair known as 'feathering,' from the back of the knees and hocks to the pasterns. The neck is well arched, chest wide and full, back short and straight, ribs round and deep, and the quarters long, level, and well down to muscular thighs. The breed is directly descended from the great war H. of medieval times.

The *Clydesdale* is the agric. H. of Scotland. It is somewhat smaller than the Shire, but is claimed to be of finer limb. Bay and brown are the commonest colours, black and grey coming next, and, more rarely, chestnut and roan. The shoulder is more oblique than in the Shire, but the 'feathering' on the backs of the legs approaches the style of the latter. The breed is remarkably active in work, and is possessed of great strength and endurance.

The *Suffolk Punch* is quite distinct from

#### SOME BRITISH AND FOREIGN BREEDS

1, Thoroughbred 2, Irish Hunter (*Farmer and Stock breeder*), 3, Cleveland Bay (*Yorkshire Post*), 4, Shire, 5, Clydesdale 6, Suffolk Punch (*Farmer and Stock breeder*), 7, Percheron (*Sport and General*), 8, Brabant (*Ten Hagen*)

the other native draught Hs., and its clean legs, or freedom from 'feathering,' make it specially well adapted for working on the land. The Suffolk is always a chestnut, varying from light sorrel to dark mahogany. It has long been kept pure, and always breeds true to colour. It averages 16 hands, and sometimes weighs as much as 2000 lb. The Suffolk is famous for its willingness to pull at a dead weight, and is an exceedingly active animal. It has a very finely arched neck, low shoulders, thick withers, and a deep round barrel-like build.

**Foreign Horses.**—The Arab is the most distinguished non-Brit. H. The earliest traces of it go back to the sixth century A.D., and since then the breed has been constantly improved by rigorous selection. It has great powers of endurance, fine intelligence, and rare courage, as well as perfect shoulder action and a light mouth. It is the ideal cavalry H., and was in request by the Remount Dept. of every war office in the world until the development of mechanised warfare. There are sev. Arab studs in Great Britain. Amongst other foreign breeds are the Percheron, the famous cart-horse breed of France (also bred in England), the Brabant of Belgium, the Russian Orloff, the Prussian Trakehner, the Jutland, and the Amer. Trotter.

**Ponies.**—With the exception of the Shetland, Brit. ponies owe much to Arabian and Thoroughbred blood. The pony breeder's object is to compress the most valuable qualities into the least compass, the aim being an animal with a small head, perfect shoulders and true action. Yet a pony must not only be a diminutive H.; it must have true pony character. The various breeds range from 14 hands, or even a little higher, down to 8 hands. The Shetland has been known sometimes to be no more than 26 in. high. Black, bay, and brown are the favourite colours. The Shetlands' sure-footedness, intelligence, and good nature make them ideal companions for children. The Highland pony is the largest and strongest of native ponies, and is unequalled for hardiness and staying power. The commonest type is the Galloway (an Irish word meaning a stout H. or hack). This breed is said to owe some of its features to the Percheron. Allied are the Barra, the Uist, the Rum, and the Skye ponies. The Welsh pony is somewhat similar to the Highland pony, but is a faster animal; in colour bays and browns are the usual shades. The New Forest pony is most commonly a fleabitten grey. Its height ranges from 12 2 to 13 2 hands. The Dartmoor and Exmoor ponies are other perfectly hardy breeds. The Fell pony is a native of Cumberland and Westmorland, used by the farmers for all sorts of work. In colour it is usually black, brown, or bay. The Connemara pony, an Irish breed, supposed to be derived from Sp. crosses with native mares, is a big pony, and is much sought after for polo. A pony suitable for polo must have powerful riding shoulders, with strength across the loins, and muscular

hind-quarters. It has to carry at top-speed weights considered ample for hunters of 15 hands and upwards. All descriptions of native breeds have been drawn on in creating the Polo pony, which should measure from 14 hands to 14 hands 2 in.

**DISEASES.** Amaurosis, or Glass Eye, is a derangement of the optic nerve. The H. carries its head well up, and steps very high. It is incurable, and its detection is very important in buying Hs. Anthrax (*q.v.*) is a very contagious disease, and must be at once reported to the police. Asthma, Broken Wind, or Heaves, is sometimes due to influenza, bronchitis, or pneumonia, but more frequently to bad food, such as musty hay or corn, or to too much exertion after feeding. Two or three grain doses of arsenic once a day in a mash may give relief. Azoturia occurs when animals are too well fed and have too little exercise. After a little work, the H. sweats profusely and ejects large quantities of blood coloured urine. Bleeding is supposed to give relief. Hog Spavin is a distention of the capsular ligament of the hock joint, and is commonest in cart Hs., especially young Clydesdales. A crossing of green tar and turning out to grass has a good effect. Bone Spavin is a bony enlargement on the lower part of the hock joint brought on by injury or over-exertion. Rest, blisters, and surgery are recommended. Bots are the grubs of a gadfly. The eggs are laid in summer on the shoulders and forelegs, and are licked off and swallowed. There is no satisfactory remedy, but a H. singeing lamp should be used to destroy the little yellow eggs. Broken Knees are of frequent occurrence. After washing and dressing with antiseptics, cold water bandages are applied. Bronchitis causes great debility. The H. should be placed in a well-ventilated box, the legs bandaged and warm sheets put on the body and a pail of cold water containing a tablespoonful of nitrate of potash given it to drink. Calculi are stony accumulations, occurring in the large intestine, and commonest in millers' Hs. They are often passed naturally, but strong purgatives must be avoided. Canker in the foot is a growth of horn on the sole, produced by injuries or by dirty wet litter. The H. must be kept dry and the foot dressed with powdered alum and dried tow. Capped Hock, Knee, or Elbow is a swelling due to a collection of fluid under the skin. Apply hot or cold applications and stimulating lotions. Cataract is a pearly-white appearance of the crystalline lens of the eye, which must be carefully looked for in a possible purchase. There is no treatment. Catarrh, or cold in the head, bowels, or bladder is often neglected, but should have prompt attention. Warm clothing, bandaging the legs, a tablespoonful of nitrate of potash, and good varied feeding should restore health. For Colic, or Gripes, two to four ounces of laudanum with two ounces of turpentine in a pint of linseed oil help the attack to pass off. In cases of Conjunctivitis bathe with tepid water to remove the irritant, and apply a boracic acid lotion. Corns generally occur in the

fore-feet. The shoes should be removed and a poultice of cold water and bran applied. Crib biting and wind sucking is often a bad habit, though it may be a form of dyspnoea. Feeding on the ground, providing a muzzle, or substituting iron for wooden stable fittings may effect a cure. Curb is an enlargement of the back and lower part of the hock joint. Rest, cold water bandages to reduce the inflammation followed by blistering and firing are beneficial. Diabetes is characterised by the passing of enormous quantities of urine due to bad food and impure water. Rest, good food, dram doses of iodine in a ball, and twenty five drops of hydrochloric acid in the drinking water are advisable. In Diarrhoea small doses of linseed oil and laudanum will check an attack. Eczema is very contagious. Treat the affected parts with a disinfectant fluid. Enteritis, or Inflammation of the Bowels, is a fatal disease, the pain being continuous, and death often occurs in five or six hrs. Hypodermic injections of morphia and atropine are the safest treatment. Farcy and glanders are allied forms of a highly dangerous and contagious disease which is compulsorily notifiable to the police. With chronic glanders, a H. may go on working and feeding for months with a ragged unhealthy coat and a leaden hue to the membrane of the nostril as the only signs, but such an animal may be a general source of infection. All Hs. and ponies have to be inoculated with mallein before being put down into a coal mine (For fuller details on this, see GLANDERS). Founder, or Laminitis, is an inflammation of the feet. Bleeding often gives relief, as also injection under the skin of a solution of adrenalin. Fractures are of six kinds: 1, simple; 2, compound; 3, compound comminuted; 4, complicated; 5, green stick; 6, impacted. In the second and third cases treatment is practically useless, and the H. is best destroyed. All the bones of the H.'s body are subject to fracture. They must be put in position and splints and bandages applied. Gastritis or inflammation of the Stomach, usually proves fatal. Four ounces of laudanum in a pint of linseed oil will relieve the pain. Injections of sixty to eighty drop doses of morphia and atropine are beneficial. Grouse is an inflammation of the skin, the hind legs of cart Hs. being most subject. Wash with disinfectants, and dust with boracic acid, iodoform, and charcoal. Hernia is a displacement of the bowel. A bandage should be sewn tightly round the body until the rupture is reduced. Larvngitis needs careful attention, as if acute the H. may become a roarer. Mustard mixed with cold water rubbed on the throat generally effects a cure. Steaming the nostrils with eucalyptus oil three or four times a day has a soothing effect. Lock-jaw, or Tetanus, is frequently a fatal disease communicable to man. Anti-tetanus serum injected at the lower portion of the neck has been successful in some cases. Mange is a parasitic disease. Any parasiticide except those containing

arsenic can be applied, but as the disease may be deep-seated or superficial, treatment varies greatly in effectiveness. The disease has been compulsorily notifiable. Nephritis, or inflammation of the kidneys, requires perfect rest, hot clothes, and small doses of linseed oil and laudanum. Pneumonia is much relieved by bleeding, accompanied by a dose of from ten to twenty oz. of linseed oil mixed with one or two oz. of spirits of nitre, and ten to fifteen drops of aconite tincture. Roaring is a peculiar noise made in the act of inspiration, and is a characteristic of unsoundness. Operations sometimes effect a cure. Saddle galls are the result of badly-fitting harness. They should be washed with antiseptics and dressed with zinc and lead lotion. Sidebone, the ossification of one or both of the lateral cartilages at the sides and top of the hoof, is commonest in cart Hs., and is often caused by high-heeled shoes. Hs. with sidebone are unsound. An operation, the use of the bar shoe, and blistering may restore soundness. Strangles is an infectious disease commonest in young Hs. and most seen during the spring months. Abscesses are formed under the jaw, round the throat, and beneath the ears. With good nursing it often passes off mildly. A preventive serum is recommended. Strangles frequently terminates in roaring.

A large vocabulary has attached itself to the breeding and management of Hs. The following is a glossary of terms in more general use: arm, or shoulder, the upper part of a fore-leg from just below the withers, to just above the elbow; bars of the mouth, the spaces between the canine teeth and the grinders; they occur at the angle of the lips and in them the bit is placed; bay, a reddish nut-brown colour with black points; blaze, a stripe of white down a horse's face; calf knee, a knee that bends sideways towards its fellow; knock-kneed; crotchets, chestnuts, or ergots, horny excrescences on the inside of each leg above the knees and below the hocks; chestnut, reddish-brown lighter than bay, but without black points, and frequently with one or more white stockings; clicking, or forking, a defect in a H.'s paces when it knocks the feet against one another; cob, a compact short-legged H.; coffin bone, the bone in the centre of the hoof; coronet, the bony fringe round the top of the hoof; dappled, coat sprinkled with rings or spots of a darker colour; docking, shortening the tail; dun, a dull dark brown generally with black extremities and a black line down the back; elbow, the bony projection just below the junction of a H.'s foreleg and body; fetlock, a lock of short hair hanging from the back of the fetlock joint—the junction of the pastern and the shank or cannon bone; flank, the part of the H.'s side between the ribs and the hip; fleabitten, small red or dark spots on a white or grey coat, also used of a H. with spots on a dark ground; forearm, the part of the fore-leg between the knee and the junction of the leg with the body; frog, the protuberance in the centre of the bottom of the H.'s foot; gaskin, the part

of a hind-leg between the hock and the junction of the leg with the body, grey, the colour composed by a mixture of black and white hairs, a measurement of height of four in, haunches, the fleshy part at the junction of body and hips hock, the backward bending joint on the hind leg, knee, the forward bending joint of the foreleg mark (*infundibulum*), the hollow upon the top of a young H's teeth which by gradually wearing down serves as an indication of age, pastern, the bone joining hoof and fetlock joint, piebald the colour which consists of patches of white and black, points, the extremities of the limbs, roan, a red or blue coat closely flecked with grey hairs, shoulder the upper part of the foreleg from its junction with the body to the shoulder joint, skewbald, the colour consisting of patches of any two colours except white and black, snip, a small patch of white upon the nose, sorrel the colour formed by yellowish or reddish brown hairs, splint bones small bones running from hock or knee to fetlock, star a square white patch upon the forehead, stifle the joint at the junction of the hind leg with the body, thigh the upper part of the hind leg, white stockings, the white colouring of one or more legs of a dark or brightly coloured H, withers the highest point of the back just behind the neck. See also ARAB, BARB, FARRIS, and HORSE RACING. See Sir W. H. Flower, *The Horse* 1891, W. H. Wanklyn, *The Australasian Racehorse* 1910, H. C. Hayes, *Veterinary Notes for Horse Owners* (first pub 1877), 1918.

**Horse-chestnut**, or *Aesculus Hippocastanum*, well known species of *Hippocastanaceae*, commonly grown in Britain as an ornamental tree. It was introduced to England early in the seventeenth century from N. Greece and Albania. It has large leaves divided into five or seven long distinct leaflets and the white flowers tinged with yellow or pink, are arranged in tall showy spikes. The fruit is a prickly capsule. It is not related to the sweet or sp. chestnut. See *CIFU*.

**Horse Guards**, name of a building in Whitehall, London, where the offices of the depts. under the command-in-chief of the army (a rank abolished in 1904) were situated. Also the name of a cavalry regiment (see next article). The Whitehall building was built in the eighteenth century, and though no longer the headquarters of the army it is still used for military purposes. At the rear, through an archway, is the Horseguards Parade, where the Trooping of the Colour takes place on the King's birthday.

**Horse Guards, Royal**. Raised in 1661 by the earl of Oxford. It wore blue clothing, hence its secondary title 'The Blues'. It fought at Sedgemoor, the Boyne and Dettingen. In 1812 two squadrons went to the Peninsula, and were present at Vittoria and the subsequent battles. At Waterloo two squadrons formed part of the famous Household Brigade. It served again in the 1882 Egyptian campaign, and during the Nile campaign was employed as 'Landwehr'. During the S. African war (1899-1902) it was at the Relief of Kimberley and at Paardeberg. During the First World War it served in France and Flanders from Mons to the Somme (1918). In the Second World War as part of the Household Cavalry, it served in Syria, as an armoured car unit in N. Africa and Italy, and in Europe as a reconnaissance unit of the Guards armoured div.

HORSE CHESTNUT

**Horse Latitudes**, belt of calm and light variable winds on the polar edges of the N.E. and S.E. Trades commonly applied to the ill-defined tropical belts of high barometric pressure which enclose the globe at 30° N. and S.

**Horse-mackerel**, popular name of *Scomber*, a genus of teleostean fishes belonging to the suborder Acanthopterygii and the family Scombridae. *Trachurus* the Brit. H. is common on our coasts where the young are often found in large colonies sheltering under medusae. They have a compressed oblong body covered with small scales.

**Horsemanship**, see *Riding*.

**Horse**, Master of the, officer of the Court who has charge of the royal stables and of all the horses of the king. His authority extends to all the people employed in the stables and he has the privilege of using the horses—the servants also being at his command. In state processions his place is next to the sovereign. The office, which dates from very early times, is tenable during the time that a particular political party is in power, and the M. of the H. is appointed by letters patent.

**Horsens**, seaport in the prov. of Aarhus, Denmark, situated 25 m. S.W. of Aarhus, on the fjord of H. Pop. 30,000.

**Horse-power**, unit used to denote the power of steam and other engines. James Watt was the man who worked out the value of 1 H.P. after experiments with strong dray horses. In consequence of the exceptional power of the animals employed, Watt's result is in excess of the amount of work an average horse can compass. It represents the amount of work done, or energy expended, when 33,000 lb. is raised 1 ft. in 1 min., and equals 746 watts. The Fr. cheval-vapeur is equal to 4500 kilogrammetres a min. (32,549 ft.-lbs.), or 736 watts, slightly less than the Eng. H.P. The nominal H.P. of an engine is a term which is quite arbitrary, and is rapidly falling into disuse. The formula for obtaining it is  $\frac{D \cdot \sqrt{S}}{15 \cdot 6}$  for high-pressure, and  $\frac{D \cdot \sqrt{S}}{47}$

for condensing engines, where D = the diameter of the piston in in., S = the length of the stroke in ft.

The indicated H.P. (I.H.P.) of a reciprocating engine is given by the formula  $\frac{2 A P R S}{33,000}$ , where A = the area of the

piston in sq. in., S = the length of the stroke in ft., P = the mean pressure on the piston in lb. per sq. in. (ascertained from the indicator), and R = the number of effective strokes per min., one for each revolution of the crank-shaft if the engine is single-acting, or two if double-acting. This formula will not apply in the case of steam turbines, as a statement of the I.H.P. supplies the measure of force acting on the cylinder of an engine, but before the power available for doing external work off the crank-shaft can be obtained, that required for driving the engine itself must be subtracted. The result, when this has been done, is known as the actual, effective, or brake H.P. (B.H.P.) of the engine. For high-class condensing engines 80 per cent. of the I.H.P., as shown by the dynamometer, or 85 per cent. for non-condensing engines, may be taken as the B.H.P., or a little more in each case if the turbines are very large. If the turbines are directly coupled to electrical generators, as is often the case on land, the H.P. can be deduced from the electrical output. Similarly, in an electric motor, if the electrical H.P. (E.H.P.), which is found by the formula  $\text{amps.} \times \text{volts} \div 10$ , and the efficiency of the motor is 86 per cent., 8.6 will be the B.H.P. of the motor. The power required to operate machinery can be exactly measured by connecting it to an electric motor, either as single units, or in groups driven from shafting. The H.P. of a boiler is an expression for the pressure and vol. of steam required to supply an engine of the same H.P. It is a question of the grate area and heating surface, or, in other words, the evaporative capacity to produce the required amount of steam. For convenience, boilers are often so classed, their H.P. under given conditions being stated by the manufacturers.

**Horse-racing**. The qualities of speed and endurance for which the horse has always been notable, irrespective of any conscious or artificial process of selection, would naturally suggest the inference that H. is a sport of some antiquity. Such is indeed the case, for classic writers record systematic H. at the Grecian Olympiads in 600 B.C., while G. Grote, *History of Greece*, 1846-56, speaks of races for one-year-old colts. A tolerably full historical account of turf matters up to the middle of the nineteenth century will be found in J. Whyte's *History of the British Turf*, 1810, from which it seems that the earliest mention of race-horses (or 'running horses,' as they were called) in Brit. national annals is not till the ninth century when Wm. of Malmesbury (q.v.) that Hugh Capet in soliciting the hand of Ethelwita, King Athelstan's sister, in marriage, sent over a present of Ger. 'running-horses.' It was not, however, till the reign of Henry II. that horse-races began to be frequent. They were generally held at Smithfield, which at that time was the prin. horse-mkt. of England. The first race of which a description exists took place, possibly at Newmarket, between animals owned by Richard II. and the earl of Arundel. But in the public favour tournaments and jousts held the first esteem, and by the Tudor period, H. had ceased to be a great public amusement. The sport revived under James I., at which time Garterly in Yorkshire, Croydon, and Enfield Chase were the customary places for the best races. It was not till about 1646 that races took place at Newmarket, although James I. built stables there near his palace. In Lincoln (on Lincoln Heath) ann racing began about 1680.

Generally speaking, it may be said that H. owes its position as pre-eminently the national pastime to the royal favour of the Stuart monarchy, especially Charles II. The earlier Hanoverian monarchs do not appear to have taken so kindly to the national sport; but if during that period H. was not the sport of kings, it certainly became that of the Princes of Wales. Prince George, afterwards George IV., owned race-horses in 1781. The memory of the late King Edward VII., especially when Prince of Wales, will long be cherished as a patron of H. Epsom, which from the fact of the 'Derby' being habitually run there, is probably the most popular racetrack in England, does not appear to have been the scene of H. till 1618 (see *Pope's Thru*). The Derby Stakes were inaugurated in 1780, but although that race continues to be regarded as the 'blue riband' of the turf, the number of entrants has at times compared unfavourably with that in other less classic races where the stakes have often been particularly much more valuable. The St. Leger sweepstakes were instituted by a Colonel St. Leger in 1776, who lived near Doncaster Tn. Moor. The 'Ladies Race' of the Oaks first took place in 1778. Ascent as a popular H. since can trace its hist. from 1711. But practically all the great

ann. steeplechases, like the Grand National, the Liverpool, and the Sandown Park Eclipse, began long after the estab. of the great classic flat-race meetings.

Some occasional steeplechasing across country is traceable, according to the Badminton Racing book, as far back as 1752, Ireland apparently being the home of its early popularity. The term 'steeplechasing' itself merely denotes the fact that some convenient goal like a neighbouring church steeple was selected as a point in the race for the horses to mark on in their cross-country run over

event. In 1808, as a result of the efforts of Lord Suffolk, Lord Coventry, the duke of Beaufort, and others in the interests of fair play, the Grand National Hunt Committee was formed as the authoritative governing body over steeplechasing, the Jockey Club refusing to assume control over disputes unconnected with flat-racing. The recognised rules and regulations of steeplechasing are to be found in Weatherby's *Steeplechase Calendar*.

The Jockey Club is the governing body over all matters appertaining to flat-racing. Its first existence is variously

*Fox Photos*

THE SCENE AT THE FINISH OF THE 1947 DERBY, WON BY 'PEARL DIVER'

ditches and hedges. (See also POINT TO POINT STEEPLCHASES.) Steeplechasing as a regulated sport is not recorded much earlier than about 1820, when plates were put up for prizes, and restrictions placed on the weights of the riders. The sport became increasingly popular some ten years later, when the first Liverpool steeplechase was run round a two-mile course near Aintree. For the first time the conditions of the race were so regulated as not only to secure for the spectators an uninterrupted view of the race, but to ensure fair play for all the competitors. After this, meetings were instituted at St. Albans, Aylesbury, and other places, but the contest originated at Liverpool, especially after the selling race became superseded by the Grand National which has continued down to the present day to be the prin. ann. steeplechasing

assigned to the years 1750 and 1758. The first express mention of it, according to Dey's book on H., occurs in R. Heber's *Racing Calendar* for 1758, in connection with a regulation passed in that year directing all riders to pass the scales when they came in, under pain of disqualification. This, however, would seem to indicate that the club had by that time got into full working order, and the tradition of 1750, as the year of its foundation, is further confirmed by the fact that in 1752 a room on the site of the present club buildings was erected and leased to the duke of Lancaster and the marquis of Hastings in trust for fifty years as the place for general meetings of the aristocracy of the racing world during the Newmarket meetings. (See also the Badminton Racing-book.) The Jockey Club promulgates the rules of racing and

amends them according to the dictates of the racing world; it also regularly appoints stewards, and defines their powers. The rules provide that the full programme of every meeting must be put in the *Racing Calendar*, with a statement of the names of two or more persons as stewards, and of the various other racing officials—the judge, clerk of the course, handicapper, stakeholder, clerk of the scales, and starter. The clerk of the course is solely responsible to the stewards for all general arrangements. The principal, at all events, most essential, function of the clerk of the course is to canvass, months before the meeting, for entries for the races.

Hurdle racing is also a popular form of race. In the early days of this kind of race the hurdles were customarily about 5 ft. in height and had very tightly in the ground, but the modern hurdle is not above 4 ft high, and is put so loosely in the ground that a horse failing to clear it may easily carry it along with him to his own great danger. The whole art of hurdle racing is to take the hurdles smoothly and easily without a perceptible pause either at making the spring or at landing.

The principal flat racing events in England, and the distances are (1 m.) The Derby Stakes (1 m. 4 furlongs), 2000 Guineas (1 m.), 1000 Guineas (1 m.), Oaks (1½ m.), Ascot Cup (2½ m.), St. Leger (1 m. 6 furlongs, 132 yds.), Lincolnshire Handicap (1 m.), Newmarket Stakes (1 m., 2 furlongs), Ascot Stakes (2½ m.), Royal Hunt Cup (7 furlongs, 166 yds.), Gold Vase, Ascot (2½ m.), Cesarewitch (2 m., 2 furlongs), Coronation Cup (1½ m.), Coventry Stakes (5 furlongs), Grand Prix de Paris (1 m. 7 furlongs), Nunthorpe Stakes (5 furlongs), Cheveley Park Stakes (6 furlongs), Cambridgeshire (9 furlongs or 1 m.), Dewhurst Stakes (7 furlongs), Champion Stakes (1 m. 2 furlongs), November Handicap (1½ m.), Middle Park Stakes (6 furlongs), Free Handicap (7 furlongs), Goodwood Cup (2 m., 5 furlongs).

The season for flat-racing in England is between March 21 and Nov. 22, or thereabouts. The rules provide for two races of 1 m. or upwards—not being selling races—for each day's racing, and that no race shall be run over a less distance than five furlongs. It is not often, however, that a two-mile course is run, though at Ascot the Gold Cup course is 2½ m., the Alexandra Stakes is 2 m. 6 furlongs 85 yds. while the Cesarewitch course is 2 m. 2 furlongs. The Derby course has been shortened 29 yds., owing to the rounding of Tattenham Corner, and is now 1 m. 4 furlongs exactly. The Derby and St. Leger are restricted to horses three years old, both fillies and colts being eligible, and except that fillies have a sex allowance of 3 lb., all the horses carry the same weight. The Oaks is for fillies only. 'Weight-for-age' races are open to horses of varying ages, horses of equal age carrying equal weights the younger less than the older. Horses of six years and upwards give weight, according to a prescribed scale, to younger competitors.

(A scale of Weights for Age will be found in *Ruff's Guide to the Turf*.) The scale is put under the sanction of the stewards of the Jockey Club as a guide to race-meeting managers, but is not intended to be imperative. The third kind of race is the handicap, which did not become a regular feature much before 1820. In handicaps the idea is to equalise the chances by apportioning to each horse the weight which, in the opinion of the official handicapper, will bring them together in a dead heat. The rules provide for the due pub of the conditions of any handicap and the date at which the entries close. The weights assigned are put in the *Racing Calendar*, and owners who do not agree with this handicap can cut their further loss by declining to accept—in other words, by becoming non-starters.

The controversy over the forward and backward seat for jumping has resulted in a marked preference for the backward seat for steeplechasing. The flat racing seat has also undergone changes. The rider usually rides with short leathers, hunched forward on the horse's neck, with his weight on knees and stirrup-lemons. With the old seat the jockey rode with longer leathers, standing in the stirrups. The American jockey, Tod Sloan, first introduced the new seat into England.

**Betting**—All contracts or agreements by way of gaming or wagering are null and void by the Gaming Act of 1845, and securities like cheques or bills of exchange given for money lost on wagers are void under an Act of 1711. (In the case of *Holfy Hamilton*, decided as late as 1898, it was held that it had always come under the wagers contemplated by the Act of 1711.) Contributions or subscriptions or agreements to subscribe or contribute towards any plate prize or sum of money to be awarded to the winner of any lawful sport (including, of course, H) are expressly excepted from the operation of the Gaming Act, 1845 (see also **BETTING, CONTRACTS, GAMING, and GAMBLING**). The business of bookmaking is only illegal if carried on in contravention of the Betting Act, 1853, which Act prohibits 'the keeping or using a house or other place' for betting purposes, and the whole question turns on the judicial construction of a place within the meaning of the Act. It has been held that a universal's enclosure is not such a place that word apparently being construed *quodam generis* with house, office, or room. Betting is permitted with a bookmaker who acts as an agent for his client, and with whom accounts are settled weekly. The tote, a mechanical betting machine, is now installed on many racecourses, and portable totes are also used.

Before the Second World War, H. was becoming more popular all over Europe and America. The Auteuil and Longchamp races of France were as notable as many Eng. race meetings, the chief races run there being the Derby, Oaks, and Grand Prix. In Germany many great meetings were annually held, and in Austria and Italy the sport was also developing. In Belgium there is a

Jockey Club with headquarters at Boisfort, while race-meetings were held at Antwerp, Ostend, Bruges, and Spa. H. was also making considerable strides in the E., particularly in India and Malaya. Foreign-owned horses are allowed to compete in Eng. races, but so far a similar privilege has not been extended to the horses of Eng. owners on some foreign courses. Eng. racehorses, however, are sought after by foreign buyers for breeding purposes. See *Ruff's Guide to the Turf*; H. S. J. Bourke, *Horse Training*, 1923; J. Hislop, *The Turf*, 1949.

**U.S.A.**—In what is now the U.S.A. H. in the beginning was largely confined to the S. states whose settlers were chiefly Brit., and brought with them the habits and traditions of the home country. When New York became a Brit. instead of a Dutch colony, H. was introduced there, and that state is still the locale of some of the best race-tracks in the country. Before the Civil war New Orleans was famous as a racing centre. Kentucky is pre-eminently the race-horse breeding state. The section near Lexington, known as the Bluegrass region, is filled with stud farms, and Kentucky horses are excelled by none. The best-known tracks are Belmont Park, Aqueduct, Empire City, and Jamaica near New York City, the one at Saratoga, New York, four near Baltimore, four near Chicago, Churchill Downs in Louisville, Kentucky, and Latonia in Kentucky, opposite Cincinnati. Most of the tracks in the U.S.A. differ from those in Great Britain, in that they are circular, and the turf has been removed, the roadway being made of dirt. In recent years the totalisator, known in the U.S.A. as the Parimutuel, has been installed in many race-tracks by state law, the state getting a percentage of the receipts, and bookmakers being barred.

**Horse-radish** (*Cochlearia Armoracia*), cultivated plant belonging to the natural order Cruciferae. The root has a strong pungent taste which closely resembles mustard, and is used either grated or made into a sauce, as a condiment with beef.

**Horse-shoeing**, see **FARRIER**.

**Horse-tails**, see **EQUUS TAIL**.

**Horsforth**, tn. situated in the W. Riding of Yorkshire, England, 5 m. to the N.W. of Leeds. It manufs. woollen goods. Pop. 12,200.

**Horsham**: (1) mkt. tn. in the co. of Sussex, England, lying 18 m. N.W. of Brighton, and about 36 m. S.S.W. of London. Among its buildings of interest are the old church, which has been restored, the grammar school, and corn exchange. The chief industries are tanning, brewing, iron-founding, and coach-building. Here also is situated Christ's Hospital, which was moved from London P. 21,000. (2) Tn. on the Wimmera R. approximately 200 m. N.W. of Melbourne, Australia, centre of the Wimmera dist., the largest wheat growing area of Victoria. The tn. has a very modern tn. hall (seating 1000), 7 churches, base hospital, and a High School, and State School. The chief industries are flour milling, agric. implement foundry, textile

machinery and ladies' clothing manuf. Other primary products associated with the tn. are wool, fruit, tomatoes. Pop. 6500.

**Horsley, John Calcott** (1817–1903), Eng. artist, b. at Brompton, London. In 1856 he was elected an R.A., and from 1862 to 1897 he was treasurer of the Academy. His best works are those dealing with everyday life. Among his works are 'Rent Day at Haddon Hall', 'Caught Napping', 'L'Allegro, il Penseroso', and 'The Healing Mercies of Christ'—the altar-piece in St. Thomas's Hospital chapel.

**Horsley, Samuel** (1733–1806), Eng. prelate, b. in London, and educated at Westminster School and Cambridge. In 1759 he became rector of Newington, a living which he held till 1793. He devoted a great part of his time, however, to a controversy with Dr. Priestley on the doctrine of the divinity of Christ. Among his other preferments may be mentioned that of bi-hop of St. David, in 1788, Rochester in 1793, and St. Asaphs in 1802. He ed. the works of Sir Isaac Newton (1785). See J. Priestley, *Tracts in Controversy with Horsley*, 1815; R. Hall, *Remarks on Horsley's Sermons*, 1819.

**Horsley, Sir Victor Alexander Haden** (1857–1916), Brit. surgeon and neurologist, b. at Kensington, London. He was prof. superintendent of Brown Institution 1881–90; secretary to the Royal Commission on Hydrophobia, 1885; surgeon to the National Hospital for Paralysis and Epilepsy, 1886; Fullerian prof. at the Royal Institution, 1891–93; president of the Pathological Section of the Brit. Medical Association, 1892–93; prof. of pathology, Univ. College, 1893–96. From 1906, he was Emeritus prof. of clinical surgery and consulting surgeon at Univ. College Hospital. One of the leaders of the medical crusade against alcoholism; and author, in collaboration with Dr. Mary Sturge, of *Alcohol and the Human Body* (1907). Among his other works are: *Experiments upon the Functions of the Cerebral Cortex* (1885), *Brain Surgery* (1887), *Hydrophobia and its Treatment* (1888). While serving as consultant with forces in Meopotamia he suffered heart-stroke, and died at Amara.

**Horst Wessel Lied**, rallying song of the Ger. National Socialist or Nazi Party, the words of which were written by a student, Horst Wessel, who was born in 1907 and was killed in 1930 in a Communist-quarter of Berlin where he lived and commanded a section of the *Abteilung* or Storm Troopers of the Nazis. No certain details exist of the precise manner of his death, but sev. persons suffered death, for their supposed implication in it, at the hands of the Gestapo. The song was sung to the tune of a music-hall song which was popular amongst the troops in 1914.

**Horta**, cap. of the is. of Fayal, belonging to the Azores group. It is situated on the S.E. coast of the is., and is also the cap. of the dist. of H. Pop. about 7000; dist., 52,700.

**Horten**, tn. situated on Oslo Fjord, Norway, about 30 m. S.W. of Oslo. It

is a naval port, and has an arsenal and an observatory. Pop. 10,000.

**Hortense Eugénie de Beauharnais** (1783-1837), queen of Holland, the daughter of the Empress Josephine by her first husband, was born in Paris. In 1802 she married Napoleon's brother, Louis Bonaparte, king of Holland. On the fall of Napoleon and his family in 1815, she fled to Switzerland. The youngest of her sons afterwards became Napoleon III. See T. A. Taylor, *Queen Hortense and her Friends*, 1907; Mlle. Cochelet, *Mémoires sur la reine Hortense et sa famille*, 1907; J. Hauoteau (ed.) *Mémoires de la reine Hortense publiés par le Prince Napoléon*, 1937.

**Hortensius, Quintus** (114-50 B.C.), surnamed Hortulus, was, after Cicero, the most famous of the Rom. orators. He was the son of Q. Lutatius Catulus, and so belonged to the aristocratic party. He supported Sulla in the civil wars, fought during two campaigns (90-89) in the Social war and became consul in 69 B.C. In 63 B.C. he came into conflict with Cicero and, on Pompey's return from the E. in 61 B.C. retired into private life. His speeches are not extant, but are described by Cicero as Asiatic and florid in style.

**Horthy de Nagybanya, Miklos**, Hungarian admiral and regent; b. 1868, of noble family at Föred in Szolnok comitat. Studied at naval academy, Fiume. Became A.D.C. to Emperor Franz Josef, and served in naval dept. of war ministry, Vienna. In the First World War, commanded cruiser *Norwa*—attacked Italy at Porto Corsini, San Giovanni di Medua, and Otranto. Severely wounded in last-mentioned engagement, May 14, 1917. When peace came, H. was placed in command of the navy of the dual monarchy: when that monarchy fell, he returned to Hungary; and, after the collapse of Bela Kun's Gov., he organized its anti-Bolshevik successor—entering Budapest, 1919 and assuming the title of 'Administrator of the Realm' (1920). In Feb. 1920 he was elected regent of Hungary by the national assembly. Twice in 1921 he used force against the ex-Empress Karl (Charles I.), who attempted to become king of Hungary. He rose to power as the safeguard of the Hapsburg Monarchy, but kept his position as protector of the interests of the big landowners. Described by Count Karolyi as the 'Hungarian Quisling,' he was the first to introduce fascist methods in Hungary and promoted a rapprochement with Italy. He supported wholeheartedly Ger. militarism, because Hungarian landlords always needed the help of Germany to carry on successfully a reactionary policy. As a reward for stabbing his ally Yugoslavia in the back in 1941 he secured parts of Transylvania, Slovakia and the Banat but soon found that he had forfeited Hungarian independence. His regency ended in 1944.

**Horticultural Colleges**, see **HORTICULTURE**.

**Horticultural Societies** were originated in order to advance the study and practice of horticult. What was probably the

first H. S. was estab. in Belgium in 1780. The *Royal Horticultural Society* of London was founded in 1804, and received a charter in 1809. The Society holds two shows yearly, one, the Spring Show, in the Royal Hospital Gardens, Chelsea, in May, and the Autumn Show in Sept. or Oct. The headquarters are at Vincent Square, S.W. 1 and the gardens are at Wisley, near Ripley, Surrey. Other important H. S. in the Brit. Isles are the *Birmingham Botanical and Horticultural Society*, founded 1829; the *North of England Horticultural Society*, the *Glasgow and West of Scotland Horticultural Society*, and the *Royal Horticultural Society of Ireland*, founded in Dublin in 1830. In the U.S.A. the *Horticultural Society of New York* was founded in 1900 and incorporated in 1902. Among many others there are the *Horticultural Society of Pennsylvania* and the *Massachusetts Horticultural Society* in Boston. In France there are H. S. in Paris, Le Havre, Lyons, and Marseilles. Other countries with horticult. or allied societies are Austria, Belgium, Bulgaria, Canada, Czechoslovakia, Denmark, Holland, India, Italy, Japan, Poland, Portugal, Sweden, Switzerland, and Russia. The first international horticult. congress was held at Brussels in 1864.

**Horticulture** (Lat. *hortus*, garden, and *cultura*, culture), is the scientific art of garden cultivation, and includes the growing of flowers, fruit, and vegetables. Almost every Eng. co. now provides special facilities for the study of H. and many offer co. council scholarships. The chief colleges which make a speciality of horticult. education are the Horticult. College, Swanley, Kent (founded 1889); Studley Agric. and Horticult. College for Women, Warwickshire; the Agric. and Horticult. College, Wellfield; and a School of Gardening for Women at Edinburgh. The Royal Horticult. Society holds ann. examinations in April. The univs. of Cambridge and Reading, and the colleges of W. and E. of Scotland possess depts. of agriculture and H. Courses in H. usually include outdoor gardening, the care of hot-houses and hotheds, and in many cases poultry raising. See **BOTANY**; **BIRDS**; **FISHS**; **FLORA**; **FLOWERS**; **FLOWER SHOWS**; **FRUIT**; **GARDEN ART**; **GARDENING**; **HERBS**; **HOUSEHOLD**; **LAWNS**; **PLANT HORMONES**; **PLANTS**; **SHRUBS**; **SOIL**; **TOPIARY**; **VEGETABLES**.

**Hortobágy Pusztai**, part of the Hungarian plain W. of Debreczen, with cattle-rearing industry. Area, 322 sq. m.

**Horton, Robert Forman** (1855-1933), Eng. Congregational minister, b. in London, and educated at Shrewsbury and New College, Oxford. In 1877 he was president of the Oxford Union, and in 1879 he became fellow of New College and lecturer on hist. In 1880 he was appointed pastor of the Lyndhurst Road church, Hampstead. In 1898 he was the chairman of the London Congregational Union, and in 1903 of the Congregational Union of England and Wales. His pub. include *Inspiration and the Bible* (1888), *The Book of Proverbs* (1891), *The Apostles*

*Creed* (1895), and *The Teaching of Jesus* (1895), *The Trinity* (1901) and *Pastoral Epistles* (1901), *The Holy Spirit* (1907), *The Early Church* (1908), *Great Issues* (1910).

Horton, Sir Max Kennedy (b. 1883), Brit. admiral. He entered the Royal Navy at the age of seventeen and served in submarines during the First World War, gaining the D.S.O. with two bars and the Legion of Honour. He was promoted to Captain in 1920 and commanded the 1st Submarine Flotilla, Atlantic Fleet, 1922-24. In 1926 he went to the Admiralty as Assistant Director, Mobilization, and in 1928 served for two years as Chief of Staff to the Commander-in-Chief, Portsmouth. In 1932 he was appointed Rear-Admiral, commanding

i.e. 'Hôr the child,' when he is represented as seated on a lotus-flower with his finger in his mouth, perhaps as a symbol of secrecy and silence. The name Hôr was also probably applied to lesser divinities, but to all forms the falcon was held sacred, and the name Hôr was the commonest title of the king in the earliest dynasties. The N. kingdom in particular was under the patronage of H.

Horus Apollo, see HORAPOLLO.

Horwich, tn. and urb. dist. in Lancashire, England, 6 m. W.N.W. of Bolton. It has extensive locomotive works, and stone is quarried in the neighbourhood; other industries are bleaching, cotton-spinning, and the manuf. of bricks and tiles. Pop. 14,900.

FIG. 1

FIG. 2

FIG. 3

2nd Battle Squadron (1933) and 1st Cruiser Squadron (1935); in 1936 Vice-Admiral, commanding Reserve Fleet (1937-39). At the beginning of the First World War he became Vice-Admiral, Submarines, and many early Brit. successes in the submarine warfare were due to his efforts. From 1912 until the end of the war he was Commander-in-Chief, Western Approaches, and was largely responsible for the success of the counter-offensive to the German U-boat campaign. H. retired at his own request in Nov. 1945. Orders conferred on him in the course of his long and successful naval career include C.B., 1934; K.C.B., 1939; G.O.B., 1945; Orders of St. George and St. Anne (Russia); Grand Cross of the Order of Orange Nassau (Netherlands); Commander of the Order of the Redeemer (Greece). He holds the silver medal for saving life on the occasion of the loss of the P. & O. steamship, *Delhi*, which ran aground off Cape Spartel Morocco, Nov. 13, 1911. In Jan. 1946 he was appointed Bath King of Arms of the Order of the Bath.

Hortus Stocus, see HERBARIUM.

Horus (Egyptian Hôr), in anct. Egyptian mythology, was the sun-god and equivalent to the Grk. 'Apollo.' He is sometimes identified with Harpokrates,

Hosanna, shout of praise and adoration used by the multitude at the triumphal entry of Jesus into Jerusalem (Matt. xxi. 9).

Hosea, first of the twelve minor prophets according to the Biblical order. Nothing is known of him beyond what is told us in the Book of II. From this we learn that he was a native of the N. kingdom of Israel, and that his father's name was Beeri. The period of his prophecies is given in the first verse: 'In the days of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah, and in the days of Jeroboam the son of Joash, king of Israel.' Since the last-named king d. during the life of Uzziah, those dates are not in full agreement. The prophecies fall into two parts: (1) Chapters 1-3, which tell the story of the prophet's marriage with Gomer the daughter of Diblaim, a profligate woman, and of the birth of his three children, to whom allegorical names are given (I. 4, 6, and 9). The application of this story is then made to the relations between Yahweh (Jehovah) and his people. (2) Chapters 4-14, wherein he denounces more fully the particular sins of unfaithfulness committed by the Israelites against Yahweh, such as their introduction of idolatrous ceremonies and their alliance with and trust in foreign nations. The

question as to whether the account of the prophet's marriage is truly biographical, or is merely introduced to give point to the later accusations has been much discussed. There seems to be no sufficient reason why it should not be biographical. There are some interpolations such as (1) those passages which extend the application of the prophecies to the S. kingdom of Judah (2) those which interrupt the denunciation to speak of a period of final happiness. See A. Simson, *Der Prophet Hosea*, 1851. W. R. Smith, *Twelve Minor Prophets*, 1876. and studies by S. J. Brown, 1932. L. J. Birns, 1932. G. C. Morgan, 1934. R. H. Wheeler, 1948. also works by W. Nowack, A. Sayce, and B. Duhm.

FIG. 4

Hoshangabad, tn. and dist. of India in the Verbudda div. of the Central Provs., on the l. b. of the R. Nerbudda, 40 m. S. S. E. of Bhopal. The chief industry of the tn. is brass working. Pop. 12,000. The prin. crops grown in the dist. are wheat, millet, and oil seeds. Area 4500 sq. m. Pop. 446,000.

**Hoshes**: (1) original name of Joshua (Nu. xii). (2) ruler of Ephraim under David (1 Ch. xxvii). (3) the last king of Samaria who slew Ickah son of Rimaliah. Assyrian inscriptions show that he was of the pro-Assyrian party in Israel and acted in concert with and as the puppet of Tiglath pileser III. But doubtless H. felt the Assyrian tribute burdensome and thereafter sought for greater independence by alliance with Sava king of Egypt. The non payment of his tribute brought Shalmaneser's forces against his cap. which was besieged for three years. Shalmaneser died and was succeeded by Sargon who conquered H. and took him prisoner (2 Kings xvii).

**Hoshiarpur**, cap. of a dist. of the same name in the Jullundur div. of the Punjab India, 62 m. N. of Amritsar. It has manufs. of cotton goods, inland wood work, and lacquer. Pop. 21,285. The dist. exports sugar, rice, and other grains, tobacco, and indigo. Area 2241 sq. m. Pop. 930,000.

**Hosiery** In its limited sense refers to the manu. of stockings (hose) but the term is used to designate all textile fabrics which are manufactured on the looped web principle and knitted goods, whether made by hand or machinery.

**Hand knitting** requires very few and simple implements, consisting of two or more straight needles. On to these an indefinite number of loops are cast, made of one continuous thread of yarn which is passed through the previously made loops to make fresh series, and left hanging free. The needles may be of steel, bone, wood or plastic and of any length or thickness. If only two are used the fabric will have a selvedge on both sides. If three or more are employed a circular web will be formed. See further under KNITTING.

**Frame work knitting**, was introduced by the Rev. W. Lee when he invented the stocking frame in 1589. This frame differed from the principles of hand knitting in having a separate needle for each loop instead of casting all the loops on to one needle. Each needle consists of a shank with a spring pointed hook which can be pressed into a socket in the shank. The following diagrams are to show the formation of the knitted loop with this type of needle. All other machine parts have been omitted to give a clear view of the stitches and needle. Fig. 1 shows the new row of loops being formed whilst the fabric is held lower down the needle. In Fig. 2 the needles have been lowered to allow the loop into the hook of the needle. The hook has been closed and is still descending into the loop of the previous row of stitches. Fig. 3 shows the old loops rising above the needles and descending on the new loops which are still held in the hook of the needle. Fig. 4 shows the needles rising to their original position with the new row of loops sliding down the shank of the needle.

The first fabric made by Lee was a flat piece with selvedge on both sides from which the garment had to be cut to shape and sewn up but he soon learned to fashion by transferring loops at the edges, inwards to narrow and outwards to widen. In Lee's machine the thread had to be placed over the needle by hand and it was not until 1857 that Luke Barton invented the first successful machine fitted with self acting mechanism for fashioning known as the straight bar rotary frame.

**Barp knitting** varies from frame work knitting in having a separate thread for each needle instead of the same thread for the whole row. By the invention of the Dawson wheel (1791) the threads can be laid in any direction and thus give greater scope for variety of design in pattern and colour which make this form of knitting specially suitable for household fabrics.

**Circular knitting** was made possible by a machine patented by Sir Marc I. Brunel in 1816, which he called the tricoteur. This produced a tubular web but did not come much into use till improved upon by Peter Claussen of Brussels in 1844. The pro-

duction of the latch needle by Townsend in 1838 helped the production of cheaper circular fabrics. The seamless stocking (as made on the circular machine) is woven in strong formation i.e. in endless succession whereas on a fashioned knitting-machine each hose is made and cast off.

*His work* was the first variation of the plain fabric produced in Lees's machine, and was produced by an invention of Jedediah Strutt in 1758, by which a second set of needles, placed at right angles to the first, drew their loops to one side, while the first set of needles drew theirs to the other side of the frame. Lee's frame had only sixteen needles for 3 in. whereas modern machines have as many as 120 needles for 3 in. Some of the most modern knitting frames work at a great speed. One with thirty draws of 476 needles each has in all 11,240 needles, each of these form loops at the rate of 80 in a minute so that 1,142,400 loops can be formed in a minute (the speed of an expert hand knitter is 100 loops per minute).

The materials used in hosiery are cotton, wool, silk and many varying mixes such as Rayon and Nylon. In the trade term 'stocking' is obsolete and 'sock' is used only for children's H. Men's socks are called *half-hose* and line length H is known as *three-quarter hose*. The two chief methods of making are *seamless* and *fully fashioned*. See J. Chamberlain *Learnings and Patterns* 1932. Miss Hosmer Mills, U.S.A., *The Stocking Machine*, 1931. A.W. Eley *Stocking*, S. L. C. *Textile Industry*, 1936.

**Hosmer, Harriet** (1830-1908), American sculptor, native of Watertown, Massachusetts, U.S.A. She studied under Gibson in Rome. Her animated and original statue of 'Puck' was a great success. Her other best works are Zenobia in chains, 'Beatrice Cenci', 'A Sleeping Faun', and 'A Waking Faun'. Certain technical processes of the art of sculpture are of her invention.

**Hospice** (Lat. *hospitium*, 'entertainment') name given to the homes of rest provided as a shelter for travellers passing over the Alps by the various monastic orders. The most famous Hs are those on the Great St Bernard tunnel 1962, on the St Gotthard dating from the thirteenth century, on the Mt Cenis, the Simplon and the Little St Bernard.

**Hospitalist**, com. in Barcelona, Spain, 1st m S.W. of the town of Barcelona. Pop. 6900.

**Hospital Fund, King Edward's**, founded in 1897 by King Edward VII when he was Prince of Wales, to commemorate the sixtieth anniversary of his mother's reign. Its object is to secure adequate support of the hospitals and convalescent homes of London. Each individual claim is considered on its merits. The total distribution in the first year was just over £50,000, and is now nearly £100,000. In 1947 the grants to hospitals and convalescent homes was £306,250, funds in hand (including gifts to cash) being £6,500,000. With the disappearance of the distinction between voluntary and

publicly provided hospitals under the provisions of the National Health Service Act, 1948 the fund, consistently with the powers conferred by its Act of Parliament of 1907, may be used for the 'support, benefit or extension of the hospitals of London.' All such things as come within the scope of the above provision and such as are incidental or conducive to it will come alike within the scope of the fund (Lord Catto). The President of the fund is H.R.H. the Duke of Gloucester.

**Hospitaliers Knights** (OF *hospitaliter*, Lat. *hospitarius*, from *hospes*, a guest), name applied to charitable brotherhoods founded at different periods, and in different countries, for the care of the sick in hospitals. The knights of St John of Jerusalem were a religious brotherhood under whose auspices had been founded a church in Jerusalem. They had their origin in Palestine in the eleventh century, then began to come to the Christian pilgrims visiting the Holy Sepulchre under their care and protection. Their military organisation was perfected in the twelfth century when they successfully defended Jerusalem after the taking of Jerusalem by the Muslims. In the fourteenth century the captured and occupied the island of Rhodes and continued to hold it till 1522 when it was seized by the Turks. After this their influence materially declined. In 1570 they found a shelter in Malta and transferred the gov. of that island to it. It was captured by Napoleon in 1800. On account of their wealth and power they were envied by most of the sovereigns of Europe and in 1806 Henry VIII confiscated their property in England. The vow of devotion to self to the work of a hospitalier was generally added to the ordinary vows of poverty, chastity and obedience commanded by Saint Augustine. The mark of the order was a black robe and cowl, with the cross of eight points on the left breast, consisting of four barbed arrowheads meeting at their points, the well known Maltese cross. In modern times this has been slightly altered and modified in the many institutes or congregations under various names and various rules. At different periods this order has been termed Knights of Rhodes and Knights of Malta. In 1818 the headquarters were fixed at Rome and governed by a council under a grand master. The Hospitaliers owned many strong castles in Syria, like those contemporaries the Templars, and on the oppression of the latter in 1312 the pope transferred most of their possessions to the Hospitaliers. Besides the Knights of St John of Jerusalem there have been twelve or more monastic congregations whose main business was popularly termed Hospitaliers. The two modern associations ascribing their origin to this order are the Brandenburg 'Johanniter-orden' and the Eng. order of the Knights of St John. The former was reorganised in 1853 and the latter in 1827. This society has its headquarters in Clerkenwell, London, and founded the street ambulance system and originated the

**Red Cross Society** It is a purely philanthropic institution, distributing charity to convalescents, etc. See J. Vertot, *Histoire des chevaliers hospitaliers de St. Jean de Jerusalem*, 1726, F. Woodhouse, *Military Religious Orders of the Middle Ages* 1879, J. Delaville de Roulx, *Les Archives, la bibliothèque et le trésor de l'ordre de St. Jean de Malte*, 1883 and *Hospitaliers* 1901, W. Bedford *Malta and the Knights Hospitaliers*, 1891 R. Kelp *Cohen Knights of Malta* 1923 1798 1920 1 1 King *Knights Hospitallers in the Holy Land* 1331

and surgery. Particular classes of patients or patients suffering from infectious disease, such as fever or smallpox, or from diseases of a particular organ, such as eye ear nose and throat, or from maladies like cancer are treated in special H. The following is a list of the main classes of H with examples from London, and elsewhere when stated.

1. **GENERAL HOSPITALS**—(a) *Teaching* St. Bartholomew's H. (founded 1123), St. Thomas's H. (1200) Westminster H. (1711) Guy's H. (1724) St. George's H. (1 3) London Hospital (1710) Charing

AN LECTURE IN PROGRESS IN A HOSPITAL

Ex Lib.

**Hospitals** are institutions for the temporary reception of the sick. The word H. is derived from the Lat. adjective *hospitalis* which belongs to the noun *hospes* (genitive *hospitis*) meaning host or guest. Hotels and hostels have a similar derivation, but like H. these terms have become limited and specialised in their application.

**Classification**—H. are teaching or non-teaching according to whether or not they have attached to them medical schools where students receive technical instruction by properly qualified lecturers and demonstrators. According to another classification they are divided into general and special H. A general H., as its name implies, is designed to treat all kinds of patients and should therefore be equipped with every appliance, both for medicine

and surgery. Particular classes of patients or patients suffering from infectious disease, such as fever or smallpox, or from diseases of a particular organ, such as eye ear nose and throat, or from maladies like cancer are treated in special H. The following is a list of the main classes of H with examples from London, and elsewhere when stated.

1. **SPECIAL HOSPITALS**—(a) *For special classes of persons* (a) *Children's hospitals* H. for Sick Children (Great Ormond St.) (1852), Victoria H. for Children (1866), Alexandra H. for Children with Hip Disease (1867). (b) *Hospitals for women and children* Royal Waterloo H. for Children and Women (1816). (c) *Maternity and lying-in hospitals* City of London Lying-in H. (1750), Queen Charlotte's Lying-in H. (1752). (d) *Hospitals for foreigners* German H. (1845) French H. (1867). 2. *For infectious diseases* (a) *Hospitals*

for fever and diphtheria: London Fever H. (1801), Gore Farm H., Kent (1890). (b) *Small-pox hospitals*: Joyce Green H., Kent (1903). (c) *Hospitals for consumption and diseases of the chest*: Brompton H. (1841), Mount Vernon H. (1860), Royal National H., Isle of Wight (1867). 3. *For diseases of particular organs*: (a) *Dental Hospitals*: Royal Dental H. of London (1858), National Dental H. (b) *Ophthalmic hospitals*: Royal London Ophthalmic H. ('Moordfields') (1801). (c) *Throat, Nose, and Ear Hospitals*: H. for Diseases of the Throat, Ear, and Nose (1863). (d) *Rectum*: St. Mark's H. (1835). 4. *For special maladies*: (a) *Cancer*: Cancer H. (Knee), (1851). (b) *Paralysis and epilepsy*: National H. for the Paralysed and Epileptic (Albany Memorial) (1859). (c) *Skin diseases*: St. John's H. (1863). (d) *Deformities*: Royal National Orthopaedic H. (1839). (e) *Incurables*: Royal H. for Incurables, Putney (1854). (Many great London and provincial Hs. were seriously damaged by Ger. air-raids in 1910-44. See further under LONDON, etc.)

**Administration.**—In the Brit. Isles many Hs. were, until the National Health Act came into force in 1918, largely supported by voluntary contributions, whilst on the Continent and in the United States these institutions are, for the most part, supported and controlled by municipalities. The rate-supported H. in England formerly almost confined to fever and smallpox Hs., a few ambulance stations, and some homes for sick and convalescent children both in the country and at the seaside were augmented in 1927 by the inclusion of the Poor Law Infirmaries ('workhouse' Hs.).

Sir Wm. Fergusson's Commission on Hospital Abuse (1871) made the following recommendations which are here quoted as indicating deficiencies previously existing in our H. system: (1) to improve the administration of poor-law medical relief; (2) to give the poor-law authorities control of all free dispensaries; (3) to check the unrestricted system of free relief; and (4) to pay the medical staff. It is well estab. that a considerable number of people who were able to pay availed themselves of free treatment, which was only intended for the poor, and pay wards are now attached to all large Hs., the patients admitted to them giving fees according to their social status. Since 1909 almoners have been appointed in certain Hs. to decide whether or not applicants for medical assistance are in a position to contribute towards its expense. Since 1948 this work has become unnecessary, since H. treatment is now available to all under the National Health Act, but H. almoners still have important social work to perform.

The rapid growth in the number of Hs. in recent years has emphasised many problems both of finance and administration, and in order to meet them the following recommendations were made by the Medical Consultative Council in 1920 and pub. in their report. They originated with a scheme of combined medical ser-

vices systematised to serve a given area, and are remarkable in the great advance shown as to the place of H. service in the state. The scheme was discussed in 1927 by the Brit. H. Association.

1. **Domiciliary**, including curative and preventive treatment. Staff: doctors, pharmacists, nurses, midwives, health visitors, and other officers of the Health authority.

2. **Primary Health Centres**, including medical, surgical and maternity beds, out-patient clinics, dental clinics, accommodation for equipment needed for treatment and investigation, accommodation for the work of communal services, ambulance service. Staff: general practitioners, visiting consultants and specialists, officers engaged in communal services, visiting dental surgeons, workers in ancillary services.

3. **Secondary Health Centres**, including facilities in curative services in cases requiring highly specialised diagnosis or treatment. Staff: consultants and specialists, officers of communal services, dental surgeons, workers in ancillary services.

4. **Supplementary services**, including facilities for specialised treatment of such conditions as tuberculosis, mental disease, etc. Staff: appropriate specialists and workers in ancillary services.

5. **Teaching H.** and medical schools for cases of unusual difficulty; including facilities for research and post-graduate study. Staff: consultants, teaching and research staff, workers in ancillary services.

6. **Research**: clinical records. 7. **Administration**: The estab. of a single Health authority to supervise local administration whether curative or preventive. Representation of the medical profession on each authority and the estab. of Local Medical Advisory Boards.

A further step forward was indicated by Mr. Neville Chamberlain as Minister of Health in 1927 whereby by special legislation Poor Law Hs. were to be transferred to the municipal authority. This measure had the very important results of removing the stigma of penury from Poor Law patients and allowing all classes to become eligible for institutional benefit.

The prohibitive charges of most private Nursing Homes have led some Hs. to conduct depts. for private patients with fees which are within the means of the middle and lower middle classes.

Besides the pressing need for co-ordination of H. services the financial position recently became increasingly urgent. It was evident that the voluntary system was inadequate to supply the necessary income and many of the voluntary Hs. functioned with restricted accommodation as a result. Local authorities have from time to time given donations and subscriptions under the authority of the Act of 1887, but under the Public Health Act of 1925 they were authorised to give such aid to the extent of a penny rate, while the Hs. themselves have had recourse to charging fees for treatment according to the means of the patient. Such fees, however, could not be legally

claimed and many patients were therefore asked to guarantee payment of costs before admittance, a procedure which was contrary to the object for which the H. operated.

**Voluntary Hospitals under the National Health Service Act, 1946.**—This Act introduces drastic changes in the system of voluntary H., for in effect it nationalises the existing H. and such future H. as may be required. The Act imposes on the minister of health the duty to provide throughout the United Kingdom such H. and specialist and nursing services as may meet all reasonable requirements. The former honorary staff are paid for their services. Special accommodation may be provided for private patients who undertake to pay the prescribed charges, which are designed to cover the whole cost of the accommodation and services provided for the patient at the H., including an appropriate amount in respect of overhead expenses, and the minister is empowered to sue for the amount. Included in the H. and consultant services are all forms of general and specialist H. care and treatment, both in patient and out-patient. Specialist opinions and treatment of all kinds are to be made available at H. (as well of course at clinics, institutions, health centres, etc.). For this national service the minister of health will take over both voluntary and public H. Supplementary services, such as midwifery, maternity and child welfare will be provided through the local authorities. In introducing this Bill, the minister of health, Mr. Aneurin Bevan, admitted that the voluntary H. had done valuable work, but he believed that 'it was repugnant to a civilised community for Hospitals to have to rely on private charity.' The gov. rejected the idea that local authorities should take over the H. and considered that the only thing to do was to create an entirely new H. service, to take over voluntary H. and local gov. H. and to organise them as a single H. service throughout the country, with the nation itself carrying the expenditure. In the early years, the gov. estimated the cost at £152,000,000, the net ann. additional exchequer expenditure being placed at £95,000,000, after allowing for a contribution of £32,000,000 from the National Insurance Fund. Regional Boards to administer the H. and specialist services will be set up in about a score of regions, each large H. or related group of H. having a management committee. Except in the case of voluntary teaching H., endowments will pass to a new fund called 'the Hospital Endowments Fund,' which the minister of health will administer, the cap. value of the fund being apportioned among the regional boards and the income from each portion passing to the board.

The Act provides that where any voluntary H. is designated as a teaching H. or is one of a group so designated, all the H. endowments will be transferred to a Board of Governors constituted in the manner provided in the Act. Endowments given after the passing of the Act (Nov. 6, 1946) but before the appointed

day, upon trusts which provide for the application of the property for some specific object distinct from the general purposes of the H. and for administration as a distinct cap. fund, will not be transferred to the H. Endowments Fund but to the H. Management Committee constituted under the provisions of the Act for the H. or group of H. in which it is comprised.

**Architecture.**—A H., viewed as a number of wards, each containing so many beds, with kitchens and other offices within easy reach of wards, is a simple building in conception, and there has been only one really important change of plan in ward erection during the last 200 years. The old method provided windows on one side of the ward only, and is well illustrated by the older blocks of the two London H., Guy's and St. Bartholomew's. In each there is a central entrance and staircase and two long wards on each side, making four in all, on each floor. Thus, each ward is lit by a single row of windows, down its length, and possibly by one or two windows at the end. In the new method in order to get the most light and air, each ward has windows on both sides. The architectural problems of the H. are by no means limited to the building of the wards, and in particular, the H. in a large city should be connected with a univ. or have a medical school attached to it, so that it may take advantage of modern scientific treatment and research. A H. in this case (to borrow the claim of one great institution) is a 'city within a city.' Its day is 24 hrs., it is a bread bakery, a power plant for the manufacture of current, a laundry, a college with lecture theatres, a laboratory for scientific research, a warehouse that stocks cotton wool by the ton, a museum and a gymnasium. It has three great depts.: Medical, Surgical and Out Patients, and has many rooms and wards for X-ray treatment and X-ray research work. Many of these depts. develop as the hospital grows, but in America during the last fifty years the generosity of wealthy philanthropists has sometimes enabled the bold schemes to be carried out as a whole, though the speed with which medical science advances rarely leaves such work unaltered. The new addition to a H. in any great country is probably the best of its kind yet built. The new blocks recently built at St. Bartholomew's in London, for example, as far as human skill makes it possible, combine the advantages of all previous architectural experience. This may be exemplified in the treatment of surgical cases: when new hygienic rules revolutionised the old operation rooms the operation theatre was usually built in any convenient corner as a separate three-room erection and was frequently far from some of the wards, thereby involving for the patient a journey through the open air, but the modern operation suite is planned as part of the surgical block, near the wards and is duplicated (or multiplied) on each floor. This modern unit has no fewer than nine parts, including instrument room, dressing rooms,

sterilising room, operating theatre and anaesthetising room, where, in agreeable surroundings, the feelings of the patient need not be harrowed by the sight of any surgical apparatus before the administration of the anaesthetic.

*History*—It is no exaggeration to say that until the eighteenth century the sick could only be cared for at home or at least in private houses. As late as 1710 St. Thomas's and St. Bartholomew's H. were the only asylums for the sick in London, and in the provinces such institutions

a century ago (Liston amputated a leg under ether at University College H. in 1818). Secondly Lister's introduction of antiseptic methods at Glasgow Royal Infirmary in 1865 paving the way for modern asepsis, thirdly the improvement in the standard of nursing as a result of Florence Nightingale's pioneer efforts at Scutari in the Crimea and later in her nursing school at St. Thomas' H. in London.

It is a mistaken belief that H. were primarily Christian institutions. Egyptian

THE PUBLIC HOSPITAL, GREEN LANE, AUCKLAND, NEW ZEALAND  
This is a fine specimen of the modern architectural conception of a hospital.

were unheard of. But since that day, and especially in the last century, rapid strides have been made, especially in England and Germany, and the H. is regarded as an indispensable factor in all the work of any size, whilst cottage H. are springing up all over the country. Popular education and the realisation of the importance of observing the laws of health wherever people congregate together are responsible for this extraordinary advance. The truth is that the welfare of the community depends on the isolation of the sick is more appreciated every year, and an attempt is made to stamp out tuberculosis by confinement of the infected in sanatoria, the expectation being that in time this scourge will lose its virulence as surely as plague, smallpox, and typhoid fever have already done. These events are of outstanding importance in the history of H. Firstly the discovery of anaesthetics

invalids slept in the shadow of their temples or Saturn 4000 B.C. in the hope that the god would make them well. The temple of Esculapius at Cos was frequented by Greek sufferers and to turn to the E., it is known that the Indian emperor, Asoka, founded a H. at Surat (c. 260 B.C.) and that Haroun al Raschid (d. A.D. 809) built many asylums at Bagdad.

*In U.S.A.*—The H. development in the U.S.A. is probably not only the most extensive of any country in the world, but on the whole, the finest. To begin with, unlike the case of most of the H. which serve the people of London, those in the larger sized towns and cities of the U.S.A. have not for so long depended upon voluntary gifts. Each municipality and many of the counties maintain their own H., whose budget comes from the taxes imposed upon the public. There is thus

ensured to the H. a steady and regular income and the ability to hire a regular trained staff of physicians and nurses and attendants. It is estimated that about 50 per cent of the cos in the U.S.A. have their own H. An even larger percentage of the bigger tns have one or more public H. About 50 per cent of the H in the world are in the U.S.A. The whole tendency in the U.S.A. is away from the old gloomy quarters suggesting disease and death. The smaller tns. have often built H in the pretty colonial style of architecture, and surrounded by parks or gardens to take the patients as much as possible away from the city noises. In the big cities, the tendency is to erect skyscraper H. Thus the Jefferson H. in Philadelphia is seventeen stories high. In Chicago St Luke is nineteen stories high. But probably the biggest H group in the world is that of New York City. It extends from Riverside Drive to Broadway and from 14th Street to 168th Street, the total site covering 22 acres. Here are the Presbyterian H., the College of Physicians and Surgeons of Columbia Univ., the Sloan H. for Women, the New York State Psychiatric Institute and H., the Babies H., the Squire Loring Institute, the Presbyterian H. School of Nursing, the Neurological H. and H., the Markness Patients Pavilion, the School of Oral and Dental Surgery, the Vanderbilt Clinic and the Linnet Institute of Public Health. Somewhere in this vast H. colony with its 1671 beds nearly all the ills to which the flesh and the mind are heir to can be treated. Many of the buildings are sky scrapers, one towering to twenty two stories. Throughout the U.S.A. all the newer H. are being built absolutely fit proof. See Sir H. Bennett, *Hospitals and a History of the World*, 1833. R. W. Chambers, *Hospitals and the State*, 1927. Lummington, *English Public Health Administration*, 1929. A. G. L. Lyes, *English Hospitals*, 1918. A. C. Bachmeyer and G. H. Minin, *The Hospital in Modern Society*, 1913.

**Hospodar** (Russian *Gospodar*) Slavonic term meaning lord or master, the title which is specially applied to the head of a family or the master of a house. It was a title of the ruler of Wallachia and Moldavia from the thirteenth century to 1866, when Rumania became independent. The title was also used by the grand dukes of Lithuania and the kings of Poland down to John Sobieski.

**Host** (Lat. *hostis*, a victim) sacrifice of Christ's body and blood in the Holy Eucharist applied more particularly to the consecrated wafer used in the service of the Mass in the Roman Catholic Church, when it is regarded as an expiatory sacrifice. It is a thin, unleavened, flat wafer of circular form with certain mystic signs impressed upon it, such as the Crucifixion or the Lamb, when used in the Anglican Church it is usually quite plain. In the Rom. Church the H., after being consecrated, is believed to be no longer bread but the real body of Christ, as the wine is His blood (see TRANSUBSTANTIATION). The celebrant breaks the H. into two

pieces, one of which is again broken over the chalice. In the Gk. Church the H. is dipped in the wine before being handed to the communicant. The ceremony of the 'Elevation of the Host' dates from the twelfth century.

**Hoste**, Sir William (1780-1828), Eng. naval officer, b. at Ingoldisthorpe, Norfolk. He saw service in all parts of the Mediterranean, and in 1811 he defeated Dubourdieu in a night off Idesa, and ultimately took Cattaro and Ragusa. He was a brilliant commander, and was a favourite of Nelson. See Lady Harriet Hoste, *Memoirs and Letters of Sir W. Hoste*, 1833.

**Hotchkiss Gun**, gun introduced into use in the Brit. Army during the first World War. It was for some years used by cavalry, park artillery and tanks, being shaped for carrying in a 'bucket.' The gun is fed by a continuous metallic strip, and the method of locking the breech is peculiar to this type of gun, embodying, as it does, the 'interrupted thread' principle. Loading is effected by the use of a thick barrel with few but large, radiating rings. The weight of the H. G. is 11 lb., or without mounting, 27 lb. It automatically fires 400 rounds a min. and is made in light and heavy forms. It was named after its Amer. inventor, Benjamin Hotchkiss (1826-83), an employee in a gun factory during the Amer. Civil War.

**Hotchpot.** The object of the H. clause, which is inserted by conveyancers in all marriage settlements, is to ensure that none of the younger children of the marriage who have been advanced a sum out of the portions' fund during their father's lifetime shall be able to claim a further share at his death in the sum remaining for his share among all the younger children without first bringing into account the sum or sums advanced. Power is usually expressly given in the settlement to the tenant for life under the 'settled Land Act' to declare on making an advance, or appointment, as it is termed, that the share appointed shall not be brought into H. which power is of use where it is the will of the tenant for life to divide the fund equally subject to a first charge in favour of a particular child. Where a share of an estate is by the terms of a will to be divided between the children of the testator and a stranger, advancements do not have to be brought into H. so as to benefit the stranger.

**Hotel** (F. *hôte*, O. I. *hostel*, Lat. *hospitale*) superior kind of inn. It provides lodging and refreshment for travellers generally, and may be set up without a licence, unless the proprietor sells excisable liquors, in that case a licence must be sought. An innkeeper is bound to provide for any one who applies to him, and may not refuse either lodging or refreshment, unless the applicant is tainted by disease or drunk, but, on the other hand, a traveller cannot select what rooms he chooses, and if he will not accept the accommodation offered him, the proprietor need not oblige him at all. Then, again, a proprietor can retain any of the property of his guest if he fails to pay his account

But the innkeeper is liable for the loss of his visitors' property within the H. to the value of £30, unless it can be proved that his guest was at fault. The word H. has different meanings. In France it originally meant the mansion of a distinguished person, then the residence of a maire, and later a place where people were lodged and fed at a fixed price. The modern Fr. word is still used for the house of a rich man, or for a public building, e.g. Hôtel de Ville is the town hall, and Hôtel de Dieu is the name given to the prin. hospital in any Fr. town, the Hôtel des Invalides in Paris is

tributed largely to raising the standard of Hs. by allowing its enamel sign to be displayed outside those of which it fully approves, and also by inserting the names of such Hs. in the ann. A.A. Handbook. The Brit. Hs. and Restaurants Association, 11 Southampton Row, W.C. 1 publishes annually to its members who number over 4000 an official Guide to the establishments. The A.A. also affixes its sign to many Hs. on the Continent, where progress in baths and sanitation have been made in late years, especially in Th. Hs., where up to date sanitary appliances were

John S. Lee

#### THE BRITISH RAILWAYS HOTEL AT MILL AMBLY, LANCASHIRE

The hotel is constructed of a light ring white concrete polished like marble and relieved by the blue tones in the architraves of the windows. There is blue green glazing on the undersides of the projecting ledges, the hoods of the balconies and the ceilings of the passages. The architect Oliver Hill designed also the interior decoration fittings and furniture thus ensuring a continuity of theme through it.

a famous military hospital and soldiers' home, founded in 1670, which contains the tomb of Napoleon. The modern H. dates from the formation of railways and is a palatial dwelling in comparison with the old-fashioned inn. The modern Hs. contain telegraph, post, and telephone offices, as well as reception, reading, smoking, and writing rooms, drawing rooms, lounges, comfortable bedrooms, and sitting rooms. Somewhat restrictive conditions still impede the development of Hs. in Great Britain, though their importance as earners of foreign exchange, through overseas tourists, is becoming increasingly recognised by the gov. and the country in general. With this in mind, everything possible is being done by managements to maintain and improve their standards of comfort and service. In America a fixed charge used to be made for board and lodging, but now as in Europe H. proprietors generally make a charge for the accommodation and an additional one for each meal taken in the H. The Automobile Association has con-

tributed largely to raising the standard of Hs. by allowing its enamel sign to be displayed outside those of which it fully approves, and also by inserting the names of such Hs. in the ann. A.A. Handbook. The Brit. Hs. and Restaurants Association, 11 Southampton Row, W.C. 1 publishes annually to its members who number over 4000 an official Guide to the establishments. The A.A. also affixes its sign to many Hs. on the Continent, where progress in baths and sanitation have been made in late years, especially in Th. Hs., where up to date sanitary appliances were

imported from England after the First World War. In general Swiss, Dutch, German, Scandinavian and most Brit. Hs. can be relied upon for scrupulous cleanliness. In London the once famous H. Cecil in the Strand which used to be a rendezvous of nobility and of wealthy Americans was dismantled to make room for new offices, a consequence, possibly, of the gradual concentration of social life in the West End. The Savoy H. still continues to entertain a distinguished clientele. In April 1931 the palatial Dorchester H. was opened in Park Lane under the management of Sir Francis Towle. The Berkeley H. in Piccadilly London modernised in 1930 makes a feature of being completely noise proof and air conditioned. The Queen's H., Leeds completed in 1931, has a completely regulated ventilating system, claiming to be noise proof. In America the Fifth Avenue H. of New York, built in 1853 was famed as a resort for eminent European visitors, but magnificent new Hs. have now been built in the leading streets of New York. Many of them are

of sky-scraper size, the New Yorker being forty-four stories high. Its development has proceeded at a great pace throughout the U.S.A., there being no important city which does not now possess one or more vast houses ten or more stories in height. In the latest and finest the custom is for each bedroom to have its own bath-room. See R. B. Ludy, *Historic Hotels of the World*, 1927.

**Hotham**, William, first Lord (1736-1813), Eng. naval officer. He entered the navy in 1718, in 1751 sailed to N. America, and ultimately served in the W. Indies. He took part in the defence of Sandy Hook and Rhode Is. under Lord Howe. His actions against the Fr. off Genoa and off Livorno (1795) were adversely criticised by Nelson in his letters.

**Hotham**, Mount (alt. 6100 ft.), one of the highest peaks in the Barry range, Victoria, S. Australia, about 135 m. E.N.E. of Melbourne.

**Hothouse** describes a glazed and heated structure used in horticulture for growing plants out of season or in colder climates by allowing close control of temp., ventilation and light to be exercised. Glazing extends to roof and all sides, and may be, with equal efficiency, of clear or semi-obscured hortic. glass. If a tenant's structure, it must be unattached to ground, permanent walls or built on, capable of being dismantled and portable, but it may rest on a loose brick, not cemented, foundation. The three common types are: Span roof, ranging from the single span garden greenhouse to the many-spanned commercial glasshouse, erected with ridge running N. and S. to admit maximum sunlight; three-quarter span roof, preferably built adjoining a S.W. or S. wall; and the single span lean-to roof, similarly situated. The smallest economic size for equable heating is probably 12 ft. x 8 ft. Site must be sunny, on well-drained soil, and foundations draught-proof. Heating equipment depends upon the minimum winter temp. to be maintained. Tropical or semi-tropical plants and vegetables require much higher temps. than temperate flowers such as primulas. A house in which the night temp. in winter does not fall below 40° F. in the severest weather is termed a cool greenhouse. It is suitable for the raising of such plants as anemone, begonia, calceolaria, carnations, celosia, chrysanthemum, cyclamen, daisy, fuchsia, geranium, gladiolus, geranium, petunia, rhodanthus, schizanthus, streptocarpus, sweet pea, verbena, zinnia, etc., from seed; chrysanthemum, celosia, cyclamen, fuchsia, hydrangea, oleander, pelargonium, plum-bago, salvia, and solanum from cuttings; and most bulb species from corms or offsets. A warm or stove house is one in which a minimum winter temp. of 60° F. is maintained, in which many flowers can be forced, vegetables grown out of season, and plants raised from seed or cuttings for later planting out of doors. The range of tender flowers that can be grown include achimenes, allamanda, anemone, anthurium, bougainvillea, bouvardia, caladium, clerodendron, croton, dipladenia,

eucharis, exacum, gardenia, gesnera, hippeastrum, hoyo, impatiens, ixora, jacobinia, jasmine, justica, lapageria, nepenthes, polkaetia, stephanotis, thunbergia, and torenia. Choice of heating apparatus depends also on the size of house. Small cool houses may be heated with special fuelless oilstoves, gas or electrical apparatus. Gas and electrical heating offer the advantage of thermostatic control, but are seldom practical at an economic cost for the maintenance of forcing temps. The most economic heating equipment consists of hot water or steam pipes extending along the sides, etc., of the house, together with a furnace or slow-combustion stove. This may be oil or gas-fired, but solid fuel, coke or anthracite, is most economical today. Techniques of soil-warming by electric cable or wire may be utilised with advantage in most houses. The aim of ventilation is to change the air without draughts. Roof ventilators are essential. Stage ventilation at the side of a house is rarely needed in winter, but helpful in summer. Sub-stage ventilators admitting air on to heating pipes are good for winter use. A constant water supply is essential in Hs., and may be arranged by gutters and pipes draining into a lidded cistern sunk to floor level inside the structure. Modern houses of steel, aluminium or alloy construction are less costly to maintain than wooden, but care should be taken to see that facilities for supporting plants by training wires or strings are provided. Whether grown in pots, boxes, or borders, H.-grown plants require well-balanced, fertile soils. Making up of soil composts for seed-growing and potting is simplified by use of formulae developed by John Innes Hort. Institution, Merton Park, London, S.W. 20. Freedom from soil-borne plant parasites, fungal or insect, is assured by soil sterilisation, preferably by heat, or the use of a 2 per cent solution of formaldehyde. Proper regulation of temp., ventilation and watering assure maintenance of buoyant atmosphere. Watering should be done early in the day to ensure plant foliage being dry when the house is closed at night. Insect control has been revolutionised by the development of new smoke generators. D.D.T. smoke controls adult white-fly, tomato moth caterpillars, woodlice, and capsids. Azobenzene smokes eliminate red spider. Against aphides, thrips, and scale, nicotine is most effective. Mildews, rust mould and other fungus diseases require the use of sulphur or copper fungicides. Plants vary in their tolerance of smoke or fumigating treatments, and this should be ascertained beforehand. See F. J. Fletcher, *Glass-houses and Propagation of Plants*, 1948.

**Hotin**, see KHOTIN.

**Hot Lake**, dist. in the N. is. of New Zealand, stretching S.W. from the bay of Plenty, and containing hot springs, geysers, and active volcanoes.

**Hotman**, François (1524-90), Fr. publicist and jurist, of Silesian origin, b. at Paris, son of a counsellor of the parliament of Paris. Studied law and began to practise at the Paris bar, but thereafter spent his life in lecturing and writing. Was at

first lecturer in Roman law at Paris Univ. Having embraced Calvinism he went to Geneva and thence to Lausanne, where he was prof. of belles-lettres. From 1550 for some years he lectured at Strasbourg and then attached himself to Antony of Navarre, being entrusted with missions from the Huguenots to German princes. He succeeded Jacques de Cujas (q.v.) at Bourges, but the civil war drove him into flight, to Orleans whence he was sent to Blois to arrange the peace of 1564. He suffered greatly during the Huguenot persecutions and again sought refuge, this time at Sancerre, where he wrote his *Consolation*, a work drawn from the Bible and St. Augustine. After the massacre of St. Bartholomew he fled to Geneva and turned his back on France forever, having written his famous Lat. political treatise, the *Franco Gallia* (1573, trans. 1574). At Geneva he was appointed prof. of Roman law; but he never found peace and eventually, in 1589, he fled to Basel, where he died and was buried in the cathedral there. His prin. work, the *Franco Gallia*, doubtless aimed at Charles IX., was never popular with his co-religionists and was also much censured by the Catholics. In it he represents the institutions that the Huguenot party demanded as being those which for long governed France, and which alone could retrieve her prosperity. According to H., these ideal institutions could be traced to the history of Gaul and the old Frankish monarchy and to the later federation of free states formed by the peoples of Gaul in Caesar's time, under a General Assembly of elected deputies—a federation which, after the conquest of Gaul by the Romans, was replaced by an elective monarchy, beginning with Childeric in which the king could be deposed by the States-General composed of nobles, magistrates, merchants and artisans, the clergy forming no order and exercising no power. This work breathed the true spirit of research and of Huguenot independence, and the sensation it caused has been compared to that produced by the *Contrat Social* of Rousseau. It was a man of unquestionable piety and lofty ideas on religion, and his frequent flights, which might seem to savour of cowardice, were really due to fears for his wife and family. His other works included the *11th Tribonian* (1567) a treatise to show that the law could not be founded on Justinian, a *Treatise on the Eucharist* (1571), *A Life of Coligny* (1577) and many works on law and politics.

Hot Springs, city and the principal seat of Garland Co., Arkansas, U.S.A. In the Ozark Hills, 15 m W.S.W. of Little Rock. It is situated in a narrow valley and contains about forty-four mineral springs which are famous as cures for chronic diseases, such as rheumatism, gout, and neuralgia. Their temp. ranges from 76° to 160° F., and the daily output is about 1,000,000 gallons. They are all contained in a reservation which has been held since 1903 by the U.S.A. gov., which maintains here a naval and military hospital and a free bath-house. Lead and silver are found here, also flint, oilstone.

There are smelters and saw and planing mills, also ostrich and alligator farms. Here was held the United Nations Conference on Food and Agriculture, in May, 1943, as a result of which an interim commission was estab., which formulated the constitution of the Food and Agriculture Organization (I.A.O.) of the United Nations (see further under FOOD AND AGRICULTURE ORGANIZATION). Pop. 22,000.

**Hotspur**, name applied to Henry Percy, son of the first earl of Northumberland. In the reign of Henry IV. II and his father gained the great victory of Homildon Hill (1402). He joined with Owen Glendower against the king, but was killed in the battle of Shrewsbury (1403).

**Hottentot**, native race of S. Africa so called probably from their hairy or unmetallizable character. The Hottentots are supposed to represent a mixture of

HOTTENTOTS

E.N.A.

stocks in which the Bushman and Hamite elements predominate. They are now numerically important and are confined for the most part to S.W. Africa N. of the Orange R. The H. race includes the Khoi Khoi, or full blood Hs., and the Bushmen. Of the former the Nama, proper are the most typical branch of

the H race, and can be distinguished by their yellowish brown complexion, oblique brown eyes, prominent cheek bones, pointed chin, broad flat nose, and black woolly hair. They are essentially a pastoral people owning long horned cattle and fat tailed sheep, whereas the Bushmen live exclusively by the chase, and their national garb is the 'kaross,' or sheep-skin, worn with the woolly side out in summer and reversed in winter. They have a particular form of clan organisation and follow a cult of sacred fire which is thought to be a Hamitic tract. Their huts are frail structures of matting which can be carried from one camping ground to another. They are sluggish, indolent people and the majority of them lead a nomadic life. Most of the tribes have been converted by Protestant missionaries but under the outward form of Christianity many old superstitions survive, and the 'Houta Lohu' or Great Spirit, is still alternately rewarded with offerings or overwhelmed with imprecations according as he shows himself propitious or hostile to the community. His devotees speak the Khoisan languages. Though the Hottentot has Hamitic features, the closest relationship appears to be with the Bushman though that with the latter is at a remote distance. The numbers using these languages are few (there are less than 20,000 surviving Bushmen) although the Nama variety of the H language is spoken by 30,000 people. It is progressively being replaced by Afrikaans. The H languages, of which only Nama and Korana are now spoken have been the subject of much research especially by German students. H speech is highly developed possessing very delicately graduated series of vowels and diphthongs unlike the Indo-Chinese languages by which different meanings are imparted to the same word. There is also an accusative case indicated by endings in the singular dual and plural, and gender is marked by distinct termination for the masculine, feminine and neuter of all three numbers. The H pop was regarded from the beginning of the nineteenth century mainly as a source of labour to replace the labour lost on the abolition of the slave trade. A few tribes retained their tribal organisation for some time, but the Hs were gradually absorbed as wage earners into the economy created by the spread of European farming and they retained neither a separate territory nor a distinct existence as a community. See F. A. Walker *A History of South Africa* 1928, J. Schapera *The Khoisan Peoples of South Africa* 1930. Lord Hailey, *An African Survey* 1935.

**Hottentots Bred**, see DIOSCORIDEA

**Hottentots Holland** mountainous dist. of Cape Prov. S. Africa which is famous for its scenery. Jonkershoek, among the mts, is noted for its old picturesque farm, where the government hatchery is.

**Houbaken, Jacob** (1698-1780), Dutch engraver, son of Arnold H. (1660-1719) & at Dordrecht. He particularly excelled in portraits and it has been said that no one has ever equalled him in the manner

of imitating the flesh and hair by means of the graver. He pub. in London (1743-52) *Heads of Illustrious Persons of Great Britain*, with lives by Dr Birch.

**Houdeng-Allmeries and Houdeng-Goegnies**, two adjoining tms in Hainaut, Belgium 11 m E of Mons. There are important coal mines. The chief industries are iron, glass and brickworks. In the neighbourhood is the first large hydraulic lift for river vessels, constructed to counteract the difference of level of two arms of the Canal du Centre. Pop. 7,600 and 4,200 respectively.

**Houdin, Robert** (1805-71), see under CONJURING

**Houdon, Jean Antoine** (1741-1828) French sculptor b. at Versailles. In 1761 he won the Prix de Rome, and went to Italy. He remained ten years, and executed the life-size figure of St Bruno, of which Pope Clement XIV said that it would stick to the rules of its order (enforced since). On his return to France he was received into the Academy, became a member in 1776. In 1781 he visited America to execute a monument of Washington; indeed it was in portraiture that he was especially successful. Some of his most famous busts are those of Turbot, Rousseau, Lafayette, Mirabeau, Napoleon, Mlle Arnould, and Moliere. See H. Dicks *Houdon's Leben und Werke*, 1887, G. G. G. *Houdon, Le Sculpteur*, J. A. Houdon *et son époque*, 1918-19, and monographs by L. Kézu 1930 and L. Maillard, 1931.

**Houghton** tn in Houghton co., Michigan U.S.A. on the S. side of Portage Lake, about 65 m NW of Marquette. It is the centre of the great copper producing dist. of Keweenaw. There is a ship canal to Lake Superior and a steamer connection. Michigan College of Mining and Technology is situated here. Besides copper mining, lumbering and agric. are also carried on. Pop. 477.

**Houghton, Marquis of**, see CRFWE, EARL OF.

**Houghton, Richard Monckton Milnes**, 1st Baron (1807-55) was an example of the best type of man about town. At Cambridge he moved in the literary set and became intimate with Thackeray, Tennyson and Brookfield, whose friendships endured through life. Later in life he joined the Philobiblon Society, and was always in the van of such movements as 'chambers' institutes, franchise, and the reform of the copyright law. A minor poet of some distinction an excellent after dinner speaker gifted with an incisive wit, he was very popular in society, and he entertained largely both at Fryton and at his London house. He ed. Keats's *Life and Letters* (1818) and ed. a collection of his poems in 1843 and again in 1876. He pub. an interesting vol. of essays, *Monographs* (1873). See Sir I. Wemyss-Fairlie, *The Life, Letters and Friendships of Lord Houghton*, 1890. J. Pope Hennessy, *Monckton Milnes: The Years of Promise*, 1919.

**Houghton-le-Spring**, tn 6 m. N.E. of Durham, England. There are collieries and iron-works. The anct. church here contains the tomb of Bernard Gilpin, the

'Apostle of the North,' who was rector here, and also founded the grammar school. Pop. 28,100.

Hougoumont, vil. near Waterloo, in Belgium, and the scene of most of the critical fighting in the Battle of Waterloo. Together with its grounds it was in the occupation of the Brit. troops when Napoleon opened battle. Defended by the Eng. guards, it remained untaken throughout the battle.

Hougue, La, see HOGUE.

Houlton, tn. in Maine, U.S.A., in the co. of Aroostook, about 98 m. from Bangor. Lumbering and farming are carried on. It is a port of entry. Pop. 7000.

Houma, co. seat of Terrebonne par. Louisiana, U.S.A., about 50 m. S.W. of New Orleans. There are sugar, rice, and cotton plantations. Natural gas supplies the tn. Pop. 9000.

Hound, term applied to dogs of the chase which hunt by scent alone, such as bloodhounds, foxhounds, staghounds, basset hounds, beagles, and harriers. Deerhounds and greyhounds, which run by sight alone, are not, strictly speaking, Hs.

Hound, par. and vil., Hampshire, England, on Southampton Water,  $\frac{1}{2}$  m. from Netley station. It contains an Early Eng. church and the Royal Military Hospital. Pop. 3714.

Hound's-tongue, name given to various species of the boraginaceous genus *Cynoglossum*. The plants grow in tropical and temperate lands, and two grow wild in Britain. Of these the better-known is *C. officinale*, the common H., which grows on waste ground, and was formerly used in medicine. It grows to a height of 2 ft., has downy leaves, and bears red flowers.

Hounslow, tn. in Middlesex, which stands at the junction of the two great W. of England roads from Bath and Exeter, and is about 14 m. from London and 24 m. from Brentford. H. Heath, W. of the tn. was the site of Rom. and Brit. camps, and was also a favourite resort of highwaymen. It is now used as an exercise ground for troops. From 1918 it was the continental air port for London till this was transferred to Croydon in 1920. The large cavalry barracks built in 1793 is the chief military depot for Middlesex. A priory of friars of the Holy Trinity was founded at H. in 1296, and the chapel was used as a church until 1830, after which the present church of the Holy Trinity was built. H. is now part of Heston—Isleworth. Pop. 23,600.

Hour, twenty-fourth part of a day. In most countries the Hs. are counted from midnight, and two twelves are reckoned, but in certain parts of Italy twenty-four Hs. are counted, beginning with sunset, so that noon and midnight occur at different times each day. The 24-H. mode of reckoning is used in the Brit. Army. *Whitaker's Almanack*, etc., e.g. 12.5 A.M. is reckoned as 0005 H., 11.50 P.M. as 2350 Hs. Each H. is divided into 60 min., and each min. into 60 secs. Many nations e.g. Gks., Jews, and Babylonians, were not accustomed to divide their day and night

into equal parts, but into unequal or planetary Hs., and double Hs. of 120 min. were employed by the Jap. and Chinese.

Hour-angle, angle made by any H.-circle with the meridian of the observer. For example, when the sundial at a certain spot registers ten o'clock in the morning, and the sun is therefore two hrs. distant from the meridian, the hr.-circle makes an angle of 30° with the meridian.

Hour-circle, in astronomy, any great circle drawn through the poles. The fixed stars complete their apparent revolution round the earth in twenty-four hrs. of sidereal time, passing through 360° in twenty-four hrs., i.e. in 15° one hr. If, therefore, two observers are 15° of long. from each other, one has any fixed star one hour of sidereal time later in his meridian than the other. Meridians in dialing are known as Hs.

Hour-glass, instrument for measuring intervals of time which consists of two glass bulbs joined by a narrow neck. One of the bulbs is almost filled with sand or mercury, which passes through the narrow aperture to the other bulb in the space of an hr. if an H., or of a min. if a min.-glass. This device was frequently employed in churches during the sixteenth and seventeenth centuries, and in the Eng. House of Commons, as a preliminary to a div., a two-min. sand-glass is still turned.

Houri, name for a beautiful damsel endowed with perpetual youth, whose companion-ship in Paradise is the reward of devout Moslems after death. The word comes from the Persian *hūrī*; Arabian *haurā*, a black-eyed virgin.

Hours and Wages, see LABOUR, HOURS AND WAGES OF.

Housatonic, riv. (length 150 m.), New England, U.S.A., rises in Berkshire co., Massachusetts, and flows generally S. through Connecticut, enters Long Is. Sound 1 m. E. of Bridgeport.

House, Edward Mandell (1858-1938), friend and adviser of President Woodrow Wilson, was b. at Houston, Texas, U.S.A. He was the son of an Englishman who emigrated to Texas when that ter. was still part of Mexico, and who took a large part in fighting Mexico. He was educated at Cornell Univ., and then returned to his native state, where he made a comfortable fortune from his plantations and other business ventures. Although he never ran for office himself, he took a keen interest in the politics of Texas, and was largely instrumental in the nomination and election of a number of its governors and senators. H. was a progressive Democrat. When Woodrow Wilson was prominently mentioned for the Democratic nomination for the Presidency in 1912, H. paid a visit to the then governor of New Jersey. The two men found that they thought alike on public questions and policies, and a friendship was begun which was to last without a break until the closing months of Wilson's life. When Wilson was triumphantly nominated and elected, H. could have had almost any position that the President could bestow, but he declined. H. went to Europe for the President. He had interviews with

most of the rulers and leading statesmen of the Old World—a practice followed by President Roosevelt in 1940 and 1941. In 1915 H. again went to Europe to be the eyes and ears of the President, and, particularly, to study the possibility of Wilson acting as mediator between the warring nations. When America entered the war in 1917, H. once more went to Europe as chief of the mission to study means of fulfilling Allied war needs. He then became a member of the Allied War Council, and when the

before 1700 B.C. Hs., of two or three storeys with stairs to the upper rooms; the ground floor rooms obtained light only through the doors, the upper floors were lit by windows. The rooms were rectangular, the roofs flat. This is the S. type of H. In Greece, in very early times, the H. was of circular form. It passed through many changes to a rectangular formation in which the circular form is retained as an apse. As rooms were increased in width, central columns were

STOKESAY CASTLE, SHROPSHIRE

John H. Stone

Powers met at Versailles to draft the Peace Treaty, Wilson named H. as one of the Amer. peace commissioners. As such he took a considerable part in drafting the League of Nations covenant. One of the most fascinating books on Europe and America just before, during and after the war is *The Intimate Papers of Colonel House*, ed. by Prof. C. Seymour, 1926-28. See A. D. Howden Smith, *The Real Colonel House*, 1918.

House, term used for a building erected for habitation. It therefore includes dwellings of any size, from a single-room building to a palace. Hs. set the architectural type of the epoch. The early Egyptians lived mostly out of doors, and their dwellings were of wood or crude brick. Their smallest Hs. consisted of single rooms. Their larger Hs. had outer and inner courts surrounded by porticoes, halls, and chambers for the family, guests and servants. The ground plans only remain. At Cnossus the Cretans built,

added. The roofs were pitched. The accommodation consisted of a porch, a megaron with a hearth, and sometimes a further sleeping chamber. The Hs. in Greece were of the N. type. The later dwellings of the Gks. were plain and unpretentious; the rooms faced inwards and round an internal courtyard, the Hs. were of one story, and the light was admitted through the doorways. They were frequently surrounded on the outer walls by shops. In Rome, the accommodation was similar to that of Hs. in Greece, the rooms being round an interior court with a peristyle; light was admitted through the doorways, and the ceilings and roofs were of wood. The buildings were one storey in height to withstand earthquakes. This type was called *domus*. There were also *insulae*, or tenements of sev. floors, similar in plan on each floor, built of concrete with brick facings. The rooms were barrel vaulted and the walls plastered. The floors were covered with

mosaic. The rooms were lit by windows. They had staircases to the upper floors from the street, as at SS. Giovanni e Paolo, Rome. There were, further, villas as that of Hadrian at Tivoli, and palaces as that of Diocletian at Rome. The accommodation was semi-public and official. The Romans built Hs. in England, but these, being of the S type, appear to have had no influence upon the Eng. H.

Between the Rom. occupation and the Norman Conquest the buildings in England were of wood. With few exceptions there was no permanent building until fifty years after the Conquest. The castles of the Conqueror were of wood surrounded by earthworks. In the twelfth century stone superseded wood, and the stone H. probably embodied the same accommodation as its wooden fore-runners. The keep was the domestic part of the castle, and the important room of the keep was the hall. The Hs. other than castles were still of wood. The keep was nearly always square, as in the case of the White Tower of the Tower of London, and Rochester Castle (1130). The walls were very thick, the rooms being badly lighted by a small window to each floor. There are two rooms to each floor in Rochester Castle, and there is a chapel in the thickness of the walls, and a circular staircase communicates with each floor. The windows are small and unglazed; a wall fireplace heats the hall, the smoke being taken through the wall. In some cases the floors of the keep were of wood, in others stone-vaulted. The rooms were on top of each other, basement, hall, and attic. The kitchen was detached. Where defence was not the paramount consideration, the rooms were placed side by side upon the ground. The hall was still the prin. apartment of the H. and was used for living, eating and sleeping. This type, the fortified manor H., survived, and developed into the modern H. The keep type continued in such buildings as the Peel tower of the N. and Lattersall Castle, Lincolnshire, and elsewhere until the mid-fifteenth century. The hall gave the name to the H. At one end of the hall was the kitchen, at the other the solar or master's room. The solar grew into the suite of rooms for the family, the kitchen into the domestic suite. In the manor type of H., the fire was in the centre of the hall, nearer the end used by the master of the H., the smoke was let out through louvres in the roof. To increase the width of the hall, a row of columns was placed on one side or on both. Glass was sometimes used in the windows in the mid-thirteenth century, but not generally until the fifteenth century. In some cases the kitchen was detached from the H. Towards the end of the thirteenth century decoration and comfort were considered.

Stoke New Castle, in Shropshire, built in 1340, is to-day a well-preserved thirteenth century castle, defended by castellated tower, moat, and gatehouse over the moat. In common with sev. other old houses, it was styled a 'castle' because the tops of the walls and towers were

fitted with battlements—in other words, castellated—where as it was really only a fortified manor house. It is considered the finest example in England of an early hall. Well preserved S. Castle is defended by moat, gatehouse, and tower. Its great hall was built in 1210 and the tower 50 years later, when the owner obtained his licence to crenellate, or fortify his home.

Haddon Hall is to-day similar in plan to what it was in the fourteenth century. It is grouped round an upper and lower courtyard, the hall divides the two courts. The building is of the fortified type, there are few windows; and it is lit from the inner courts. The rooms communicate directly with one another, but privacy is assured by the use of screens. There are some rooms on the first floor over the kitchen. The planning is wasteful. The windows are small. In the Hs. were built side by side within the walls until the available space was utilised. By the close of the fifteenth century, the need for fortification had passed. Elizabethan plans of Hs. were more economical of material and their planning was more convenient. They were designed to produce effects (though there is some evidence of unnecessary towers earlier). Towards the end of the sixteenth century the builders considered the symmetry of their elevations. During this century the greatest changes took place. The period coincided with the Renaissance, which commenced in this country, in the reign of Henry VIII., with the dissolution of the monasteries, and the transfer of wealth from the Church to the Court. On the elevation the cornice and pilaster appear, and within the plan more privacy is provided by the use of corridors, as at Hengrave Hall, 1538. The subjects of Queen Elizabeth died with each other in building large estates. The H type plan was evolved as fitting in more air than the courtyard type. Windows became larger, chimneys and fireplaces were more highly developed.

In the seventeenth century the design of Hs. became personal. The taste for the H. fashion was gratified by Inigo Jones, Wren, and, later, Vanbrugh. In the country districts the old traditional type of plan and building continued. The design of Hs. now followed two lines. In the academic type, the position and use of the hall were slowly altered from that of a living-room to that of an entrance. The ground floor was used for the day rooms, the upper floor for the sleeping rooms. The staircase became more central. Such windows were first employed. The chimneys collected into stacks, and there were dormers as part of the roof and not, as formerly, as part of the walls. The Civil War disturbed the development of building. Architecture became fashionable through books on the subject. Castle Howard is the culmination of this period. It was built for display, and the outside wings are similar, though the rooms behind them are put to different uses.

In the eighteenth century, the idea of show and stateliness was still further realised. Rules of proportion produced

beautiful Hs. which were highly inconvenient. The rooms were too lofty for comfort, though pleasing in appearance. The kitchen balanced the stables, but both were separated from the H by long colonnades. There was some protest against this tendency, but usually the dictates of Andrea Palladio triumphed, and Hs lost comfort and gained stateliness. Some of the smaller Hs were more practically built. The In H was developed on a narrow frontage facing on to squares and streets, repeating the same plan side by side in blocks and groups. With the nineteenth century, the growth of building increased with the pop and their migration from the country to the towns and cities. The people had to be housed near their work. Little Hs in terraces

ated with sculpture. Baths and gymnasia are provided. In England, the modification of the building regulations to allow of artificial ventilation of bathrooms will affect the future planning of flats and Hs. On the Continent there are Hs. built to satisfy the phrase 'a machine to live in' as the definition of a H. This tendency has had some influence on recent housing planning.

From the middle of the nineteenth century detached country Hs followed in the design of their elevations the successive preferences for past periods native and foreign styles. The plan has grown more convenient and orderly, attention being given to economy of management, and convenience of the arrangement of the kitchen, scullery, offices, and the

German State Railways

A BLOCK OF FLATS IN GERMANY, REPRESENTATIVE OF A TYPE WIDELY ADOPTED

and courts comprising one room upstairs and one room down built back to back with windows to one side only. Common earth closet and pump. Large villas were built round Regent's Park, and blocks of large residences in upper Regent Street. In the country, the spectacular Palladian H was built side by side with a revival of the forgotten Gothic. In some instances it was combined with a classical plan. In others as at Fonthill, it was a reversion to medieval ideas, but with an attempt to imitate the features and ornament were incorporated in new Hs.

In 1831, Lord Shaftesbury called attention to the condition of overcrowding in London. In some localities there were more than eighty Hs to the acre, with families in each room. Legislation was enacted providing for the erection of lodging-Hs. subsidized out of the poor rates. Other Acts followed. They did not produce the desired effect. In 1890 the London C. Council began to deal with the problem. They built flats, the more recent of which are five floors high, three floors of flats and the fourth and fifth floors two storey tenements. Continental countries have adopted flats. In Stockholm they are sometimes twelve storeys high. In Amsterdam six to eight storeys. In Germany and Austria the courts about the blocks of flats are decorated

with a room. Sanitary arrangements have been improved, and water provided. Since the First World War detached Hs have become smaller. Motor ming has declined and the motor has taken house holders out of doors.

1-8-4—The Amer. H dates from the earliest colonial period. Seventeenth century work is medieval in character, picturesque, and emphasizes the importance of structure. The buildings are wooden framed and derived from English sources the small H being wooden examples of the cottages. In the eighteenth century they became formal in plan, based upon the palladian style copied and adapted from books by English writers. This type and period are called 'Georgian Colonial'. The early Republican H show the influence. Oval rooms are found, the communication within the H is carefully studied, the bedrooms being entered through separate doors. In New York there are Hs of the eighteenth century with Dutch characteristics, notably covered verandas. In the S. Sp. types prevail, the walls are thick, the buildings of one storey round open patios and the chimneys outside. In the N. the plans are more compact, the chimneys inside the H. With the opening of the nineteenth century, romanticism influenced the design of the Amer. H. In the twentieth century the ideas found in all these periods

and areas have been exploited and developed. In general, modern Amer. H. plans have the living-room and the dining-room connected, the dining-room being reached from the kitchen and living-room only. The dining-room is usually small. The bedrooms are often without fireplaces. In many Hs. the living-room contains the only fireplace, the Hs. being heated artificially. There is a tendency to place the living-room at the rear, garage and services towards the street. In New York, apartment Hs. of thirty-one stories, 380 ft. high, have been built. Indeed, with the difficulties of obtaining servants, the building of big modern apartment Hs. has been increased in Amer. cities.

**Interior Decoration, General.**—Electric lighting has led to considerable experiment in the interior decoration of Hs. Diffused, concealed, reflected, and strip lighting have all been used. Colour has been given to light by tinted glass screens and neon tubing. Walls are sometimes considered as texture in order to break the even distribution of the light. Glass is used in ceilings; polished steel for floors. Mural painting has been revived. Colour is used for psychological ends. Glass in various colours and as mirrors is being largely employed. The room and its furnishing are being considered as an entity. Emotional and spectacular effects, rendered possible from the use of colour and form, are being successfully designed. The various rooms are being decorated to accord with the moods appropriate to their use. The walls, ceilings, windows and doors have all been treated with the same colour or shades as tending to homogeneity. The bathroom is being considered—cheerfulness being stimulated by coloured walls and fittings of various material—porcelain, ceramic, mosaic and paint. Glass and stainless steel have been tried as handrails and for various fittings. Built-in fittings are used in most of the rooms of the H. in order to economise space and simplify decoration by giving the room that greater unity which follows from the employment of the architect of the H. as the designer of its furniture. Mouldings have been reduced, and surfaces are less broken. Pictures are selected with greater care—for colour and design—their setting being considered, or designed for them. There is less ornament in Hs. and less provision for their display. Ornaments are selected for emotional effect. The psychologist and the scientist have been studied by the decorator in order to stimulate health and pleasure. *See also* BUILDING; FLORAL DECORATION; HALL; HOUSING; MURAL DECORATION; WALL-PAPER. *See* J. Glibberd, *The Modern Flat*, 1937; F. Yorke, *The Modern House in England*, 1937; R. McGrath, *Twentieth Century Houses*, 1940; Victoria Sackville West, *English Country Houses*, 1945; R. Dutton, *The English Interior*, 1949.

**Houseboat**, riv. boat which is fitted with every convenience for habitation, i.e. has living, sleeping, and cooking apartments. In England these boats are found mainly on the R. Thames, and are only used as temporary houses by people making riv. excursions; but in the E. countries Hs., which very much resemble floating huts, are common on all the large rivers, and are used as permanent residences; indeed, many of the Chinese, Burmese, etc., spend their whole lives on these floating craft.

**Housebreaking**, *see under* BURGLARY.

**Housecraft**. Term which includes not only housewifery (*q.v.*) and cookery, but which has wider implications, the scientific practice of H. being known as 'domestic science', and including the choice of a house, its furnishing and equipment, cleaning and care, and embracing such subjects as cookery, dietetics, laundry work, and home nursing. Teachers' training courses in H. may be taken at the Battersea Polytechnic; Berridge House, Hamstead (now under the National Societies Training College of Domestic Subjects); the National Training College of Domestic Subjects, Buckingham Palace Road, and King's College of Household and Social Science (Univ. of London), Campden Hill. In the prov., and abroad also, many schools and colleges provide full courses, and degrees are awarded in domestic science. Shorter courses of instruction in housecraft are given at various polytechnics and schools of Domestic Science.

The choice of a site for a house should be considered in relationship to the soil, aspect, contour of the land, drainage facilities, and provision of water, gas and electricity; the plan of the house should be prepared with full regard to the facilities offered by the site. Choice of furnishings, largely a matter of individual taste, should, nevertheless, have regard to a general colour scheme, walls, floor covering, curtains, and style of furniture having a relationship to each other. The kitchen is the workshop of the house and should receive special consideration, as the smooth running of the entire estab. depends largely upon its efficiency. Labour-saving devices should be incorporated as far as possible, not only in the kitchen, but in the other rooms of the house. These may include: built-in cupboards and wardrobes; rounded corners to facilitate cleaning; washable or tiled walls in kitchens and bathrooms; plain doors to cupboards and rooms; hot and cold running water in the bedrooms; kitchen cabinets for the storage of dry goods and a hatchway unit between din-

ing-room and kitchen; airing cupboards for linen; stainless steel sink units with draining trays, cupboards, etc.; stainless metal taps; bakelite or plastic electric fittings; enamelled gas and electric cooking stoves; electric vacuum cleaners and floor polishers; electric washing and washing-up machines. Information and advice on good household equipment can be obtained from The Good Housekeeping Institute, 28-30, Grosvenor Gardens, London, S.W. 1. See E. W. Gregory, *The Art and Craft of Home-Making*, 192; E. E. Jardine, *Housecraft*, 1928; Pauline Griffin, *Happy is the Bride*, 1946, also Blackie's Domestic Science Handbooks including *Simple Lessons on Health and Habits*, *Simple Lessons on Household Management*, and *The Chemistry of Housecraft*.

**House-duty, Inhabited**, tax imposed on inhabited dwelling-houses, of the ann. value of upwards of £20 in England, Wales and Scotland. Its incidence was on the legal occupier and not on the owner. There were numerous exemptions, such as houses belonging to the royal family, hospitals, almshouses, school buildings, trade and business houses and others. The duty ceased to be chargeable after 1923-24 (Finance Act 1924, Sect. 20).

**House-fly, Flesh-fly**, or *Musca domestica*, name given to a species of dipterous insects belonging to the family Muscidae.

1 *White and Jones*  
THE PROBOSCIS OF A HOUSE FLY

The two jointed proboscis is shown, with the palps and the lips (labella) palmeated by feeding tubes.

These flies are widely distributed and very numerous, especially in summer. The eggs are deposited on dung-heaps or similar places, and the larvæ feed on their surroundings until pupation, which takes place in a few days' time; at the end of a fortnight they are fully-developed winged insects. The chief characteristics are the sucking proboscis and the bristle-feathered antennæ. Hs. are considered frequently to be agents in the spreading of disease;

they pass the winter chiefly in the pupal state.

**Household, Royal.** The R. H. probably had its origin in the *comitatus* described by Tacitus which consisted of *comites* or companions who were the personal attendants of the Teutonic chieftain. In England before the Conquest the *comites* had been replaced by thegn, the chief of whom were the staller or horse thegn and the bowthegn, while in Normandy a similar arrangement had been estab. and each duke had his seneschal or steward, his chamberlain, and his constable. After the Conquest this ducal household was reproduced in the R. H. of England. The hist. of the R. H., however, is difficult to trace, as very few records concerning it are forthcoming. The *Black Book of the Erchequer* enumerates its offices in Henry II's reign, but gives no account of their functions; and the *Collection of Ordinances and Regulations for the Government of the Royal Household, made in Divers Reigns from Edward III to King William and Queen Mary* (printed 1790), contains very scanty information. The *Black Book of the Household* and the *Statutes of Eltham* do, indeed, give some details about the court arrangements during the fifteenth and sixteenth centuries, and Chamberlayne's *Present State of England* contains a catalogue of the officials at the court of Queen Anne, but no connected list is forthcoming. Be this as it may, the existing R. H. is essentially the same as that under the Tudors or Plantagenets, and consists of three main depts.: the lord steward's dept. (Board of Green Cloth), the lord chamberlain's Dept., and the master of the horse's Dept., which can perhaps claim the greatest antiquity. At the head of the first is the lord steward, who must always be a member of the gov. and a peer, and it is interesting to note that he still possesses a criminal jurisdiction such as was originally inherent in every head of a dept. Indeed, all jurisdiction relating to homicide in respect of the R. H. resides in him, and under his mandate alone can inquests be held or criminals be indicted and tried. Under him are the treasurer, the comptroller, the master of the household, the offices of the almonry, and the paymaster of the Household. At the head of the second is the lord chamberlain, who must also be a member of the gov. and a peer, and under him are the vice chamberlain, the master of the Ceremonies, whose duty it is to enforce the observance of the etiquette of the court, the gentleman usher of the Black Rod, the prin. usher of the kingdom, the lords and grooms-in-waiting, who attend on the king in turn for about three weeks at a time, the captain of the Corps of Gentlemen at-Arms, the captain of the king's bodyguard, the Yeomen of the Guard, the comptroller and examiner of accounts, the dean and the sub-dean of the Chapels Royal, the pages, the master of the king's music, the poet laureate, the royal physicians and surgeons, chaplains, painters, librarians, and musicians.

The Queen Consort's Household is also

in this dept and comprises a lord Chamberlain, a treasurer, equerry, and various ladies. These include the mistress of the robes, who attends the queen at all State functions and is the only lady of the Court who comes into office with the gov., seven ladies of the bedchamber, who must be peeresses, seven women of the bedchamber who appear only at Court functions and eight maids of honour, who as a rule are daughters or granddaughters of peers, and who in any case have the right to prefix 'honourable' to their names even if not entitled to do so by birth. The third dept has at its head the master of the Horse who also is a member of the gov. He has charge of all matters connected with the horses and hounds of the king and under him are the cross-hunters who practically manage the royal stables and stud, the equerries who are always officers of the armed forces and attend the king in turn like the lords and groom in waiting, and the pages of honour, youths who wait on the king at state ceremonies. Besides the three depts mentioned there is also the Privy Purse Dept. which consists of the king's 'personal' staff and includes the keeper of the privy purse and the privy secretary. The civil list provides for the maintenance of the P. H. £134,000 being granted for salary and £172,800 for expenses besides grants of £110,000 for their majesties' privy purses, £20,000 for works, £13,200 for royal bounty and £8000 unappropriated.

**Household Troops** are those whose special duty it is to guard the reigning monarch and their troops. There are two regiments of cavalry and five of infantry, the cavalry being the Royal Horse Guards and the Life Guards, and the infantry, the Grenadier, Coldstream, Scots Irish and Welsh Guards. See also GUARDS.

**House**, for many centuries the English name for the English rose regarded as a Victorian cult until the late 19th century. (cf. Shakespeare's unheeded, unnamed.)

**House-leek**, popular name given to various species of *Sempervivum*, a genus of Crassulaceae. The plants are succulent, have star-shaped flowers, and flourish on the mts. of Europe, Asia, and Africa. Several species occur in Britain as hardy plants, and their cultivation requires little trouble as they thrive in the poorest soil. *S. tetrum* the common H., is frequently planted on the roofs and walls of cottages to keep the tiles together. The leaves are arranged in rosettes, are fleshy and in colour are a vivid green; the flowers are purple and vegetative multiplication takes place by offsets.

In many parts of England and especially in Huntingdonshire, the H. is planted on the roof of houses, in the widespread belief that if it is on the roof the house will never catch fire.

**Housemaid's Knee**, see KNEE.

**House of Commons and House of Lords**, see PARLIAMENT.

**Houses of Parliament**, see PARLIAMENT, HOUSES OF.

**Housewifery**, term defining activity of the wife in the home, and not confined to routine housework, but embracing the

care of the fabric and contents of a house, and the skill necessary to convert the house into a home—a happy home and a contented household being an important contribution, at all times, to the national life. The surroundings of a house are important. It should, if possible, stand in a productive garden. The rooms of the house should be so arranged as to admit the maximum of sun and air to those frequently used. Modern practice is for the house to face S.E. or S.W. and not due S. The kitchen, scullery, and larder should face N. or N.E. Bedrooms can face S.E., S. or S.W. The aim of the modern housewife should be to attain satisfactory results within a reasonable time and with the minimum amount of physical labour, this can be achieved by acquiring a knowledge of, and using modern labour-saving equipment as far as means permit (see also HOUSEWORK).

(Good furniture should be regarded as an essential, but over-furnishing should be avoided; there should be ample space in which to work and move about. Personal requirements vary, but a good rule is to buy only the essentials if possible from a well-planned range of unit furniture which can be put together like unit block-helms, thus allowing for additional pieces as time and occasion may demand. Furniture may be classified as utility—carefully and well designed and of pleasing proportions but of varying standards of decoration; or as decorative and more individual, and made of varying periods, and generally of good quality as far as material and workmanship is concerned, but very often at a large price for the modern house or flat. Antiques— invariably well made, but often unsuitable for a modern house and always expensive.

**DAILY CLEANING**—A certain amount of cleaning each day is a necessity, though attention should not be made at a thorough cleaning of the entire house each day. A satisfactory result can be obtained in a reasonable time, and efforts should be made to attain a happy medium between perfect work and planning an exhaustive daily routine. The cleaning of a house may more efficiently be accomplished if the following order is observed: bedrooms (bath and lavatory if on the first floor), landing, stairs, hall, living room, kitchen and back premises. In brief, the work is from the top of the house down wards. Daily cleaning ensures that nothing is overlooked (to become very dirty and thus demand excessive time, materials and labour on its cleaning) and it gives an opportunity of keeping all polished surfaces—floors, mirrors, windows, etc.—bright and shining, and generally to 'tidy up' all the rooms. Household routine should always be so planned that this daily cleaning is finished before the start of the general work of the day. As varying houses present their own problems, and even rooms of the same type demand special requirements, only general principles of daily cleaning which should be adapted to meet individual requirements can be considered here.

**General order of daily work**—The room should be aired and the cleaning apparatus ready to hand. A beginning should be made by cleaning the fireplace and relaying the fire. If a bedroom is being cleaned, re-making of the bed should be given first attention, followed by the cleaning of any fitted hand basin, and afterwards the sweeping of the floor (or sweeper or vacuum cleaner over the carpet) and shaking any small mats. The main work done: the furniture, bed, rug, door and window frames etc. may be dusted and all bright surfaces polished with a polishing cloth and a mop rubbed over any polished surrounds on the floor. Lastly, the room should be generally tidied. When all the household cleaning is completed the cleaning equipment and materials should be carefully packed away. Beds should be opened by removing all the bedclothes and placing them over two chairs, arching the mattress so that it may air. The mattress should be turned daily, from side to side and from head to foot alternately. The bolster and pillows should be shaken up. Bedclothes should be smoothed and creases and the sheets tucked tightly under the mattress. Where it is possible for two people to make the beds the work is halved and made much easier.

**To clean a fireplace**—The hearth rug should first be rolled up and the carpet turned back while the floor in front of the hearth should be covered with newspapers, and the fender and fire irons moved to one side where the soot from the back of the grate is swept down and the cinders removed. It is advisable to save these cinders for the next fire, but the ashes should be completely removed, preferably using for the purpose an old bucket lined with newspaper, which facilitates disposal in the dustbin. The fire is laid by lightly crumpling newspaper on top of which dry sticks are placed crosswise, the cinders being placed at the back of the fireplace. Small pieces of coal at the front and larger pieces at either side. Finally, any bright surfaces should be polished, and the tiles washed before the replacement of the fire irons, hearth rug and carpet and the refilling of the coal box.

**To clean a fitted hand basin and surround**—The basin should be half filled with warm water in which the tooth glass can be washed and then dried. The glass shelf and its contents dusted, and the surround to the basin, and the soap wells wiped. The basin should now be emptied, rinsed and dried, and the taps rubbed up with a dry duster.

**To clean the lavatory and bathroom**—It is advisable first to sweep or mop over the floor, when the lavatory should be flushed and a little disinfectant sprinkled. The bath should be wiped over with a damp cloth, sprinkled with a little paraffin, and afterwards rinsed. Any stains upon the bath may be removed by rubbing soap on the cloth and applying to the stains, while it will be found that vinegar will remove any blue stains. Care is advisable in the use of abrasive substances when cleaning the bath, as these may tend to spoil the surface enamel. To complete the work,

all ledges should be dusted and the window left open while if the weather permits, the towels and bath mats should be dried in the open air.

**WEEKLY CLEANING**—A more thorough cleaning should be given to each part of the house, if possible at weekly intervals. The order of work should, generally, follow that advised for daily cleaning, except that, after cleaning and relaying the fire the walls should be swept, paint work on doors, window sills and mantel piece, etc., should be washed and the furniture and floor polished. Dust sheets should cover furniture during the weekly cleaning unless an electric cleaner is being used. After use they should be carefully removed, folded with the dusty side inside, taken outside and shaken and packed away. Clocks should be moved as little as possible and covered with a cloth while cleaning is in progress. Where there are large numbers of books they should be dusted while remaining on the shelves. The case dusted and the whole covered with a dust sheet.

**SPRING AND SPECIAL CLEANINGS**—Spring cleaning should be finished before the weather begins, but after it is possible to do without fire and when the weather permits, furniture hangings, carpets may be put out into the garden for airing and cleaning. The housewife should plan carefully as much as can be done each day without disorganising the usual work of the house, avoiding weekends and ensuring that the extra work is not interfere with the preparation of proper meals for members of the family and herself. A decision should first be made regarding any necessary decorations and arrangements made for this work to be done, and it may be found that the chimneys require sweeping. Before the cleaning begins, the housewife should be sure that there is a good supply of cleaning materials and that all the equipment is in good order, and a beginning may be conveniently made by turning out and thoroughly cleaning all cupboards, drawers, chests, etc., and by cleaning and storing away winter clothes, curtains, extra blankets, bedcovers, etc. If this connection it will be found that protection against roths is advisable. Special work to be done during the spring cleaning includes the cleaning and if necessary polishing of all pictures, ornaments, walls, paintwork, furniture, carpets and bedsteads.

**Order of Spring cleaning**—Work should begin at the top of the house, cleaning first those rooms which are least used. Landings, passages, hall, and staircase should be cleaned after the rooms, and the kitchen and back premises last of all. It is best to finish one room before beginning the next, and to keep the doors of rooms already cleaned closed.

**Special cleanings**—A sick room should be kept scrupulously clean, and the fewer its contents the better (see **NURSING—Home Nursing**). The fireplace should first be cleaned, and the coal-box quietly refilled. Before sweeping the floor all furniture should be drawn out from the

walls in order to remove any dust that has collected. Damp tea-leaves or sawdust should be sprinkled over the surface before sweeping is begun, as this prevents the dust from rising. If the floor is carpet-covered, a carpet-sweeper should be used daily, and furniture, ledges, dusted with a slightly damp cloth, finishing with a dry cloth. Fresh water should be given daily to flowers in the sick-room, and their removal at night.

**Preparation for chimney-sweeping.**—The sweep will expect to be told the exact date and time he is to attend, and to be informed of the number of chimneys which will require his attention. Unless the sweep is using the new vacuum (or a similar) method, by which chimneys may be swept without disturbing the room, the following preparations should be made: furniture should be covered with dust-sheets or newspapers; curtains and the hearth-rug removed from the room; the carpet should be turned back from the fireplace and the floor covered with newspaper; the floor-space immediately near the fireplace should be well covered to allow the sweep space on which to rest his tools; the windows and door should be kept shut while sweeping is in progress.

**HOUSEHOLD CLEANING EQUIPMENT.**—Brooms and brushes, whether made from horse-hair, fibre, bass, bristle, or one of the various substitutes, should be washed when necessary, (a) soft brushes in warm soapy water, rinsed in clean warm water and dried in the open air; (b) stiff brushes in cold salt water, allowing 2 tablespoonfuls of salt to a bucket of water, rinsed in cold salted water. Care should be taken not to lean on a brush or allow the bristles to bend or break, and to remove all dust and fluff, after use, by shaking. Brooms and brushes should be hung up in a cupboard when not in use. Carpet sweepers operate by means of a revolving brush between two dustpans. These dustpans should be emptied daily, and all pieces of fluff, cotton, etc., may then be removed; it is possible for the entire instrument to be cleaned by the housewife herself, and this may be done occasionally by unscrewing the handle, removing the furniture guard, and taking out the revolving brush. The component parts may then be thoroughly cleaned and reassembled. Electric cleaners are an important part of the household cleaning equipment, especially where electricity is cheap. The best-known types are the outside bag type, also known as the broom-handle type, such as the Hoover, etc., and the enclosed bag type, such as the Electrolux, etc.

Kneeling mats are made from a variety of different materials, and can be bought or improvised from a pad of old soft material. Step ladders long enough to allow the housewife to reach easily up to the top of cupboards, etc., are extremely useful. There are many kinds, but the safety-ladder type should always be bought. Racks for brooms and brushes are extremely useful as they enable brooms, brushes, and other cleaning equipment to be tidily stored. They can either be bought or improvised from odd materials.

**KITCHEN EQUIPMENT AND CLEANING.**—Glass cooking utensils should be steeped in cold water if they have been used for milky or floury foods, and in hot water if used for greasy foods. They should be washed with hot soapy water, soda being added if the dishes are very greasy, and if very dirty they may be scoured with steel wool, a saucepan brush, or scourer, afterwards being rinsed and dried with a net cloth. Saucepans should be cleaned according to the surface material—they may be obtained in various materials ranging from aluminium to enamel. Only the outside and lids of saucepans should be polished, the pans being filled with water immediately after use, hot water being used to remove greasy food and cold water to remove milky or floury foods. Saucepans should be cleaned as soon after use as possible, dried thoroughly, and kept upside down in an airy place. Enamel ware should be washed with warm soapy water, a fine cleaning powder being used if necessary, after which the articles should be rinsed and thoroughly dried. Care should be taken to avoid knocking the surface of enamel-ware articles, as this causes the enamel to crack, exposing the foundation metal, which rusts on exposure to moisture and air. Earthenware casseroles should be steeped in hot water if greasy, or in cold water if milky; they should then be washed in hot soapy water, using a saucepan brush, or scourer, and the outside may be cleaned with a fine cleaning powder. The use of soda should be avoided, as this is apt to remove the glaze from the inner lining.

Baking and roasting tins should be steeped in hot soapy soda water, afterwards being washed in a further solution of hot soapy soda water. Stains may be removed by the use of a cleaning powder, after which the tins should be rinsed and dried in a warm place. Cake tins should be rubbed over whilst still warm with absorbent paper, but washing should be avoided unless this becomes absolutely necessary, when the tins may be treated as for baking and roasting tins. Frying pans should first be emptied by pouring the remaining fat into a small jar and reserving for future use, after which the pan should be wiped with clean absorbent paper; washing with soap and water should be avoided, as this spoils the surface and tends to make food stick to the pan. Mincing machines after use should be taken apart so that all food may be removed with a fork, scraping if necessary, and afterwards washed in hot soapy water. After rinsing and drying with a net cloth the drying process may be advantageously completed by placing the mincer in a cool oven or on the plate rack.

China jugs or bowls which have contained milky or floury foods should be rinsed with cold water, then filled with cold water and stood aside to soak; any pieces should be scraped off plates, which should then be washed in hot soapy water, using a cotton mop; it is advisable to begin washing the cleanest things, finishing with the greasy china. After rinsing in hot water, china may be allowed to dry

sible with a cloth and then either hung in the open air, or left to dry indoors with the doors and windows open to create a draught. Matting requires cleaning daily by sweeping, and may periodically be gently scrubbed with cold salted water on both sides, afterwards being rinsed and dried in the open air.

**WALL COVERINGS** may be enamel, paint, tiles, wallpaper, or distemper. Tiles may be cleaned with warm soapy water: wallpaper may be cleaned by removing the surface dust with a brush covered with a clean cloth, or with the vacuum cleaner, and especially dirty marks can be removed by the careful use of India rubber; varnished or washable surfaces should be cleaned by removing the surface dust and washing the most soiled parts with tepid water and borax, allowing 1 tablespoonful of borax to one quart of water; distemper, or colour wash, may be cleaned with warm soapy water.

**WOOD.**—A number of different woods may be used in a house in the flooring, furniture, fixtures, and domestic appliances. Wooden surfaces may be left smooth and plain, as in the case with pastry and draining boards, or they may be covered with some protective coating, such as paint, enamel, or stain, which may afterwards be varnished. Plain wooden surfaces are easily cleaned by scrubbing with hot soapy water, care being taken to scrub with the grain to avoid roughening the wood: the wood may be carefully scraped with the grain, using an old knife, if particles adhere after scrubbing; rinse in cold water, which helps to keep the wood a good colour, dry with a net cloth and finish drying in the open air if possible. Stains such as those made by meat, vegetables, parsley, etc., may be scrubbed off with plain cold water, or, if obdurate, they may be sprinkled with kitchen salt and then scrubbed; oil and grease usually yield to hot soapy water. Protected wooden surfaces should be dusted daily and rubbed hard with the duster to maintain the polish and occasionally washed with warm soapy water, using a soft nail brush for carved surfaces. Polished or varnished surfaces should be finished with furniture cream or polish. Paint on woodwork exposed to the outer air should not be washed with soapy water, as this tends to blister the paint, use being made instead of a mixture of paraffin and water, allowing 1 tablespoonful of paraffin to half a bucket of warm water.

**FURNITURE.**—All furniture should be dusted or brushed daily, loose covers being straightened and well tucked in and cushions puffed up. Cane furniture may be cleaned by washing and rinsing with cold salt water, allowing 1 tablespoonful of salt to 1 quart of water, and drying thoroughly in the open air. Wicker furniture should be washed with warm soapy water, using a soft cloth, and if very dirty a soft nail brush may be used. After rinsing and drying the furniture may be polished with a liquid furniture polish. Drying in front of the fire should be avoided, as this causes the furniture to crack. Leather and imitation leather cloth may be periodically

cleaned by washing with warm soapy water, using a soft cloth. After rinsing and drying it should be polished with furniture polish or cream.

**GLASS.**—Flower glasses and bowls should be washed with warm soapy water, using a soft nail brush if necessary; stains may be removed by placing a tablespoonful of salt in each vase, covering with vinegar and water, and allowing the vase to soak overnight, then washing in the usual way. Windows and mirrors should first be dusted, then rubbed with a pad of lightly-crushed newspaper, or tissue paper. Periodically the paint-work of the window frame should be cleaned, and then the window. Methylated spirit, or one of the commercial window-cleaning liquids may be used instead of water to clean windows and mirrors. It is unwise to wash windows in frosty weather, or while the sun is shining directly on the window.

**METALS.**—A number of metals are usually used in the ordinary house. Aluminium, chromium plate, electroplate, galvanised iron, lead, monel metal, pewter, silver, stainless steel, etc. Steel knives, tin and zinc, can be washed with hot soapy water, using a soft cloth, stains being removed by the use of a little fine cleaning powder. Steel wool can be used for removing stains from aluminium and pewter, and powdered bathbrick for removing stains from galvanised iron. Chromium plate, monel metal and stainless steel may be polished by rubbing with a dry duster; aluminium and tin by rubbing with dry whitening and polishing with a duster; electroplate and silver by rubbing with whitening or polishing with a commercial plate preparation; galvanised iron, lead and zinc by rubbing with powdered bath-brick and paraffin, finishing with a dry duster; pewter as for solid silver; steel by rubbing thoroughly with dry steel wool or emerypaper and finishing with a soft dry cloth.

**BEDS AND BEDDING.**—Bedsteads should be made as plainly and simply as possible to allow for easy cleaning; a bedstead consists of a head board and a footboard, held upright by means of iron side bars, on which rests the wire mattress and the upholstered mattress. The design of modern bedsteads is changing and the head and footboards are becoming lower and smaller; in some cases the footboard is omitted altogether. If both head and footboards are omitted, the bed then becomes a divan bed. Mattresses consist of wire links of different shapes, mounted in a metal frame; the upholstered mattress is soft and warm and covers the wire mattress; there are several types of filling for upholstered mattresses—horsehair, wool, flock, fibre, etc. There are also several varieties of mattress such as the spring mattress, which, as its name suggests, contains springs in addition to the filling; the box mattress, containing spiral springs and filling, etc. A wire mattress, unless made of stainless metal, should always be covered to prevent rust and stains being transferred to the upholstered mattress—covers can be made from clean sack, hessian, or any piece of thick cotton

material. An upholstered mattress should always be kept clean by having a loose washable cotton cover slipped over it.

**Pillows**—The standard size is 20 in. by 30 in. and this should be remembered when buying pillow cases. The filling may be of down or feathers, and the outer covering is made from a cotton material known as pillow ticking, a finer variety of mattress ticking. Bolsters are always filled with feathers and the outer covering is the same as for pillows.

**HOUSEHOLD LINEN**—In every house a special place should be set apart for the safe keeping of the household linen. The linen cupboard should be dry and airy but not hot, as heat is liable to cause the linen to take on a yellow tinge. Linen should not be stored if it has been starched. The shelves of the linen cupboard should be covered with clean white paper or with material such as old sheeting. A written list (inventors) should be kept of all the linen and if this is kept up to date it will assist in arranging replacements. Household linen can be marked by using marking ink or by the use of woven names. Because of the heavy initial cost of household linen it is essential that it should be kept in perfect condition for as long as possible. This can be done by careful mending, careful ironing and careful use. When too old to serve its original purpose, and mending no longer possible, it should be cut low and used for other purposes.

**How to LAUNDRY**—The aim of the housewife undertaking home laundering should be to render garments clean, clean fresh and crisp, without in any way damaging the fabrics. In preparing for the work she should ensure that there are sufficient washing materials at hand to collect all soiled clothes and heat the water in the boiler. Divide the clothes according to their material—woollens, white cottons and most colours, loss of colours, silks, table linen and rough cloth, busby, oven clothes, etc.

**Method**—Wash the white and fast coloured cottons using hot water and soap. Rub the soiled parts well with the soap, use a rubbing board but brush only the very dirty parts of the material. Rinse well and boil in a copper of water to which grated soap has been added until a good lather appears. While the clothes are boiling wash the silks, then the woollens, beginning with those that are cleanest, in warm copy water. Keep the garments under the water whilst kneading and squeezing. Do not rub as this causes breakage of the fibres. Place any very dirty parts flat on the hand and rub the soapy lather across them (as rubbing removes the scales from the woolen fibres and makes the fabric harsh), rinse in two waters of approximately the same temp. as the washing water. It is unwise to wring woollens and silks through the hands—they should be squeezed to remove the bulk of the water, and then put through the wringer. Peg on the line by the upper part of the garment. Soak dusters, etc., in a pail of soapy water, leaving them in this while the other washing is done.

Remove the cottons from the copper and rinse in cold water. Squeeze a blue bag in a bowl of water until the resultant liquid is just blue in the hollow of the hand, and dip in the cottons which do not need starching. Put through the wringer and hang out to dry. Wash the loose coloured cottons in the same manner as for woollens, then wash the dusters which have been soaking and any other rough cloths which may have been put with them in the pail of soapy water. When in doubt regarding any material wash as for woollens.

**Starching**—Starch stiffens clothes and has the advantage of preserving their cleanliness. Mix 2 tablespoonfuls of starch in a bowl with 4 tablespoonfuls of cold water, pour on boiling water, stirring all the time until the mixture thickens and takes on a greyish tinge, to this add three times as much cold water as the mixture. Starch the clothes by dipping them out (as in the case of pillow cases) and then the open ends in the starch. Stir a convenient order for starching is (1) tray cloth, (2) table cloths, (3) table napkins, (4) cotton dresses, (5) trousers and collars.

**Finishing and Ironing**—Only the starched clothes should require dampening. Dip in with warm water and wring out. Cut the cork or cut the strips away from the original cork or from the cloth to be ironed and sprinkle the water all over them. Fold the articles and allow them to lie flat for a few minutes. Roll up the remainder of the laundry in a few days. Prepare the ironing table by putting over it a thick piece of flannel, then tying on an ironing cloth. The hot board should be used for dresses and blouses. For cottons, use a hot iron first testing on a bit of paper. A hot iron is one which is used for an old iron. It should be kept in a string to be pressed on. The woollens should be pressed on a hot iron with a warm iron. All double cloth and type should be ironed on both sides, begin ironing with the bottom half of a garment. Iron the waistcoat, any trousers with a hot iron. The ironing board should be ironed on the top half of the garment and the collar, if any. Embroidery should be ironed on the reverse side, using a press.

The equipment required for home laundering need only be of the simplest kind, essentials being a press (heated by a white electricity or gas or a portable gas which may be heated by a gas or even a primus stove), soft bristle brushes, good fatty soap, a rubbing board, a hot iron (electric, gas, or the flat iron) and must be heated. Other equipment is, however, on the market to assist the housewife, chief of which is the electric washing machine, a valuable labour saving device where the washing for a large family has to be undertaken by the housewife, there are also commercial soap powders, bleaching powders, etc., all of which have their particular uses, and are sold with full instructions supplied by the manufacturers, whose instructions should be closely followed.

**MINOR ELECTRICAL FAULTS.**—One of the commonest electrical faults in the house is the failure of a lamp to light when the switch is turned on. The bulb should first be tried in another socket to ascertain whether it is worn out or still operating; if the fault is not that of the bulb, the lampholder may need adjustment; or the flex at the plug and ceiling may be faulty. Fuses can be tested by switching on lights in the same circuit; if these are working the fault lies between the fuse box and the lamp; care should be taken to switch off all current before inspecting any electrical equipment—flex, lampholder, etc. If a fuse has blown, switch off at the main, pull out the fuse holders in turn from their fixing clips until one carrying an incomplete (melted) wire, or only ends, is found. A dark stain caused by the combustion will probably be noted. The terminals of the holder should then be unscrewed to release the ends, and a length of new fuse wire inserted loosely connecting the two ends. It is important that fuse wire of the correct thickness be used. A supply of fuse wire both for lighting and power circuits should always be kept at hand.

**Electric bells.**—Common faults in battery-operated bell systems usually arise from the batteries themselves. Leclanché type or wet cells consisting of a zinc element and a porous pot immersed in a solution of sal-ammoniac, should have the level of the liquid, if low, replenished with a solution consisting of 1 ozs. sal-ammoniac to 2 pints of clean water. Zincs which are nearly eaten through should be replaced. Replace dry cell batteries from time to time before they are quite worn out. (See also ELECTRIC BELLS and ALARMS.)

**Housing.** Less than fifty years ago the Statute Book contained no legislative enactment (beyond one or two ineffective Acts to enable local authorities to acquire labourers' lodging-houses or artisans' dwellings) even purporting to deal at all comprehensively with the H. problem. That problem is the consequence of the intense industrialisation of England consequent on the development of machinery. Practically all the great manufacturing towns, each with its squalid alleys and slums, sprang up in the course of the last century. The Factory Acts (see FACTORY LEGISLATION) interfered with a one-sided freedom of contract by imposing on the employer the necessity of making the environment of factory workers less dangerous and less insanitary. The H. of the Working Classes Acts, the first of which under that title was passed in 1890, in-

cluded in that environment the home itself. H. legislation up to 1890 was more or less ineffective. Then came the Act of 1890, which was passed after the report of the Royal Commission on the H. of the Working Classes of 1884, to consolidate the Artisans' and Labourers' Dwellings Improvements Acts, 1875 to 1885, and other Acts. Compared with its predecessors, this Act was an ambitious piece of legislation, and many of its provisions for dealing with unhealthy areas and houses unfit for human habitation were repeated in the consolidating Act of 1925. Burns's H. and Tn. Planning Act, 1909, was also an ambitious piece of legislation, and sought to improve the health of the people by raising the character of the house and home, and by extended inspection, supervision, and direction of central control to help local authorities to do more than they could at this time. The Act of 1890, together with the Acts of 1903, 1909, and amending Acts up to 1909, contained powers sufficiently wide to enable effective action to be taken by local authorities who were prepared to act in spite of inherent difficulties. The consolidating legislation resulted in two chief measures from which local authorities derive their powers. These two Acts were the H. Act of 1925 and the Tn. Planning Act of the same year (as to the latter see under TOWN PLANNING). An Act passed in 1930 made further provision with respect to the clearance or improvement of unhealthy areas, and, in 1935, legislation was passed to prevent overcrowding. Practically the whole of the provisions of the H. Acts of 1925, 1930, and 1935 were repealed and re-enacted, with slight modifications, in the codifying H. Act of 1936.

After the end of the war, Dr. Addison, as the first minister of health in the new Coalition Cabinet, inaugurated a new scheme under the H. (Additional Powers) Act, 1919 (to provide dwellings for returning soldiers—'homes for heroes'). The country was divided into eleven areas under H. Commissioners, and local authorities were encouraged to follow the lead. In brief, the scheme turned on an undertaking by the Exchequer to make good losses incurred under the Act, the authorities being responsible to the extent of a penny rate. As a result 211,000 houses were erected suitable for occupation by the working classes. Unfortunately an indirect result of the scheme was the rapid rise in costs, which moved in the case of a single three-bedroomed house from £643 in 1917 to £888 in 1920, while London Co. Council houses at Roehampton rose to £1,750! Dr. Addison was succeeded by Sir Alfred Mond (later, Lord Melchett), and in the same year the Geddes Economy Committee passed severe strictures upon the financial aspect of the scheme, and by Oct. 1922 the price had fallen to £346. The number of houses built under the Addison Scheme was 68,000 in 1921, 106,000 in 1922, 25,000 in 1923. Private building without State aid was increasing, however, reaching 53,000 houses during the same year, and it appeared that soon local authorities might

proceed with programmes independent of gov help.

With the return of the Conservative Party, Mr Neville Chamberlain again became minister of health, and during the year his H Act was passed. It was an important Act in that it established the legal position of H, gathering the errant threads from as far back as 1890, while the Tn Planning Act did the same service for Tn planning—the Tn planning Part of Burns's Act, 1909, involved a material advance in the relations between the owners of land and the local authorities, but the provisions of the Bill in its original form were greatly modified in the committee stage of its progress. Three principles are insisted upon by the Acts: (1) the power to compel local authorities to act, (2) the right of an owner to be informed of the proposals of the local authorities and to appeal to the Ministry of Health, and (3) the right of the owner to compensation in certain cases where he is injuriously affected. Part II of the H Act of 1924 authorises the local authority to carry out *Improvement Schemes* for dealing with unhealthy areas.

This provision is repeated in the H Act of 1936, as to improvement schemes already undertaken, but that Act makes no provision for future improvement schemes, and would appear so concentrate on the more drastic plan of *clearance schemes*, which involve demolition of all the buildings within the scheduled area (see *infra*). The Ministry may require the local authority to provide suitable accommodation for persons of the working classes who may be displaced by the scheme. As to houses unfit for human habitation, the local authority must cause their dist to be inspected, and there is also a duty imposed on the medical officer of health to act on his own initiative, and if approached by local gov electors, he must inspect the premises complained of and report to the local authority. The next step is for the authority to make a closing order (statutory machinery, which was borrowed from Burns's Act of 1909) prohibiting the use of the house or houses in question until they are fit for habitation. The owners must be notified, and may appeal to the Ministry of Health. Reasonable removal expenses must be paid to tenants who have to quit the condemned house or houses. If the owner fails to make the house fit for habitation within a specified period the local authority must then consider the issue of a demolition order (these orders were also provided for in the 1909 Act), and the owner has the right to be heard on it. The authority may make or postpone the order for six months, and the Ministry of Health may, on application by the owner rescind the order if good cause be shown. If, however, the order becomes operative, the owner must take the house down within three months, failing which the local authority may do so, sell the materials and pay the owner any balance after payment of expenses. Certain 'back-to-back' houses erected after 1909, and also rooms habitually used as sleeping places,

the surface of whose floors are more than 3 ft below the adjacent street, are to be deemed unfit for human habitation. It was the Act of 1903 which prohibited the erection of back to back houses, that is houses constructed without any space in the rear or any windows except in the front walls, so that there is no possibility of any through ventilation from front to rear. But where there are no by-laws requiring open space in the front as well as in the rear, the erection is not prohibited if houses one room in depth with no backyard and no rear wall windows, provided they do not back on to similar houses. Part III of the Act of 1925 relates to the provision of houses for the working classes. Every local authority must consider the needs of its area, and, as often as occasion arises, or within three months after notice given by the Ministry of Health, prepare and submit to the Ministry a scheme specifying (1) the approximate number and nature of the houses to be provided, (2) the average number of houses to the acre, (3) the quantity and locality of the land to be acquired for the purpose, and (4) the time within which the scheme or part of it is to be carried into effect. The Ministry may approve the scheme with or without modification and itself fix a time limit. Where two or more local authorities are affected, a joint scheme may be prepared. The Ministry of Health may enforce the exercise by the local authority of the statutory powers under Part III or authorise the council to act in their stead, or they may themselves take action. (For the purposes of Part III rural dist councils are included as local authorities.) Provision is also made for loans on mortgage from the local authority to persons constructing or altering houses, but such advances are subject to a limit as to the size of the house or houses under construction. Power is also given to local councils to promote the formation of public utility societies by making limited grants or loans for housing. The number of houses built with State assistance between 1919 and 1923 was 721,000, of which such assistance was £1,000 and, of the latter, 74,000 were of not more than £100 value, or £1,000 value in the Metropolitan police dist. Since the first World War and up to 1930, the total amount of payments from the Exchequer solely in respect of housing amounted to £15,000,000. Up to 1936, more than 500,000 new houses had been built in the United Kingdom. So far as slum clearance was concerned already, by that year 400,000 slum dwellers had been provided with new and better accommodation under the gov's slum clearance programme.

The Act of 1930 (the so called 'Slum Clearance' Act) made further provision with respect to the clearance or improvement of unhealthy areas, the repair or demolition of insanitary houses and H. of the working classes. It also amended all the previous Acts relating to H. subsidies. Where local authorities declare an area to be an *improvement area*, due provision

must be made for persons displaced, whether through demolition abatement of overcrowding etc., and similarly where areas are scheduled as clearance areas which in effect means demolition. Increased powers were given to local authorities to enforce notices to repair or demolish insanitary houses but an appeal lay to the co court. Where premises were demolished the co court had power to determine the lease. The re-enacting clauses of the Act of 1936, make no more than indirect reference to improvement schemes and it is to be presumed that the appropriate remedy is now only by clearance schemes except where improvement schemes were initiated before the Act of 1936 came into operation. A clearance scheme applies to an area in which the houses are by reason of disrepair or sanitary defects unfit for habitation or by reason of their bad arrangement or the narrowness or bad arrangement of the streets dangerous or injurious to the health of the inhabitants and in which the other buildings if any in the area are for a like reason dangerous or injurious to health and where the most satisfactory method of dealing with the conditions in the area is the demolition of all the buildings in the area. But the local authority is bound first to provide suitable alternative accommodation for the persons of the working classes who are displaced by the clearance. The usual conditions as to passing and submitting a resolution apply. In any case the scheme must be within the local authority's resources. A clearance order requires confirmation by the Minister. The owner or owners of the property involved must demolish it within 6 weeks from the date at which the order requires the buildings to be vacated, and if the local authority undertakes demolition they too must do so within that period.

A survey was undertaken by the Ministry of Health in 1936 into the incidence of overcrowding and over 100 local authorities co-operated in it. The result showed that of a total of 8,924,23 dwellings inspected, 341,433 (3.8 per cent) were overcrowded, and that the survey also showed that the vast majority of working class dwellers are housed well above the overcrowding level (see *infra*) except that the concentration at the disposal of large families of eight units or more has on the whole been sufficient. The average overcrowding percentage for the different classes of local authorities was 1.0 in boroughs, 7.0 in co-boroughs, 1.2 in non-co-boroughs and urban districts, 3.0 in rural districts, 2.3. The percentage in London varied from 17.2 (Shoreditch) to 1.7 (Woolwich). In co-boroughs from 20.8 (Bundoran) to 0.3 (Bournemouth) and in geographical counties from 12.0 (Durham) to 0.7 (Isle of Wight). Of 87,043 council houses inspected, 44,888 or 51 per cent were found to be overcrowded—as compared with a percentage of 34 per cent for privately owned dwellings.

The H. Act, 1935 (repealed but re-

enacted in the codifying Act of 1936), sponsored by Mr Kingsley Wood, introduced new measures for the abatement of overcrowding and the fixing of a national standard of accommodation (Schedule I). There is a statutory definition of overcrowding, though the Minister of Health and the local authority may in certain circumstances, relax the standard.

The overcrowding standard may be relaxed by the Minister only where a large proportion of the housing accommodation in the area is constituted by dwelling houses consisting of few rooms or rooms of exceptional floor area and then only after consultation with the Central Advisory Committee (see *infra*). The local authority may also relax the standard by licence but only owing to the existence of exceptional circumstances including seasonal increases of population, e.g. influx of visitors at holiday times. In any event there is a time limit on relaxations. Both landlord and tenant are made responsible for overcrowding and there are statutory defences available, e.g. if alternative accommodation was offered and refused. The steps to be taken by the local authority with regard to overcrowding are by way of inspection and report followed by proposals for new accommodation and the decision when the steps have to be completed are fixed by the Minister. If the result of the inspection is such as to call for a redevelopment scheme the local authority will have to pass a resolution to that effect and within 6 months prepare a redevelopment plan for submission to the Minister.

In regard to redevelopment the codifying Act of 1936 provided that if the local authority for any urban area are satisfied that their district comprises any area containing 50 or more working class houses, that at least one third are overcrowded or unfit or congested, that the industrial and social conditions of the district are such that the area should be used to a substantial extent for the working classes, and that it is expedient in connection with the provision of accommodation for the working classes that the area should be redeveloped as a whole, it is the duty to pass a resolution declaring the area a redevelopment area and proceed accordingly.

Under the Minister and local authority there is statutory provision for the constitution of a Central H. Advisory Committee to advise both the Minister and the various H. Management Commissions. These Commissions are of a permanent character and exercise such of the local authority's functions as to the management, regulation and control and the repair and maintenance of working class houses and other buildings or land provided in connection with such houses, as may be delegated to them by the local authority with the approval of the Minister. Provision is also made for the encouragement and promotion of H. Associations—voluntary bodies which are evidently 'public utility societies' under a new name. These associations are entitled to the same amount of subsidy

as the local authority itself would have been entitled to under the Act of 1925.

A demolition order may now be made in respect of 'obstructive buildings, which, although in themselves not unfit for habitation, would detract from the benefit of the measures taken for the improvement of H. conditions. A building, for this purpose, will be 'obstructive' if it is, by reason *only* of its contact or proximity to other buildings, dangerous or injurious to health. An offer may be made to the local authority by the owner for the sale of his interest and for assessment of compensation and the local authority is bound to accept the offer if made in the terms prescribed by statute. If no offer be made the owner must demolish within a specified period or the local authority will enter and demolish, and sell the materials in the usual way.

An exchequer subsidy will be paid in respect of blocks of flats of not less than three stories, built on expensive sites. Local authorities will be called on to contribute sums equal to half the amounts of the Exchequer payments. The idea implicit in the Act of 1935 is that private building enterprise should house the classes who can pay economic rents while the local authorities are to house the neediest with the help of subsidies.

Powers are conferred on local authorities compulsorily to acquire properties for *reconditioning* at market valuation or to arrange with property owners or public utility corporations to carry out reconditioning.

As regards the compensation provisions of the H. (Financial Provisions) Act of 1935, provided that in dwelling houses or other buildings were no longer to be included in slum clearance areas and compulsorily acquired at site value. The 'production factor' reducing compensation otherwise payable to owners of property required for H. purposes was abolished by the same Act. The Act also provided that a distinction should be made in favour of landlords who had endeavoured to maintain slum property in habitable condition, and special compensation paid to them on the basis of the amounts expended on repairs in the 5 years preceding condemnation.

Concurrently with the question of the supply of new houses, there arose as a result of the First World War, an economic problem concerning the rents of pre-war houses. Owing to the demand exceeding the supply it was foreseen that property owners would seek to profit unduly at the expense of their tenants. To prevent threatened hardship the Rent Restrictions Act of 1915 was passed, and no increase in rent beyond that of 1914 of small houses was permitted until 1919, when, owing to the greatly increased cost of repairs, some advance in rents became necessary. Perhaps profiteering was most flagrant in the case of furnished houses, and these were included in a further Act in 1920. Increases of rates, however were passed on to the tenant. In 1925 an Act which continued till 1927 provided

that houses which became empty after 1923 ceased to be controlled. (See RENT RESTRICTION ACTS.)

While, then, the primary need for new houses claimed the greater prominence in the gov.'s attention to H. in the years immediately following the First World War slum clearance received most attention in the field of legislation after 1930. Up to 1926 schemes resulted in the demolition of 11,572 houses. This number was only a very small proportion of those needing demolition. Indeed, it is a question whether that number was not equalled by the growth of fresh slum areas, through overcrowding and neglect of repairs, aggravated by demolition. The method of H. the poor in tenement dwellings, and the least popular according to the findings of the Chamberlain Committee on Unhealthy Areas, appeared to be the only sound alternative in congested areas built in areas, as they are called. The difficulties of space and the workers travelling to work offer no ready solution. But in rural areas it is possible to develop H. homes side by side with the planning idea. By the Act of 1919 every urban authority of 20,000 inhabitants was compelled to offer schemes for the approval of the Ministry of Health. An important part of the schemes was the division of the new areas into zones, for industrial, commercial, shopping, residential, and public use. By 1926 nearly 300 schemes had been evolved. Some 800,000 persons were removed from slums into new houses during the first five years' programme for slum clearance (1919-24) and during that period 168,134 houses were demolished. Since that year the plan was extended to cover over 130,000 slum dwellings. Leeds, the most notorious for slums, then had the most advanced schemes for H. Decentralised renting was introduced in 1921. The need was to be housed in accordance with the size of their families, regardless of their paying capacity, and the rents were to be fixed in proportion to their incomes.

It is a cynical comment on the great procession of H. Acts—with their total annual burden of £1,000,000 accrued by 1935—that the 'G' bomb has done more to eliminate slums than all the legislation. When the air raids began in 1940 overcrowding in shelters and on tube platforms at night rendered the painfully won national standard of accommodation of 1935 a mockery. Fortunately large-scale evacuation from London prevented serious congestion in the Metropolis despite considerable destruction of H. accommodation. Even where bombing had been concentrated on a particular area, and workers had had to move away from their work, the great net-work of London's transport services was instrumental in obviating any enduring difficulty in travelling. But this fortuitously happy combination of circumstances did not obtain in many of the chief provincial cities, which had suffered heavy bombardment. There, evacuation had been on a much smaller scale, and the destruction of living accommodation raised

1

an acute H. problem. Furthermore, overcrowding and social distress were only the beginning of the nation's difficulties in this matter. Some industrial towns were soon being threatened with a situation in which it was not physically possible to house workers within reasonable distance of their work. This problem was beyond the control of the local authorities, and its solution required compulsory billeting over a wide area, coupled with the general requisitioning of all available large or empty houses and halls. It called also for the immediate construction of new accommodation in the form of huts, hostels, and temporary houses and a still more vigorous evacuation policy. It became obvious that rehousing was not simply a post-war problem; in some areas it was a problem which, on a temporary basis at least, required prompt solution in order that neither public morale nor production might suffer.

**Housing after the Second World War.**—A greater H. problem than that imposed on the country by the First World War was that which followed the Second. Millions of houses were destroyed or more or less seriously damaged in the air raids; moreover the programme of house-building during the war years was a very limited one, as was that of the immediately antecedent period. After hostilities had ended Britain entered upon an era of the most acute economic crisis when the shortage of both labour and, still more, of materials made it impossible for some time to carry out even a small part of the planned H. programme. Far more new permanent houses were planned and actually started in 1946 than could possibly have been finished within a reasonable time. Up to the end of that year some 170,000 families were found accommodation by the repair or refashioning of existing dwellings, as against 150,000 families rehoused by the construction of new dwellings. The most fruitful form of new construction was the temporary housing scheme which yielded 92,000 new homes (pre-fabricated houses). The three types of permanent house construction—provision by local authorities, provision by private builders and other private agencies, and the rebuilding of war-damaged dwellings—together produced no more than 55,000 dwellings. Of these, 24,000 were municipally owned and 25,000 (nearly all for sale) privately owned. During the war scarcity of building labour was generally expected to be the main obstacle to a rapid expansion of house construction. As demobilised building workers became avail-

able in all districts, tremendous pressure was applied to get house building started in all districts, in order to prevent any drift of labour out of the building industry. But later, and before the close of 1946, it became easier to enlarge the number of workers than to enlarge the supply of materials needed to keep them fully occupied, and in Dec. 1946 the industry's total labour force 1,250,000 was practically equal to what it had been in 1939 (June) 1 or 1947 H. work of all kinds was allotted three-fifths of all building labour. Work on existing houses (maintenance, repairs, conversions, (tc.) was to be allowed to absorb 280,000 operatives, while 300,000 were to build new permanent houses. With this labour force, and with a stock of 204,000 unfinished dwellings left over from 1946 (including 97 per cent of the municipal houses started in 1946), the aim for 1947 was: the starting of 240,000 new permanent dwellings, of which 201,000 would be carried forward for completion in 1948, and the completion of 240,000, including the 204,000 brought forward from 1946. The houses to be completed included 190,000 municipal dwellings, 15,000 war-damaged houses and 35,000 to be built by private enterprise and other agencies. Some 60,000 bungalows wanted to wind up the temporary H. scheme were also included in the 1947 programme. The first white paper on post-war H. (dated March 1945) set out three objectives. The first was to give every family a separate home and, to do this, it was estimated that 750,000 dwellings would be needed. The second was to continue the slum-clearance schemes suspended during the war; it is estimated that another 500,000 houses would be needed to replace unfit houses and to relieve overcrowding already condemned before 1939. The third or long-term objective was defined as 'a continuous programme of improvement in housing conditions, bringing old houses up to date, converting others into flats, and building new houses where necessary to meet changes in the location of industry. No figure was assigned for this but the minister of health, much later, said that they had to 'envisage a programme of something like 4,000,000 to 5,000,000 houses, and even then we should have some arrears still left.' Though the target of 750,000 houses above mentioned was reached the number proved hopelessly inadequate to its purpose. Between the end of the war and mid 1949, the number of new houses completed in Great Britain reached 684,013 (226,897 permanent and 457,116 temporary) during Sept. was attained the objective of 750,000 addi-

#### SOME EXAMPLES OF ENGLISH HOUSING

1. Acrey type houses of non traditional construction in the New Forest, living room kitchen, parlour scullery, three bedrooms, bathroom and W.C., wash house, fuel store and second W.C. in out building. 1947.
2. Traditional brick houses in Barrington Road, Worthing (architect C. Cowie Voysey, F.R.I.B.A. living-room, kitchen, three bedrooms, bathroom, separate W.C., and outbuilding containing fuel and tool stores. 1947. *C.O.I. Crown copyright*
3. Aluminium prefabricated houses at Cheltenham, two bedrooms. *Hauspav.*
4. Flats at Hildrop Estate, Islington. 207 flats in 4 blocks—2 one-room, 33 two-room; 81 three room; 81 four-room; 10 five room, completed in 1948. *London County Council.*

tional houses, which the Coalition Gov. had estimated at the end of the war to be necessary to provide a separate home for each family in need of one. In mid-1949, 190,486 permanent houses were under construction in Great Britain, and an additional 63,867 more were approved but not begun. The monthly figure of permanent houses put into occupation over the preceding year exceeded 15,000, and the yearly total increased steadily in the period 1945-48. Moreover, there was a gov. programme for the building of 15,000 aluminium bungalows, allocated to mining areas to relieve a particular need. For rural dists. Sir Edwin Airey designed a two-storey house of concrete blocks and posts, and 2,000 of these were allocated. The need for increased production of coal and food led the gov. to give priority to the housing needs of workers in mines and on the land; from April 1947 to June 1949 30,328 new permanent or temporary houses built by local authorities were let to miners, and from April 1945 to June 1949 18,418 to agric. workers. The difficulty of softwood timber imports was a limiting factor; supplies from Europe and Russia contracted sharply in comparison with pre-war years, and N. Amer. imports were a charge on dollar resources. By the end of June 1949, 912,700 families had been housed: 681,043 in permanent or temporary new houses; 139,887 by the repair of houses rendered uninhabitable by bombing; 111,770 by the adaptation and conversion of existing dwellings. When the use of service camps and temporary huts, and requisitioning is taken into account, 999,710 families were housed. Some three and a quarter million people had, in sum, been provided with homes. Repairs were also effected to 775,000 damaged but habitable houses.

More and better houses have been built in Great Britain than after the First World War, though perhaps fewer than in 1933 when there were fewer men to build them. Houses today however are one-fifth larger than before 1939 and there are more fittings, points and gadgets. This may partly account for their taking longer to build today. It has been calculated that if the housing situation requires a programme of four to five million houses at the pre-1939 rate of building it would take from thirteen to sixteen years to complete; and at the present (1949) rate it might take seventeen to twenty years. As regards construction, some experts think there is not sufficient experimentation with non-traditional methods; others, however, think that brick is always to be preferred. Experience has shown that the 'pre-fab' house takes as long to build, besides costing as much, if not more. A committee of inquiry into cost recently reported that a typical local authority house of 1947 cost 31 times as much as its pre-war counterpart and required double the labour and a third more material. In London the average cost was £543 in 1939, including the cost of land, roads and sewers; in 1949 the comparable average figure was £1816—threefold more. Rents, however, are not three times more.

The rents ordinarily payable by the persons of the working classes are mostly controlled rents under the Rent Restriction Acts, pegged at 1914 rents plus 40 per cent in the case of old-controlled houses, or at 1939 rents for others. To enable local authorities to keep the rents of new houses down to a reasonable level, the subsidy was raised to £16 10s. a year for 60 years from the State, and to £5 10s. from the local rates or £22 per house in all. This subsidy, it was estimated, would enable the rent to be fixed at 10s. a week. But though building costs had risen since 1946 the subsidy remained the same, and to meet the higher interest charges on the higher capital cost, local authorities had to increase the rent, or make larger contributions from the rates, or both. Private builders were (1949) building for owner-occupiers one-fifth of the total number of houses allocated; in addition, the greater proportion of local authority houses were being erected by private builders, working under contract for the local authority. In June 1949 the maximum price of privately-built houses was made variable according to the type and size of house, and was to be assessed by the local authority according to the cost of similar houses built by them, instead of being tied to the previous limit of £1,300 (£1,100 in London). Also the maximum superficial area of such houses was raised from 1,000 sq. ft. to 1,500 sq. ft.

Under the Housing Act of 1949, which applies to England and Wales, improvement carried out by the local authority must ensure satisfactory accommodation for at least thirty years, and the work must conform to standards of amenity and fitness specified by the minister. Exchequer grants towards the cost will equal three-quarters of the estimated annual loss to the local authority, the remaining quarter to be met from local rates. Local authorities will pay grants for the approved schemes of private owners, to the maximum of one-half; an Exchequer contribution will be given to the local authority. From most sections of the Housing Acts the term "working classes" is deleted, thus enabling local authorities to create balanced communities by the provision of mixed estates of houses of varying type and size. Local authorities are empowered to provide restaurant and laundry services and to sell furniture. Allowances for persons displaced from sites acquired for housing are permitted. Control of selling price and rents of new premises provided by building or conversion is extended from Dec. 1949 to Dec. 1953. The £1,500 limit on house-value for which councils may loan money for purchase under the 1936 Housing Act or the Small Dwellings (Acquisition) Acts is raised to £5,000. Other provisions include special subsidies for residential hotels provided by housing associations, new tn. development corporations, or local authorities; the preservation of houses which have special historic or architectural interest; an increase of Exchequer subsidies and contributions from the rates in cases where building costs are

raised by measures (e.g. building in stone) taken to preserve the character of the surroundings, such measures to be approved by the minister; and the quashing of demolition orders, operative before Jan. 1, 1946, where houses have been made fit for habitation, as has happened in a small number of cases. The extra subsidies payable for houses and flats built on expensive sites will be adjusted for schemes approved by the minister after Feb. 1949, in order to take into account variations in density of development.

Fremantle, *Housing and the Nation*, 1926; T. Sophian, *The Housing Act, 1935*; The League of Nations, *Urban and Rural Housing*, 1939; Ministry of Health, *Annual Report, 1941-45*, 1945; M. Bowley, *Housing and the State, 1919-1944*, 1945; Dent's 'Design for Britain' booklets, 1942-44; Bournville Village Trust, *Land-usage and Housing Development* 1949; and S. Gale, *Modern Housing Estates*, 1949.

**Housman, Alfred Edward** (1859-1936), Eng. Latinist and poet. Educated in Worcestershire at Bromsgrove School; St. John's College, Oxford. Higher-div. clerk in H. M. Patent Office, 1882-92. Prof. of Lat., Univ. College, London, 1892-1911. Fellow of Trinity College, and prof. of Lat., Cambridge, 1911. Pub. poetry is *A Shropshire Lad* (1896), *Last Poems* (1922). Ed. *Manilius*—Bk. I, 1903; Book II, 1912; Book III, 1916; Book IV, 1920; Book V, 1930; *Juvenal* (1905), *Lucan* (1926), *More Poems* was pub. posthumously in 1936. There have been many reprints of *A Shropshire Lad* which is a string of sixty-three ballad-like poems (they have been set to music)—on love, country-life, drinking, and fighting. H.'s poetic craftsmanship is remarkably perfect in one who could give comparatively little time to verse. His total output is small, but in his work there is hardly a weak line. He has the secret of creating beauty by scrupulous elimination of the decorative ornamental. In regard to the content of his poetry, he has been compared to Hardy, but the likeness is superficial, for his philosophic outlook is that of the unregenerate fatalist, despairing but resolute in his acceptance of man's hopeless struggle. See L. Housman, *Some poems, letters and a personal memoir*, 1937; and G. Richards, *Housman*, 1939.

**Housman, Laurence**, Eng. author and illustrator, b. 1865; brother of Alfred Edward H. Studied art at S. Kensington, and illustrated: George Meredith's *Jump-to-Glory Jane* (1892), Christina Rossetti's *Goblin Market* and Jonas Lie's *Weird Tales from Northern Seas* (1893), his sister Clemence's *Were-Wolf* (1896), Shelley's *Sensitive Plant* (1898), and his own *Farm in Fairyland* (1894) and *New Child's Guide* (1911). His poetry, much influenced by D. G. Rossetti, includes: *Spikenard* (1898), *Mendicant Rhymes* (1906), *The Heart of Peace*, etc. (1918), *The Love Concealed* (1928). His tales include: *All Fellows* (1896), *The Blue*

*Moon* (1904), *John of Jingalo* (1912), *The Royal Runaway* (sequel to preceding, 1911), *Turn Again Tales* (1930). His novels are: *An Englishwoman's Love-Letters* (1900), *A Modern Antares* (1901), *Subrina Warham* (1904), *Trimblerrigg* (1921), *Uncle Tom Pudd* (1927), *H.L.H. the Duke of Flamborough* (1928). Plays include: *Prunella* (with H. Granville-Barker, 1911), *The Death of Orpheus* (1921) *Possession* (1921), *Little Plays of St. Francis* (1922). He has also written *Arthur Hoyd Houghton* (1896), *Dethronements* (imaginary dialogues, 1922), *Echo de Paris* (about Oscar Wilde, 1923), *Palace Plays* (1931), *The Queen's Progress* (1932), *The Unexpected Years* (1933), *Palace Scenes* (1937), *Collected Poems* (1938), *Gravious Majesty* (1941), *Samuel, The Kingmaker* (1944).

**Housain, or Hussein**, son of Ali and Fatima, see HASSAN.

**Houssay, see HAUSAY.**

**Houssaye (or Housset), Arsène** (1815-96), Fr. littérateur and poet, famous by 1836 for his novels, *La Couronne de Bleue* (1840), and *La Pêcheresse* (1865). He was director of the Théâtre Français (c. 1849-56), and then became inspector-general of the Musées. His works include criticisms of art and literature, poetry (*Poésies Complètes*, 1849), and many novels. His *Confessions* appeared in 1845-91. See J. Lemaitre, *A. Houssaye*, 1897.

**Houssaye, Henri** (1818-1911), Fr. historian, son of Arsène. His early works, such as *Histoire d'Apelle* (1867), *Histoire d'Alcibiade* . . . (1873), dealt with classical antiquities. His best writings are those treating of the Napoleonic period. '1814' (1888), followed by '1815' in three parts (1893-1905), the second dealing with *Waterloo*, the third with *La seconde restauration, la terreur blanche*. *Napoléon, homme de guerre*, appeared in 1901. H. became a member of the Fr. Academy, 1894. He wrote under the pseudonym 'Georges Werner.' See L. Solovet, *Henri Houssaye*, 1901.

**Houston**, cap. of Harris co., Texas, U.S.A., on Buffalo Bayou, 18 m. N.W. of Galveston on the gulf of Mexico. The Bayou is navigable to H. and over fifty steamship lines use the port. H. is also a very important railway centre. Manufs. include engines, machinery, railway-cars. Sugar, cotton, and oil are produced, and lumber trade flourishes. Settled in 1836, it was named after Sam H., and has fine public buildings. Pop. 384,500.

**Houston, Samuel** (Sam) (1793-1863), Amer. soldier and politician, first president of Texas (1836). In early life he lived among the Cherokee Indians in Tennessee. He enlisted, 1813, serving in the army till 1819, notably in Jackson's campaign against the Creeks. H. then left to study law, and became governor of Tennessee, 1827. On the outbreak of the Texan War, H. became leader of the Amer. colonists. After some losses he defeated the Mexicans under Santa-Anna on the San Jacinto (1836), thus winning independence for Texas. He was elected president, and served again from 1841 to 1844. On the annexation of Texas (1845),

he represented it in the U.S.A. Senate, 1846-59. Elected governor of Texas in 1859, he was dismissed (1861) for opposing his state's secession. See lives by A. Williams, 1893; W. Crane, 1881; H. Bruce, 1891 and M. James, *The Raven: the Life of Sam Houston*, 1929.

**Houting**, see under CORGONUS POLLAN.

**Houton**, see NORMOT.

**Hove**, or **West Brighton**, municipal bor. and the most fashionable quarter of Brighton, on the coast of Sussex, England. It has many fine shops and clean well-spaced streets. Along the parade are well-kept gardens. The Sussex Co. Cricket Ground is here. Pop. 75,300.

**Hoven**, see HOOVE.

**Hovey**, Richard (1861-1900), Amer. poet, b. at Naumk, Ill.; graduated at Dartmouth, and followed various professions in succession; came to Europe and trans. poems of Maeterlinck. Wrote much original verse, including *Luincht and Guinevere*, a series of dramas, *Tallierin*, *A Masque*, and *Seavari*, pub. together in a posthumous collection, *The Holy Grail* (1907). Collaborated with Bliss Carman (q.v.) in *Songs from Vagabondia* (1893 and 1896), and pub. miscellaneous poems, *Along the Trail* (1898).

**Howard**, illustrious Eng. family, dukes of Norfolk since the fifteenth century, at the head of the nobility, perhaps descended from the Hereward of Edgar's reign (957-75). The first noted member of the house was Sir William H., or Haward, chief justice of the Common Pleas under Edward I. and Edward II. (1297-1308). His grandson, Sir John, was admiral and captain of Edward III's navy in the N., and sheriff of Norfolk. The admiral's great-grandson, Sir John, was a prominent Yorkist, created first duke of Norfolk and earl-marshal of England (1483). He fell at Bosworth Field (1485) fighting for Richard III. His son, Thomas, earl of Surrey, was imprisoned for three years, but then regained his rights and titles, commanding the Eng. at Flodden (1513). His son, Thomas, third duke of Norfolk, was attainted by Henry VIII., and only escaped a death similar to that of his son, Surrey, the poet, by Henry's own death. Thomas, the fourth duke, was beheaded for communicating with Mary Queen of Scots (1592). His son, Philip, earl of Arundel, died in the Tower (1535). The family honours were restored by the Stuarts to his descendants. Thomas became earl of Arundel and Surrey (1604), and earl marshal (1621). Bernard Edward H. (duke of Norfolk, 1815), was great-grandfather of the sixteenth duke, Bernard Marmaduke Fitz-Alan H. (b. 1908).

The numerous branches of the family of H. are represented by the dukedoms or earldoms of Carlisle, Suffolk, Berkshire, Northampton, Arundel, Wicklow, Norwich, Eppingham, and the baronies of Hindon, Howard de Walden, Howard of Castle Rising, Howard of Eppingham, and Howard of Glossop. See Sir W. Dugdale, *Baronage of England*, 1675-76; G. Howard, *Historical Anecdotes of the Howard Family*, 1769; A. Collins, *Peer-*

*age of England*, 1779; M. Tierney, *History of Arundel*, 1834; H. Howard of Corby, *Memorials of the Howard Family*, 1834; H. K. Causton, *The Howard Papers*, 1863; C. T. Gatty, *The Noble Family of Howard*, 1879; G. Brennan and E. Statham, *The House of Howard*, 1907.

**Howard, Catherine** (c. 1520-12), granddaughter of the second duke of Norfolk (d. 1524); brought up by his widow, she became fifth wife of Henry VIII. soon after the divorce of Anne of Cleves (1540). This marriage pleased the Rom. Catholic party, but Catherine was soon accused of immorality with Culpeper and Dereham. She protested that she had been faithful to the king since her marriage, but was beheaded with all the partners of her intrigues, including Lady Rochford (1542). See J. Froude, *History of England*, iv., 1858; Agnes Strickland, *Lives of the Queens of England*, iii., 1877.

**Howard, Charles**, second Lord Howard of Effingham (1536-1624), Eng. admiral, grandson of the second duke of Norfolk. He held various civil and military posts under Elizabeth, becoming lord high admiral (1593). As commander-in-chief against the Sp. of the Armada (1588), he had Drake as his second-in-command. H. was associated with Essex (1596) in the successful expedition against Cadiz, and made earl of Nottingham in reward for his services. When fresh Sp. invasions were feared, between 1597 and 1599, Nottingham was appointed lord-lieutenant of England. He continued to hold high office under James I. See J. Campbell, *Lives of British Admirals and Eminent Seamen*, i., 1779.

**Howard, Sir Ebenezer**, Eng. urbanist (1850-1924); b. at London. Began work as a clerk in various stockbrokers' offices in the city. Emigrated to Nebraska where he farmed for a short time, but moved to Chicago and took up the calling of shorthand writer. Returned to England in 1876 where we worked at shorthand writing in the Law Courts and elsewhere. The Garden City founded by A. T. Stewart on Long Island and now a suburb of New York probably first aroused his interest in the planning. H. married in 1879, and at the Zetetical Society, a debating club, first met G. B. Shaw and Sidney Webb.

Possibly suggested by Henry George's *Progress and Poverty*, H.'s scheme for a garden city based on land values created by the community was embodied in his book *Tomorrow: A Peaceful Path to Real Reform* (1891, revised 1902) which expounded his theory of rent-rates. H. did not advocate the nationalisation of land but its ownership by municipal authorities who would derive the whole of their revenue from rents or leases, thus ensuring that development value of land should accrue to the advantage of the community. He inspired though he did not organise the founding of Letchworth and Welwyn Garden Cities in 1903 and 1919 respectively. Became O.B.E. 1921, knighted 1927. Died at Welwyn Garden City, where he is commemorated by a memorial, as also at Letchworth. See

life by D. Macfadyen, 1933; and C. B. Purdom, *The Building of Satellite Towns*, 1925, 1949.

Howard, Frederick and George William Frederick, see CARLISLE, EARLS OF.

Howard, Henry and Thomas, see SURREY, EARLS OF.

Howard, John (1726-90), Eng. philanthropist, especially famous for his labours to secure prison reforms. While attempting to go to the relief of the survivors of the Lisbon earthquake (1755), he was captured by the Fr., but soon managed to effect an exchange for himself and his fellow-prisoners. He became high sheriff of Bedfordshire (1773), and in this capacity had his interest in the condition of prisoners roused. He travelled widely, visiting gaols throughout England and Europe. His *State of Prisons in England and Wales, with an Account of some Foreign Prisons* . . . (1777), resulted in the adoption of the hard-labour system. An Appendix was added in 1780. His *Account of the Principal Lazarettos in Europe* appeared in 1789. He died of camp-fever at Dophinovka, now Stopanovka, near Kherson in Russia. See lives by J. Aikin, 1792; J. Baldwin Brown, 1818; T. Taylor, 1836; W. Dixon, 1849; J. Field, 1850; J. Stoughton, (new ed.) 1881; E. H. C. Gibbon, 1921; also *Anecdotes of J. Howard by a Gentleman*, 1790, and J. Field, *Correspondence of J. Howard*, 1853; A. R. Gardner, *The Place of John Howard in Penal Reform*, 1920. There now exists a H. League for Penal Reform with offices in London to promote the right treatment of delinquents and the prevention of crime.

Howard, Leslie, stage name of Leslie Stainer (1893-1943), Eng. actor, b. in London; educated at Dulwich College. On leaving school he worked as a clerk in a bank until the outbreak of war in 1914 when he served in the army until his discharge in 1917. He then decided to fulfil an early ambition to become an actor. He joined a touring company and his first appearance was as Jerry in *Peg o' My Heart* in 1917. He appeared on the London stage the following year, playing in *Mr. Pim passes by*, *Our Mr. Hepplewhite*, and other plays. He spent the next few years in New York, and returned to London in 1925, appearing at the Queen's Theatre in *The Way You Look at It*. During a second visit to New York in 1927 he produced *Her Caribbean Lover*, in which he made one of his greatest stage successes. He brought the play to the Lyric Theatre, London, the following year. Other notable performances were in *Berkeley Square* (1929) and *This Side Idolatry* (1933), in which he played the part of Wm. Shakespeare. He was himself the author of a play produced in New York as *Murray Hill* in 1927 and in London as *Tell me the Truth* in 1928. From 1930 onwards he played a number of leading parts in films, including *Of Human Bondage*, *The Petrified Forest*, *The Scarlet Pimpernel*, and its modern counterpart *Pimpernel Smith*, and *Eggmalion*. During the Second World War he did valuable work as a 'voice of Britain'

in his broadcasts to overseas listeners. In 1943 he went to Madrid to lecture on behalf of the Brit. Council. He was killed on the return journey when the aeroplane in which he was travelling was brought down by enemy aircraft (June 1, 1943).

Howden, par. and mkt. t.n. of E. Riding Yorkshire, England, on the Ouse, 3 m. N.N.E. of Goole. It has a thirteenth-century church and a famous horse fair. Coal is mined. Pop. 11,900.

'Howe,' battleship of the *King George V.* (g.r.) class, laid down in 1937 on the Clyde and commissioned in 1942. Her displacement, complement, size and armament are similar to those of the *Anson* (g.r.).

Howe, Elias (1819-87), Amer. inventor, b. at Spencer, Massachusetts. While employed as a machinist he conceived the idea of inventing a sewing-machine, entered into partnership with Fisher (1844), and completed his lock-stitch machine, 1845. He was granted a patent (1846), but success was long in coming to him. The imitations and improvements of Isaac Merritt Singer (1811-75) and of others infringed his patent, but H.'s rights were finally estab. after a law suit (1854). See J. Parton, 'History of the Sewing-Machine,' in the *Atlantic Monthly* (May 1867); P. G. Hubert, *Inventors*, 1893.

Howe, John (1630-1705), Eng. dissenting minister, known as the 'Platonic Puritan.' He was domestic chaplain to Cromwell the Protector and his son Richard (1656-59). The Act of Uniformity (1662) ejected him from Great Torrington. He returned to London as minister of a Puritan congregation (1675). He travelled abroad with Lord Wharton (1685), but returned on James's 'Declaration for Liberty of Conscience' (1687). His works include: *The Blessedness of the Righteous* (1668), *The Redeemer's Tears* . . . (1684), and his fine production *The Living Temple* (1671-1702). See lives by E. Calamy, 1832; S. Dunn, 1836; and R. F. Horton, 1896.

Howe, Joseph (1801-73), Canadian statesman, b. at Halifax, N.S. Became (1828) proprietor and ed. of the *Academy Scotian*, to which he contributed many sketches. He was elected to the local Parliament, and was instrumental in winning for Nova Scotia a responsible gov. Became speaker of assembly (1840), secretary of state for the dominion (1870), and governor of Nova Scotia (1873).

Howe, Julia (née Ward) (1819-1910), Amer. poetess and philanthropist, married in 1843 to Dr. Howe. With him she ed. the *Boston Commonwealth* (1851-53). She lectured on social subjects, and was active in championing the cause of women, and urging prison and other reforms. She helped to organise the Amer. Women Suffrage Association (1869), and in 1872 was president of the New England Women's Club. Her works include: *Passion Flowers* (1854), 'Battle-Hymn of the Republic' (1862), and other poems, all collected in *From Sunset Ridge Poems Old and New* (1898), two dramas (1855, 1858), the prose works *Sex and Education* (1874), *Modern Society* (1881),

*Reminiscences, 1810-99* (1900). *Sketches of Representative Women of New England* (1905). See *They Walk with God*, by her daughter, Laura E. Richards, 1919.

**Howe, Richard, first Earl** (1726-99), Eng. admiral, a younger son of Emanuel Scrope Howe, second viscount Howe in the Irish peerage; his mother was the daughter of Baron Kichmanssee, Master of the Horse to George I. when Elector of Hanover. He served with distinction in

RICHARD, FIRST EARL HOWE

the Seven Years' war against the Fr. (1756-63), accompanying Boscawen to N. America, helping to capture the 'Alcide' and the 'Lys', and being present at Quiberon Bay (1759). He became treasurer of the navy (1765-70). In 1776 he returned to N. America as commander-in-chief, and forced the passage of the Delaware, successfully resisting the Fr. under D. E. Laung. He next won fame by his relief of Gibraltar (1772), and returning to England became first lord of the admiralty (1783-88). His most famous achievement was the victory of 'the glorious first of June' (1791) over the Fr. off Ushant. See life by Sir J. Barrow, 1838. See also: I. Campbell, *Lives of the British Admirals and Eminent Seamen*, 1779; J. Rupp, *Naval Biography*, 1, 1826; and T. Anderson, *The Command of the Howe Brothers during the American Revolution*, 1936.

**Howe, Samuel Gridley** (1801-76), noted Amer. philanthropist, known as 'the Lafayette of the Gk. Revolution' for his services in the War of Independence from 1821-30. After returning to Boston he worked to establish there a school for the blind, becoming director of the Perkins Institute (1822). He was especially successful over the case of Laura Bridgman (1829-83) (q.v.). In 1846 Dr. Howe concerned himself with the education of idiots and the feeble-minded. He wrote *Historical Sketches of the Greek Revolution*

(1828), and a *Reader for the Blind*. See J. G. Whittier's poem, *The Hero*; J. W. Howe (his wife) *Memoir*, 1876; life by F. B. Sanborn, 1891; and L. E. Richards (ed.), *Letters and Journals*, 1910.

**Howe, Sir William, fifth Viscount** (1729-1811), Brit. soldier of the Amer. Revolution, succeeded his brother Richard as Viscount H. (1799); this Irish peerage becoming extinct on his death. Going to America (1758) he helped in the capture of Louisburg, and accompanied Wolfe to Quebec. He returned to Europe (1760), and after holding various commands became major-general (1772). He was again sent to America, commanding the Brit. at Bunker's Hill (1775). Driven from Boston by Washington (1776), he won the battle of Long Island, and entered New York. He later defeated Washington at the Brandywine (1777), and occupied Philadelphia, resigning soon afterwards. See *Narrative of Sir W. Howe*, 1780; and T. Anderson, *The Command of the Howe Brothers during the American Revolution*, 1936.

**Howeloke, Johann**, see HEVERIUS.

**Howell, James** (c. 1594-1686), Brit. author, graduated from Oxford (1613). He travelled abroad (1616-22), and then engaged for a time in diplomatic work. He was imprisoned from 1643-51, but released on the Restoration (1660), and appointed historiographer royal of England. His works include: *Druidology*; *Dodona's Grove or the Vocall Forrest* (1640, a poem); *Instructions for Foreign Travellers* (1642); *Le uon Ptolemy* (1660); and the *First and Most Familiar Letters Domestic and Foreign* (1645-1655, reprint by J. Jacobs of 10th ed. 1890-1891). Reppner's ed., 1907, (Temple Classics series). See W. Vain, *Notes on the writings of James Howell*, 1921, and E. Benson, *James Howell*, 1922-27.

**Howells, William Dean** (1837-1920), Amer. novelist, critic, and poet, b. at St. Martin's Ferry, Belmont, Ohio; son of Wm. Cooper H. He early became a journalist in Ohio, was United States consul at Venice, 1861-65, and on his return was connected with sev. New York newspapers, and with the Boston *Atlantic Monthly* (1866-81), becoming editor about 1871. He was the recognised leader of the realistic school, and his works discussing familiar incidents and details of ordinary everyday life in America have been both popular and influential. He tried some of the subtlety of Henry James, with a plainer narrative style. He pub. a campaign *Life of Lincoln* (1860), and *Poems by Two Friends* (H. and J. Piatt). Other works are: *Venetian Life* (1866), *Thou Wedding Journey* (1872), *The Lady of the Aroostook* (1874), *A Modern Instance* (1882), *A Woman's Reason* (1884), *The Rise of Silas Lapham* (1885), *The Minister's Charge* (1886), *A Hazard of New Fortunes* (1889), *The Landlord at Lion's Head* (1897), *Certain Delightful English Towns* (1906), the farces *Out of the Question* and *The Mouse Trap*; *Poems* (1873, 1886, 1895), *Literary Friends and Acquaintances* (1901), *Heroines in Fiction* (1901), *Literature and Life* (1902), *London*

*Films* (1905), *Between the Dark and the Daylight*, *Fennel and Rue* (1908), *Imaginary Interviews* (1910), *My Mark Twain* (1910), *New Leaf Mills and Familiar Spanish Travels* (1913), *The Seen and Unseen in Stratford-on-Avon* (1914). See J. M. Robertson, *Essays towards a Critical Method*, 1889; H. C. Vedder, *American Writers*, 1894; O. W. Kirkhus, *William Dean Howells*, 1921. He has been classed as 'one of the five Amer. novelists of international distinction.' See *Life in Letters*, by his daughter, Mildred Howells, 1924.

**Howell's State Trials.** The true originator of this series of 'State Trials' was Cobbett (1762-1835), in 1809, but they received their present title as T. B. Howell (1768-1815) ed. vols. i.-xxi. (1809-15), and his son T. J. Howell (d. 1858), vols. xxii.-xxviii.

**Howitt, William** (1792-1879), Eng. author. He began to write at an early age, and when he was thirteen, one of his poems appeared in the *Monthly Magazine*. In 1821 he married Mary Gotham, and husband and wife wrote many books in collaboration. He early studied natural science and modern literature and languages, becoming a very miscellaneous and prolific writer and very popular. *The Book of the Seasons, or the Calendar of Nature* (1831), a *Popular History of Priestcraft* (1833), *Pantula, or Traditions of the Most Ancient Times* (1835), and the *Rural Life of England* (1838), give some idea of his scope. His most successful work was a *Popular History of England* (1856-62). The literary work of H. and his wife covered poetry, fiction, history, translations, and social and economic subjects; useful and pleasing in its day, little of it has survived. Mary Howitt's autobiography was by her daughter in 1889.

**Howitzer**, name applied to a particular piece of ordnance which is of the greatest value in sieges. The word is derived from a Bohemian word meaning a catapult. This particular form of gun has been in fairly general use since the sixteenth century. It is a small, light gun which fires a shell at a small velocity but at a steep angle of descent. It has therefore proved invaluable as a means of bombarding trenches and scouring low-lying and hidden defences. The First World War occasioned a great development in Hs., and the employment of large pieces by the Gers. during the siege of Liège marked a definite advance in construction. The fortifications constructed before the war were no match for the huge weight of projectile used on them, so that when trench-warfare set in, and it was necessary to construct shelters for personnel, gun emplacements and protection of any kind within range, all former specifications of such works required considerable modification to meet the new weapon. Although the Gers. had this start of the Allies, the latter took prompt measures to nullify the disadvantage, and in the course of time heavier and heavier Hs. appeared in the zone of operations, until the 9.2-in. ('Mother') and the largest, the 16-in. ('Granny'), appeared in 1915. Hs. were generally employed against forti-

cations, dumps, guns and for cutting wire entanglements. If their work had been done too well they disturbed the surface of the earth so much that it was often difficult for the slide which employed them to traverse the ground to carry out the intentions of the commander. Transport and the removal of casualties were hampered a good deal in this manner. The conditions of static warfare favoured the employment of huge Hs., but their transport and ammunition supply precluded their employment in war of movement.

**Howling Monkeys**, name given to the species of *Myctes*, a genus of mammals belonging to the order Primates and the family Cebidae. They are hideous in appearance, having a prominent face and deep jaw, while the tail is long and prehensile. The howling is produced by the unusually developed sacular diverticula of the larynx. These monkeys are common to Central and S. America.

**Howrah**, tn. of W. Bengal, India, on the R. Hugli, opposite Calcutta, of which it forms a suburb. It is a railway terminus, and has dockyards and manuf. of jute and cotton. Pop. 379,290.

**Howth**, tn. situated on a rocky peninsula (563 ft. high) of the same name, N. side of Dublin Bay, Ire. It is an important fishing depot and a summer resort. There are ruins of an abbey of the thirteenth century. Pop. 3000.

**Hoxter** tn. on the Wezer, in Westphalia, Germany, 37 m. N.E. of Paderborn. Here are Renaissance timber buildings. Near by at Corvey is the famous castellated Benedictine abbey suppressed in 1503. Pop. 7800.

**Hoxton** (the 'Hochestr' of the Domesday Book), dist. of London, metropolitan bor. of Shoreditch, 2 m. N.E. of St. Paul's. In the Elizabethan era it was a pleasure resort. Cabinet-making and upholstery are carried on. Pop. 16,686.

**Hoy** (Scandinavian *Hoy*, high is.), one of the Orkney Is., Scotland, 1 m. S. of Stronsness, and separated from the mainland by the Sound of Hoy. Area 53 sq. m., length 13½ m., breadth 3 furlongs to 6½ m. It rises abruptly from the sea and has magnificent cliff scenery. The chief heights are Braebrough Head (1140 ft.), Ward Hill (1561 ft.), and Cullage Hill (1120 ft.). The 'Old Man of Hoy' is a detached sandstone rock, 150 ft. high, 1 m. from Roray Head. There is a good harbour at Longhope. Pop. 1000.

**Hoylake**, tn. and eccles. par. on the Wirral Peninsula, Cheshire, 8 m. W. of Liverpool, England. There is fine sea-bathing, and golf, and many Liverpool business men live here. Pop. with W. Kirby 27,700.

**Hoyland Nether**, tn. in W. Riding, Yorkshire, England, 3½ m. S.E. of Barnsley. There are coal mines, rolling mills, brick works. Pop. 15,200.

**Hoyle**, Edmund (1672-1769), writer on whist and other games. Of his early life nothing is definitely known, but he is supposed to have read for the law. He lived in London, giving instruction in and writing on whist; both Fielding and

Byron have alluded to him. His books include: *Short Treatise on Whist* (1742), *Backgammon* (1743), *Piquet* (1744), *Quadrille* (1745), and *Chess* (1761).

**Hradec Králové** (Ger. Königgratz), tn. of Bohemia, Czechoslovakia, on the Elbe, 65 m. E.N.E. of Prague. It is famous for its battle in 1866, in which the Prussians were victorious over the Austrians; this was known as the Battle of Sadova. Pop. 32,300.

**Hrdlička, Aleš** (1869-1943), Amer. anthropologist, b. at Humpolec, Bohemia. M.D., New York Eclectic College, 1892; New York Homeopathic College, 1894. Studied insanity, New York. Accompanied anthropological expeditions, 1898-1913, into all quarters of the world. Assistant curator of physical anthropology, U.S.A. National Museum, 1903-10; and later curator. Member, National Academy of Sciences, U.S.A. and of Czech Academy of Sciences and Arts. Huxley Medal, 1927. Wrote *Ancient Man in North America* (1907), *Ancient Man in South America* (1912), *Recent Discoveries attributed to Early Man in America* (1919), *The Anthropology of Florida* (1922), *The Old Americans* (1925). Also *Practical Anthropometry* (1920), *Skeletal Remains of Early Man* (1930), *Man from the Farthest Past*, 1930.

**Hrosowitha, Hroiwitha, Roswita, Roswitha, or Hrotsuit** (c. 935-c. 1000), Ger. poetess and chronicler. Little is known of her life, but she appears to have been a Benedictine nun of Gandersheim, near Göttingen, entering the nunnery previous to 959. Here she studied the Scriptures and the classics. Her works, written in Lat., have considerable merit, but great coarseness. They include Lat. legendary poems, six prose Terentian comedies for the entertainment of the sisterhood, of which *Callimachus*, written in praise of chastity, is the best, and a poetical panegyric chronicle of Otto I. Her works were ed. by Konrad Celtes at Nuremberg in 1501, by H. Schwizfisch at Wittenberg in 1877, and by Barrack at Nuremberg in 1888. Eng. trans. of the plays were pub. by C. St. John in 1923; H. J. W. Tillyard, 1923. See W. M. Hudson, *English Historical*, 1888; J. Schreiderhan, *Roswitha*, 1912; M. G. Wiegand, *Nondramatic Works of Hrosowitha*, 1936.

**Hrozný, Friedrich**, Czech orientalist; b. 1879, at Lysá. Has devoted attention chiefly to inscriptions in Hittite language, which he assigns to the Indo-Germanic branch. Pubs. include *Die Sprache der Hethiter* (1917), *Herhittische Keilschrifttexte aus Boghazköi* (1919), etc.; *Über die Völker und Sprachen des alten Chatti-Landes* (1920), *Code hittite* (transcription and Fr. trans., 1922).

**Hsianfu, or Singanfu**, cap. of Shensi, China, on the r. b. of the Weiho, 75 m. above its confluence with the Yellow R. (Hwangho). During the Civil war it was besieged in 1926.

**Hsiang, riv. of China**, trib. of the Yangtsiang, in Hunan; very important as connecting Kwangtung with Central China. Its W. branch is connected by canal with the Kweikiang in Kwangsi.

**Hsiangtau**, important dist. and tn. of Hunan China, where produce for Canton (300 m. to the N.) and coal for the Yangtsiang are transhipped. The Hsiang R. is navigable for junks up to this tn. Pop. upwards of 600,000.

**Hsiapaw**, see THIRAW.

**Hsüan T'ung**, last emperor of China; b. 1905 or 1906. His original name was Pu-yi; he was nephew to Kwang-shü, ninth emperor of the Manchu dynasty. His father was Tsai-Pong (Prince Ch'un); and he was selected Nov. 13, 1908, by the Empress-Dowager Tzu-Hsi, who d. Nov. 15, immediately after Kwang-shü. Prince Ch'un was made regent. The revolution that began Oct. 1911, ended Feb. 12, 1912, in the estab. of a republic. H. T. retained his title, received a handsome allowance, and was allowed to remain in the Summer Palace of Peking. In July 1917 he was replaced as ruling Emperor for a few days through the instrumentality of Gen. Chang Hsün. He married in 1922. When the Kuomintang obtained possession of Peking in Nov. 1924, they abolished his title and remaining privileges, and he went to reside under Jap. protection at Tientsin. He had cut off his queue, and called himself Henry Pu-yi. In 1934 he was proclaimed emperor of Manchukuo by the Jap. See also CHINA.—History.

**Huachou-fu**, see SU-FU.

**Huallaga**, riv. of Peru, rising in the Andes, about 10° 40' S. It flows generally northward for some 700 m. and joins the Amazon (Marañon) about lat. 5° S., 73° W.

**Huambisac**, race of S. Amer. half-breeds, belonging to the Jivaroan stock, and dwelling on the borders of Peru and Ecuador on the Upper Santiago and Marañon-Amazon rivs. The Sp. blood in them, shown by their light complexions, dates from the sack of Sevilla del Oro in 1599, when 7000 Sp. women were carried off.

**Huanavelica**, or **Guanavelica**: (1) dept. of Peru. Area 8297 sq. m. The surface is mountainous and mineral wealth abundant. Pop. 244,500. (2) Cap. of dept. of same name, and of a prov. of Peru in the Andes, 150 m. S.E. of Lima. The chief industry is the mining and smelting of gold, silver, and mercury. Elevation 11,850 ft. Pop. 12,000.

**Huangho**, see YELLOW RIVER.

**Huanuco**, or **Guanuco**: (1) dept. of Peru. Traversed by the Cordillera Oriental, and watered by the R. Huallaga. There is much mineral wealth. Coffee is grown in the dist. Area 15,426 sq. m. Pop. 231,000. (2) Cap. of the above dept., Peru, on R. Huallaga, 170 m. N.E. of Lima. It stands in a lovely and fertile valley. A bishop's see. Pop. 20,000.

**Huaráz**, cap. of Ancash dept., Peru, on the R. Huaráz, 185 m. N.W. of Lima. Elevation 10,000 ft. Pop. 20,000.

**Huasco**, or **Guasco**, seaport tn. in the prov. of Atacama, Chile, at the mouth of the Huasco R. It is the centre of a fine fruit-growing dist., is noted for its grapes and raisins and has considerable coasting trade. It is a port for mining products. Pop. about 4000.

**Huata**, Maori weapon, *see under* MAORI.  
**Hubbard, Elbert Green** (1856-1915), Amer. writer and printer, b. at Bloomington, Illinois, U.S.A. began his 'Bohemian' career as a salesman and then wrote a few poor novels. Met Wm. Morris and tried to emulate his ideas on printing, decoration and medieval design, producing at E. Aurora, New York, a shoddy imitation of the Kelmscott Press, which he named 'Rovercraft,' after the Eng. printer of that name. From this beginning he founded, and wrote the material for, an 'inspirational' monthly magazine, *The Philistine* (1895-1915), which he used to express his homely, often shrewd, platitudinous philosophy. A similar magazine, *The Fra* (1908-17)—a title which he had conferred on himself—never achieved the great popularity of the earlier pub. In 1894 he wrote *A Little Journey to the Home of George Eliot*, the first of his monthly sketches, chiefly biographical, issued in 14 vols. covering 15 years and numbering 170 booklets in all. His chief work, however, is his *A Message to Garcia* (1899)—an essay by which the Cuban lawyer and revolutionary, Calixto García (1838-98), became widely known in the U.S.A. This he followed by *Loyalty in Business* (1921). By the close of his life his Rovercraft Corporation had greatly developed become a large estab., from which he pub. besides his own books works, many artistic books, hand-illuminated and hand-bound. *See* A. Lane, *Elbert Hubbard and His Work*, 1901; and F. Shay, *Elbert Hubbard of East Aurora*, 1926.

**Huber, Johann Nepomuk** (1830-79), Ger. theologian and philosophical writer, b. in Munich, where he ultimately became univ. prof. He was leader of the Old Catholics and a bold opponent of the Ultramontanes. His works, *Die Philosophie der Kirchenvater* (1859), and *Der Jesuitorden* (1873), were placed upon the Index Expurgatorius. He collaborated with J. Dollinger in writing the celebrated *Der Papst und das Konzil von Janus* (1869). *See* E. Zimiglobl, *Johannes Huber*, 1881.

**Huberman, Bronislaw** (1882-1917), Polish violinist of Jewish origin, b. near Warsaw. Studied as a child under Joachim, who advanced his interests. In 1894, after sev. public appearances in European caps., he played in London. Made a strong impression on Brahms in Vienna in 1895. Thereafter his life was that of a famous virtuoso. The creation of the Palestine Symphony Orchestra was due to his initiative and was financed by him. D. at Vevey.

**Hubert, Saint** (636-727), patron saint of hunters (Day, Nov. 3). Hunting on Good Friday, although a holy day, he saw a cross growing out of the forehead of a stag. This he took as a sign from Heaven, became a monk, and founded an abbey. He was son of a duke of Guienne, and became bishop of Liège (Maastricht).

**Hubli**, tn. in the dist. and 15 m. S.E. of Dhartiwar, Bombay, India, has important cotton manufs. and considerable trade. Pop. 90,000.

**Hübner, Joseph Alexander, Count** (1811-92), Austrian diplomat and author, b. in Vienna. His real name was *Hafenbrell*, which he afterwards changed to H. In March 1819 he went on a special mission to Paris and, later in the same year, was appointed ambas. to France. To his influence was largely due the friendly attitude of Austria to the Allies in the Crimean war. But he was taken by surprise by Napoleon III.'s intervention on behalf of Italy, of which the first public intimation was given by the Fr. emperor's cold reception of H. (1859). He did not return to Paris after the war but in 1865 became ambas. at Rome, which post he left in 1867. He then toured the world recording his observations in *Ein Spaziergang um die Welt* (1872). His other works are *Siletus V.* (1872), *Durch das britische Reich, 1863-94* (1886), *Ein Jahr meines Lebens, 1848-49* (1891). His works, which are very interesting, show considerable insight into their subjects—whether political intrigues of the period, or Brit. colonial questions or the political ideals of Metternich and Schwarzenberg. *See* Sir E. Satow, *An Austrian Diplomatist in the 'Fifties*, 1908.

**Huo, Evariste-Régis** (1813-80), Rom. Catholic missionary, b. at Toulouse, educated by the Lazarists in Paris. In 1839 he was ordained and joined the Lazarist Mission to China at Si-Wang. In 1844 he and Joseph Gabet, his fellow Lazarist (accompanied by a young Tibetan neophyte to who had embraced Christianity), were sent into Tibet to determine the extent of the new apostolic vicariate of Mongolia. They spent some time in a lama monastery, learning the language, and in 1846 reached Lhasa after much danger and difficulty. They were, however, expelled and forced to return to China. H. returned to France in 1852 and pub. sev. books on his journey, the most famous being *Souvenirs d'un Voyage dans la Tartarie, le Thibet, et la Chine pendant les années, 1844-46* (2 vols., 1850; Eng. trans. by W. Hazlitt, 1851, abbrev. by M. Jones, 1859)—a book which contains passages of so remarkable a character as to excite incredulity; but later research seems to have confirmed all that H. wrote. Its supplement, *L'Empire Chinois* (2 vols., 1854, Eng. trans. 1859), was crowned by the Academy. *Le Christianisme en Chine* (4 vols., 1857-58), is an elaborate historical work. All his works are written in a racy and lucid style which contributed to their unusual degree of popularity. *See* Prince Henry of Orleans, *Le Père Huo et ses critiques*, 1893.

**Huch, Ricarda** (1861-1917), Ger. authoress; b. in Brunswick. Educated at Zürich; took Ph.D. degree, 1891. In 1897, secretary to State Library Zürich. Married, 1907, Richard Huch, doctor of laws. Pub. vols. of poetry; but most of her work is tales, novels, and hist. or novel-hists.; e.g.: *Aus der Triumphgasse* (1901), *Die Sommernähe* (1902), also *Geschichte von Garibaldi* (1906-07), *Das Risorgimento* (1908), *Der grosse Krieg in Deutschland* (1914), *Der Fall Deruga* (1917), *Im alten Reich* (1927-34),

*Zeitalter des Glaubensspaltungen* (1937). In literary criticism: *Blutzeit der Romantik* (1898), *Ausbreitung und Verfall der Romantik* (1902). She was a bitter opponent of the Nazis, and when Hitler came to power in 1933 she resigned from the Academy of Arts and Sciences because she refused to take the oath of allegiance to the new regime. See E. Gillischowski, *Das Schicksalsproblem bei Ricarda Huch*, 1925, and study by E. Hoppe, 1936.

**Huchtenburg**, Jan van (1646-1733), Dutch battle painter and engraver, b. in Haarlem; pupil of Thomas Wyck and later of Van der Meulen in Paris.

**Huckleberry**, see WHORLIFERRY.

**Hucknall**, formerly Hucknall Torkard, tn. in Nottinghamshire, 8 m. N.W. of Nottingham. It has extensive collieries. The body of Lord Byron was brought from Greece and buried in H. par. church, restored in 1873. Pop. 20,800.

**Huddersfield**, co. bor. in the W. Riding of Yorkshire, England, at the confluence of the R. Colne and R. Holme, 16 m. S.W. of Leeds and 190 m. from London. It is served by rail and by canals. The surrounding dist. is rich in coal and iron. H. is situated on the great escarpment of the Lower Coal Measures between two entirely contrasting types of scenery—with farming and mining vils. on the E. and S.E. and, on the W. and S. untamed moors and moorland, mostly uninhabited and rising to a height of 2000 ft. From the tn. itself the prin. eminence seen is Castle Hill (900 ft.), crowned by a tower erected to commemorate Queen Victoria's diamond jubilee. The summit is the site of an anct. Brit. encampment and is scheduled as a National Monument.

Stretching over a considerable area the bor. has the advantage of avoiding congestion. Most of the residential areas are within a mile or two from the tn., e.g. the garden suburb of Fartown and Sheepridge, the suburb of Kirkby, Kirby, and the semi-rural dists. of Crowland Manor and Almondbury. Among the chief buildings are the par. church of St. Peter, the third on the same site. The first was c. 1190, the second 1508 and the present church was built in 1836. It is in the Gothic style, the tower has ten bells and the windows are ornate with sacred scenes and emblems, notably those by Ward. There are about a score of other Estab. Churches in the tn. and immediate neighbourhood and numerous Nonconformist places of worship. The Tn. Hall and Municipal Offices are virtually one large handsome block. The Hall (which cost £57,000) is in neo-classical style and beautifully decorated. Ravensknowle Hall (with grounds), Dalton, presented to the tn. in 1919 by Legh Tolson for a museum and park, was built in 1860 by John Beaumont of Dalton. Attached to the Tolson Memorial Museum is a meteorological station. There is a Central library near the municipal offices and seven branch libraries. The old Cloth Hall was demolished in 1930 under a tn. planning scheme; parts of the original building, including the pillars, clock tower and doorway have been re-erected at Ravens-

knowle Park. There is an art gallery, containing many engravings by J. M. W. Turner. The earliest recorded date in connection with Almondbury church is March 23, 1231, when Wm. de Nuthyland was instituted rector of *Almanneburie*, being presented by John de Lacl, lord of Pontefract and Constable of Chester. The early church was in the early Eng. style, 1150-1200 and the whole was restored between 1872-77. Almondbury had a weekly mkt. as far back as the year 1272; it was discontinued c. 1672, when powers were granted to the Ramsden family to hold a mkt. in H. The foundation stone of the present mkt. hall was laid in 1873; it is built in decorated Gothic, a typical specimen of the Gothic revival; great improvements were introduced in the rebuilding after a fire in 1923. The Technical College began in 1841, in Queen Street, as the Young Men's Mental Improvement Society; the memorial stone of the present building was laid in 1881 and the name, Technical School and Mechanics Institute, changed to Technical College in 1896. In 1905 the College became affiliated with Leeds Univ.; its main depts. are chem., textile industries, civil and mechanical engineering, electrical engineering, physics, mathematics, biology, school of art, commerce and economics and domestic science. There are six secondary schools, and primary schools are distributed throughout the bor. At what is now the Huddersfield College (Municipal Boys' School) the late earl of Oxford and Asquith, then known as H. H. Asquith, received his early education, he being a nephew of a former freeman of the bor.

The main sections of local industry are textiles, engineering, cloth dyeing, shrinking and finishing, manuf. of chemicals and dyestuffs and wholesale tailoring. H. and the adjoining dists. are a natural centre of the woollen and worsted fabric industry of the W. Riding of Yorkshire. In the Colne and Holme valleys there are scores of firms, many of them old estab. individual or private enterprises, which for generations have produced textile fabrics regarded as their own specialties. In the Colne Valley are many of the larger mills which produce millions of yds. of cloths and tweeds. There are also numerous other trades carried on, notably printing and bookbinding, machine and hand tools; wood-working; sheet-metal working; furniture and cabinet making; rubber fittings; auxiliary textile equipment; brewing; patent glazing; dyeing; pottery; tanning and leather goods; boot and clog making; coach and motor body building; galvanised metal goods; brick and clay ware; aerated waters; sports requisites (especially footballs in great quantities); confectionery; hosiery yarns; gas-producing and coking by-products plant; paint; carpets and rugs; carrier bags; cardboard boxes; jams and preserves; pre-cast cement using; constructional and building industries.

**History.**—Although as a co. bor. and industrial centre H. is relatively a modern

tn., it is not entirely without historical associations. It was mentioned in Domesday Book as *Oderresfeld*, and in Subsidy Rolls, dated 1207, as *Huderesfeld*, but until the nineteenth century it certainly occupied a position secondary to that of Almondbury which is now one of its suburbs. For this reason the historical monuments and associations in the area of the tn. are comparatively few; yet there are some survivals of interest, especially the older houses in the outlying dlts. or in the tn. itself in the courts off the main streets. Almondbury, with its anct. church, stocks, par. registers and par. chests, and the old half-timbered preni es adjoining, is much richer in historical associations; so as to regard many of the other areas adjoining the tn. of H. A few miles from H. at Kirkstall is the reputed grave of Robin Hood. The old Three Nuns Hotel is said to be named through the presence of nuns at the former Kirkstall monastic estab. over which Robin Hood's sister is said to have ruled as abbess. Near by, at Cooper Bridge is the 'Dumb Steeple' commemorating the Luddite riots. At 'Lack' near Outland, excavations have revealed the remains of a former Roman camp, and similar work at Castle Hill has brought to light distinct traces of both Roman and other occupation of this hill as a watch tower, a camp and fortifications.

**Hudnall Common**, open space of over 100 ac. Situated between A-hbridge Park and Whipsnade, Hertfordshire, and noted for its hard- and flowers.

**Hudson, George** (1800-71), Eng. railway promoter, the 'Railway King,' b. at Howsham, Yorkshire. He started life as a linen draper, but in 1824 inherited a fortune of £50,000. This allowed him to interest himself in railway promoting, with very successful results, and he became the dictator of railway speculation. But the railway crisis of 1847-48 proved his ruin, for he was accused of fraud. Carlyle alluded to him as 'the big swollen gambler.'

**Hudson, Henry** (d. 1611), distinguished Eng. navigator. He was employed by the Muscovy Company, and later by the Dutch E. India Company, to discover the N.E. and N.W. passages. In 1607-10. In 1609 he explored the Hudson R. On his last voyage in 1610 he discovered the Bay and Strait which are named after him. Early in 1611 his crew mutinied, and set him and his son with seven others adrift in a small boat, and nothing further was heard of him. 'The Last Voyage of Henry Hudson' is the title of John Collier's famous and poignant picture of the doomed navigator and his crew. See C. Asber, *Henry Hudson, the Navigator*, 1860; and studies by T. A. Janvier, 1909, and L. Powys, 1928.

**Hudson, John** (1662-1719), Eng. classical scholar, who ed. anct. writings. He graduated at Univ. College, Oxford (1681), later became Fellow, and in 1701 was appointed keeper of the Bodleian Library. Also Prin. of St. Mary Hall, Oxford.

**Hudson, William Henry** (1841-1922), field-naturalist and author; b. in Rio de

la Plata State, Buenos Aires—now absorbed in Argentina; son of Daniel H., native of Marblehead, Mass.; and grandson of Daniel H., native of Exeter, England. The early part of his life was spent on an estancia of the Argentine pampas. He left S. America, 1869, and thenceforth resided in England. His wife, a musician (d. 1921), was much older than himself: they lived in various houses in London, went on long gipsy-like journeys into the country, and were sometimes in want. In 1901 H. was granted a Civil List pension, which he relinquished when his circumstances improved. H. 'writes as the

W. H. HUDSON

writer grows.' He saw life as an immense and complex flow of creativeness, and in depicting nature and especially bird life, he evolved a style that has been a model for this century. His observation combined scientific detachment with intense intuitive perception. 'Few men have left a monument more permanent than Hudson left in his own books,' wrote Cunningham Graham. His works, which fall roughly into the two categories of S. America and Eng., include *The Purple Land which England Lost* (i.e. Uruguay, 1885), *A Crystal Age* (satire on peaceful Utopias, 1887), *A Naturalist in La Plata* (1892), *Idle Days in Patagonia* (1893), *British Birds* (1894), *Nature in Doonland* (1900), *Birds and Man* (1901), *El Ombú* (1902), *Hampshire Days* (1903), *Green Mansions* (1904), *A Little Boy Lost* (1905), *The Land's End* (1908), *Afoot in England* (1909), *A Shepherd's Life* (1910), *Far Away and Long Ago* (1913), *Birds of La Plata* (1920), *Dead Man's Black and An Old Thorn* (stories in 1 vol., 1920), *A Traveller in Little Things* (sketches, 1931),

*A Hind in Richmond Park (1922).* Ho d. in London and is commemorated by the Bird Sanctuary with Epstein's 'Rima' (after the bird-woman 'Itolamoo' in *Green Mansions*) in Hyde Park. See life by M. Roberts, 1924. See also F. Ithys, W. H. Hudson, *Rare Traveller*, 1920; R. Charles, *The Writings of Hudson*, 1935.

Hudson, cap. of Columbia co., New York, U.S.A., on Hudson R., 28 m. S. of Albany. It has a large riv. trade and numerous manufs. of engines, paper, leather, flour, clothing, knit goods, tobacco. Founded in 1783, and formerly a whaling port. Pop. 11,500.

Hudson, tn. of Middlesex co., Massachusetts, U.S.A., on Assabet R. 15 m. N.E. of Worcester. It has manufs. of leather, rubber shoes, webbing, gas-amers, paper boxes, lasts, etc. There are wool scouring and combing mills. Pop. 8,000.

Hudson, riv. of New York, U.S.A. Rises in the Adirondack Mts., and flows about 350 m., roughly, in a southerly direction, into New York Bay. Its estuary, known as N. R., forms part of New York Harbour. It is navigable for small boats up to Glen Falls (200 m.), for small steamers to Troy (151 m.), and for large steamers to H. (117 m.). Much of the scenery on its banks is very fine, especially in the highlands of the H., part of the Appalachian Range, below Newburgh. Chief tribes, the Mohawk, Wal-kill, Hootic, and Sacandaga. It was first explored by Henry Hudson in 1609, and the first successful Amer. attempt at steam navigation was made upon it in 1807.

Hudson Bay, or Canadian Sea, inland sea of the N.W. of N. America, communicating with the Atlantic Ocean by Hudson Strait and with the Arctic Ocean by Fox Channel, Fury and Hecla Strait, and the gulf of Boothia. It lies entirely in Brit. ter., having Manitoba on the W., Ontario on the S., and Southampton Is. on the N. A long narrow arm in the S. is known as James Bay. Area about 500,000 sq. m., length 850 to 1300 m., greatest width 600 m. It occupies a basin in the old Laurentian area, and is mostly shallow, with low shore-lines, especially in the S. and W. The average depth is 70 to 100 fathoms. The E. shores are rocky, and steep bluffs occur here and occasionally in the W. A chain of small is. lies off the E. shore. There are few submerged rocks or shoals, but ice renders navigation impossible for three-fourths of the year. The climate is very rigorous in winter, but mild and pleasant during the short summer. The bay is the great drainage area of the Canadian N.W. Ters., and is fed by the Rs. Churchill, Nelson, Albany, Main, Rupert, Severn, and Moose. There are fisheries of salmon, seal, whale, and walrus, and the surrounding country is rich in minerals and fur-bearing animals. York Factory is the chief port. The bay was discovered by Henry Hudson in 1610. He wintered in James Bay, and the next year was abandoned by his mutinous crew. See F. H. Kitts, *The Hudson Bay Region*, 1929.

Hudson's Bay Company, Eng. chartered company incorporated by Charles II. in 1670 and founded by Prince Rupert and other adventurers for the purpose of trading with the N. Amer. Indians on the shores of Hudson Bay. The estab. of the Amer. fur trade seems to have been due to the demand in the European mkt. for large felt hats adorned with fur which became the vogue from the time of Charles I. In the search for the N.W. Passage Henry Hudson, by discovering the bay which is named after him, had found a route to the very edge of what is the greatest fur forest in the world. But Hudson died without being aware of what he had accomplished. It remained for the Sieur Médard des Groseillers and his brother-in-law, Pierre Radisson, and through them the founders of the H.B.C., to reveal the value of his discovery for the fur trade. The first achievement of Groseillers, an Indianised Frenchman, was to penetrate to the Great Lakes and induce the Hurons to bring furs down to the St. Lawrence. It was then that he found that the Cree of the great N. forest were the real source of the fur supplies which reached the Fr. in the S. The Fr. governor refused to issue to Groseillers a licence to journey thither, except on the condition that he received half the profits. Groseillers and Radisson therefore went independently and returned (c. 1663) with a great supply of furs and were then charged and fined for illicit trading. Failing to obtain redress in France the two men repaired to Boston to visit Sir George Carteret, Privy Councillor to Charles II. and through him they ultimately reached Windsor as guests of the king, who was equally interested in their proposals for a trading expedition in N. America beyond the confines of England's Amer. colonies. But progress was slow, and it was not until 1667 that Prince Rupert, the king's cousin, took up the project, with the co-operation of the duke of York (afterwards James II.) the duke of Albemarle, the earls of Arlington, Craven and Shaftesbury, Sir George Carteret and James Hayes, secretary to Prince Rupert. All these were the original subscribers to the initial cap. of about £110,000 and the company's hist. really begins at that date, when a converted ketch, the *Nomach*, with Groseillers, sailed for N. America, reaching James Bay on Sept. 29, 1668. The king loaned the naval boat *Engel* which sailed with Radisson, but at Hudson Strait the *Engel* was too damaged to proceed further. In St. James's Bay Groseillers then built Fort Charles—really only a poor log hut with a stockade, yet veritably the cornerstone of a great trading empire. Groseillers (called Mr. Gooseberry by the Eng.) soon sailed again with the *Nomach* laden with furs. This successful voyage confirmed the hopes of the frontier adventurers, who now applied to the king for a Royal Charter. This was granted on May 2, 1670. Wide imperial powers were conferred on 'the Governor and Company of Adventurers of England Trading into Hudson's Bay.' Rights to 'sole trade

and commence' within the entrance of Hudson Strait were bestowed by Charles upon 'our dear and entirely beloved cousin Prince Rupert' and his associates, who, according to the Charter, were to be 'the true and absolute Lordes and Proprietors' over more ter than was then even known to Europeans. In present-day geographical terms, the Adventurers were granted the Prov. of Ontario and Quebec N of the Laurentian Hills and W of Labrador boundary all Manitoba and Saskatchewan, the S half of Alberta and the S E corner of the N W T's. It proved to be a well drafted Charter for it successfully resisted all attacks on its validity in the law courts. The F in Quebec and Montreal soon took up the challenge of the Ing cnty into the Amer fur trade from the N and for nearly a century the Ing and Fr. struggled for the trade, in a long drawn period of war, with intervals of peace, lasting till 1713 — these intervals being accompanied by outbreaks of violence on the shores of the bay. These were for the most part mere forest skirmishes, insignificant as measured in terms of military operations, but they were significant in the hist of Canada, and the fact that the company defended Ing interests for so long served the Company in good stead w the Charter Rights came to be considered by a Parl Committee in 1749.

By 1680 there were forts at Rupert R., Moose, and Albany, factories in James Bay, and Fort Nelson (or York Factory) on the W coast of Hudson's Bay. Several of these were taken by the Chevalier de Troyes and in 1697 as the result of a sea fight when the Sieur d'Iberville's ship *Pelican* off York Factory defeated three Eng ships under Captain Bailey who was in command for the company. The company was then left with but a single post on the bay, Albany factory. The Treaty of Ryswick brought peace to Hudson's Bay but it left the company almost ruined. Two notable names in the hist of the company at this period were those of Henry Kelsey, who entered as an apprentice in 1684 and undertook a journey into the prairie lands, and James Knight, who was one of the first to establish discipline both within the forts and in the relations with the Indians. Kelsey is notable as the first of the company's servants to establish that understanding, which was to prove the most powerful factor in the development of the fur trade in Canada. His *Journals* became the subject of political and later historical controversy which was only finally cleared up in 1926. From 1697-1713 (Treaty of Utrecht) the company's sole post on the Bay was Albany. The duke of Marlborough, whose victories culminated in the Treaty of Utrecht, had been a governor of the company. The Treaty brought the bay forts back to the company and thereafter the company was to have nearly seventy years of peaceful trading. In 1715 Knight sent Wm. Stewart into the interior as an arbitrator of peace with the Indians, notably the Crees. Knight built a post N. of York

Factory at the mouth of the Churchill R. to enable the Chipewyans from Great Slave and Athabasca Lakes to bring furs to the bay. Thus was Churchill (then called Prince of Wales's Fort) established.

Meanwhile the Fr. through Pierre de Varennes, Sieur de Vérendrye, renewed attempts to secure part of the fur trade, W of the Great Lakes, and set up a number of trading posts in the W Prairie, a challenge to the charter and rights of the H B C. From 1754, therefore the company's servants began to penetrate the W. Thus, Anthony Henday travelled for a year with Indians, going as far as the Rockies. A notable name in the company's annals of this period was that of Samuel Hearne, who began as mate in a company whaling ship and later (1776) was stationed at Prince of Wales's Fort on Churchill R., a stone fortress which had replaced Knight's wooden fort on Churchill R. Hearne was the first white man to reach the Arctic Sea from the interior, having reached the mouth of the Coppermine R. This stone fort had only been completed in 1771 after nearly forty years labour but in 1782 Hearne, the governor, surrendered it to La Perouse without firing a shot — he having only thirty nine men in the garrison. The Fr. attempted to blow up the fortress without success. The main walls of this very strong fortress survive as an historic site owned by the Dominion of Canada.

It was about the year 1784 that saw the dawn of the historic rivalry of the N W Company, which was destined to become the strongest of all the H.B.C.'s competitors. This competition was in effect that of the Hudson Bay and the Montreal routes for the trade of the great fur forest. Brit subjects in Montreal following La Vérendrye's precedent, built posts among the Indians and again directed trade into the Montreal route. In 1774 the H.B.C. replied by building Cumberland House, near the Saskatchewan R. Among the well-known names of the pioneer traders of the N.W. Company were those of Krobisher, Alexander Mackenzie, McKay, McLoughlin, all courageous and enterprising Scottish-Canadian traders from Montreal, who pushed their activities across the Prairie and the Rockies into the Arctic Ocean in defiance of the monopoly rights of the H.B.C. Forts were built in juxtaposition at trading points but before the two companies were merged in 1821 there was to be violence and bloodshed, arrests and mitigation. It was Alexander Mackenzie, most famous fur trader of his time, who first went up the Peace R. (1793), was knighted after the pub of his *Voyages* and produced a plan for the union of all the fur trading interests in one great chartered company having the use of the Hudson Bay route and he tried to buy out the H.B.C. through Lord Selkirk, who then controlled the company. But Selkirk co-operated with Andrew Wedderburn (Andrew Colvile) in reorganising the company by launching his Red River Colony Scheme (1812). This colony was taken over by the H.B.C. in 1836, with a

form of government in harmony with the company's charter—a governor and council appointed by the governor and committee in London. The union of the two companies was accomplished by a deed of co partnership and thus developed into the union, which eliminated wasteful competition. By this union the trade enjoyed the use of the route through Hudson Strait and the company's title to the soil was recognised by all parties. Thus the company entered upon a great period of its history, which was to continue till the transfer of Rupert's Land to the

British America, became the dominant body of the whole structure of Canada. It established the regulations for the fur trade, applied discipline and recommended promotions. It was a structure unique in commercial history, combining trading rights with a sovereignty under the British Crown. Simpson was administrator for forty years following the union of the two companies. The rigid discipline which he imposed on the fur trade in the colonies for him but his mastery of every detail of the company's affairs and his wide imagination especially in the field of

Dominion of Canada. In 1821 Parliament passed an Act affirming for the monopoly of the regions described as the N.W. Territory to be given to any company undertaking to fulfil certain conditions. The licence conveying the monopoly was given to the united company subject to the Treaty with America of 1818 which gave Americans equal rights for the W. of the Rockies. The empire over which the company now held administrative as well as trading powers included all modern Canada except the Great Lakes basin and the Maritime Provinces. The company's executive control was in London with the governor, deputy governor and committee, representing the shareholders or 'proprietors' as they are still called. Under Sir George Simpson who was appointed governor in chief of Rupert's Land, the council of the N. Dept. of Rupert's Land, one of the four great depths into which the company divided

exploration and hunting the greatest of all fur traders.

In the time of the N.W. Company the Americans began to acquire rights in the region of the Columbia River. The N.W. Company bought out the Astor Pacific Fur Company which had established posts within the mouth of the river and up to Kamlay. But both countries claimed the sovereignty of the land. An agreement was arranged in 1818 by which each nation recognised for ten years the other's right to trade. It was renewed in 1827 and continued in force until the Oregon Treaty of 1846. Dr. John McLoughlin, known to Americans as the 'Father of Oregon' ruled the Columbia district (on the Pacific coast) under Simpson with wide powers. He severed his connection with the company and became an American citizen when his vast domain became part of the Republic. James Douglas, who established Victoria and combined the offices

of chief factor and colonial governor, carried on McLoughlin's work and later became governor of the crown colony of Vancouver Is and of Brit Columbia. It was after the Oregon crisis and Treaty colony on the Is of Vancouver and the task of founding the colony was assigned to the H B C by a grant dated Jan 13 1849 which the company did by offering the land on terms which could be attractive to none but Englishmen desiring to be gentlemen farmers. Following American charges against the H B C of maladministration designed to break the company's monopoly, there was an inquiry by a parliamentary committee (15 7) and it was as a result of this inquiry that Vancouver Is was made a crown colony. Sir George Simpson was one of the principal witnesses at the inquiry, and among the members of the committee were Wm Ewart Gladstone Lord Stanley and Lord John Russell. Celebrated explorers and travellers, including John Ross, Col Lecky Sir John Richardson, and Dr Rae were among other witnesses, and the committee's report, which was adopted by parliament, found that Canada's wish to assume the land of the W for settlement was reasonable and that arrangements should be made for their cost. Canada and that where settlement was impracticable, the H B C should remain in control.

Thus the end of the company's monopoly was in sight. Sir George Simpson died in 1860 but the company carried on as rulers of the W under the crown until 1869. When Confederation became a political reality it was evident that the end of the company's administration of Rupert's Land was approaching and provision was made by the British America Act of 1867 (clause 146) for the admission of that ter (then the company's land) and the N W Ter (crown domain) into the Confederation. The Rupert's Land Act of 1868 laid down the procedure. Under the ensuing agreement (Canada) paid £300 000 as compensation and one twentieth part of the land in any township settled within the fertile belt. By the Decd of Surrender of 1869 the Company did not give up its Royal Charter but only certain of its trading privileges. The final transfer of land to the company under this deed was not completed until 1921 or fifty six years after the date of surrender, under which the company was allowed the privileges of a private trading corporation without hindrance or exceptional taxation. The Decd brought to the company an area in the fertile belt of seven million acs. Its land grew up in many of the fur trading areas and the company's posts in numerous places have become departmental stores. By 1934 2,000 000 acs (cultured through Manitoba, Saskatchewan and Alberta) remained unsold. The Land Dept of the company administers this huge estate which includes extensive lots in city areas. The company's title to the land it offers for sale is direct from the crown and is therefore guaranteed by the Prov. and Dominion Govs. By 1869, indeed,

the charter of 1870, which had served its purpose for 200 years, had outlived its time. In 1863 the International Financial Society had secured enough stock to control and reorganise the company and up to 1920 there had been five supplemental charters regularising changes in dealings with the company's stock and reflecting the actual business carried on by the company. With the outbreak of the First World War the H B C was called upon to engage in activities far greater than at any time during its history, including *e.g.* the organisation of steamship services for the transport of goods to France and during 1915 it handled some 13 000 000 tons of supplies and operated over a million tons of shipping.

On the other hand, the Hudson's Bay Company continues to conduct its business under a Royal Charter and is therefore exempt from the provisions of the Companies Act of Great Britain. A governing deputy governor, and committee (or board of directors) have direct control of the company's affairs in unbroken continuity since the incorporation. Today this executive group of nine is elected by the proprietors at the annual general court. The Board meets regularly in Hibernia Bay House, London, adjoining which is the church of St Ethelburga the Virgin within Bishopsgate (c. 1400-1410) where Henry Hudson received confirmation on April 13, 1607 shortly before sailing on his first voyage of discovery. Since 1961 the company's affairs in Canada have been under the administration of a Canadian committee. For that time the committee served in an advisory capacity. The Canadian committee is responsible to the governor, deputy governor and committee. It meets in Hibernia Bay House, Winnipeg, where it maintains its offices, as a central organization in Canada. Hudson Bay House, Winnipeg is also the headquarters of the former Canadian Dept. of the company—the Fur Trade Transport Land and Boat Stores. (See *Hudson's Bay Company's Brief History* issued by Hudson Bay House, London, 1934.)

**Hudson Bay Territory**, see NORTH-WEST TERRITORIES.

**Hué**, fort. tn., is the cap. of Annam, Fr. Indo-China. It is on the Hué R., 10 m. from its mouth, and carries on considerable trade through Thuanan. It is surrounded by a wall and moat, and contains an old palace. It was at H. that the treaty establishing a Fr. Protectorate was signed, Feb. 23, 1886. Fr. troops occupy part of the citadel (called Mang-Ca) of H. There are normal and secondary schools. In the revolutionary disturbances in Indo-China which followed the capitulation of Japan (1945) H. was a centre of Viet-Nam revolt, the Court of H. having sealed its own doom during the world war by rallying to the Jap. The Fr. garrison of H. was attacked at the end of 1946 but gradually, with the arrival of reinforcements, the Fr. gained the upper hand. Pop. 15,000.

**Hue and Cry**, old phrase derived from the method of pursuit of felons by the general public, as provided for in common law. Also the title of a gazette containing the names of deserters, persons charged with crimes, etc. pub. in 1710.

**Hueffer, Ford Madox**, see FORD, FORD MADOX.

**Hueffer, Francis** (1845-89), musical critic, b. at Münster Westphalia; educated at Göttingen. In 1882 he was naturalised as a Brit. subject. In 1886 he became

editor of *The Musical World*, and musical critic to *The Times* (1879). He was the apostle of Wagner in England, and pub. *Richard Wagner and the Music of the Future* (1874), *The Troubadours* (1878), etc. In 1888 he issued a trans. of the *Correspondence of Wagner and Liszt*.

**Huehuetenango**, tn. in the dept. of Guatemala Central America, is the cap. of H. dept., 106 m. N.W. of Guatemala. It is the centre of a lead-mining dist., and quite near are the ruins of an old Indian city. Pop. 10,000.

**Huelva**: (1) Prov. of Andalusia, Spain, bordering on Portugal and the Atlantic Ocean. Area 3906 sq. m. Much of the surface is occupied by the Sierra Morena, and it is watered by the Lepe, Odell, and Tinto Rs., and tribs. of the Guadiana and Guadalquivir. There are rich deposits of iron and copper pyrites, and valuable mineral waters, while some dists. are very fertile. Pop. 374,200. (2) Cap. of above prov., on the estuary of the Odell and Tinto Rs., 49 m. S.W. of Seville. The harbour is large and safe, but the entrance is partially blocked by a bar. There is a large export trade of metallic ores and agric. produce. Pop. 58,000.

**Huercal Overa**, or **Huercal Overa**, tn. in Spain in the prov. of, and 40 m. N.E. of, the tn. of Almería, is near an important mining dist. and has considerable trade in agric. produce. Pop. 16,367.

**Huerta, Adolfo de la**, was governor of the Mexican prov. Sonora when it seceded, April 1920. When revolution displaced Carranza on April 23, H. became provincial president of Mexico; confirmed in office (after Carranza's assassination) May 24. He was only a stop-gap—Obregón being inaugurated in Dec.

**Huerta, Victoriano** (1854-1918), Mexican president and generalissimo, b. at Colotlan of Indian parents. Educated in the Military College, Mexico City, as a result of the interest taken in him by Juárez the Mexican President. Became a lieutenant of Engineers in 1877, after a most successful career in the College. On active service in various parts of Mexico 1878-1912, being promoted to the rank of general in 1901. His prin. service during this period was to suppress the Chihuahua rebellion in 1912. Made military commandant of the Federal Dist. in Mexico City in 1913. When Lascurain resigned, Huerta became Interim President. At this time the ex-President Madero, who was awaiting trial for treason, was, together with Suarez, the ex-Vice-President, murdered while being conveyed to the Penitentiary. For this act, which may or may not have been instigated by him, H. incurred the utmost odium throughout the U.S.A. and his protracted conflict with America may be said to have begun from that date (Feb. 1913). Gen. Carranza aided by Gen. Villa, headed rebellious against him after he had been confirmed in office. No efforts on the part of President Wilson at mediation were successful in reconciling the insurgents with H., whose ruin was completed by his own folly in repudiating the National Debt and thereby precipitating a state of

anarchy and disorder which was only remedied by active Amer. intervention. He resigned in the summer of 1911, just before the beginning of the first World War, in which the only part he played was to endeavour to lead a revolutionary force into Texas.

**Huesca**: (1) Prov. of Aragon, N. Spain, bounded on the N. by France and on the E. by the prov. of Lerida. Area 5819 sq. m. Pop. 224,500. (2) Cap. of the above prov. on R. Isuela, 45 m. N.E. of Saragossa. It is picturesquely built on a height above a fertile valley. The Romans knew it as Osca, and Sertorius was murdered here in 72 B.C. The town was important under the Arabs and the kings of Aragon, and part of its old walls still remain. Among the notable buildings are the Gothic cathedral (1300-1515), the univ. (1354), and the auct. palace of the kings of Aragon, where the 'Massacre of the Bell' occurred in 1136. Pop. 11,600.

**Huescar**, city in Spain, 68 m. N.E. of Granada. Manufs. woollen fabrics. Pop. 8300.

**Huet, Pierre Daniel** (1630-1721), Fr. scholar and churchman, b. at Caen. In 1652 he visited the Swedish Court in company with Bochart, and discovered at Stockholm the famous Origen MS., which he ed. in 1668. In 1670 he and Bossuet were appointed tutors of the Dauphin, and prepared an ed. of the classics for their pupil's use. He took orders in 1676; became abbot of Aunay (1678), bishop of Soissons (1685), bishop of Avranches (1692), and abbot of Fontenay (1699). In 1701 he settled in the Jesuit College in Paris. His works include: *De Interpretatione* (1661), a collection of poems (1664), *Demonstratio Evangelica* (1679), *Traité de la Faiblesse de l'Esprit Humain* (pub. posthumously, 1923), etc.

BARON VON HÜGEL

**Hügel, Baron Friedrich von** (1852-1925), Catholic religious writer; b. at

Florence. His father was Baron Karl von H. and his mother was Scottish. Baron Karl was Austrian minister at Brussels, 1860-67. Friedrich was never at school or univ.; an attack of typhus in 1871 left him deaf. He received instruction from the historian Reumont, was influenced by Abbé Huvelin and W. G. Ward. He became naturalised subject of Great Britain during the first World War. He was foremost Catholic scholar in England of his time, after Lord Acton. Although at one time suspected of Modernism and certainly liberal in thought, he was nevertheless loyal to the church, his whole life and practice being inspired by her teaching and doctrine. Everything he did was 'to be in the mind of the church.' Works include: *The Mystical Element in Religion* (1908-09), *Eternal Life* (1912-13), *The German Soul*, etc. (1916), *Essays and Addresses on the Philosophy of Religion* (1921). See B. Holland (ed.) *Selected Letters of Hügel*, 1927; Gwendolen Greene (ed.) *Letters to a Niece*, 1928; Algar Thorold (ed.) *Readings from Friedrich von Hügel*, 1928.

**Hugglescote**, par. in Coalville urb. dist., 6 m S.E. of Ashby-de-la-Zouch, Leicestershire. It has collieries. Pop. 6500.

**Hughenden**, or **Hitchendon**, par. in Buckinghamshire, 1 m. N. of Wycombe. H. Manor was the residence of Disraeli. He was buried in the par. church which contains a monument to him erected by Queen Victoria. Pop. 2500.

**Hughes Capet**, see CAPET, HUGHES.

**Hughes, Charles Evans** (1862-1948), Amer. lawyer and statesman, b. at Glen Falls, New York, son of Rev. David Charles H. Educated at Colgate and Brown Univs., and the Columbia Law School. He was prof. of law at Cornell Univ., 1891-93. In 1905 he won prominence as the attorney for the Armstrong Legislative committee, which investigated the methods of the life insurance companies incorporated under the laws of New York. H. became the inevitable candidate of the Republican party for governor of New York. He was duly nominated in 1906, and the Democrats nominated W. R. Hearst, the newspaper proprietor. H. was elected, and re-elected in 1908. In 1910 President Taft appointed him an associate Justice of the U.S. Supreme Court. In 1916 the Republican party again nominated him and he at once resigned from the U.S. Supreme Court and began a vigorous campaign. On the night of the election on Nov. 7 it was found he had carried the whole of New England except New Hampshire, New York, New Jersey, Indiana, and Illinois. It was assumed that H. had been overwhelmingly elected; but the far W. states were still voting, and the W. was doubtful because of the Democratic slogan about Wilson—'He kept us out of the War.' For several days the real result of the election hung in the balance. The presidency now hung upon the results in California. Wilson was finally found to have carried California by a little less than 4000, and was therefore duly re-elected President. He had lost his great opportunity through the

failure of his managers to mend the breach in California, but even in other parts of the country he did not obtain the support that had been expected. He then returned to the practice of the law in New York, where, upon the United States' entry into the war, he acted as member of the draft appeal board and took charge of an inquiry into aircraft. In 1921, when President Harding held the reins of gov., he made H. secretary of state. The most notable event of his term was the arms conference held in Washington in Nov. 1921. As president of that conference he did much to bring about an agreement that led to a closer understanding between the United States and Great Britain. There was also the four-power treaty between the U.S.A., Great Britain, France, and Japan regarding their possessions in the Pacific, and the cancellation of the Anglo-Jap. alliance. H. held on as secretary of state for a time under President Coolidge and then resigned to resume the practice of law. He was Judge of the Permanent Court of International Justice, The Hague, 1923-30; President of the Amer. Society of International Law, 1925-29; and Chief Justice of the United States, 1930-11. An impartial judge he found himself compelled, like his associates, to declare invalid and unconstitutional a great number of the laws passed by Congress at the instance of President Franklin Roosevelt as parts of the 'New Deal.' He pub. *The Pathway of Peace* (1925), *The Supreme Court of the United States* (1929), and *Pan American Peace Plans* (Yale Univ. Lectures, 1929).

**Hughes, David Edward** (1831-1900), Anglo-Amer. inventor, b. in London; went to Virginia in 1847; in 1850 became Prof. of music at Bard-town College, Kentucky. His inventions include an improved telegraph type-printer (1854-55), and the microphone (1878), which was produced almost simultaneously by Luitge. He was made F.R.S. in 1880, gold medalist of the Royal Society in 1883, vice-president of the Royal Institution in 1891, and Albert medalist of the Society of Arts in 1893.

**Hughes, Sir Edward** (c. 1720-94), Eng. admiral, b. at Hertford and entered the navy, 1733. He assisted in the attacks on Cartagena and at the taking of Louisbourg and Quebec. He became commander-in-chief in the E. Indies, 1773. During 1782-83 he had five encounters with the Fr., and was made admiral in 1793.

**Hughes, Hugh Price** (1817-1902), Welsh Wesleyan minister, b. at Carmarthen, educated for Wesleyan Methodist ministry at Richmond College. In 1884 he became prominent in London at Brixton Hill as a leader of the 'Forward party,' and in 1886 started the W. London Mission. In 1885 he became editor of the *Methodist Times*, in 1896, first president of the National Council of the Evangelical Free Churches, and in 1899 president of the Wesleyan Methodist Conference. See life by his daughter, 1904.

**Hughes, John** (fl. 1869). Welsh iron and shipbuilding master. After his apprenticeship in Ebbw Vale, Wales, he

estab. a factory at Newport. Then directed a Millwall iron and shipbuilding yard and made the Millwall shield, a resistant armour which interested Russia. Toured the Russian mines, and, in 1869, founded a company to supply all Russian railways with iron. Before the 'Hughes works' were set up with 3000 men employed, there had been a vast stoppage with primitive peasants and 'tchumaks' or carriers driving bullocks for grain transport. The H., father and sons, came to the Don country, which then soon outstripped the trials of those days with many iron-works. The centre was named Hughesovka or Yuzovka. This fn. ultimately was renamed Stalino (*q.v.*).

**Hughes, John** (1677-1720), Eng. poet b. at Marlborough, Wiltshire, and educated in London. He became a clerk in the ordnance office. He was delicate, and suffered much from poverty till his appointment as secretary in the Court of Chancery. His best work, *The Sack of Damascus* was produced at Drury Lane Theatre (1720), but he died the same evening from consumption. Besides his poems, he wrote a *History of England* (1706), *The Works of Mr. Edmund Spenser* (1715), and contributed to sev. periodicals. See S. Johnson in *The Lives of the Poets*, vol. II., 1781.

**Hughes, Richard Arthur Warren** (b. 1900), Welsh author. Educated at Charterhouse and Oriel College, Oxford. Earliest work was *The Sister's Tragedy* (play) and *Gipsy-Night* (and other poems) both pub. in 1922. These were followed by *A Comedy of Good and Evil* (1925) and *Confessio Juvenis* (collected poems) (1926). H. was the first dramatist to write specially for broadcasting and he has been associated with the Welsh National Theatre. He is, however, best known for two novels: *A High Wind in Jamaica* (1929) and *In Hazard* (1933); the first-named being a story of some children who fall into the hands of modern pirates, notable for its original narrative style and for its convincing interpretation of child mentality; the second, a vivid story of a ship's adventures in a hurricane. Other works: *A Moment of Time* (short stories, 1926), *Collected Plays* (1928), *The Spider's Palace* (stories for children, 1931), *Don't Blame Me* (1910), *City of Angels* (1941), and *Her Fabulous Fortune* (1943).

**Hughes, Sir Sam** (1833-1921), Canadian general; b. at Darlington, Ontario. Educated: Toronto, Normal School and Univ. In S. African War he was Assistant Inspector-general of communications; afterwards chief intelligence-officer to Sir Chas. Warren. In 1911 he was appointed minister of militia and defence; and he had a great deal to do with preparation of Canadian force that fought in the First World War. K.C.B. and major-general, 1915.

**Hughes, Thomas** (1822-96), author, began life as a barrister and a follower of Frederick Denison Maurice and other leaders of the Christian Social School. He was a founder of the Working Men's College, and prin. of that institution from

1872 to 1883. He sat in Parliament from 1866 to 1874, and was a co. court judge from 1882. The author of sev. books and many tracts and essays, his fame rests entirely upon *Tom Brown's School Days*, pub. anonymously in 1877. It is a simple story of public-school life, admirably presented, and underlying it is a strong, sound religious sense, that had the greater influence for not being unduly obtruded. See M. L. Parrish and B. K. Mann, *Charles Kingsley and Thomas Hughes*, 1936.

Hughes, William Morris (b. 1861), Australian statesman; b. in Montgomeryshire, Wales. Educated: Llandudno Grammar School; St. Stephen's church school, Westminster. Emigrated to Australia, 1884. Worked as farm hand, coasting sailor, labour organiser. Member of Parliament since its estab. in 1901. Called to N.S.W. Bar, 1903. Minister for external affairs, 1904. Attorney-general, 1908-09, again, 1910-13; and again 1914. Fisher resigned premiership in 1915, and H. took his place. He visited England, then in the turmoil of war, in 1916, was made P.C., and preached an imperialism little to the taste of the Brit. Labour Party. He had become essentially a war-premier, failed to carry conscription, fell out of favour on the coming of peace, had to resign in 1923, and in 1929 began forming a new group called the 'Australian party'. In that year he pub. an evan gel of empire called *The Splendid Adventure*. Joined the Commonwealth Gov. as vice-president of the executive council, 1931-3; and again in 1937-38. Minister of health and repatriation (Lyons Gov.), 1931-3; 1936-37; of external affairs, 1938-40; attorney-general and minister for industry, 1940-41; minister for the Navy, 1941-44.

Hughesovka, see STALINO.

Hugh of Lincoln, St. (1. c. 1135-1200), bishop of Lincoln, b. at Avalon, Burgundy, of noble parentage, entered the Grande Chartreuse about 1160, and became bursar there. Rose to the office of procurator which brought him into touch with the outer world; and about 1175 he was invited to England by Henry II., to estab. at Witham, Somerset, the first Eng. Carthusian monastery. In 1186 he became bishop of Lincoln; in 1189 went on an embassy to France; in 1194 excommunicated King John, and in 1198 led the first refusal of a money grant. He was canonised in 1220. The chief life of St. H. is the *Magna Vita S. Hugonis* (in Mss. in the Bodleian Library), written by Adam, private chaplain to St. H. See also Canon Perry's *Life of St. Hugh of Avalon*, 1879; and life by Marson, 1901. (2) (c. 1246-55), Eng. Christian child who is traditionally alleged to have been at the age of eleven crucified by a Jew of Lincoln, named Copin, after having been tortured and starved on account of his faith. His body was buried near that of Grosseteste in Lincoln Cathedral. The story of his martyrdom was a favourite one with Eng. ballad-makers and chroniclers. It is the theme of the 'Priores's Tale' in Chaucer's *Canterbury Tales*, and is also referred to by Marlowe.

Hugh Town, tn. and cap. of the Scilly Is., Cornwall, on St. Mary's Is.

Hughl, Hooghly, or Hoogly: (1) most westerly and most important of the mouths of the Ganges, India, formed by the confluence of the Bhágrathi, the Jalangi, and the Murmá streams. Its length is about 200 m., and it is about 10 m. wide at the mouth. It is the only mouth of the Ganges navigable by large vessels, which can safely go up to Calcutta. Navigation is, however, much hindered by silting and the formation of sandbanks. The 'bore' is often of great height and velocity. The H. is held sacred by the Hindus. (2) Cap. of dist. of same name, W. Bengal, India, on R. H., 23 m. N. of Calcutta. The chief building is the Inambarra, a Muslim institution. The tn. was founded about 1537 by the Portuguese, who were driven out a century later by the Mohammedans. Pop., with Chinsurah, 50,000.

Hugo, Victor Marie (1802-85), fr. poet, dramatist, and novelist, b. at Bescon, the son of Gen. H., an officer in Napoleon's army. His childhood was full of change, as the family usually followed their father and the army, and he was educated at the Feuillantines in Paris (1809-11, and 1813-15), at Madrid (1812), and at the École Polytechnique. His poetical genius asserted itself very early. In 1816 he produced a tragedy; the next year was nearly successful in an Academic competition; in 1819 began to contribute to the newly founded *Conservateur Littéraire*; and was sev. times the victor at the floral games of Toulouse. In 1822 he made his real literary début with *Odes et poésies diverses*. This vol. contains no great innovations, but is remarkable for strength and beauty of diction and great dexterity in the handling of difficult rhythms. In 1823 he pub. anonymously *Han d'Islande*, a fantastic and extravagant prose romance, dealing forcibly, but with an utter disregard of possibilities, with a N. bandit. It was followed by *Bug Jargal*, a similar production (1826). His second vol. of poem., *Odes et ballades* (1826), and his third, *Orientales* (1829), definitely mark the trend of his tastes and opinions. They are 'romantic' in the extreme, the subjects being barbaric and fantastic, the metre varied and irregular, and the language glowing and exotic, but the matter is still rather empty and puérile. His first attempt at drama appeared in 1825 (*Tomcel*), which was never acted, is more a romance in dramatic form than a true drama, but is of some importance in literary hist. It was preceded by a somewhat paradoxical and incoherent preface, which served as a manifesto of the new romantic school, asserting the dramatist's independence and emancipation from all the old conventions. Its pub. made H. the recognised head of the new movement, a position in which he took himself and his mission very seriously. In 1830 *Hernani*, the first of his typical dramas, was acted at the Théâtre Français. Its subject is the suicide of a noble Spaniard at the moment of his marriage, on account of a point of honour. Its style is in direct

antithesis to all the traditions of the Fr. stage. The language, though gorgeous, has none of the old classical periphrasis; the Alexandrine metre is completely changed in character by constant overlapping, and the old dramatic laws are set at naught. The play was the text of long and violent contention between the Classicists and the Romantists, and this circumstance has given it a fictitious importance, since in spite of the splendid march of the verse and the gorgeous diction, *Hernani* is lacking in some of the principles of dramatic art.

VICTOR HUGO

In 1831 a correspondingly revolutionary production in the realm of prose romance appeared in *Notre Dame de Paris*, a pretentious but picturesque novel of medieval Paris, which shows the influence of Sir Walter Scott. Its failings are a lack of proportion and humour, and an incompleteness of construction, but to the average reader these are at any rate at first, completely outweighed by H's wonderful faculty of description, command of passion, and splendid and poetical language. In the same year H pub *Les Feuilles d'automne*, a vol of lyric and contemplative verse, which contains some very fine poetry.

The next few years were occupied in the production of dramas on the lines of *Hernani*. *Marion Delorme*, which appeared in 1831, is usually considered his best. The next year saw *Le Roi s'amuse*, interdicted after the first night, which has gained a world wide reputation as *Itigoletto*. They were followed by *Lucrèce Borgia* (1833), a melodrama, *Marie Tudor* (1833) *Angelo* (1835), a prose melodrama, *Ruy Blas* (1838), which stands second among his plays; and *Les Burgraves* (1843), a kind of sentimental epic clumsily put into dramatic form, which

contains, however, some wonderful writing. All these dramas show command of language and fertility of invention, but are lacking in constructive art, which probably accounts for the waning of their popularity. Their production was interspersed with that of several volumes of charming verse viz *Chants du crépuscule* (1835), *Les Fous intérieurs* (1837), and *Les Rayons et les ombres* (1840), and he also issued during this decade *Claude Gueux* (1831), *Littérature et philosophie mêlées* (1834) a collection of juvenilia and *La Esmeralda* (1836), an opera for Mlle Bertin.

H's political opinions had in the meantime been undergoing considerable changes. Previous to 1830 he had been an ardent legitimist, but during the reign of Louis Philippe he became a constitutional royalist sitting in the Assemblée Constituante as a representative of Paris, later an extreme Liberal, and finally, on his election to the Assemblée Législative in 1848 a democratic republican. After the coup d'état of 1852 he was banished for opposition to Louis Napoleon, and fled to Brussels and then to Jersey. During this time his literary output was mainly confined to journalism and pamphleteering, but he soon resumed more serious work in exile. The first work to appear was *Napoléon le Petit*, the least literary of all his works. In 1853 he issued *Les Châtiments*, giving vent to his anger against the Second Empire. The book is notable as a rare example of lyric satire, i.e. a combination of true poetry with invective. After three years of silence, he emerged in an entirely different light with *Les Contemplations* (1856), a collection of lyrics remarkable for beautiful expression, simple diction, and breadth and profundity of thought. In 1859 appeared the *Légende des siècles*, a collection of narrative and pictorial poems dealing with different periods of the world's hist., which, though somewhat unequal, contains some of his masterpieces. Among the best of the poems are *Armstrong*, *Le Petit Roi de Galice*, and *Evadimus*.

In 1862 H issued *Les Misérables*, a long and unequal prose romance dealing with modern life. Its descriptive portions are remarkable and much of the writing is touching and sincere, but the style is full of mannerisms, and the plot abounds in absurdities. *William Shakespeare* (1861), was a strange and rhapsodical vol of criticism, containing some fine passages of ornate prose. In 1863 there appeared *Chansons des rues et des bois*, a collection of light lyric verse, notable for its style. It shows H in rather a new light, and the grace, daintiness, and wit of some of these poems, though not always free from laboured mannerism, show the extraordinary adaptability of his genius. *Les Travailleurs de la mer* (1867), another prose romance, is a tale of passionate adventure and self sacrifice, and contains some exquisite passages. Another romance, historical in nature, was pub in 1869, under the title of *L'Homme qui Rit*. Though full of power, it is rather extra-

gant, and the general effect is overwhelming and almost wearisome.

After the revolution of 1870, H. returned to France and again entered politics, though not with very happy results. He was elected to the National Assembly at Bordeaux as representative for the Seine, but soon resigned. He remained through the rule of the Commune and defended the Vendôme Column as long as possible and then retired to Brussels. He was expelled from Belgium on account of an imprudent speech in favour of the Communists, and returned to France, where he unsuccessfully stood for Paris. He lived in France till his death, in considerable literary and general popularity.

The writings of this last part of his life are of comparatively little importance. They include: *L'Année terrible* (1872), almost his weakest book, a series of eloquent pictures of the war, full of praises of France and invective against Italy; *Quatre-Vingt-Treize* (1874), another historical romance; a collection of speeches and addresses in 1875-76; *Seconde Légende des siècles* (1876), which, though not equal to its predecessor, is still full of vigour; *Histoire d'un crime* (1877), described as 'the apotheosis of the Special Correspondent'; *L'Art d'être grand-père* (1877), containing much that is charming, but a good deal of 'sentimentalism'; *Le Pape* (1878); *La Pitié Suprême* (1879), *L'Âne* (1880), *Les Quatre Venis de l'Esprit* (1881), a remarkable last flash of genius; and *Torquemada* (1882). He died on May 22, and his funeral was marked by a great display of public feeling.

H.'s position in Fr. literature is important in that he not only bestowed on Fr. romanticism a peculiarly 'decorative' character, but actually kept the romantic spirit alive in France for some thirty years after its apparent decease. As a writer his powers were wonderful. To name only a few of his characteristics, he is notable for vitality, wide scope of genius, graceful lyrical power, rhetorical magnificence, the ability to express pathos, awe, and indignation; wealth of colour and light; variety of style, and consummate skill in the handling of metre and language. His main defects are a lack of humour and proportion, and an all-pervading egotism, but despite these he stands on a level with the great names of international literature. See E. Bré, *Victor Hugo*, 1880, and other vols. by the same author; E. Dupuy, *Victor Hugo, l'homme et le poète*, 1887, and *La Jeunesse de Victor Hugo*, 1902; F. Gregh, *Étude sur Victor Hugo*, 1915; Mme. Duclaux, *Victor Hugo*, 1921; Mary Robinson, *Victor Hugo*, 1921; E. M. Grant, *Victor Hugo during the Second Republic*, 1935; P. Zumbor, *Victor Hugo, poète de l'âme*, 1946.

**Huguenots**, name applied to the Fr. Protestants of the sixteenth and seventeenth centuries. The party grew up during the reigns of Francis I. and Henry II., and under Francis II. developed into a religious-political organisation, headed by the Bourbons, especially the

king of Navarre and the duke of Condé, and opposed to the Catholic party, headed by the Guises. The strife between them developed into the long series of religious wars which began in 1562. Civil rights were granted to the H. by Henry IV. in the Edict of Nantes (1598), but this was revoked by Louis XIV. in 1685, and many Protestants were driven out of France. Perfect civil equality was secured to all denominations by the revolution of 1789. See also FRANCE.—History.

Hulchaulu, tn. in the Anhwei prov. of China, 100 m. S.W. of Hangzhou. It is famous for its tea.

Hulla, dept. of Colombia, S. America, which lies in the S. between the central and E. Cordilleras and is watered by the Magdalena R. It has an area of 7990 sq. m. Coffee is grown by smallholders, but on a much smaller scale than in a number of other depts. The cap. is Neiva (pop. 15,000) on the upper Magdalena R. Gold has been found near Neiva. Pop. 233,800.

Hulla, volcano in the Andes, Colombia, 60 m. N.E. of Popayan. It is 18,500 ft. high.

Hulla, fort. tn. in the prov. of Angola, Portuguese W. Africa, 90 m. N.E. of Mossamedes. It is healthily situated and is the centre of a fertile agric. dist.

Huitzilopochtli, name of the Mexican war-god whose feasts were formerly celebrated in May, July, and Dec., amid scenes of revolting savagery. Many thousands of human victims were sacrificed yearly in his honour. The idol is generally carved in wood and of huge proportions: the face is covered with a golden mask, and on the head is a plumed helmet, the shape of a bird's beak.

Hukwang, formerly a prov. of Central China, is now divided into the two provs. of Hupeh and Hunan.

Huleh, Baheiret el-, see MEROM.

Hull, Cordell (b. 1871), Amer. statesman and lawyer, b. in Overton Co. (now Pickett), Tennessee, U.S.A. Studied at National Normal Univ., Lebanon, Ohio. Became a lawyer and judge. Served as a captain in the Cuban War of 1895. Member of Tennessee House of Representatives (1893-97), then a judge in Tennessee (1903-07). Was Democrat Representative for Tennessee in Congress from 1907-21 and from 1923-25. Senator for Tennessee State 1931-37, resigning to become secretary of state (foreign minister) in Roosevelt's cabinet. Was the leading figure in the Pan-Amer. conference at Monte Video (1933), a landmark in New

World hist. Like Roosevelt he showed, as early as 1933, that he belonged emphatically to the internationalist, as opposed to the isolationist, school of thought. Won a signal victory for liberalism with his reciprocal trade agreement law, and much credit belongs to him for many trade treaties which achieved an unexpected success, though a fanatical adherence to the obsolete doctrine of 'most-favoured-nation' treatment has virtually limited these trade agreements to commodities of which the other party is the sole or main supplier (E. H. Carr). An unremitting advocate of tariff reduction the world over and the unflagging opponent of mercantilist policies or of anything that operated against economic internationalism, he triumphed by 1910 over all opposition in Congress and put all secession to rout. When H. entered the State Dept. in 1933 his one aim was to secure the reduction of tariff barriers, and though when he left that dept. in 1941, the U.S. was at war in four continents he still thought in terms of free trade and the rule of international law. With Roosevelt he was in Advance of Amer. opinion. In 1937, on the Sino-Jap. war, and would have taken positive steps to hamper Japan's aggression. In 1938 he unofficially declared 'a moral embargo' upon the shipment of airplanes to all countries which engaged in the aerial bombardment of civilians. Though the pendulum, at first, swung but slowly from isolationism to internationalism, it is due to H. (next to Roosevelt) that the Amer. people were awakened to their danger, and as a foreign minister he stands in the line of Adams, Webster and Hay. H. persistently avoided commitments even in war time, except for the commitment to the vague phrases of the United Nations. When 'normal' conditions returned he counted on an improved Wilsonian system—where Roosevelt relied on his personal contacts with the rulers of the Great Powers neither H. nor Roosevelt seems to have envisaged the policy leading to permanent military commitments and continuing economic action. See *The Memoirs of Cordell Hull*, 1948.

Hull, or Kingston-upon-Hull, parl. and ex. bor. and riv. port of the E. Riding of Yorkshire, England, at the junction of the R. Hull with the R. Humber, 22 m. from the N. Sea, 38 m. S.E. of York and 181 m. N. of London. For more than 700 years the port has been in existence, H. having been famous since the days of mediæval ships. Situated as it is on the N. bank of the Humber, which is the natural approach to the great industrial areas of Yorkshire, E. Lancs. and the N. Midlands, the port has adequate accommodation and equipment for the rapid and economical handling of goods consigned to or from all parts of the world. Pop. 1938 (est.) 318,700. 1948 (est.) 293,000.

**Port, docks and trade.**—The port accommodation comprises ten docks, with a water area of 200 ac. and 13 m. of quays and has a frontage to the Humber of over 7 m. The King George Dock

covering 53 ac. (entrance 750 ft. long and 85 ft. wide) is the largest and best equipped dock on the N.E. coast, and when a further extension is completed it will contain an area of 85 ac. It has a large grain silo at the W. end, 2 graving docks, electric cranes, and an 80-ton floating crane. Alexandra Dock (53 ac.), with a depth of 32½ ft., can accommodate large ocean-going steamers. It is used to a large extent by the grain trade and for the export of heavy machinery, chemicals, iron, and steel. The Victoria Dock (25 ac.) is the chief centre of the timber import trade. The Tn. Docks (Humber, Railway, and Princes) (total area 18 ac.) are used chiefly by vessels in the continental and coastwise trades. St. Andrew's and Extension Docks (19½ ac.) are set apart for the fishing trade. The Salt End Oil Jetties are an ocean depot for discharging and loading mineral oils. The Railway Executive owns five public dry docks and seven other dry docks are operated by sev. companies, mostly marine engineers. The R. H., which rises in the Yorkshire Wolds and flows into the Humber, is a valuable asset to the city and port, for it provides a ready means of warehouse accommodation and is of great economic value to manufacturing concerns. Steamers up to 200 ft. in length use the Old Harbour, which is the term given to the lower part of the R. H. (oil) is conveyed from Yorkshire and the Midlands by riv. craft to the mills and sawworks on the R. H. No Brit. port stands so well naturally or economically as H. for riv. or canal barge traffic. Inland water navigation and transport link H. with Leeds, Sheffield, and numerous other tns. of Yorkshire and the Midlands. Altogether H. is the base of 600 m. of inland water navigation.

The chief trades using the port are: grain, timber, wool, fruit, dairy produce imported meat, coal exporting, and cold storage. There is storage accommodation for over 750,000 quarters of grain (in 1935 grain imports into H. were 1,166,855 tons). H. is the second largest soft-wood importing centre of the United Kingdom, and in 1939 timber imports exceeded a million loads. Wool imports in 1934 amounted to nearly 31,000 tons. The H. fishing industry, which is the largest single business existent in H., is now domiciled at St. Andrew's and St. Andrew's Extension Docks at the W. end of the city and represents a self-contained community with ice factories, fish meal and oil works, ship-repair and engineering shops, all owned and conducted by the fishing trade. The Fish Mkt., which was reconstructed in 1933, embracing merchants' offices, post office, banks etc., is already inadequate to meet expanding needs.

**Industries.** H. has large ship-repairing and marine engineering establs., manufs. of oil, paint, colours, machinery, ropes, chemicals, tanning, milling industries, sawmilling, industrial alcohol, margarine, cement, central heating apparatus, household requisites, blue, starch, chocolates, surgical dressings, machine belting, elec-

tric lamps, fish oils, fish meal and cured fish. H is the chief centre of the seed crushing and oil extraction trade in the kingdom. A branch of this industry is the manu of feeding cake and meal for cattle. It is one of the largest and oldest centres in the world for the manu of all classes of paints, enamels, colours, polishes, stains, distempers, and varnishes. The laundry blue and starch industry commenced in H in 1811, and the making of ultramarine, which is the basis for the blue now used in household washing, was begun in 1833. The starch made here is a fine product and is sold in packets. Engineering has been one of H's staple industries. Steam was in its infancy when the industry began in H in a small way. In 1902 the first concrete bridge to be built in England was constructed in H. Allied to the ship building industry is that of marine engine construction and ship repair work, and to day about 8000 men find employment in these and the general engineering industries. Industrial alcohol is produced on a large scale, and among other chemicals produced are acetic acid, acetone, butyl alcohol and many allied chemicals of the first importance to such industries as artificial silk, cellulose, lacquers, pharmaceutical chemicals, and textiles.

**Buildings**—The prin churches of H are the great church of Holy Trinity beside the mkt place, which dates back to the thirteenth century. Its tower is 130 ft high and the church is 272 ft long. The church, in the early Eng style, is said to be one of the oldest buildings of brick in the kingdom still in use for the original purpose. The rest of the fabric is of stone and mainly of Late Perpendicular date. Holy Trinity is the only building left which shows the importance which Edward I attached to his new foundation and the church was designed from the first to serve a great city. St Mary's Church, Lowgate, originally built by the Knights Hospitallers of N Ferriby, dates from the early fourteenth century. It is said that Henry VIII caused a large part of the church to be removed for the enlargement of his manor house. St Peter's Church, Drypool, near Victoria Dock, though not within the tn at the date of its building is reputed to have been built originally in the reign of Edward I. The present building, constructed about 130 years ago, is the third on the site, and this stands in ruins as a result of enemy action during the Second World War. Among the other notable buildings of H are the city hall and dock offices, the central library in Albion Street, the Forens art gallery in Queen Victoria Square, the Guildhall and Law Courts, the central police station, and the Wilberforce monument. Wilberforce House, High Street, a fine Elizabethan manor and hp of Wm. Wilberforce, the philanthropist, now serves as the city's historical museum and memorial to Wilberforce. Among educational institutions are the Nautical School and School for Fishermen, the Trinity House Navigation

School and the Marine Engineering and Wireless Telegraphy and Telephony Depts of the Technical College serve the special needs of H's maritime pop. The Technical College, the College of Arts and Crafts and the College of Commerce are large and well equipped colleges. The Univ College, opened in 1928, provides courses in preparation for the external degrees of the Univ of London in Arts, Science, Law, Economics, and Commerce.

**History**—H clearly takes its name from the R H, on whose r b a trading place was estab at least as early as the twelfth century. The hist of 'H,' however begins with the tuship of Wyke, the port being referred to in ant documents as 'Hulmo' or 'Le Hul,' whose trade records go back to as early as the year 1193. The forerunner of the original bor of H was the manor of Myton, together with the afore said hant of Wyke, both of which were part of the eccles pary of H's le and N Ferriby. These places, except for the portion in the pary of N Ferriby, were acquired by degrees from 1160 to 1180 by the Cistercian monks of Meaux Abbey in Holderness, who cultivated the lands and built themselves a grange in Myton on the site now occupied by the Railway Dock. Their settlement being known as Wyke. In 1279 the monks were granted the right to hold a mkt and a fair in Wyke, the fair later becoming H's mkt, one of the best known of the old Eng trade fairs. Wyke was acquired by King Edward I in 1293 and its name was changed to Kingston upon H. It was granted its first Charter (1299), making the tn a free bor. From its earliest days Wyke was a port with a flourishing export trade in wool and in imports of continental wines and merchandise. Later, its strategic importance as the key to the N Midlands, was recognised. New quays were built, the internal communications improved, a ferry to the Lincolnshire shore of the Humber was estab, and in 1322 the tn was enclosed and fortified. The progress of the tn and its trade evidently justified the confidence of Edward I. During the reign of Edward III William de la Pole, the first mayor of H, was the most influential king's Merchant of his time and largely financed the earlier campaigns of the Hundred Years' war. The collegiate church of Wingfield with its De la Pole chantry chapel, remains a permanent memorial of the munificence of the De la Pole family, though the Carthusian Priory in H was their prin burial place. Elizabeth Plan tagenet, sister of Edward IV, was the last of the family to hold the manor and tn of H.

The privileges of H were greatly extended by the charter granted by Henry VI in May 1440, when the tn was incorporated, and the co of the tn created. The co was afterwards (1447) extended to include the pary of H's le and N Ferriby, the priory of Ha'temple and other town ships (all of which remained part of Hullshire till 1835). During succeeding centuries H maintained its position as a leading port, its trade depending on

the export of woollen cloth and lead and the importation of spices, pitch, flax, iron, timber, tallow, furs, and other goods from the Baltic. In the wars of the Roses Edward IV. landed on the Holderness coast and Richard Anson, mayor of Hull, fighting for the house of York. Henry VIII took a keen personal interest in Hull and new fortifications to protect the harbour were largely devised by the king himself, whose instructions in his own handwriting are still extant. It was from the Humber that the Pilgrim Fathers set sail for Leyden in 1620 whence they re-embarked for Plymouth to join the *Mayflower* (there was a *Mayflower* in Elizabeth's reign trading from Hull, where she was built, but whether this was the

King George V (1914). In all, thirty-seven Charters and Letters Patent were granted to the town by various sovereigns and of these thirty-two are still preserved in the Guildhall. The Charter of 1661 became the governing charter of the town under which the corporation acted until the passing of the Municipal Corporations Act 1835. The town was created a city by the Charter of Queen Victoria July 6, 1837 and the office of mayor was raised to the dignity of Lord Mayor by the Charter of King George V, June 26, 1911. In the First World War over 7000 men belonging to Hull laid down their lives. The city also suffered both in life and property by frequent attacks at night by enemy airships. A memorial to Oppyville

A COPY OF AN ANCIENT PLAN OF HULL

From a drawing in the Cotton MSS

same ship is unknown). In the Civil war the first forcible resistance to Charles I. was the closing of the gates of Hull against him in 1642, the king proclaiming the governor, Hotham, a traitor. Hotham later plotted to betray the garrison to Charles but the plot was discovered and Hotham secretly fled only to be captured and executed on Tower Hill. The town also sustained two sieges. Andrew Marvell represented Hull in the last Parliament of the Commonwealth and after the Restoration.

Wm. Wilberforce (1759-1833) was a citizen of Hull and its member of Parliament for a time during his long fight for the abolition of slavery in the British Empire. The construction of docks was a development of this era, the Queen's Dock (known as the Old Dock) being excavated between 1771 and 1774 (filled in, in 1930 and laid out as gardens and now known as Queen's Gardens). Before 1830 two other docks were made, completing a ring of water around the old town—the Humber Dock was opened in 1803 and the Prince's Dock in 1829. Hull's largest dock, the King George, was opened by King George V in 1911. The city has a very fine collection of Royal Charters and Letters Patent dating from King Edward I (1299) to

commemorates the part played by the sons of Hull in the battle of Oppy Wood on May 3, 1916.

The city of Hull was one of the three most bomb-damaged areas in the country in the Second World War. The concentrated fury of the Luftwaffe left its traces in no uncertain manner in the central area of the city, though in no way was the damage so concentrated as it was in the other two areas—London and Plymouth. Out of the 1,100 dwelling houses 30% were completely destroyed or so badly damaged that demolition was necessary, while there was a total of 114,738 reported damages during the war period all of which have been repaired. Of the shops nearly half were destroyed. The principal industries also suffered severely, two of the three large flour mills and several oil and seed crushing mills and oil refineries were almost completely demolished. It is estimated that extensive reconstruction will be required throughout this industry to re-establish it. This may also be said of most of the various groups of industry in Hull. The 1944 Plan for Hull prepared by Sir Patrick Abercrombie and the late Sir Edwin Lutyens contemplates the policy of radical rebuilding of central areas, requiring a big reduction of population at the centre and

adequate local open space and area for community purposes. The shopping centre is planned as a highly specialised precinct, free from through traffic but adjacent to the central traffic routes. Something completely new in shopping centres is proposed which should restore to H. its pre-war position serving a surrounding area comprising a pop. of 750,000 people. Industrial expansion is provided for up the R. H. and along the Humber. Other proposals relate to level crossings and the road system, education buildings, agricultural reservation and green belt. Many of the proposals were under contemplation before the war; they are now regarded in the plan as imperative, and in many cases have been rendered comparatively easy of realisation through the destruction caused by the war.

Hull, city on the N. shore of the Ottawa R. in the co. of H. in the prov. of Quebec (Canada). The varied industries are engaged in the manufacture of pulp, paper, cement, silica, clothing, dressed lumber, concrete blocks, machinery, jewellery, etc. Within the city and its surroundings there are four large electric generating stations of which the largest has a capacity of 250,000 h.p. H. is the shopping centre for a very prosperous farming country. Urban transportation is by a modern autobus system. Pop. 10,000.

Hull, Edward (1821-93), Irish geologist b. in Antrim. In 1869 he was appointed director of the Geological Survey of Ireland and prof. of geology in the Royal College of Science, Dublin. In 1873 president of the Royal Geological Society of Ireland. He conducted a geological expedition under the auspices of the Palestine Exploration Fund in S. Palestine and Arabia Petraea in 1883-84, and another in the Nile Valley in 1893.

Hullah, John Pyke (1812-84), English musical reformer b. at Worcester. He entered the Royal Academy of Music in 1832 and attained fame as the composer of the music to Dickens's opera *The Village Coquettes*. Other of his works were *The Outpost* and *The Barbers of Russia*. In 1841 he started popular classes for the vocal training of schoolmasters in Exeter Hall. He was appointed prof. of singing at King's College and afterwards inspector of training schools for the United Kingdom. In 1846 Edinburgh Univ. conferred on him the degree of LL.D. He always opposed the tonic solfa system. He is the author of a *History of Modern Music* (1862), and a *Grammar of Vocal Music* (1813). His most popular songs are *Three Fishers*, *The Storm*, and *O! Had we two were Maying*.

Hulls, tn. of the Rhineland, Germany, 17 m. NW of Düsseldorf. Manufactures silk, velvet, and linen. Pop. 7000.

Hulsean Lectures, founded by John Hulse (1708-90), an Eng. divine. Hulse graduated at St. John's College, Cambridge, in 1724, and took orders, but in 1733 he came into his father's property in Cheshire, to which he retired, and on his death he left the property to Cambridge Univ. to maintain two divinity scholars at £30 a year each at his old

college, to found a prize for a dissertation, and to found the offices of Christian advocate and Christian preacher or Hulsean lecturer. In 1860 the former office was changed by statute into the Hulsean professorship of divinity. The original terms of the lectureship provided for twenty lectures or sermons in St. Mary's great church (Cambridge) but these were reduced to eight in 1840, and later they were further reduced to four. The value of the Hulsean endowment is between £900 and £900 a year; one tenth goes to the lectureship, a done tenth to the Hulsean prize, and the rest to the prof. of divinity. The first to hold the office was the Rev. Christopher Ben on who lectured in 1820, and the following well known names may be found among the lecturers: R. O. Trinch (1841), Christopher Wordsworth, 1847, James Moorhouse, 1865, F. W. Farrar, 1870, F. J. A. Hort, 1871, W. Boyd Carpenter, 1878, and M. Creighton, 1893.

Hulton, Little, par. and tn. of S. Lancashire, England, situated 4 m. S.E. of Bolton. There are extensive coal mines near. Pop. (1931) 7800.

Humacao, tn. on the E. coast of the is. of Puerto Rico, W. India, 30 m. S.E. of San Juan. Pop. 16,000.

Humane Society, The Royal. This society was founded in England in 1774 by Dr. Wm. Hawes (1746-1808) and Dr. Thomas Cogan (1736-1818), the object being to save life from drowning and to resort by artificial means those who appear to be drowned. The two doctors, having made many experiments, collected a number of their friends at the Chapter Coffee house in St. Paul's Churchyard and there the society was founded. The Receiving House, Hyde Park, was their first depot (there are now some 300), and the boats and boatmen with life-saving apparatus are kept, and women supplied during the skating season. Money rewards, medals, clasps and testimonials are bestowed on those who save or attempt to save people from drowning, and the society has extended its scope to include 'all cases of exceptional bravery in rescuing or attempting to rescue persons from asphyxia in mines, wells, blasting furnaces, or in sewers where foul gas may endanger life'. In 1937 the Stanhope gold medal was instituted and is given to the 'case exhibiting the greatest gallantry during the year', prizes are also given for swimming to public schools and training ships. The society is carried on by means of subscriptions and bequests, the head office are at 1 Trafalgar Square, London.

Humanism, see PRAGMATISM.

Humanitarians, originally a name given to a certain school of theologians in the middle of the eighteenth century who did not believe in the Trinity and regarded Jesus Christ as merely human—the founders of the Unitarian churches in England. It was also applied to the followers of Pierre Leroux (q.v.) who taught the perfection of man apart from the divine. In a more general sense it is used in modern times of a set of people

whose main object is to lessen as far as possible the physical pain and discomfort in the world of to-day, and who hold strong views with regard to modern warfare, corporal punishment, etc.

In this modern sense, the Humanitarian League, founded by H. S. Salt, aimed at consolidating philanthropic and zoophilist sentiments and ideas into a 'humanitarian system of ethics.' See H. S. Salt (d. 1937) *Seventy years among savages*, 1921; *The Logic of Vegetarianism*, 1933; H. Moore, *The Universal Kinship*, 1935.

**Human Rights, Universal Declaration of.** This, the first international Bill of Rights in human hist., drawn up after two-and-a-half years detailed study, was adopted by the plenary session of the General Assembly of the United Nations on Dec. 10 by forty-eight votes to nil, with eight abstentions (The Soviet Union, Poland, Czechoslovakia, Yugoslavia, the Ukraine, Byelorussia, S. Africa, and Saudi Arabia). The Social and Humanitarian Committee approved the final draft on Dec. 7 by twenty-nine votes against the six of the Slav bloc with Canada abstaining on the grounds that social legislation in Canada was for the prov. govs. and not for the Federal Gov. (Canada, however, voted in favour of the Declaration in the plenary session. The Preamble relates the declaration by implication, to the disregard and contempt for human rights manifested in the Second World War by barbarous acts which 'outraged the conscience of mankind' and assumes that, 'if man is not to be compelled to have recourse to rebellion against tyranny and oppression, human rights should be protected by the rule of law'; and it goes on to relate the declaration also to the reaffirmation by the peoples of the United Nations in their Charter (q.v.) of their 'faith in fundamental human rights, and in the equal rights of men and women,' and to their determination 'to promote social progress and better standards of life in larger freedom.' The Preamble is followed by thirty-one Articles setting out the rights in detail. These rights are those which are commonly associated with the way of life of a modern W. democracy and to be found embodied to a greater or lesser extent in the provisions of a free democratic constitution or in the decisions of the courts. They may be said also to be a sequel to the declaration of peace aims in the Atlantic Charter (q.v.), particularly that Article of the Charter which emphasises the right of all men 'to live out their lives in freedom from fear and want.' Among the rights enumerated are: that all human beings are born free and equal in dignity and rights—a re-echo of the famous assertion in the Amer. Constitution; the right to life, liberty, and security of the person; equality before the law; freedom from arbitrary arrest, detention or exile; trial by independent and impartial tribunals; the right of everyone charged with a penal offence to be presumed innocent until proved guilty—a long-established principle of the Eng. common law; freedom from arbitrary interference with a

person's privacy, family, home, or correspondence—by implication a condemnation of notorious practices of the Gestapo; freedom of movement and residence within the borders of one's State; the right to a nationality (many of the 'displaced persons' were 'stateless' as also were and are many women who marry aliens) and to change one's nationality; the right to marry and found a family; marriage to be entered into only with the free and full consent of the intending spouses, the right to own property alone or in association with others (a right hardly to be reconciled with a communist economy); the right to freedom of thought, conscience, and religion, and of freedom of opinion and expression; freedom of peaceful assembly and association—also a familiar principle of the Eng. common law; the right to take part in the gov. of one's country, directly or through freely-chosen representatives; universal and equal suffrage by secret vote; the right to social security, the right to work, to free choice of employment, to just and favourable conditions of work, and to protection against unemployment; to equal pay for equal work, to form and to join trade unions; the right to rest and leisure, and to an adequate standard of living. In the nature of things these rights are guaranteed by no legal sanctions; but the Preamble proclaims the Declaration to be a common standard of achievement for all nations, 'to the end that every individual and organ of society shall strive by teaching and education to promote respect for these rights and freedoms and by progressive measures, national and international, to secure their universal and effective recognition and observance, both among the peoples of Member States (of the United Nations) themselves and among the peoples of others, under their jurisdiction.' The principle of collective responsibility for the maintenance of human rights and fundamental liberties was accepted (Aug. 22, 1949) by 11 votes to 5 in the legal Committee of the Consultative Assembly of the Council of Europe, which met at Strasbourg.

**Humansdorp**, div. of Cape Prov., S. Africa, bordering on the Indian Ocean, and bounded on the N. by the Winterhoek Mts. Cap. Humansdorp, 50 m. W. of Port Elizabeth. Pop. (tn.) 1600; (div.) 9000

**Humayun** (1508–56), Mogul emperor of Delhi. In 1530 he succeeded his father, Baber, in India, the kingdom of Kabul and Lahore going to his brother Kamran. For ten years he was engaged in fighting the Afghans under Sher Shah, and was at length defeated and fled to Persia. In 1545 Sher Shah was killed, and H. returned to India with his son Akbar, and again occupied Delhi, but six months later he was killed by a fall from the parapet of his palace (1556), and his son, Akbar the Great, succeeded him. It was at his tomb, one of the magnificent Mogul monuments near Delhi, that Hodson captured the last of the Moguls, Bahadur Shah, 1857.

**Humber**, estuary on the E. coast of England lying between Yorkshire and the

N and Lincolnshire on the S., and formed by the Rrs. Trent and Ouse. These rivers join near the vil. of Faxfleet, and from there the H. runs for 18 m. in an easterly direction, and then 19 m. in a S.-easterly direction to the N. Sea, widening from 4 m. at the head to 8 m. in the bay formed by a spur on the Yorkshire coast known as Spurn Head. The area drained by the H. is 9,293 sq. m. It is an important commercial waterway and has on its banks the ports of Hull and Grimsby.

**Humbert I., Ranieri Carlo Emanuele Giovanni Maria Ferdinando Eugenio** (1841-1900) King of Italy (1878-1900), eldest son of Victor Emmanuel I., b. at Turin, Savoy. He succeeded his father as H. I., having previously married his cousin, Margherita Teresa Giovanna, princess of Savoy and daughter of the duke of Genoa. He at once proceeded on a tour through his kingdom, and an attempt was made to assassinate him at Naples (Nov. 17, 1878) by a fanatic named Passanante. His reign was peaceful, and he secured for it by a share in the Triple Alliance, his relations with Great Britain being always most friendly. He was a fine soldier and won popularity by his generosity and munificence and his personal activity among his people, who called him 'Il Re Buono'. A second attempt was made on his life in April 1897 by an anarchist named Acciaio and a third attempt made by another anarchist, named Bresci, proved unsuccessful, and he d. at Monza. See I. Pedrotti, *Fate e regno di Umberto I.*, 1901.

**Humble-bee, or Bumble-bee**, name given to all species of *Hombus*, a well-known genus of Hymenoptera belonging to the family Apidae and subfamily Socialinae, the social bee. Their habits bear close resemblance to those of the wasps than to the case with the genus *Apis*. The workers do not differ externally from the queens, and the colonies perish at the end of each season save for a few females which survive the winter, and each of which starts a new society in the spring. The female of *B. lapidarius* builds its nest in cavities among stones merely lining the sides with moss, but *B. terrestris* and other species form a habitation out of dried moss, in deserted mouse-holes in the soil, etc. The wax is secreted in the abdomen of the insect, and is then transferred to the legs and moulded into building material. After the construction of the first cell, the female deposits the eggs therein, closes up the cavity, and rests several days before proceeding to the construction of other cells. The larvae expand and distend the cell in a curious, irregular manner, and when full-grown they pupate in the moss, each larva forming a cocoon of finest silk. The queen scrapes away the wax from the cocoon, to assist pupation, and as the brood becomes matured she gives up to them the labour of collecting pollen and confines herself to producing eggs. The females, which are smaller than the mother, assist her in the process of egg-laying, as also do the workers to a lesser extent. The species of *Psithyrus* also inhabit the nests

of the humble-bees, and some of them bear a curious resemblance to their hosts. There is not that symmetry of structure in the cell of the H. B. which is so marked in the cell of the honey-bee, and they vary considerably in size. H. Bs. display a great variety of colouring, which runs generally in bars of alternate light and dark. *B. terrestris*, *B. hortorum*, *B. lapidarius*, etc., vary even in the same species. The genus is widely distributed in the S. hemisphere, but is unknown in the Ethiopian and Australian regions. See also Bz.

**Humboldt, riv.**, rises in the N.E. of Nevada, flows W S W through the Humboldt Lake, and is lost in the marshy district known as the H. and Carson Sink. Length, 181 m.

**Humboldt, Friedrich Heinrich Alexander, Baron von** (1769-1859), naturalist, b. at Berlin. He studied at Frankfurt on the Oder and Göttingen, and having made an excursion into the Rhine during a vacation, pub. *Mineralogische Beobachtungen über einige Basalte am Rhein* (1790). He afterwards went to Freiberg to study geology and produced his *Flora Iherigena Specimen* (1793). In 1799 he went to S. America with Aimé Bonpland, and the next five years were taken up with explorations in Venezuela, Colombia, Ecuador, Peru, Cuba, and Mexico, an account of which was pub. in his *Voyage aux régions équinoxiales du Nouveau Continent* (1807), which consisted of thirty fasc. and quarto vol. In 1807 he paid a visit to Italy, but ultimately went to Berlin where he was occupied from 1827 to 1828 in giving lectures. The substance of what he appeared later in *Cosmos* (1845-46) is one of the greatest scientific works ever pub. In 1829 he made a journey into Persia and Chirchik through Central Asia and explored the Central Altai Mts., Pamirs, and the Caspian, the results of this expedition appearing in *Fragments géologiques et de climatologie asiatiques* (1831), and in *Asie Centrale* (an enlargement of the earlier work, 1843). See also by H. Brühns, 1872 trans. into Eng. by the Misses Lassall. 1873. A. Leitzen, 1936, and J. Douin, *Wesen und Aufbau der Geographie bei Alexander von Humboldt*, 1951.

**Humboldt, Karl Wilhelm, Baron von** (1767-1835), philologist (elder brother of Alexander von H., b. at Potsdam). He was educated at Berlin, Göttingen, and Bonn, and in 1801 became Prussian minister at Rome. In 1808 he returned to Prussia, and the following year was appointed minister of public instruction, the Berlin Univ. owing its existence to him. In 1813 he was Prussian plenipotentiary at the Congress of Prague, but he retired from political life in 1819 and devoted himself to literature. He made a special study of the Basque language. He also studied the languages of the E. and of the S. Sea is the great work of his life being on the ant. Kawi language of Java. In 1821 he pub. *Researches into the Early Inhabitants of Spain by the Help of the Basque Language*, the result of his visit to the Basque country, and in 1828

*Über den Dualis.* His *Gesammelte Werke* (1841-52), were pub. by his brother, and his correspondence with Schiller, of whom he was a great friend, appeared in 1830. See E. Spranger, *Wilhelm von Humboldt und die Humanitätsidee*, 1928; and studies by R. Haym, 1856; O. Harnack, 1913; P. Binswanger, 1937; J. A. von Rantzaup, 1939; and E. Howald, 1944.

Hume, Allan Octavian (1829-1912), 'Father' of the Indian National Congress, son of Joseph H., a doctor of the E. India Company. He was educated at the E. India College (now Haileybury College), passing from there to the Indian Civil Service (1849). In Simla he formed an organisation which would further the aspirations of advanced Indians; this was the birth of the National Congress (see his *Audi Alteram Partem*). When H. returned to England in 1894 he took great interest in the Brit. Committee of the Indian Congress. In India H. made a valuable collection of botanical and ornithological specimens, and pub. *The Game Birds of India, Burma, and Ceylon* (1879-81). He presented his collection to the Brit. Museum of Natural Hist. (S. Kensington). He founded the S. London Botanical Museum and made provision for it in perpetuity. See studies by W. Wedderburn, 1913, and H. V. Lovett, in *History of the Indian Nationalist Movement*, 1920.

Hume, David (1711-76), Scottish philosopher and historian, was intended for the Bar, but abandoned the intention of becoming a lawyer owing to ill-health. He went to France in 1731 to recuperate, and there wrote his *Treatise on Human Nature*, which was pub. anonymously in 1739, two years after his return. This book attracted little attention at the time, but a better fate attended his *Essays Moral and Political* (1741-42), and his subsequent works, *Philosophical Essays on Human Understanding* (1748), the famous *Enquiry concerning the Principles of Morals* (1751), and his *Political Discourses* (1752). He had failed in 1745 to secure the professorship of ethics at Edinburgh Univ., and later his application for the chair of logic at Glasgow Univ. was not successful; but in 1752 he was appointed keeper of the Advocate's Library at Edinburgh and also secretary to the Edinburgh Philosophical Society, which latter post he resigned five years later. He now worked steadily at his hist., which was pub. two vols. at a time, between 1754 and 1761. In 1763 he went to Paris with Lord Hertford, and held an official post at the embassy, and became a noted and popular figure in the society of the cap. The last years of his life were spent at Edinburgh. His autobiography, *My Own Life*, was pub. two years after his death, and his *Correspondence* (ed. Birkbeck Hill) in 1888. Other posthumous works were *Suicide and Immortality* (1777), and *Dialogues on Natural Religion* (1779). The value of his philosophical writings has never been questioned, although at one time his scepticism made him notorious among the orthodox, and he takes his place as one of the leading

metaphysicians in this or any other country. His hist. suffers severely from inadequate research, and is best studied in the abbreviated version, ed. by Dr. Wm. Smith, 1870. The force of H.'s philosophy lies in the fact that he carries the empirical and sensationalistic tendencies of Locke and Berkeley to their conclusion. The psychology on which his results are founded follows that of his predecessors but is less ambiguous. Every object whatsoever is reduced either to an impression or an idea—ideas evidently corresponding closely to impressions but differing in the degree of force or vivacity. For H. impressions and ideas, whether simple or complex, are the sole contents of the human mind, all of them going back originally to impressions. Hence, as Berkeley said, there can be no such thing as material substance, and reality is co-extensive with ideas. Berkeley held, however, that we could know spiritual substance as opposed to material; but H. asks what, indeed, is the positive impression on which the idea of spirit is founded, and he held that neither had any existence. H. said that, if all his perceptions were removed by death and could he neither think, nor feel, nor see, nor love, nor hate after the dissolution of his body, he would be entirely annihilated, nor did he conceive what was further requisite to make him a perfect nonentity. In short H.'s scepticism can imagine no life after this annihilation of the perceptions (we may not say 'of the self' because H. denies the validity of the notion 'self'). H., however, holds that there are certain all-pervading relations, outside the relation to a self, which seem to bind our ideas to form what we call knowledge. The most important of these relations is that of cause and effect, but that it is necessary to examine whether such relations correspond to definite impressions. Berkeley thought that he had found a basis for the reality of causation in the free activity of Spirit. H. however asks for the corresponding impression and seeks the derivation of the relation of cause-and-effect from some relation among objects themselves as distinct from any particular qualities in those objects; and he finds such relation in the two concepts of contiguity and succession. These, however, do not exhaust causation; for an idea may be continuous and prior to another without being regarded as its cause. Something of the first importance remains to be added and that is the idea of necessary connection. To the question, for what reason do we pronounce it necessary that everything whose existence has a beginning should also have a cause, H. denies that the necessity exists and that every demonstration which may be produced for the necessity of a cause is fallacious and sophistical. To the question, why do we conclude that such particular causes must necessarily have such particular effects and what is the nature of that inference we draw from the one question to the other, H. answers by suggesting that, if the belief in the necessity of a cause is not

referable to any intuitive truth, it must proceed from observation and experience. And here, he says, we insensibly light upon a new relation between cause and effect, that is, their constant conjunction or, in other words, contiguity and succession are not sufficient to make us pronounce any two objects to be cause and effect, unless we perceive that these two relations are preserved in sev. instances, an inquiry which will enable us to discover the essential nature of the idea of necessary connection. H. arrives at the conclusion that the peculiar strength of our belief in casual inference is due to the fact that, by constant conjunction, the relation of cause and effect has acquired the force of custom, or habit. What we call power, or force, or casual efficiency, says H., exists not at all in objects, but only in the mind. 'Necessity is something that exists in the mind, not in objects; nor is it possible for us ever to form the most distant idea of it, considered as a quality in bodies.' This is his chief contribution to philosophy; he admits that it is a violent paradox but considered that he had advanced solid proof and reasoning to justify it. From this hypothesis, he goes on to consider the origin of a belief in the external world or to answer the question, 'How out of a flux of unrelated feelings, never repeated, do we evolve an independent world of identical things, and identical selves?' And suggests that we have only succeeded in reasoning ourselves 'into a frame of mind where the solid fabric of the world dissolves like a dream before our eyes, or passes into a kaleidoscopic unreality of change'. But, he asks, is then scepticism the final word of philosophy? Apparently the result of H.'s inquiry is not intended to destroy belief (assuming that were possible), but to dispose of the false assumption of its certain and demonstrable character. Of course the forthright nature of H.'s conclusions was itself the promise of a new epoch, and the first attack on his scepticism came from the so-called Scottish school of Reid, Dugald Stewart, and Sir Wm. Hamilton, though the merits of Reid have tended to be obscured in the greater light of Kant. See lives by T. H. Huxley, 1879; W. Knight, 1886; T. H. Grose and T. H. Green, 1888; C. J. Franken, 1907; R. Metz, 1929; J. Y. Greig, 1931; also J. McCosh, *Scottish Philosophy*, 1875; E. Albee, *Hume's Ethical System*, 1897; G. H. Hume, Grizel, see RAILLIE, LADY GRIZEL.  
Hume Reservoir and River, see MURRAY or HUME.

**Humerus**, in physiology a term denoting the bone of the upper arm; or, in quadrupeds, the upper fore-leg.

**Humidity**, of the atmosphere, refers to the amount of moisture that it contains. It is high or low according as the air is damp or dry. The amount of moisture in the air at any given time has a great bearing on weather conditions. The amount varies in different localities, and is never constant even in any one place; and temp., pressure, wind, and sunshine are all affected according as the H. is high or low. The warmth of the body and breathing even depend upon H. Thus when the air is dry much more water vapour is expelled with each respiration than when the H. is high. Cold and heat are much more easily resisted in places of low H. than in places where the air is damp. (For methods of finding the absolute and relative H. see HYGROMETERS.) When the air is fully saturated with moisture, the relative H. would be 100, and this is seldom reached in practice except in fogs or mists. Sea air naturally has a high H., over 90 per cent, but land air, particularly in dry winter weather, may be as low as 50 per cent., or even, over deserts, 20 per cent. The relative H. in the Brit. Isles varies from 30 to over 80 per cent, but as a rule it is very high.

**Hummel, Johann Nepomuk** (1778-1837), Austrian pianist and composer, b. at Pressburg. He was a pupil of Mozart and stayed with him. At the age of ten he started on a concert tour through Europe, and returned to Vienna (1795) to study

J. N. HUMMEL

under Albrechtsberger and Salieri. In 1801 he succeeded Haydn as kapellmeister to Prince Esterhazy; in 1816 he was appointed musical director at Stuttgart, and in 1820 he filled the same position at Weimar, where he d. He conducted operas in the chief cities of England, Russia, France, and Holland. His chief works are sonatas and études for the piano. See W. Meyer, *Johann Nepomuk Hummel als Klavier Komponist* (Kiel).

1922; G. Spork, *L'interprétation des sonates de Johann Nepomuk Hummel*, 1933.

**Humming-bird Moth**, see **HAWK MOTH**.

**Humming-birds** are members of the coraciiform family Trochilidae, and are so called because of the vibrating sound produced by their wings; there are from 400 to 500 species, all of which are confined to America and the W. Indies. Among them are some of the smallest of living birds, *Mellisuga minima* measuring only  $\frac{3}{4}$  in. in length. They are characterised by a long, awl-shaped bill, and a long cleft tongue in the form of a double tube, which can be protruded to a considerable distance and withdrawn again very rapidly; the sternum is greatly developed, forming a suitable base for the strong wing-muscles, which assist the untiring flight; the plumage is generally exquisite in colouring, especially in the males, with a brilliant metallic lustre, the effect of which is heightened by the crest, ear-tufts, and ruffs. The Trochilidae are insectivores, and dart from flower to flower in search of food, hanging over the plant with the body suspended in a vertical position and the wings whirling continuously, which gives a curiously indistinct and misty effect to the plumage. *Patagona gigas*, the largest species, reaches a length of  $8\frac{1}{2}$  in., and inhabits the Andes from Ecuador to Chili; it is bronze-green, with reddish underparts, and is characterised by the flapping movement of its wings, in place of the usual vibratory movement. *Trochilus colubris*, in addition to the green-and-white colouring, has a brilliant red throat, with a forked tail of bluish black; *T. alexandri* of N. America has the throat of deep purple. *Lophornis* is a beautiful genus, extending from Costa Rica to Mexico; *L. ornatus* has fawn-coloured tufts with green terminal spots on each side of the neck. *Loddigesia mirabilis* of Peru is one of the most gorgeous species; the upper plumage is a lustrous bronze-green, the under-parts are white, the throat is emerald-green, rimmed with black, and the head and crest are a vivid blue. The female is green, with white below. *M. minima*, called the bee H. because of its tiny size, is found in Jamaica and San Domingo, and the male is characterised by its dark throat-spots. *Docimastes enifer*, the sword-bill, has a straight beak,  $5\frac{1}{2}$  in. long, which is more than the length of body and head together. *Ithamphomeron*, the thorn-bills, have the smallest beaks, that of *I. microrhynchum*, measuring only  $\frac{1}{4}$  in. The species of *Phaethornis* are sometimes termed the hermits, because of their more sombre green and brown plumage, and also from their habit of frequenting dark woods and forests; they examine the crevices of trees in search of spiders, which form their habitual diet, and, poised in mid-air, the hermit will pass his bill over the under-surface of leaves, swallowing any insects hidden there. The H. will rarely live in captivity, and few have been carried across the Atlantic alive.

**Humpback**, see **HUNCHBACK**.

**Humperdinck, Engelbert** (1854-1921), Ger. musician, b. at Siesburg. He studied at Paderborn Gymnasium, Köln Conservatory, and the Royal School of Music, Munich, and from 1880 to 1881 assisted Wagner in the preparations for the production of *Parsifal*. He taught music in the conservatories of Barcelona and Cologne (1885-88), and acted as musical adviser to Schott & Sons, pubrs. (Mainz), 1888-89. In 1881 his popular choral work *Das Glück von Edenhall* was first sung, and the choral ballade *Die Wallfahrt nach Kerlar* in 1887; but it was the appearance of his *Hansel und Gretel*, a musical fairy play, which made him famous. This was followed by *Königs-kinder* (melodrama, 1896), and *Dornroschen* (1902). He also composed *Königs-kinder* (opera, 1910), *The Miracle* (Olympia 1912), and *Moorish Rhapsody* (1898).

**Humphreys, Mrs. W. Desmond**, see **RLA**.

**Hunan**, prov. of Central China, bounded on the N. by Hupeh on the E. by Kiangsi, on the S. by Kwangsi and Kwangtung, and on the W. by Kweichow and Szechuen. The prov. is hilly in character, the only plain lying around Lake Lungting. The N. of the prov. is higher than the S., and among the mts. there is Hengshan, one of the five sacred mts. (Wu) upon which the celebrated tablet of Yu was placed. The prin. rivs. are the Siangkang, with a basin of 39,000 sq. m., the Tszekang, with a basin of 16,000 sq. m., the Yuenkang, with 35,000 sq. m., and the Ling-kang, with 80,000 sq. m. The prin. products are tea, hemp, cotton, rice, paper, tobacco, and coal, the whole of the S.E. part of the prov. being one vast coal-field 21,700 sq. m. in extent. More than 90 per cent of China's production of antimony comes from H., the ann. output being about 25,000 tons. Mining for wolfram is carried on. The prin. tns. are the cap., Changshan, Siang'an on the Siangkang, and Changtsefu on the Yuenkang. Since the time of the Taiping rebellion the Hunanese have been noted for their pride and obstinacy in admitting outside control. A considerable amount of fighting took place in this area during the Civil war, particularly during the 1926 campaign. Area 79,300 sq. m. Pop. 26,171,000.

**Hunchback**, or **Humpback**, deformed condition of the spinal column. Slight irregularities of the normal curvature of the spine may result from various causes, such as malformation of other portions of the body, or even a well estab. habit of standing or walking causing irregular pressure. The presence of a definite hump, however, is generally due to the development of Pott's disease, or tuberculous ulceration of the spine. This disease is characterised by the lodgment of tubercle germs in the vertebrae, and the consequent disintegration of part of their tissue by ulceration. In many cases a fall or blow originates the trouble, the structure being weakened and becoming more liable to tubercular infection. If the disease is not checked, the body of sev. vertebrae may crumble away, there

is a collapse of their structure, and the spine curves sharply inwards, forming a pronounced hump and causing disproportion in the body generally. Unfortunately, the early symptoms are often indefinite. The child—for the disease is characteristic of the developing period of the body structure—does not perhaps feel actual pain in the spine but is easily fatigued and avoids anything like vigorous action. What ails there are may be ascribed to indigestion or rheumatism. The more definite symptoms are an inability to bend the back in stooping, a continued stiffness in the neck if the trouble be situated in the upper part of the column, and a disposition to turn the whole body instead of the trunk only when looking backwards for an instant.

The treatment when early diagnosis is possible involves complete rest for the spinal column by providing the patient with a carriage in which he can lie at full length on his back. The upright posture should never be assumed and the patient should spend as much time as possible in the open air. The period of rest must be prolonged until there is reason to suppose that the distorted structures have been built up again. Suitable splints should be provided to keep the parts quiet. Pure air and good food are necessary adjuncts to any course of treatment. If the disease has run its course for some time without detection and the deformity has actually set in there is little hope of a permanent cure. A certain proportion of cases have responded favourably to operative measures which involve removing some of the posterior parts of the vertebrae. This operation, known as *laminectomy*, is resorted to when there are indications that the curvature has caused serious compression of the spinal cord.

**Hundred**, one of the most ancient subdivisions of a shire, analogous to the *pagoi* of *facitus*, being, according to Stubbs, the union of a number of townships for the purpose of judicial administration, peace and defence. It is an ancient and diverse theory to account for the exact origin of the term but the most generally accepted is that it was at first an association of one hundred persons for purposes of police and justice. The chief man of the H was the *Hundred's call* and each H originally had a court called the H moot. The personal rather than topographical origin of the H—which latter view is disproved by the inequality in size of the different Hs—seems to be confirmed by the now obsolete action against the H in case of any loss by robbery, the object of which according to Blackstone, was to make the H answer for the robbery unless it succeeded in capturing the felon. The term H still exists, but is now of no significance for any local governmental purposes, though under an old statute the H or any corresponding division is still liable in certain circumstances for damage caused by riot. The H as an ecclesiastical unit is now replaced by the deanery, and the H rate by the rate *See under* HIGHWAYS as to repair of H. bridges.

**Hundred Years' War, between England and France, 1338-1453**, was begun by Edward III of England attempting to enforce his claims to the Fr throne and ended by the loss to England of all her Fr conquests except Calais. In 1328 Charles IV of France died leaving no male issue, and Edward then claimed the throne in right of his mother Isabella, sister of Charles. But by the Salic law women were excluded from the Fr throne, Edward's retort was that his mother could transmit the right to him, an argument which would in any event, have given a better claim to Charles of Navarre. The Fr peers refused to acknowledge Edward and received Philip of Valois as their king and Edward then submitted and did homage to Philip for Gueldres, which belonged to the Eng Crown. But when Philip espoused the cause of David II of Scotland against Edward, the latter renewed his claim to the Fr crown, assumed the title of king of France, made alliances and prepared for war, hostilities commencing as throughout history, from the side of Flanders. The chief events in the period from 1339 to 1355 were the defeat of the Fr fleet off Sluys (1340) the campaign in Brittany (1342) the battle of Crécy (1346) and, in the same year the beginning of the siege of Calais. Meanwhile David had invaded England as the ally of France, but was heavily defeated by Queen Philippa's army at Neville's Cross (October 1346). In 1346 famine compelled Calais to surrender to Edward and a truce was made with France which was further prolonged by the Black Death. In 1355 the war was renewed as fiercely as before. Philip had no son and given place to his son John, who found his kingdom torn with factions fomented by Charles of Navarre, a state of things which weakened the country against resisting invasion. Edward advanced from Calais while the Black Prince ravaged the S of France. The next events were the battle of Poitiers (Sept 19 1356) the capture there of King John and the latter's signed promise to return all the possessions in France which had been held by Henry II, without exacting homage. The Fr nobility refused to ratify these terms and Edward again invaded France with the result that fresh negotiations were set afoot and the treaty of Brétigny or the Great Peace, was signed in which Edward renounced all claim to the Fr crown and to the provinces of Normandy, Maine, Anjou and Aquitaine, but received in return without obligation of homage, the province of Poitou, Gascony, and the title of Calais together with three million acid crowns as a ransom for King John (May 8, 1360). War was renewed, however in 1367, owing to the Black Prince's attempt to tax the Gascons. The latter appealed to John's successor, Charles of France, who summoned the Prince to Paris and as this summons was contrary to the Treaty, the Prince started thither at the head of a large army. But failing health compelled him to relinquish his command, and thereafter France gradually won back all the possessions,

only Bordeaux, Bayonne, and Calais remaining to the Eng. crown (1370). The war dragged on, however, through the reign of Richard II., who got into difficulties over his poll tax to meet its expenses. Richard was unfit both as general and administrator, and when hostilities were renewed in earnest it was at the initiation of the Fr. king, who demanded from Henry IV. of England the dowry and jewels of the widowed Isabella, which Henry retained as part of John's ransom. There was no open declaration of war, but a kind of piratical warfare was carried on at sea, and eventually, through the dissensions between the houses of Orleans and Burgundy and the imbecility of the Fr. King Charles, England won back the sovereignty of Aquitaine, Poitou and Angoulême (1412). The distracted state of France at this time gave every encouragement to the ambitious Henry V., who demanded the restoration of all the possessions held in France by King John, the hand of Charles's daughter in marriage, and a dowry of two million crowns. The answer being evasive, Henry invaded France and won the battle of Agincourt (Oct. 25, 1415), returned to England and renewed the invasion in 1417, with a larger army than before. The Burgundians having thrown in their lot with him, owing to the murder of the duke of Burgundy by the rival faction, the Fr. Gov. had no option but to acquiesce in all Henry's demands, and the treaty of Troyes was signed in 1420, recognising Henry as regent, with the right to succeed to the Fr. throne on the death of Charles. The premature death of Henry V., however, followed by the accession of the infant Henry VI., upset all these schemes, and though the infant Henry was duly proclaimed king of France, the late dauphin assumed the title of Charles VII., Charles VI. having died soon after the late Eng. king asserted his claim. At Crévy, in 1423, and Verneuil, in 1424, the dauphin met with crushing defeats and was forced to retire across the Loire. In 1428 the regent, Bedford, planned to cross the riv. and marched into those provs. in the S. which adhered to the cause of Charles. The next great event was the battle of Hérings, fought while Bedford was besieging Orleans as the key to the S. (1429). The defeat sustained by the Fr. so discouraged them that Charles was on the point of giving up the contest altogether and leaving the country when the whole face of things was changed by the advent of Joan of Arc. After the coronation of Charles VII. and the burning of the Maid of Orleans the Eng. cause in France rapidly waned. The duke of Bedford quarrelled with the powerful duke of Burgundy and then tried to reconcile his affairs with the Fr. Court, and in 1435 he signed a treaty of friendship with Charles at Arras. Bedford d. in the same year, and before the new regent had reached France, Paris fell into the hands of the Fr. king and in 1444 the Eng. were glad to make a truce for two years. On its expiration Fr. troops overwhelmed Normandy through Maine and Anjou, and

then, turning S., captured Guenne, and by 1451 Calais alone remained to the Eng. and the longdrawn war was at an end. See F. Funck-Brentano, *The Middle Ages*, 1922; E. C. Lodge, *Gascony under English Rule, 1152-1483*, 1926; H. S. Lucas, *The Loio Countries and the Hundred Years' War*, 1929; H. Belloc, *Six British Battles*, 1931 (for Crécy and Poitiers); F. M. Huneker, James Gibbons (1860-1921), Amer. musical critic, b. at Philadelphia. For long he was musical critic of the *New York Sun*. Among his works are *Iconoclasts: a Book of Dramatists* (1905), *Visionaries: Fantasies and Fiction* (1905), *Egoists: a Book of Supermen* (1909), *Fritz Listz: a Study* (1911), *The Pathos of Distance* (1913), *Old Foggy, His Musical Opinions and Grotesques* (1913), *New Cosmopolis* (1913), *Baudelaire* (1919), *Steeplejack* (his memoirs, 1921). See Josephine Huneker (ed.) *John Gibbons Hunter, Intimate Letters*, 1937.

Hungary (Magyarország), republic of Central Europe (pop. 9,316,600) lying between the Alps and the Carpathians and including parts of the basin of the middle Danube. Its area is 35,903 sq. m. and it is an entirely landlocked country. The cap. is Budapest. It is one of the succession states of the old Austro-Hungarian Dual Monarchy. The anct. kingdom of H. always took high rank among the states of Europe in respect of ter. and pop. Although its armed forces, with the exception of the Honveds, were formerly united with Austria, yet H. remained an independent state, the head of which was His Majesty Francis Joseph, the apostolic king. By unanimous vote of the National Assembly H. was reconstituted a kingdom in 1920 after having been declared a republic on Nov. 17, 1918. Following the surrender at the end of the Second World War of the Axis powers H. was occupied by the Allied Control Commission. Self-gov. was, nominally, re-estab. in 1945, and after a general election a republic was again declared (Feb. 1, 1946) with a constitutional President and a cabinet. Though constitutionally a kingdom between 1920 and 1946, the throne remained vacant throughout this period, the question of the return of the Hapsburgs having been left unsettled.

H. lies almost in the centre of Europe, and before the First World War had a well-defined frontier formed on the N., N.E., and E. by the Carpathians, and on the S. by the rivs. Danube and Save. The whole country was in the form of an ellipse, from which a neck of land extends to the Adriatic. The Carpathians scarcely rise to the level of permanent snow, as the highest peak in the N. is the Francis Joseph (8736 ft.), and in the S. Nagol (8813 ft.). Sav. peaks range between 5000 and 7000 ft. Those of the High Tatra, being precipitous and without foothills on the S. side, there reveal their full altitude. At the S. extremity of the range the banks of the Danube offer a

series of beautiful pictures. The lower reaches from Hódvász to Orsova are unrivalled in their majestic wildness. It was to H that Europe entrusted the work of overcoming the dangers to navigation in this stretch of whirling water. On the W. three branches of the Alps enter Hungarian ter. One near Visegrád faces the spurs of the Carpathians, which extend right down to the Danube. This part of the riv., flanked by forest clad mts., also offers a magnificent panorama. After the 1st World War H. became considerably smaller. The boundaries between H. and Austria (Czechoslovakia, Yugoslavia and Rumania) were fixed in general terms by the peace treaty of Trianon, June 1920. As a result of this treaty, H.

lost the Körös, Maros, Gran, Sáros, Tisza, and the Vág, but many of these tribs. have been divided by the boundaries determined by the treaty of Trianon. The main canals are the Francis Joseph, between the Danube and the Tisza, and the Béga between the riv. of that name and the Temes. The latter canal, cut by the Romans, was enlarged in 1777. The frontier of H. includes the Lesser Hungarian Plain (Kis Alföld) lying N.W. of the Bükkory forest and the greater part of the Great Hungarian Plain (Nagy Alföld) stretching E. of the Danube. The surface of the Great Plain undulates from 200 to 400 ft. above sea level. Its S. part comprising the Bakka and the Banat

L.V. 1

ON THE HORTOBÁGY PLAIN NEAR DEBRECEN

lost much of her mt. country with practically all her forest lands through the transfer of Transylvania to Rumania of Croatia and Slavonia to Yugoslavia and of Ruthenia to Czechoslovakia. The former at a was approx. 121,400 sq. m. Her pop. was reduced from 11,214,000 to 7,482,000. In 1938 the pop. was about 8,700,000. As the result of a plebiscite since 1920, H. obtained Sopron (Gronberg) from Austria. In 1938, following the forced cession of Sudetic Austria to Germany, most of Ruthenia (1200 sq. m., pop. 900,000) was ceded to H. by Czechoslovakia. The area of H. then became about 40,000 sq. m. and the pop. about 9,600,000. (See also under *History*, below.)

In the gently undulating part of the country which extends along the r. b. of the Danube are found H.'s largest lakes, the Balaton and the Körös, only half of which now belongs to H. The former is 47 m. long, with an area of 286 sq. m., and contains abundance of fish, the largest and most remarkable of which is that known as the fogas. In addition to the Danube, the prin. rivs. of H. are the

no longer belongs to H. Nearly all the area is under successful cultivation (cornfields now take the place of pasture land) and on once sterile sandy wastes there are now flourishing vineyards. The change has been largely due to the introduction of the false acacia (*Robinia pseudo-acacia*), which was the first tree to become acclimated and by its protection and its influence on the climatic conditions, has made possible the growth of the trees. Although the whole of H. is between 47° and 49°, yet there are great divergences in different parts between the minimum mean, and maximum temps. The mean ann. temp. ranges between 18° in the N. to 32° in the S. The Carpathian mts. in the N. and N.E., however, largely protect the lowlands from northern winds. The rainfall also shows great divergences, and decreases in amount eastwards, on the W. slopes of the Bükkory forest the ann. average is between 30-35 in., whereas in the region of the middle Tisza it is 15 in. or even less in dry years.

The chief agric. product of H. is wheat, from which is made the famous Hungarian

flour. Other important products are maize, barley, oats, rye, and other cereals, as well as tobacco. Vineyards occupy about 600,000 ac. Melons and other choice fruits are raised in great abundance. Between three quarters of a million to one million fruit-bearing trees have been planted on the sides of the highroads. Much red pepper, known as paprika, is grown in some cos.

Nature has been very bountiful to H. in respect of minerals. From the Bronze Age onwards these have been dug and smelted. In later periods the Romans did much mining in the country, and derived from it their chief supply of gold. Gold and silver mines are worked by the State. Coal is very abundant, but much of it is of rather inferior quality. The better quality coal is mined in the Mecsek Mt. in the dist. of Pécs. Nearly 14 million tons of coal and lignite were produced in 1941. A plentiful supply of iron-ore keeps sev. large smelting works fully occupied. Copper, lead, antimony, and zinc are also found. Bauxite deposits yield half a million tons in a year. H. possesses the only opal mine in Europe. Enormous quantities of rock-salt exist in E. H. Having been worked for many centuries, some of the salt mines include subterranean excavations of great extent. The salt industry is a monopoly of the State. Asphalt and petroleum are also found. The discovery of the oilfield of Láspe in 1937 increased the output of oil from 300 tons (Jan.-June 1937) to 750,000 tons in 1943. But the most remarkable treasure is natural gas, which during recent years has been found by deep borings in many parts of the country. These Hungarian gas wells are equal in extent and value to those of Pittsburg and other places in America. Mineral waters of various kinds, both hot and cold, spring forth plentifully in many parts, and are found to be very efficacious in the treatment of disease. At Ránk-hirány, near Kassa, a geyser may frequently be seen uplifting a great column of water. Before the Second World War the most famous baths were those of Budapest, Trnseőntelitz, Vizakna, the Baths of Hercules, and Pestyén. At the last-named place radio-active mud may be successfully used in the treatment of rheumatism and allied disorders.

Education is compulsory from 6-15. There are some 8000 elementary schools with a million pupils. There are also middle and continuation schools, and six state universities with over 8000 students (1940). Religious toleration is stated to be one of the fundamental principles of the Hungarian State. Some two-thirds of the Magyars are Rom. Catholics, while the remainder are mostly Calvinist.

The div. of the pop. according to language is approx.: Hungarian (Magyar) 81.4 per cent, Ruthenian 10.4 per cent, Germans (prior to their expulsion in 1945) 8 per cent, with small proportions of Slovaks, Croats, Rumanians, Serbs and others. The pop. of Budapest in 1938 was 1,059,000. Other large cities are Szeged (140,000), Debrecen (127,000),

Kolozsvár (101,000), Kecskemét (85,000), Nagyvárad (84,000), Miskolc (75,000), Vipest (74,000), Pétszentzserhet (73,000), Pécs (72,000), Kispes (61,000) and sev. other tns. with a pop. over 50,000. But H. lost many flourishing tns. through the treaty of Trianon, as well as a number of beauty spots. In Szobon, Brasso, and other cos. near the S.E. frontier there are many large vils. occupied by the Saxons whose forefathers settled there in the twelfth century and received extensive grants of land, which, having been retained as common property, has greatly contributed to the very remarkable prosperity of these communities. Saxons, like all the other subnationalities in H., have retained their own language, religion, and customs. The pastures of H. support a vast number of useful animals. The census of such in 1938 showed that there were 813,000 horses, 1,882,000 cattle, 1,029,000 sheep and 3,110,000 pigs.

*History.*—H. was founded about the year 889 by the then savage Magyars and U'ngri, who were pressing westwards across the Carpathians. St. Stephen (997-1038) instituted the monarchy. It was he, too, who did all he could to encourage his people to embrace Christianity; for he estab. an eccles. polity, and endowed the Infant Church by founding many bishoprics and abbeys. His countrymen cherish his name because of the refining influence his humanity exercised over their untamed and warlike ancestors, and because of the stimulus his practical good sense gave to mining and other peaceful industries. At this time the king only exercised his authority directly over certain privileged tns. and the royal demesnes; nobility and Church were largely self-governing, whilst the nation at large was, for the most part, at the mercy of the landowners. We may here notice the 'Golden Bull,' which King Andrew II. conceded in 1222 to his barons: by this charter he recognised their right to take up arms against the sovereign should he be guilty of any grave infringement of their privileges and guaranteed that the Diet should be summoned annually.

The bulk of this brief sketch will be occupied with an account of the wars with Turkey and of the relationship of H. with the sister kingdom of Austria. The Hungarians first waged war against the Saxon kings, Henry the Fowler and Otto the Great, who gained a great victory over them in 955, and from 1211 onwards they were busily engaged in repelling the persistent advances of the Mongols or Tartars. It was under Louis the Great (1342-82) that they first gained a signal victory over the Turks by the banks of the Maritza. This Louis was king also of Poland, and the importance of such a victory will be appreciated when it is remembered that H. and Poland were the natural bulwarks against Mohammedan aggression on W. Christendom. In 1396 the Sultan Bajazet defeated Sigmund of H. at the battle of Nikopolis, but the disgrace was soon blotted out by the triumphant victories of the soldier-patriot, John Hunyadi,

Panic among the latter's troops, due to the king's death, accounts for the defeat of the Hungarians at Varna (1444), but in 1456, a few months before his death, Hunyadi succeeded in raising the siege of Belgrade and scattering a formidable Ottoman host.

H. reached the summit of her glory under Matthias Corvinus (1458-90), the son of Hunyadi. His successors were weak, and the country, therefore, fell an easy prey to the Turkish invaders. In 1526 these latter, under the leadership of Sultan Suleyman, who had already captured Shabatz and Belgrade, overwhelmed the Hungarians at the battle of Mohacs and slew their king, Louis II. Buda, the cap., was taken, and the splendid library of Matthias wantonly destroyed. Until the Peace of Carlowitz (1699), which concluded a bitter struggle between Austria and the Porte, the greater part of H. remained in Turkish hands, and a Turkish pasha presided in Buda. By that peace the Ottomans were obliged to yield most of their Hungarian conquests, but it was not till 1716, when Prince Eugene defeated them, that H. finally became independent of their sway. Sigismund, who was king of H. from 1392 to 1437, and who was crowned emperor of the Holy Rom. empire in 1433, is the first link between the crowns of H. and Austria. After Louis's death (1526), to which reference has already been made, the sovereignty of his kingdom was conferred on Ferdinand, archduke of Austria, who was elected emperor in 1558. Thenceforward it remained with the Austrian archdukes: until 1687 it was elective, but in that year it was made hereditary in the Hapsburg family.

It must not be thought that H. submitted to Austrian rule without a struggle. The resentment naturally rising from the loss of a national king was aggravated by the folly of many of the emperors. Thus Leopold I. (1657-1705), in his ruthless attempt to re-catholicise the kingdom, was responsible for the wholesale massacre of Protestants and for their alliance in self-defence with their hereditary foes, the Turks; and Joseph II. (1780-90) committed a fatal error in endeavouring to ride rough-shod over all their most time-hallowed institutions. The year of revolution (1848) witnessed an outbreak of intense patriotism. The Hungarians, under the famous Kossuth, Deak, and others, made a desperate attempt to regain their former independence. A new constitution was promulgated, and for a time Kossuth was acknowledged as supreme governor. But in the end the Austrians, who had summoned the Russians to their aid, prevailed, and the old despotic régime was resumed. It was not until 1867 that the dual monarchy was consolidated and Francis Joseph, emperor of Austria, was crowned king of H. Foreign affairs, the army, and finance were controlled by the Delegations—a body composed equally of Austrian and Hungarian deputies. Otherwise the two nations were distinct, and had their own parliament, executive, and laws.

For H. during the First World War, see AUSTRIA-HUNGARY. On Oct. 3, 1918, a revolution broke out in H. with the aim of establishing a Republic. The revolution was successful and on Nov. 16, 1918, H. was proclaimed an independent Republic. Count Michael Karolyi was chosen as President, and the Republic was known as the Hungarian Peoples' Republic. The two Houses of the legislature were abolished, and a Provisional National Council was set up. But in March 1919 there was a second revolution under Bela Kun, who was financed by Russia. This resulted in a Soviet gov. being set up with a dictatorship of the proletariat. When the Republic was proclaimed in 1915 under the presidency of Count Karolyi, there seemed, to the outside world, some prospect of H. settling down to a constitutional form of gov. This was the moment that might have been seized by the Entente powers to prevent discontent and disruption. The moment was missed in the all-absorbing concentration on peace with Germany, with the result that Rumania, Yugoslavia and Czechoslovakia—all with more or less conflicting interests—prompted by the policy of drift to carve up portions of H. in defiance of the Wilsonian principle of 'self-determination.' This naturally aroused the fiercest passions in H. and the people as a whole were ready to follow any party in the country which might offer a plausible remedy. It was always the intention of certain members of the Karolyi administration to ignore Constitutional methods and sooner or later declare openly for the Bolshevik régime of Lenin and Trotsky. With the Hungarian masses chasing, in the spring of 1919, under the prospect of total national ruin, this Mafia or clique, trained in Russian methods and financed by Russia, deluded the Hungarians into the belief that these imported doctrines were the sole panacea for the existing chaos. Rumania invaded H. and expelled Bela Kun, and, after a short Socialist régime, the kingdom was restored in 1920 under Admiral Horthy (q.v.) as regent. Two attempts at restoring the ex-king Karl in 1921 proved abortive.

The revision of the treaty of Trianon, by which in 1920 H. lost three-fifths of her former ter. and two-thirds of her pop., became thenceforth the head and front of Hungarian policy. This Hungarian irredentism aimed at more than the mere recovery of geographical areas, for together with the lost ter. went also a great part of the estates on which the power of the ruling aristocracy was founded. Without such a recovery H. could never aspire to a dominant position in the Danubian basin nor assume the position of bulwark of the W. against the E. an aspiration particularly of the Magyars who regard the peoples E. and S. of Vienna as their cultural and racial inferiors. Mussolini openly sympathised with these aspirations because they seemed to involve the disruption of Yugoslavia, an aim common to Italy and H. The Rome Protocols signed in 1934 between

Italy, H., and Austria offered a show of resistance to the nascent menace of Hitlerite Germany, but even before the Ger. annexation of Austria had brought Germany into contiguity with Italy and H., both those countries had decided to compromise with their formidable neighbour in the hope that together they might appear strong enough to secure some advantages. But the theoretically 'mutual' expansionist aims of Nazi Germany, Fascist Italy, and Horthy's H. were, in practice, certain to clash, though for some time Horthy thought Germany would be too preoccupied with exploiting her territorial gains to become involved in S.E. Europe. When this illusion was dispelled H. proclaimed her entry into the war against Russia as inspired by crusading motives suggested by the anti-Comintern Pact and divorced from any territorial ambitions. It was hoped in H. that their contribution to the invasion of Russia would be restricted to air reconnaissance and garrison duty; but the Voronezh disaster (see under EASTERN FRONT IN SECOND WORLD WAR) of Nov. 1942 altered the aspect of the war in the E. Soon two-thirds of the Hungarian Army—an army built up with the connivance of Hitler in defiance of the Trianon Treaty—was destroyed on the battlefields of the E.; 'mutual' aid, with Germany, indeed meant that Germany always got the best of the bargain. It is true that for her complicity in the dismemberment of Czechoslovakia H. secured a common frontier with Poland; yet, having seen Poland destroyed in 1939, H. in 1940 assisted the Ger. conquest of Rumania by accepting N. Transylvania. H. thus offered to the world an abject spectacle of perfidy and fear. The country which had stabbed Czechoslovakia, Poland, and Rumania in the back was now to stab Yugoslavia. There were, at this time, some ten thousand men in H. who affected aristocratic descent. They ruled or tried to rule the remaining thirteen millions. A majority of them regarded Hitler and his methods with acute distaste. Many of them went to gaol for the frankness of their opinions. The minority, who favoured Hitler, eccentrics like Festetics who formed the first pseudo-Nazi Party in H., never carried much weight. Their collapse came easily, not because the peasants and workers of H. were 'pro-Ger. or pro-Nazi' (they were so only in the areas inhabited by Gers. to the W. of the Danube), but simply because the aristocracy, reinstated under Horthy, had smothered every attempt to imbue the Hungarian masses with the spirit of liberal politics or educate them in democratic institutions. Having secured N. Transylvania, H. paid for her bargain by finding herself burdened with a new frontier rebuilt, politically and economically, in such a manner as to be little else than a Ger. lever for putting pressure alternately on the two victims, H. and Rumania.

The pact of 'eternal friendship' with Yugoslavia signed Dec. 12, 1940, seemed superficially to denote a change of policy,

if not of heart; but on April 11 (1941) Hungarian troops, on Horthy's orders, invaded Yugoslavia and occupied Volvodine. So flagrant an act of aggression, occurring so soon after the ratification of the Treaty, explains the frenzied Hungarian efforts to 'explain' it, especially as Count Teleki, the Prime Minister, had committed suicide eight days prior to the invasion. For Count Teleki was the 'strong' man of H. For over two years following the fall of his predecessor, Imre, early in 1939, he had danced along the tightrope of non-intervention and non-belligerency, the abyss of a Ger. alliance always yawning beneath him. Until the fall of France he was successful and H. was committed to nothing more than tacit non-military support of Germany. After the fall of France this attitude had to change; and gradually, as indicated above, H. came more and more within the Ger. orbit. Hence, following the suicide of Teleki and the invasion of Yugoslavia, the discredited Hungarian gov. built up the legend of the strong man, Teleki, who had resisted Germany's demands; though the only possible resistance, in any valid sense, would have been for H. to stand athwart the path of the Ger. Wehrmacht in the manner of the Yugoslavs. Teleki, by taking his own life, merely left the way open to the Wehrmacht and to his successor to continue a policy which he himself had sponsored but whose logical consequences he was too cowardly to face. Thus H. had become committed to war on Germany's side against the Allies and, after the Brit. failure in Greece, this seemed to be the right side. But with the success of the Red Army, H. began to reconsider her position, especially as the tide of the Russian counter-offensive was sweeping towards the Carpathian basin, and thereby threatening that portion of Transylvania which Hitler had given to Teleki in exchange for the use of the Hungarian army against the Soviet Union. Moreover, the Rumanian army was being decimated at Odessa, and the more deeply the Rumanians became involved, the more feeble, by contrast was H.'s share in building Hitler's New Order (*g.e.*) in which, as Hitler reiterated, each country's status would depend on the extent of its individual positive contribution. But the most pressing need, as H.'s rulers saw it, was to preserve the foundations of the régime and the power on which it rested. Hence in July 1943 was issued a decree authorising the minister of the Interior to form armed auxiliary police formations. As Kallay, Teleki's successor, said, 'In H., as in Germany, there must not be another 1918.' But the factor now disturbing the balance was fear of the effect of military events on public morale, and this explained the obvious signs of panic in Budapest—the talk of declaring Budapest an open city almost before the Allies were within striking distance, and the gov.'s use of the newspaper of the social democratic trade union. The Horthy régime could speak with sev. different voices and assume

various masks: but behind them all was the face of the stubborn, greedy, reactionary landlords who were the real rulers of H.

In Jan. 1944 the increasing rapidity of the Russian advance in the direction of the Carpathians threw Hungarian gov. into great perturbation, and ministers were now telling the people that they must prepare to defend their frontiers against any enemy, from whatsoever quarter he might come. The Gers. took drastic measures to ensure that H. should not desert the Axis (q.v.). Horthy was ordered by Hitler to a conference at Obersalzberg (March 16) where he was forced to agree to the entry of Ger. troops into H. and to the dismissal of the Kallay gov. When Horthy returned to Budapest on March 19 he found that Ger. troops had already entered the city. The new Hungarian gov. under Sztójay now dissolved all the liberal or democratic parties, as well as associations and clubs not of a clearly fascist character; but the chief efforts of the gov. were devoted to the persecution of the Jews who, in spite of all decrees against them, were still playing a considerable part in the economic life of the country. But soon the persecutors of the Jews had to turn about the safety of their own skins. The Russians were already in E. H. and making great progress. The defection of Rumania from the Axis (Aug. 1944) led to a strong movement in H. for coming to terms with the Allies, but the announcement that Russia had promised Transylvania to Rumania was a sufficient inducement to the Hungarians to continue the war. A few days later Russian and Rumanian troops crossed the Rumanian frontier into H. Between Oct. 8-10 they had crossed the Tisa, taken Szeged and advanced to within 60 m. of Budapest and also taken Debreczen. Upon this, Szalasy, leader of the Nyilas or Arrow Cross organization or movement (comprising a score of factions of a pro-Nazi or anti-democratic character produced by the short-sighted repressive policy of the aristocratic oligarchy), carried out a coup d'état (Oct. 15) by which Horthy was forced to resign and Szalasy installed himself as acting-Regent.

Early in Nov. Pest was under siege by a Russian army, while another Russian army, advancing up the Danube from the direction of Yugoslavia, reached Lake Balaton on Dec. 5, and soon the Red Army was closely investing the whole of the cap. Later in the month Gen. Miklos was appointed premier by a Provisional National Assembly to reverse his predecessor's policy. This his provisional gov. did by declaring its readiness to conclude an armistice with Russia and the other countries with which H. was at war and to declare war on Germany. Ger. resistance in Budapest, however, supported by Szalasy's followers, continued till Feb. 13, by which time a large part of the city had been reduced to ruins. During the ensuing few weeks heavy fighting took place between the Russians and the Gers. around Lake Balaton, but about

March 20 the Gers. were forced to give way and within two weeks from that time they had been driven out of H., and with them went the Szulasy gov., while that of Miklos now became the effective gov. for the whole of H. (For details of the Russian invasion of Hungary and the siege of Budapest, see under EASTERN FRONT OR RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR). At Moscow (Jan. 20, 1945) the Provisional National Gov. of Miklos concluded an armistice with the United Nations by which H. undertook to withdraw her troops within the frontiers of H. as they existed at the end of 1937: to pay reparations to Russia, Czechoslovakia, and Yugoslavia to an amount equivalent to 300,000,000 Amer. dollars; while the Vienna Arbitration Awards of 1938 and 1940 assigning N. Transylvania to H. were declared null and void. Recruiting was begun in Feb. for the eight divs. promised by H. for the war against Germany. In March the gov. brought into operation a Land Reform Bill based on the recommendations of the National Peasant Party, involving confiscation of all large estates. On Aug. 27 a Russo-Hungarian Trade Agreement was signed providing for a reciprocal exchange of Hungarian goods and for extensive Soviet participation in the control of Hungarian industry, production, communications, and banking. The privileges thereby conferred on Russia provoked a protest from Great Britain and America, and the ratification of the agreement was deferred by the Hungarian Assembly. In the new gov. the Smallholders, Communist, and Socialist-Communist Parties were all represented, but in the ensuing election held under the Allied Control Commission headed by Marshal Voroshilov, Soviet commander-in-chief, the Smallholders obtained 246 seats against 71 Socialist, 67 Communist, and 22 National Peasant; and Zoltan Tildy, leader of the Smallholders, became Prime Minister. Tildy's coalition gov. on Dec. 11 dissolved the Russo-Hungarian Trading Company formed after the conclusion of the Trading Agreement mentioned above. Later it issued a decree expelling from H. all Ger. speaking residents, numbering 500,000, in addition to the Gers., numbering about 250,000, previously ordered to leave.

H. lost more than two-thirds of her national wealth in the war. She had no cap. to replace the losses suffered in animal stock and agric. machinery. At the same time she had to provide for the feeding of a large Soviet army of occupation. Her communication system was destroyed or dislocated during the three battles. Her reparation liabilities compelled her to pay \$75,000,000, of which two-thirds were due to Russia and the remaining one-third in equal shares to Czechoslovakia and Yugoslavia. In fulfilment of the commercial agreement of Aug. 1945 with the Soviet Union joint Soviet-Hungarian companies were founded for the exploitation of Hungarian bauxite deposits and oilfields. The two greatest sources of H.'s national wealth were thus put under direct Soviet control and

management. Similar companies were founded in respect of Hungarian air communications and riv. navigation. Following the Potsdam agreement all shares in Hungarian undertakings which were in Ger. hands were transferred into Soviet possession. This factor placed Russia in the position of directing the management of many Hungarian industrial undertakings. H.'s only hope was that the W. would realise that by not leaving her to her fate it protected its own spiritual dominion. In March 1947 the United States sent a

elimination of liberal and social-democratic elements and an increasing orientation of H. towards Soviet Russia both in domestic and foreign affairs.

Much reconstruction work has been done since the end of the war. Fighting, by 1915, had destroyed the greater part of H.'s agric. implements, half the cattle and horses, and three quarters of the sheep. All are (1949) being replaced. The permanent reconstruction of main buildings, offices, houses, roads, tramways, buses and trains has been in progress for some time

L.N.A

▲ TRADITIONAL PROCESSION OF VINEYARD WORKERS IN A HUNGARIAN VILLAGE

note of protest to the Russian chairman of the Allied Control Commission for H. against Soviet interference with the non-Communist Gov. of H. It accused Russia of unlimited interference in the internal affairs of H. by attempting to substitute a communist dictatorship for the existing freely elected gov., and said that the United States was impelled at this time to express its feeling of concern at the political crisis which has been precipitated in H.'

The Peace treaty of Paris with the Allies was ratified by the H. National Assembly on July 2, 1947 and by President Tildy on Aug. 8, 1947. The Russian occupation troops were then officially withdrawn. Another general election took place on Aug. 31, 1947 in which the communists gained only 22 1/2 per cent of the total votes. However, all developments since point to a rising forcible

and continues at remarkable speed. Moreover, hospitals equipped in the most modern way, schools, a univ., nurseries, people's colleges (a revolutionary residential experiment in education at no cost to the 6,000 sons of poor farmers or workers in them) arise here and there throughout the country. H. is a partly-socialised State and so far about 700 enterprises have been nationalised, while more than 3,000 with fewer than 100 employees each remain at present in private hands. The small-holders number about 1,790,000, who have been allotted from five to fifteen acres—the latter figure is for farmers who have gained a diploma. To intensify agriculture under small owners with capital, hundreds of tractor stations are springing up, and by about 1952 some 750 will be completed, each stocked with ten home-manufactured

tractors, sprayers, threshing-machines and other apparatus, together with 25 trained workers. By 1949 the State had nationalised the Church-sponsored schools and dispossessed the clergy of 1,000,000 ac., granting the Church only about 27,000 ac. out of H.'s 20,000,000.

In Feb. 1949 the traditional conception of liberty of conscience of the whole W. world was ruthlessly violated by the barbarous trial before a 'people's court' of Cardinal Josef Mindszenty, archbishop of Esztergom and Prince Primate of H., on charges of disloyalty to the State and 'anti-democratic' activities, followed by conviction and a sentence of life imprisonment and confiscation of all property. Six other persons were also charged with similar offences, including Prof. Justin Baranyai, Prince Paul Esterhazy, and Dr. Andras Zakar, the cardinal's private secretary, all of whom were sentenced to varying terms of imprisonment. The specific charges against the cardinal, which included also alleged violation of foreign exchange regulations and smuggling refugees, were, in themselves, no more than instruments of communist policy devised for the purpose of removing those whom it regarded as its enemies. In essence the trial was really the manifestation of the great conflict between idealist religion, as expressed in Christianity and embodied in the Rom. Church, and materialism as expressed in communism and embodied in the Soviet inspired gov. of H. The cardinal, son of Sualban peasants from the fervently catholic W. of H., had always treated the communists simply as men who were positive believers in a faith without a God, and more to be opposed and prayed for than negotiated with, and that attitude was reinforced by the intractability of his own character, by his right-wing political opinions, and by the tradition of the catholic hierarchy in H., which throughout hist. has always supported the authority of an almost feudal state. At the beginning of 1948, when the feud between him and the communists became open battle, the Cardinal refused to give the new communist state any declaration of loyalty except on the conditions of freedom for all Catholic associations—sev. of which had been banned under the anti-Fascist law—and resumption of diplomatic relations with the Vatican. In the minds of the whole people of H. he had become the undeclared leader of a political opposition as well as of a religious faith. The Communists tried to persuade their own people and the world that they were not against religion, but against the cardinal, whom they accused of seeking to restore a thoroughly unjust and discredited society. In theory religious worship in H. was free; religious teaching compulsory in the nationalised schools, and, officially, all children were bound to attend church. But the new People's Colleges were teaching Marx's doctrine about the rôle of organised religion in hist. The Calvinist Church made its peace with the gov. and negotiated exemption from nationalisation of its lay schools. The cardinal refused

to negotiate and therefore none of the catholic lay schools was exempted, and he always forbade the monks and nuns to teach in the State schools. In short, the cardinal's protest was against those dangers to the human spirit which everywhere in the E. of Europe were unfolding under communism with the result that persecution began with vilification and ended in the tragic farce of his trial. There never was a chance from the moment of his arrest that the cardinal might be acquitted or set free: for the purpose of the 'people's courts,' whether in the Soviet Union or in the communist countries around, was not to try their prisoners for guilt or innocence but to arraign and condemn the enemies of the communist state, and proceedings of this kind were an indispensable part of the process of breaking down the opposition wherever communism had seized power. The appointed end of a conviction following on a 'confession' was, as usual, extorted by third-degree methods, the familiar prelude at this trial to the inevitable sentence. Immediately after the trial the United States gov. considered the possible course of taking the case to the United Nations. The House of Representatives unanimously adopted a resolution urging the United States gov. to protest against H.'s treatment of the cardinal—through the United Nations or by other 'appropriate' means. Numerous Hungarian officials in the United States, including the Acting-consul general, in New York prepared to leave the country. Dr. Evatt, minister of external affairs, Australia, in the House of Representatives, said that the issue was much broader than the treatment of the cardinal, and appeared to involve the general question of rights guaranteed under the treaty of peace with H. to which Australia was a party, and which included freedom of religion and freedom of speech. He did not exclude a possible miscarriage of justice not only in relation to the cardinal but also to the leaders of the calvinist and lutheran churches in H. Thus the matter was destined to be brought before the General Assembly of the United Nations. Mr. Ernest Bevin, Brit. foreign secretary, protested to the Hungarian minister in London at the Hungarian gov.'s refusal to allow representatives of the Brit. legation in Budapest to attend the trial. He also directed the Minister's attention to the very strong feeling evinced by public opinion in Britain over the whole circumstances of the case.

*Language.*—Few languages offer more fascination to the philologist than Hungarian. Until the seventeenth century it seemed a pure anomaly, for it was clearly not even a distant cousin to the neighbouring Ger., Wallachian, or Russian. In 1769 an astronomer, John Sajnovics, visited the Laplanders in Norway, and was impressed by the similarity of their language to his own. So vivid was this impression that he forgot for the moment about his astronomy and wrote instead a book (in Lat.) to demonstrate the affinity between the two tongues. Since his day

many other facts have come to light which go to prove that Magyar belongs with Vögnland Ostiak to the Ugric branch of the Finno-Ugric div. of the Ural-Altaic family. There follows a brief enumeration of the most striking peculiarities of Magyar: (1) It is a language of affixes. *Atyamert* means 'for my father, *m* being 'my' and *ert* 'for.' (2) The active verbs have definite and indefinite forms: *látom* means 'I see him, her, or it,' and *látok* merely 'I see.' (3) There is no gender: 'he,' 'she,' and 'it' are not even distinguished. (4) Extra syllables give the verb a potential, causative, or frequentative sense: *verhet* means 'he can beat'; *verel*, 'he causes to beat'; *verget*, 'he often beats.' (5) Nouns have possessive suffixes, which vary according to number: *tollunk*, 'our pen'; *tollaink* 'our pens.' Magyar is, moreover, rich in verbal derivatives, has a copious vocabulary, and is decidedly musical—and therefore adapted to poetry—by reason of the harmony of its consonants and vowels.

**Literature.**—The national literature of H. is, comparatively speaking, young. Indeed, there was little life in it till well on in the eighteenth century. The cause if this is not far to seek. Ever since the priests from Germany and Italy introduced Christianity during the eleventh century, Lat. has been the official language. It was spoken at court and in the churches: it was taught in the higher schools, and so became the language of the educated classes, and finally it was introduced into the administration. Lat. was not discontinued in the schools till 1790, and was talked in Parliament as late as 1825. The oldest written fragment in Magyar belongs to a funeral oration dating from the early thirteenth century. During the pre-Reformation and Reformation periods (1437-1606) men of letters were chiefly engaged either in translating portions of the Bible or in writing voluminous rhyming chronicles. King Matthias Hunyadi was a true Medici to his countrymen in that he made his court a centre of intellectual and artistic life, gathered together a great library, and invited to his kingdom men of learning from all parts. In 1473 the first book was printed in H., namely, *Hudai Krónika*, a hist. of H. up to his day. During the seventeenth century many writers distinguished themselves in the fields of theology and philology, but none attained to such high honour as the poets Nicholas Zrínyi (1620-61) and Stephen Gyongyösi (1629-1705). The former wrote a national epic, the *Zrínyiász*, after the manner of *Tasso*, in which he sang of the powers of his ancestors. There is life in his character drawing, and his language is sincerely emotional, if unpolished. The *Venus of Muring* of Gyongyösi, though spoilt somewhat by an excess of mythology and metaphor, is redolent with an Ovidian grace of melody and descriptive charm. In the eighteenth century, not unjustly called the 'age of decadence,' the only outstanding name is that of Francis Faludi (d. 1779), the Jesuit, who developed

a singularly pure and refined style both in his trans. and in his original songs and idylls. From 1772 to 1830 there was a revival in literature and also a conscientious effort to reform the language. George Bessenyei (1747-1811) and Benedict Virag (d. 1830) are both representative of the classical school, who took Lat. poets as their model. The former dreamed of being the Voltaire of H., whilst Virag wrote epistles and odes which fully account for his proud title of 'the Magyar Horace.' Francis Kazinczy (1759-1831), who wrote readable didactic verse and good biography in prose, was the leader of the movement for language reform. Alexander Kisfaludy (1772-1844), the author of the famous lyrics, *Himfy's Love*, was brother to the more celebrated Charles Kisfaludy (1788-1830), who may truly be said to have regenerated, if not created, national drama. Two other notable poets of this period are Francis Kolcsy (1790-1838), the idealist, who composed the *Hymnusz*, now a national anthem, and Joseph Katona (1791-1830), who wrote the fine historical tragedy *Bánk Bán* (1820), and is considered to be one of the greatest of Hungarian dramatic poets. One of the foremost of H.'s poets is Michael Vorosmarty (1800-1855). Had he left only his trans. of Shakespeare behind him, his name would have lived; but as it is there are many fine lyrics and epics, such as the woefully tragic *Two Castles*, which prove Vorosmarty to be a great original poet besides an excellent translator. In the splendour of his lyrics, however, he was surpassed by Alexander Petöfi (1823-1849), whose freshness, rapture, sincerity, and passionate love of Nature have rarely been equalled in the poetry of any nation. And side by side with Petöfi will ever stand John Arany (1817-1882). In his immortal epics, *Toldi* and *The Death of Huda*, as in his ballads, he absorbed all that is best in the old Hun and Magyar legend, whilst in creating Nicholas Toldi he touched indeed the very depths of Hungarian character. The earliest historical novelist was Baron Nicholas Jósika (1794-1865), an enthusiastic admirer of Scott. The humour, spontaneous faculty for invention, and irrepressible delight in storytelling of Maurus Jókai (1825-1904), explain at once his unbounded popularity as a writer of fiction.

The years 1825-49 proved a period of national revival, but this period was followed by one of less distinction, popular literature giving way to a literature of modern society. Kalman Tóth (1831-81), a lyric poet, was a follower of Petöfi, while many poets of this time were followers of Arany, such as Joseph Kiss in his ballads. Edward Székely (1814-1878), a prolific dramatist, supplied the Hungarian stage with comedies and national historical dramas. Among prose-writers the followers of Jókai's Kolman Mikszáth (1817-1910), Géza Gárdonyi (1863-1922) and Francis Herczeg (b. 1863), who is also a successful dramatist, produced good work. Mikszáth, in his turn, has had considerable influence on writers

such as Victor Rókosi and Alexius Benedek.

In mod. Hungarian drama three schools may be discerned: the folk-drama, represented by Edward Tóth, the neo-romantic drama, to which such writers as Eugen Rákosi and Louis Dóczy belong, and the school of Gregor Csiky to which, among others, Francis Herczeg belongs. Naturalism in modern literature is represented by S. Bródy (1863-1921), T. Kóbor (b. 1867), and Z. Ambrus (1861-1932). The periodical 'Nyugat' (West) founded in 1908 by Ignatus (Hugo Velgelesberg, b. 1869) exerted a modernistic influence and counted among its chief contributors the lyric poets E. Ady (1877-1919) and D. Kosztolányi (1884-1936), M. Babits (1883-1941), stylist and translator, and the naturalistic novelist, Z. Móricz (1879-1942), D. Szabós (1879-1945) and L. Zilahy (b. 1892 and living in America) exerted a great influence after the First World War. Folk-literature is represented by the novelist J. Kodolányi (b. 1899), and the poets G. Illyés (b. 1902) and J. Erdelyi (b. 1896). Among Hungarian authors with an international reputation and living abroad are: F. Molnár (b. 1878), J. J. Foldes (b. 1903), M. László (b. 1895), and F. Kormendi (b. 1900).

Art.—II. possesses a beautiful national art, but much of importance from the Middle Ages was destroyed in the wars with the Turks. The flat-roofed basilicas often show Lombardic and Byzantine influence in their decorative details. The abbey church at Ják (thirteenth century) shows the transition to the Gothic style which came to II. from France. Among other important buildings dating from the fourteenth to sixteenth centuries are St. Michael's Chapel and the Cathedral in Koszice (now in Czechoslovakia), the Black Church in Brassó (Transylvania, 1383-1421), the Benedictine Church in Sopron, and a number of castles built by kings and nobles, e.g. that of Vajdahunyad. Biblical subjects began to be used in the twelfth century (e.g. the crypt in Pécs) and there are tombs and wooden and bronze sculptures which date from the fourteenth century (e.g. the statue of St. George in Prague by the brothers Kolozsvári).

Renaissance art-forms were, with few exceptions, imported from Italy rather than of native growth, and little has been preserved. There was, however, a native revival in the Baroque period, which produced somewhat ostentatious churches (the cathedrals of Győr, Nyitra, Kalocsa) and palaces, and many W. H. tns., such as Győr and Pozsony received their present stamp at this time. Many II. artists, such as the two painters Mányoki and Bogdán, worked abroad, whereas much was done in II. by Austrian artists. The representative architects in the class. period were M. Pollack (National Museum, Budapest) and J. Hiltl, who designed the cathedral at Eger. The second half of the nineteenth century saw the creation of the main buildings of Budapest: the parliament (A. Steindl), opera (M. Yul, Kurio (A. Hauszmann) etc. Other archi-

tecs were F. Schulek, G. Petschacher and Ö. Lechner, who exerted a considerable influence on the succeeding generation (K. Kós, E. Thoroczkai-Wiegand). In sculpture the class work of I. Ferenczy was followed by that of A. Stróbl, G. Zala and A. Huszár, which showed a tendency towards allegory. E. Teka and L. Damkö produced mainly bronze and terracotta figures. At the present day there are two trends: one towards realism, represented by such artists as L. Petri, I. Pásztor, Z. Kisfaludi-Stróbl and I. Szentgyörgyi and another towards a stylised formalism represented by I. Sinay, F. Pátzay, Ö. F. Beck, M. Vedres, E. Kalmár, G. Csorba and A. Kocsis.

Painting, after its early beginnings in the Byzantine style, made great developments from the fourteenth to the beginning of the sixteenth century. A fine example is the altar-piece at Esztergom. In the first half of the nineteenth century painting, influenced by Vienna, moved from classicism to romanticism (Markó Barabás). After 1848 national hist. became the main theme (Madarász, Benczúr). Chief among genre and landscape painters were Paál, Munkácsy, Mészöly, Mednyánszky. French naturalism and impressionism influenced Iványi-Grunwald, Ferenczy, Thorma, Itéti, Vaszary, Fényes, Csók, Kornstock and Rippel-Rónay among others. Most recently painters such as Márty, Czöbel, Rudnay, Egyri and Bernath have come to the fore still under the influence of expressionism.

H. music occupies a characteristic position between E. and W. The oriental streak is clearly discernible in the folk-music, but apart from this H. music was, until recently, completely W. European in style and tonality, when B. Bartók and Z. Kodály, both of whom are extremely interested in folk-music, made great use of it in their own compositions, thus giving their music a markedly national character. It was mainly due to Fr. Liszt, Fr. Erkel (nineteenth century), and their predecessors S. Tinódi (sixteenth century) and J. Kajoni (seventeenth century), that an interest in H. music was awakened in W. Europe. The chief modern composers are: Ádám, G. Kós, L. Bardos and A. Veress, all influenced by Bartók and Kodály.

**Hunger**, indefinite sensation usually referred to the stomach, but also combined with a non-localised feeling of weakness or faintness. Normal H. is not of necessity strictly periodic, but training may result in its recurrence becoming regular. In its earliest stages no suffering accompanies it, but later a gnawing pain sets in at the epigastrium, followed by weakness, and finally by the delirium of starvation. The general faintness is normally removed by the introduction of solid or semi-solid nutriment into the alimentary tract, even though the stomach is not used, as in the passage of easily assimilated food into the large intestine. The almost immediate alleviation of suffering may be caused by the free secretion of gastric juice which may be brought about by the ingestion of indigestible substances. Abnormal H. accompanies some diseases, particularly those associated with marasmus. Other diseases cause morbid appetites, as the craving for chalk and lime, etc.

Hungerford, par. and tn. of Berkshire, England, on the Wilts border. The aet. name was Ingelford, meaning 'Ford of the

Angles.' It is situated on the R. Kennet, 9 m. N.W. of Newbury and 27 m. S.W. of Reading, and is a hunting and fishing centre. Pop. 9500.

Huningen (Fr. *Huningue*), tn. and former fortress of the dept. of Haut-Rhin, Alsace, situated on the l. b. of the Rhine, 3 m. N. of Basle. It was once one of the prin. ports on the E. Fr. frontier. Pop. 3000.

Huns (Lat. *Hunni*, Gk. *Ουνοί*), wild nomadic people who were busily engaged in the early centuries A.D. in sweeping away old boundaries and in over-running the fers. of nations which time had long since hallowed. Gibbon lays emphasis on their 'broad shoulders, flat noses, and small black eyes deeply buried in the head' and other authorities speak of their swarthy complexions, rude manners, high-pitched voices, and frequent deformities. In the confused narratives of the Dark Ages historians can distinguish four migratory tribes to which the name of H. has been applied: (1) The Magyars were Hunnish invaders of Hungary from A.D. 898, whilst the race of modern Hungarians was probably formed by these Magyars coalescing with the Kumans and other hordes, who had preceded them in the march westwards. (2) The White H., or Ephialtes, inhabited Bactria and the tracts between the Oxus and the Caspian in the days of Attila's conquests. In 484 they inflicted a crushing defeat on their Persian neighbours under Peroz, who was slain in battle, but during the following century their power was broken by the aggressive Turks. (3) The Hūnas, who made inroads into India were contemporary with the Ephialtes, and undoubtedly belonged to the same wave of barbarian migration. (4) But last, has most to say about those savage hordes of H. who contributed so largely to the disintegration of the Rom. empire, and who from A.D. 372 to 453 were continually threatening, nay thrusting back, imperial confines. An army of H., under Balamir, overcame the Hant, who dwelt between the Volga and the Don, completely disorganised the empire of the Ostrogoths (Göetungn), and finally routed the Visigoths (Tervingi). These tribes were driven to seek new homes between the Pruth and Danube, but in time their ferocious conquerors wrested even these lands from them and obliged them to retreat still farther, this time beyond the Danubian frontier. Two facts show that Rom. supremacy was already on the wane: Emperors had begun to enlist the arms of the Hunnish invaders against other foes, and in 132 Theodosius II. agreed to buy peace from Rhmas or Rugilas, their king, by an ann. payment of 350 pounds of gold. But the peace was hollow, and the death of Rhmas alone staved off the inevitable humiliation of Rome. Attila and Bleda succeeded Rhmas, their uncle, and were so formidable as to secure a double tribute. Under these chiefs the H. laid waste Scythia and Media, threatened Persia, sacked the Rom. city of Margus in the E. (441) and Sirmium in the W. In 445 Attila stood with his victorious

armies before the walls of Constantinople; in 451 his progress westward across the Rhine was only stayed after a terrible battle on the Catalaunian plains (near Méry-sur-Seine), and in the following year, after razing Aquileia and the cities of Venice, Attila was confronted with Pope Leo I. on the banks of the Minio—an interview which ended in a retreat of the H. beyond the Alps. Next year Attila d., and in 454 the Goths, Gopidæ, and Suevi avenged his insolent victories near the R. Nctad in Pannonia, where 30,000 H. were slain. The Hunnish nation never survived this calamitous defeat; their tribes dispersed, some settling in the Dobrudzha, others in Dacia, and others, again, returning to their old haunts—the S. steppes of modern Russia. Perhaps the Bulgarians are at the root a Hunnish people. See M. A. Czaplicka, *Turks of Central Asia*, 1918; R. Saffet, *Contributions à une sincère histoire d'Attila*, 1934; F. Lot, *The Invasion Germ.*, 1935; R. Grosset, *L'Empire des Steppes*, 1939.

Hunstanton, watering-place of Norfolk, England, situated on the Wash, 15 m. N.E. of King's Lynn. New H. stands about 1 m. from the old vil., and possesses a pier, a wide expanse of sand, and a lighthouse with a fixed light, visible for 16 m. Pop. 3500.

Hunt, Alfred William (1830-90), Eng. painter, b. in Liverpool, son of Andrew H., a landscape painter. He won the Newdigate Prize poem in 1851. He exhibited landscapes in oil and water-colour at the Royal Academy, and took up painting professionally in 1861. His best pictures are in water-colour. Fine examples are in the Tate Gallery, London, and the Walker Art Gallery, Liverpool. See F. Wedmore, in *Magazine of Art*, 1891.

Hunt, Henry (1773-1835), political agitator, the son of a Wiltshire farmer, on whose land he worked. For some years he worked in conjunction with Cobbett, and in 1810 they shared the same cell in goal, to which they had been committed for their political opinions. He more than once stood for Parliament, but he was never elected. He was an active member of the Hampton Club, and he presided over the meeting in St. Peter's Field, Manchester, in Aug. 1819, which, owing to the intervention of the soldiery, is known as the Peterloo Massacre. There is no doubt that he was of value to the cause of which he was an advocate. He pub. his *Memoirs* in 1820, and his *Correspondence* appeared in the same year. There is a worthless biography by R. Hulse (1836).

Hunt, Leigh (James Henry Leigh-) (1784-1859), author, was educated at Christ's Hospital School, London, to which he went from 1792. He was a shy, nervous, sensitive lad, and at a very early age he read poetry and began to write verses, which his father collected and pub. in 1801 under the title of *Juvenilia*, or *A Collection of Poems written between the ages of twelve and sixteen*, by J. H. L. Hunt. Owing to the elder Hunt's energy, a large subscription was obtained, and the little book passed through four eds. in three

years. The quality of the verse was not such as to merit much success. In 1805 H. began to contribute dramatic criticism to the *News*, and a selection of his articles was reprinted in book form two years later. In 1808 H. and his brother John started a newspaper, the *Examiner*, and for thirteen years wrote largely in its columns on many subjects, taking part not only in its literary direction, but also contributing political leaders. His persistent attacks on the character of the Prince Regent led to a gov. prosecution

LEIGH HUNT

of the brothers in 1812, and they were sentenced to two years' imprisonment. It was while he was in prison that Thomas Moore introduced him to Byron, which was the beginning of the famous friendship between these men. At this time, too, he made the acquaintance of Keats, and introduced him to Shelley. He pub. sev. vols. of poems, including *The Story of Rimini* (1816). In 1822 H. went to Italy to join Byron, with whom later he quarrelled. In 1825 he returned to England, and three years later he pub. *Lord Byron and some of his Contemporaries*, which brought a hornet's nest about his ears. All this time he was working very hard, contributing to the newspapers, editing periodicals, writing dramatic criticism and book-reviews, and every now and then issuing a book. He wrote a novel *Sir Ralph Lusher* (1832), and a vol. on *Christianism*, and he reprinted the best of his papers which had appeared in the *Indicator* and the *Companion* (1830). His play *A Legend of Florence* was produced at Covent Garden in 1840. Four years later appeared one of his best-known books, *The Town*, and in 1855 appeared the most delightful of all his books, *The Old Court Suburb, or Memorials of Kensington* (reprinted 1902), when it was ed. by Austen Dobson. He had earlier, in 1850, pub. his delightful *Autobiography*, which is certainly, and deservedly, the most popular of all his works, and won

high praise from Carlyle. It was as a poet that H. desired to achieve fame, but it cannot be said that his ambition was ever satisfied. His verse was easy and agreeable, but it lacks dignity: he had not the lyrical gift, and has never taken the place he desired to fill in the roll of Eng. poets. It is as an essayist that he has his claim to remembrance. In this branch of letters he does not, of course, rank with Lamb or Hazlitt, but he has undoubtedly, on a humbler plane, an individuality and a charm of his own. His wide reading and his knowledge of the world gave him ample scope for finding suitable subjects for his innumerable papers, but he is never happier than when writing of 'My Books,' or discoursing about London, or describing the country. His *Autobiography*, and his *Correspondence*, ed. by his eldest son (1862), are the prin. authorities for his life. The character of Harold Skimpole, the sponging amateur artist, in Dickens' *Bleak House*, was founded on H. and had to be altered on account of its close resemblance. See S. Collins, *Essays*, 1883; W. Hazlitt, *The Spirit of the Age*, 1891 (Eyreman's Library, 1910); lives by E. Blunden, 1930, and L. Landré, 1936, and also the *Autobiography*, ed. with notes by J. E. Morpurgo, 1949.

Hunt, Richard Morris (1828-95), Amer. architect, b. at Brattleborough, Vermont. He came to Europe to study, chiefly in Paris, where, in 1851, he was appointed inspector of works on the buildings connecting the Tuilleries with the Louvre, and where he designed the Pavillon de la Bibliothèque. Returning to New York in 1855, he designed the Lenox Library, the Stuyvesant, and Tribune buildings; also public buildings in Princeton and Yale. He obtained the gold medal of the Institute of Brit. Architects for his Administration Building at the Chicago Exhibition (1893). He did much to raise Amer. architecture in the opinion of other countries, and helped to found the Amer. Institute of Architects. There is a fine memorial to him in the wall of Central Park, New York City.

Hunt, Thomas Sterry (1826-92), Amer. chemist and geologist, b. at Norwich, Connecticut. He wrote a remarkable 'Essay on the History of the Names Cambrian and Silurian' (*Canadian Naturalist*, 1872), and his works include *Chemical and Geological Essays* (1875), *Mineral Physiology and Physiography* (1886), *A New Basis for Chemistry* (1887), and *Systematic Mineralogy* (1891).

Hunt, William Henry (1790-1861), Eng. water-colour painter, b. in London, and studied with John Varley. He was a prominent member of the Society of Painters in Water Colours, and may be regarded as one of the chief figures in the great Eng. school. His prin. pictures were of interiors, figures, and still life. Many fine examples are in the Victoria and Albert Museum, S. Kensington.

Hunt, William Holman (1827-1910), Eng. painter, b. in London, joined the Royal Academy schools (1844), gaining admission to the exhibition with 'Hark

in 1846. In 1848 the Pre-Raphaelite Brotherhood was started with Rossetti, Millais, and others, inspired by the technique of Ford Madox Brown. H.'s earlier pictures include 'Rienzi' (1818), 'Valentine and Sylvia' (1851, greatly praised by Ruskin), 'A Hiredling Shepherd' (1852), 'Strayed Sheep' (1852), and 'Claudio and Isabella' (1853). In 1854 came, perhaps, his greatest and certainly most successful religious picture, 'The Light of the World,' presented to Keble College, Oxford, by the purchaser, Mr. Combe, of which a modified replica was painted in 1901 and exhibited in the chief cities of the Brit. empire. A visit to Palestine produced 'The Scapegoat' (1856), a meticulous study of the scenery of the Dead Sea; 'The Finding of Our Saviour in the Temple' (1860), now at Birmingham; 'The Shadow of Death' (exhibited 1873), representing a shadow of the Crucifixion thrown on the workshop wall by the stretched arms of Jesus, is at Manchester; 'The Triumph of the Innocents,' of which there are two pictures, at Liverpool and Birmingham, begun in 1875, was not finished till 1885. His best-known later picture is 'May Day on Magdalen Tower, Oxford' (1891). H. remained to the last a fervent adherent to the principles of the Pre-Raphaelites. The best statement of his ideals and of the inner hist. of the movement is in his *History of Pre-Raphaelitism* (1907). He received the Order of Merit, and was buried in St. Paul's. See Ford Madox Brown, *Pre-Raphaelite Diaries and Letters*, 1900; J. Phyllian, *Pre-Raphaelite Brotherhood*, 1906; L. Housman, *Pre-Raphaelites in Art and Poetry*, 1933.

Hunter, George (1863-1916), Scottish missionary, b. at Aberdeen. At 26, left Scotland, and set out on the long trek to Chinese Turkestan. At Urumsai, cap. of Chinese Zungaria, he built himself a rough home; and for many years he travelled in his little Chinese cart on the trade routes across the high plateau, conveying the Scriptures, trans. by him into the various local dialects. In H.'s early days, Chinese wore pigtails; so he grew his own, and wore a simple hide gown. One Mongol servant was his only usual companion, and provided the same meal every day for 50 years—boiled mutton and rice. Robbers were not his only danger, but he was on good terms with camelmen, Qazaq farmers, and Sarter merchants trading in wool, skins, and bricks of tea. Unselfish and devoted, he had great influence on the wandering folk of Chinese Turkestan. When war came in 1939, his presence on the border of the Soviet Union aroused the suspicion of the Russian authorities; he was watched, arrested as a 'secret agent', and kept under terrible conditions in a Soviet gaol. He was refused a copy of the Bible, but knowing most of it by heart, he recited it aloud. Released and flown back into China proper, where he d. in 1946. See Mildred Cable and Francesa French, *George Hunter, Apostle of Turkestan*, 1948. Hunter, John (1728-93), Scottish surgeon and anatomist, b. at Long Calder-

wood, E. Kilbride, Lanarkshire; son of John H., and brother of Wm. H., whom he assisted in dissection in London (1748). He attended Chelsea Hospital under Cheselden, 1750. In 1751 he became pupil at St. Bartholomew's. A Master of Anatomy, Surgeon's Corporation, 1753. Surgeon's pupil, St. George's Hospital, 1751; house-surgeon, 1756. Matriculated,

JOHN HUNTER

St. Mary Hall, Oxford, 1755; but classical studies bored him. In 1761 he took part in an expedition to Belleisle where he studied the conditions of the coagulation of the blood, and served with the Brit. army in Portugal in 1762, acquiring knowledge of gunshot wounds and inflammation. In 1763 he started a practice in London, but devoted his spare time to dissection and experiment. He became surgeon to St. George's Hospital, 1768; surgeon-extraord. to the king, 1776; deputy-surgeon-general to the Army, 1780. His works include many papers contributed to *Philosophical Transactions* and *A Treatise on the Natural History of the Human Teeth* (1771-1778), *On the Digestion of the Stomach after Death* (1784), *A Treatise on the Venereal Disease* (1786), *Observations on Certain Parts of the Animal Economy* (1786), *A Treatise on the Blood, Inflammation, and Gunshot Wounds* (1794), *Observations and Reflections on Geology*, pub. posthumously. H. made a notable surgical advance in the tying of the artery about the seat of disease in aneurism; indeed, he has been called by some the founder of scientific surgery. He was exceedingly industrious; but he was a poor lecturer, and never had many pupils. He was a bigoted Tory in politics, choleric, and stiff-necked. He died suddenly after a dispute at a board-meeting at St. George's Hospital.

Hunter, William (1718-83), doctor and

anatomist, b. in Lanarkshire. He studied at Glasgow, Edinburgh, and St. George's Hospital, London. He became the leading obstetrician of his time, and was consulted by Queen Charlotte, to whom he was appointed physician extraordinary in 1764. He was the first prof. of anatomy in the Royal Academy (1768), and president of the Medical Society (1781). His chief work is *On the Human Gravid Uterus* (1774, 1st.), the material for which took him twenty-five years to collect. It has been ed. by Baillie (1794) and Rigby (1813). He also pub. *Medical Commentaries* (1762-64), and important papers on *Medical Observations and Inquiries*.

Hunter, Sir William Wilson (1840-1900), Indian civil servant and historian, was educated at Glasgow. In 1869 he was appointed by Lord Mayo to organise a statistical survey of the Indian Empire. This work occupied him for twelve years, the compilation reaching 128 vols., but the whole was condensed into *The Imperial Gazetteer of India* (9 vols., 1881), his article on 'India' being reissued in 1895 as *The Indian Empire: its Peoples, History, and Products*. He also pub. a *Comparative Dictionary of Non-Aryan Languages of India and High Asia* (1868).

Hunter, see under HORNES.

Hunter River, Coquon, or Coal River, riv. of New S. Wales, Australia, which rises in the Liverpool range. Its basin is an immense coal-field, and it flows into the Pacific at Port Hunter after a winding course of 300 m.

Hunter's Moon, full moon next after the harvest moon, following the Autumn Equinox. It rises an hr. after sunset during the middle of Oct.

Hunterville, tn. of N. Island, New Zealand, in the prov. of Rangitikei. Pop. 1000.

Hunting, see BIG GAME, FOX HUNTING, DILK STALKING, and SHOOTING.

Huntingdon, mkrt. tn. and municipal bor., and the co. tn. of Huntingdonshire, England, situated on the l. b. of the Ouse, 60 m. N. of London. It owes its early importance to the crossing of the riv. by Fensie Street, which forms the main thoroughfare of the tn. In the tenth century the Danes constructed a defensive earthwork, or 'burh' here, remains of which may be seen on Mill Common. Edward the Elder captured the tn. in 921, but it was destroyed by the Danes in 1010. It is now the agric. centre of the dist., but the anct. mkrt., held on Saturdays, has decreased greatly in importance. The bor. is governed by a mayor, four aldermen and twelve councillors, and possesses a fine but incomplete series of Royal charters from 1201. The seventeenth century mace has acquired world-wide notoriety from its curious hist.; the silver head was pledged by the almost-bankrupt corporation to Leicester in the eighteenth century and a cheap imitation was substituted, which still remains. The leading industries are a vegetable canning factory and the manuf. of rubber fittings for motor cars etc.; lesser industries are confectionery, mineral water works, pottery and radio parts. Brewing is

carried on by the successor, of the Chequer Inn and Maiting, headquarters of King Charles in 1645 after he had expelled the Parliamentarians from the tn. In the middle ages there were three monasteries, three hospitals and sixteen par churches. Only two of the churches have survived. All Saints dating from the thirteenth to sixteenth centuries, and St. Mary's, twelfth to seventeenth centuries. The fine fourteenth century tower partly fell in 1607, destroying the N aisle and arcade, which were rebuilt between 1608 and 1620. Hinchinbrooke, N W of the tn, (the seat of the earl of Sandwich) stands on the site of a nunnery, reputed to have been founded by Wm the Conqueror. It is a building of various dates from the sixteenth to twentieth centuries but incorporates remains of the earlier work. The gatehouse is particularly fine. Cromwell House, in the High Street, stands on the site of an Augustinian Friary, but is mostly modern. Here was born Oliver Cromwell. The Augustinian Priory (quite distinct from the Friary) was founded in the twelfth century. The modern cemetery of the tn, stands on its site, and foundations of the old buildings are often encountered in digging graves. In the narrowest part of the High Street, facing the chancel of All Saints church, is the Old Grammar School formerly the hospital of St. John the Baptist, a twelfth century foundation. Here Oliver Cromwell went to school. The much restored building is of Norman date and retains a large W doorway with zig-zag ornamentation. Blocked arches once opened into aisle and another, also blocked, opened into a chapel. The modern Grammar School was built in 1938 and replaced the old building in the High Street. At the S end of the High Street is the site of the castle, now a public open space. The earthworks, constructed in 1068, and amongst the finest of their type, consist of a moat with a bailey partly surrounded by rim parts, and a deep ditch. The Huntingdon to Cambridge railway cuts across the mound, dividing the site into two disconnected parts. Close by is the beautiful medieval bridge of six arches built in 1322, in the centre of the parapet arc slots marking the boundary separating H. from the bor of Godmanchester. On the E side of the High Street opposite the entrance to the Castle, is the eighteenth century gaol, now converted into houses. It has some fine brick luncheon in the walling of which are iron staples for confining prisoners. There are many good houses of the seventeenth and eighteenth centuries, chief of which are Walden House and Terrar House, both seventeenth century, Whitwell House, Cowper House, Monks House and Castle Hill House, all eighteenth century. The George Hotel has a seventeenth century galleried courtyard. The red brick tn hall was built in 1745 by private subscription, and contains some interesting paintings of royalty and local celebrities. A feature of the tn. is the extensive commons which almost encircle it and

provide many pleasant walks, they are the property of the Freeman. There are also walks along the banks of the Ouse as far as Hartford. Pop 4700.

Huntingdon, bor and co seat of H co., Pennsylvania U S A, on the R Juniata, 100 m N of Pittsburgh. It is built on ground sloping to the riv, which is used for water power, and the surrounding country is rich in coal, iron, limestone, and fireclay. The tn was named after the countess of H in 1767. Pop 3000.

Huntingdon, Selma Hastings, Countess of (1707-51), daughter of Washington Shirley second earl of Ferris and married in 1728. Theophilus until earl of H, of Donington Park Leicestershire. She was converted to Methodism by her sister in law Lady Margaret Hastings and hence forth devoted most of her time and energy to religious and religious work. She became intimate with George Whitefield and later with the Wesleys and was a member of the first Methodist society founded in 1739 in London in 1739. She died in a hospital in Brighton in 1751 and afterwards at such other fashionable resorts. Bath and Tunbridge Wells. In the topographical literature to her connection in mind of the upper classes (see COUNTESS OF HUNTINGDON CONNECTION). In 1739 she edited *Præterea* a House in N. W. side of the building institute for members of her religious conviction and subsequently extended her operations to America though she never visited that continent. Survives by J. B. Higgins, 1891 and Sarah Taylor, 1907.

Huntingdonians, see COUNTESS OF HUNTINGDON CONNECTION.

Huntingdonshire, or Hunts, inland co of England an archdeaconry in the diocese of Ely in the prov of Cantuariensis. The surface of the co. which is all below 500 ft is a gentle undulating W slope and the soil whilst the E and N E form part of the flint district. The principal rivers are the Ouse and the Nen. The chief industries are agriculture and grazing, there are no minerals of importance and other industries, which are also not very important, include brick making, pottery making, brewing, milking, leather and iron working. From a geological point of view the whole co. save for a small portion in the N E, belongs to the Old Red ks. Area of administrative co 23 sq. m. Pop 62,000. See W. M. N. *Huntingdonshire* 1920. A. Moe *Huntingdonshire and Bedfordshire*, 1939.

Huntington, name of sev places in the U S A. (1) The co seat of H co., Indiana, on the R Little, 25 m S W of Fort Wayne. Pop 15,000. (2) City and co seat of Cabell co in the state of W. Virginia, on the S bank of the Ohio R, 50 m W of Charleston. Among the prin buildings are the state asylum for incurable lunatics, the co hospital, and a Carnegie library. It has car and railway wagon repairing shops, machine shops, steel rolling mills. Pop 76,000. (3) A township of Suffolk co., New York, on the N side of Long Is. The S part is occupied in market gardening, but along the Sound are the vill. of H., Cold Spring

Harbour, Centreport, and Northport, where many New York business men have residences.

**Huntington, Ellsworth** (b. 1876), Amer. geographer; prof. at Yale Univ. since 1910. He accompanied sev. expeditions to Asia, and undertook research into the drying out of the continent. Works include: *Palestine, and its Transformation* (1911), *The Climatic Factor* (1914), *Civilisation and Climate* (1915), *Red Man's Continent* (1919), *Earth-Sun* (1923), *The Character of Races* (1924), *Quaternary Climates* (1925), *The Human Habitat* (1928), *Weather and Health*, 1930.

**Huntingtower and Ruthvenfield**, united vls. of Perthshire, Scotland, situated in Tibbermore par. The castle which belonged to the earls of Gowrie, was the scene of the 'Raid of Ruthven' in 1582, when James VI., then a boy, was kidnapped. There are bleachfields, which were estab. in 1774; these are fed with water by a Rom. aqueduct from the little R. Almond.

**Huntly**, mkt. tn. of Aberdeenshire, Scotland, situated at the junction of the Bogie and Deveron, 9 m. S.E. of Keith, and 10 m. N.W. of Aberdeen. The ruins of Huntly, or St. Abbogic castle are in the vicinity. It is a prosperous tn., lying in a rich agric. dist., with a trade in farm produce, and manufs. farm implements. Pop. 4200.

**Huntsman Process**, see under IRON AND STEEL.

**Huntsville**, cap. of Madison co., Alabama, U.S.A. Indian corn, cotton, and fruit are cultivated. The Monte Sano health resort is near. Pop. 2000.

**Hunyadi Janos, or John Corvinus Hunyadi** (c. 1387-1456), eminent Hungarian soldier, b. at Hunyad in Transylvania. At an early age he entered the service of King Sigismund and distinguished himself in the Hussite wars. After the death of Albert in 1399, he co-operated in the election of Ladislaus III., who made him voivode of Transylvania and captain of the fortress of Belgrade. In subsequent struggles with the Turks he won victories at Szecudo (1441), at Szentimre, and the Iron Gates of the Danube (1442), but was defeated in 1444 at Varna, where the king met his death. He was made governor of the country during the minority of Ladislaus V., but had continually to contend against the jealousy of Gara and the Callici. In 1453 the king was declared of age, and H. organised a Turkish crusade, during which he won his last victory at Mendor Fehaza in 1456, dying of plague in the camp three weeks after the battle. He was the first great Hungarian general in a modern sense, as he was the first to depend chiefly on strategy and tactics for his victories.

**Hunza** (also Kanjut) and Nagar, two small states on the N.W. frontier of Kashmir. The two states, though peopled by the same Dard race, were always at war, and when the Gilgit agency was estab. they turned their attention to the Brit. agent. This led to the Hunza-Nagar expedition (1891) under Col. A. Duraud, the storming of Fort Nilt, and the subsequent

occupation of the two states by Brit. troops.

**Huoli, or Hualu**, tn. of China, in the prov. of Chili, in 38° N. and 114° 26' E. It is at the foot of the pass which leads from Chili to Shansi, with which a trade in coal, iron, and pottery is carried on.

**Huon Gulf**, extensive inlet, in the E. of Ger. New Guinea, situated between lat. 6° 45' and 7° 30' S.; it possesses sev. fine harbours. In the Second World War, the Jap., having invaded New Guinea early in 1942, held most of the H. G. area by mid-March of that year. Salamana was taken later in 1942 and became Japan's chief centre in the H. G. area. Landings were also effected at Lae, further N. In subsequent fighting in the Salamana-Lae area the Jap. lost at least 12,000 men and by 1944 their garrisons had been reduced to impotence. See further under PACIFIC CAMPAIGNS IN SECOND WORLD WAR, and NAVAL OPERATIONS IN SECOND WORLD WAR; also under NEW GUINEA.

**Huon of Bordeaux**, central figure or hero of a thirteenth-century Fr. *chanson de geste* called after his name. The poem is a mixture of the older historical epic and the later romances, and contains historical and purely legendary matter, the latter being marked by the character of the fairy Oberon or Auberon. It was printed in a prose version in 1516, and was trans. into Eng. by Lord Berners, 1540. See Guisard and Grandmaison, *Anciens Poètes de la France*, 1860; S. Lee ed. of Berners' trans., 1883; and Gaston Paris' ed., 1898.

**Hupa, or Hoopa**, name of an Indian tribe who inhabit the Hoopa valley, California, and who formerly lived in vils. by the Lower Trinity R.

**Hupé**, prov. of Central China, bounded on the N. by Honan, S. by Hunan, E. by Szechuan, and W. by Shensi and Szechwan. The main portion of the prov. is a plain through which flows the Han R. Agriculture is the chief industry, cotton, wheat, rape-seed, tobacco, and beans being grown; vegetable tallow also forms one of the prin. exports. A small quantity of gold is found in the Han R. and some coal is worked. Other minerals found are iron, salt, lime, sulphure, and sulphur. Trade in opium is largely carried on, the big riv. ports being the centre of this traffic. The plant is cultivated in the W. part of the prov. Cap. Wuchang. Chief port, Hankow. The whole of the E. half of the prov. was in effective Jap. occupation from 1941 to 1945. The area is 71,900 sq. m., and the pop. 21,000,000.

**Hurd, Richard** (1720-1808), Eng. divine and writer, b. at Congreve, Staffordshire. He was ordained in 1742, and in 1750 was appointed preacher at Whitehall through the influence of his friend Wm. Warburton. In 1765 he was made preacher at Lincoln's Inn, and two years later archdeacon of Gloucester. In 1774 he was appointed to the see of Lichfield and Coventry and became tutor to the Prince of Wales and duke of York, being made bishop of Worcester in 1781. His residence, Hartlebury Castle, contained a magnificent library. His works include: *Moral and Political Dialogues* (1769)

*Letters on Chivalry and Romance* (1762), *Uses of Foreign Travel* (1763) *Collected Works* (8 vols., 1811) See 1 Kilvert *Memoirs of the Life and Writings of Bishop Hurd*, 1860.

Hurdy, see HURDOI

Hurdwar, see HARDWAR

**Hurdy-gurdy**, musical instrument akin to the organistrum, of which indeed it was a later development. In appearance it was something between a lute and a guitar. There were four or six strings in all, but only the first, called the *chanterelle*, was reached by the movable frets or keys, so that it was possible to play a diatonic melody. The other strings were tuned as drones and were made to vibrate by the friction of a leather covered and well rosined wooden wheel turned by a handle with the right hand. This quaint instrument was invented by the O.E.

resembled the H.G. in shape but had pipes like an organ and a device that allowed the wheel to act as both bow and bellows.

**Hurford**, tn of Ayrshire, Scotland, situated on the River 2 m S of Kilmarlock. The manuf. of fireclay is carried on and there are coal mines and iron works. Pop 5000.

**Hurlingham Park**, fashionable resort at Fulham London. The organisation of polo in England dates from its adoption by the Hurlingham Club in 1873 and the game is still played there. In 1867 the Hurlingham Pigeon shooting Club was formed and the sport was carried on until its suppression in 1906.

**Huron** city of S Dakota, U.S.A., co seat of Deuel co. It stands on the r.b. of the James R. 103 m E of Pierre. It has a large shipping business. Huron College is situated here. Pop 10 900.

HURDY GURDY

school (thirteenth century) when it was developing polyphony over a pedal base. It was known in France as the *vielle à roue*. Tuned to the chords of C or G major, the H.G. could support the singing voice or make music by itself. In course of time the H.G. acquired a reputation for rusticity. Other countries called it the German lyre, though the Germans did not rate it highly and its only place in society was at the French court, where it still flourished in the eighteenth century. Methods existed for its study and sonatas for one or two H.G.s were composed by Lully and other composers, while the popularity of mock rusticity at the court of Versailles in the time of Marie Antoinette gave rise to the *fiat champêtre* orchestra which included the H.G., bagpipes, flutes, recorders and oboes. Lavishly ornamented and jewelled instruments were made some of which are to be seen today in museums. The *vielle à roue* continued to appear intermittently during the nineteenth century, thus it was employed in Donizetti's opera *Linda di Chamounix* (1842) to give local colour for two arias. In 1949 Mr John Christie, founder of Glyndebourne Opera, played on the H.G. a divertimento by Haydn, adapted from one of several concertos which the composer wrote for the King of Naples in 1786. This monarch performed on the *lyra organizzata*, which

**Huron, Lake**, in point of size (23 200 sq m) the second of the five Great Lakes between Canada and the U.S.A. in N America. It is bounded by Ontario except on the W. and S.W. where it adjoins Michigan. Grand Manitoulin is one of three thousand and the peninsula of Manitoulin divide the lake into two unequal sections, the N. consisting of N. Channel and Georgian Bay. At the N.E. end a R. carries down water from Lake Superior which is 20 ft higher, whilst at the S. the St. Clair R. discharges into Lake Erie which is 14 ft lower, on the N.W. the Straits of Mackinac makes a connection with Lake Michigan. Lake Huron is 320 m long, 581 ft above the sea, and reaches a depth of 802 ft. It is subject to violent storms, and is rich in salmon trout etc. The lake was discovered in 1615 by Champlain and Father LeClerc who reached it from the Ottawa R. Champlain named it *La Mer Douce*, i.e. fresh water sea. It was subsequently called *Lac d'Orléans* but eventually, on account of the establishment of the Huron missions, received the name *Lac des Hurons* or Huron Lake. For long the N. channel of the lake continued to be a highway for the fur trade (see HURON'S BAY COMPANY). For many years the lake has been a centre of lumbering operations. See E. P. Morton, *Lake Huron and the Country of the Algon-*

quins, 1913, P. C. Day, *Transportation on the Great Lakes* (U.S. War Dept.), 1936, H. Hatcher, *The Great Lakes*, 1944.

Huronian, name of a class of rocks which belong to the pre-Cambrian group. They consist of more or less metamorphosed sedimentary rocks, and, in Canada especially, valuable deposits of most of the important metals are found therein. Generally speaking, the H. rocks comprise quartzite, slate, limestone, and other igneous rocks. They are well developed in certain regions of Michigan, Wisconsin and Minnesota—the last named having valuable iron ores.

Hurons (fr. *huré*, bristled, used as a word of contempt in the sense of stout.) Applied by the Fr. in Canada to the Indian tribes occupying a part of the country in Ontario which was called Huronia. Huronia lay S. of Georgian Bay, it comprised a stretch of country about 40 m. long bounded on the W. by Nottawa-aga Bay and on the E. by Lake Simcoe. The tribes were of Iroquoian descent, and formed a confederacy called Wendat (Islanders), corrupted by the Eng. into Wendot (*q.v.*). The name is still found in the Hurons of Lorette in Quebec, and in the Great Lake Huron. Cartier in his voyage to Canada, 1534, is supposed to have met Huron Indians on the banks of the St. Lawrence but if so, they must have been driven out of the river valley when Champlain came upon them early in the seventeenth century. They seem to have numbered between 20,000 and 30,000. Champlain made friends with them by mutual trading and played them off as allies against the common foe, the Iroquois. It was near what is now the vil. of Hawkeston on the W. shore of Lake Simcoe that Champlain joined a band of Huron warriors and set out to fight the Iroquois during the time when he discovered Lake Ontario (*see also under HURONS BAY COMPANY*). The H. Jesuits established their first mission in Huronia in 1626 and their ministrations served to check the bellicose zeal of the H. When however the Iroquois with the aid of arms bought from the Dutch in New York destroyed the vil. of Huronia (1619) the H. fled some to neighbouring neutral tribes, others to Quebec, where to day their descendants are to be found in Lorette. The H. represented a high state of Indian civilisation and were good agriculturists as well as fishermen but like other Indian tribes, they imposed the drudgery of life on their women folk. Gov. was vested in the tribal chief and there was a well developed system of law. *See E. I. Hathaway, The Story of the Hurons* (Toronto), 1915.

Hurricane, wind storm. The word was borrowed in the fifteenth century by the Portuguese navigators from the Caribbeans, who described such a phenomenon by the word *huracan*. H. has the technical meaning of wind speed more than 72 m.p.h. (Beaufort force 12), but is popularly used of any violent tempest, though, of course, it primarily referred to the sudden storms to which the W. Indies are subject. Thus tornadoes, cyclones, and

typhoons are all species of H. The tropical Hs are whirling storms, the diameter of their circular motion being often as great as 300 m. They usually travel in a westerly direction from the equatorial belt of calms where they form, then mostly curve away from the equator and eventually move in an easterly direction to temperate latitudes. At first, Hs usually travel at about 15 m.p.h., but when beginning to move to the E. they often attract cold air and change into the larger frontal depressions, common to temperate and polar latitudes, which move much faster. The winds blow spirally inward with a tremendous velocity, often reaching 72 m.p.h. and even over 100 m.p.h. As in all low pressure systems the direction of these inward blowing air currents is counter-clockwise in the N. and in the opposite direction in the S. hemisphere. The centre of the swirl is also the centre of lowest pressure and is called the eye of the storm. As the eye is reached the winds drop suddenly, the torrential rain stops, the clouds often break leaving blue sky and only high clouds, and the sea waves become confused and pyramidal. Fortunately perhaps, they form mostly on the sea where they are a great source of danger to ships, but if they pass over an inhabited area they scatter the most violent destruction in their path, and even if they do not strike an area, they often cause great damage by heaving up huge waves against the continental shores.

Typhoon is the specific name for similar wind storms in Orientals seas. *See CYCLONE and TYPHOON*.

Hurricane, single seat low wing cantilever monoplane. It was designed by Sydney Cummins an employee of the H. G. Hawker Engineering Company which in 1935 changed its name to Hawker Aircraft Ltd. and later to the Hawker Siddeley Aircraft Co. Ltd. It is a very early design while it was still on the drawing board the H. was known to the Hawker Co. as the Hurv monoplane and was designed for the 100 h.p. Rolls Royce 'Cobra' steam cooled motor but in 1934 this motor was dropped for the Rolls Royce 'Merlin', a 12 cylinder liquid cooled engine giving 1,000 h.p. at 1,000 ft. This was the engine used in the H. Mark I. The first H., flown by George Bullman on Nov. 6, 1931, was the first fighter that had a retractable undercarriage and an enclosed cockpit, or conservatory. From that time the H. was altered very little in essential the only important alteration being the instead of having a fabric covering, the wings were all metal with a stress skin. The standard fly weight of the H. was then 6,600 lb. but for special purposes it could fly at more than 7,000 lb. In its original design the H. was to be armed with 4 machine guns all inside the fuselage and all firing through the airscrew disk by means of interrupter gear, but subsequently it was fitted with 8 guns in a row outside the airscrew, where they could fire at their own limit of speed without reference to the engine. The H. was put into production early in 1936 and the first machine off the production line was

flown in Oct. 1937. Later, the 8 Brown-ing guns were fitted, 4 in each wing and on each side of the fuselage, firing outside the disk swept by the airscrew. After its early trials, the tail-wheel was made non-retractable and, with a two-blade, fixed-pitch wooden airscrew, the top speed was 330 m.p.h. at 17,000 ft. With metal wings and Rotol constant-speed airscrew, the top speed was 335 m.p.h. at 17,500 ft. This was the stage of development made known just before the outbreak of the Second World War; but even then, by improvements and refinements, the actual speed of the H. was far beyond these figures. The H., together with the Spit-fire (q.v.) was used against the Gers, at the Battle of Britain (q.v.) with annihilating effect.

**Hurst Castle**, par. and castle of Hamp-shire, England, situated about 1 m. S.W. of Lymington. The castle was erected by Henry VIII. for the purpose of defending the Solent. Charles I. was imprisoned here (1648). It is a fortress and look out station. At the rear of the point of fortifications are two lighthouses with occulting and fixed lights.

**Hurst, Fannie** (Mrs. J. S. Danielson), Amer. writer, b. at St. Louis, Missouri, 1889. Educated at Washington and Columbia Univs. She became one of the highest-paid magazine writers in the U.S.A. She has also written novels, somewhat marred by an affected style. President, Authors Guild of America, 1936-37, Vice-President, Authors League of America, 1944-45, Chairman, Women's National Housing Committee, 1936-1937; Member of National Advisory Committee to the Work Projects Administration, 1940-41. Among her best books are *Gaslight Sonatas* (1914), *Humoresque* (1919), *Stardust* (1921), *Luminox* (1923), *Fire and Ice* (1929), *Invitation to Life* (1933), *Admiral's Dance* (1934), *Heard Laughter* (1936), *Lonely Parade* (1942), *Hallelujah* (1944), *The Hands of Veronica* (1945), *We are Ten* (short stories, 1937).

**Hurstonceaux** (Herstmonceaux), vil. of Sussex, in the Eastbourne par. div. 9 m. from Eastbourne. The name is derived from Waleran de Monceaux, who was lord of the manor in the eleventh century. There is an interesting and exceptionally well-preserved castle in the vil. H. castle was built by Sir Roger de Fienes, treasurer to the Household of Henry VI. It was he who obtained a licence in 1441 to enclose, remodel, and furnish with towers and battlements his manor of H. There are no brick buildings S. of the Thames earlier in date than this castle, which is probably not only the best of the early brick buildings of England but the most beautiful of English baronial buildings. The mouldings and dressed work are mostly executed in green sand stone which permits of sharpness of detail. After 1740 the castle fell into neglect and in 1777 the interior, including the buildings in the court within the main rectangular structure, were demolished and the materials used to build the mansion now known as H. Place. Little survived

of the old fabric beyond the outer walls, with their towers, and portions of the inner walls. In 1911 the castle was purchased by Col. Claude Lowther, who began the work of restoration. After his death it was acquired in 1932 by Sir Paul Latham, who completed the restoration (a description of the situation of the castle will be found in Francis Grose's *Antiquities of England and Wales*, written in the eighteenth century; see also article by Sir Harold Spencer Jones, *Astronomer Royal*, in *Nature*, July 20, 1946). Extensive search has been made for a new site for an observatory; purity of atmosphere being an essential, the removal of the observatory from Greenwich had to be faced. H. castle was selected by the Admiralty and along with the castle some 370 ac. of ground were acquired for the erection of the instrumental equipment and also as a safeguard against encroachment too near the observatory of other buildings.

**Hurstpierpoint**, par. and tn. of Sussex, England, 8 m. N. of Brighton, and 2 m. from Hassocks (its station on the S. Region railway). Holy Trinity Church is a fine modern building. Here is St John's College, a public school for boys. Pop. 3000.

**Hurtado de Mendoza, Diego** (1503-75), Sp. diplomatist, poet, and historian, b. at Granada, and educated at the univ. of Salamanca, also attended lectures at Bologna, Padua, and Rome whilst serving under Charles V. He was sent as ambassador to England in 1538, to Venice in the following year, acted for some time as military governor of Siena, and represented the diplomatic interest of Spain at the Council of Trent. From 1547 to 1554 he was special plenipotentiary at Rome; being obliged in 1558 to leave the Court on account of a quarrel with Philip II., he settled at Granada and devoted himself to the study of Arabic poetry and to the production of his best work, the *Guerra de Granada* a list of the revolt of the Moors of Alpujarras under Philip II. This hist., although written in 1572, was not pub. until 1627. His talents as a poet were of no mean order, and he popularised the classical H. hendecasyllables. He is generally allowed to be the author of that great picturesque novel *La virilude lornes*. See A. Santa y Alonso *Diego Hurtado de Mendoza apuntes biograficos criticos*, 1880; and monograph by A. G. Palencia and E. Mole, 1912-13.

**Husband and Wife**. The consideration of the essentials to a validly celebrated marriage, and the various recognised forms, past and present, of the ceremony or contract of marriage itself, are not dealt with in this article, and will be found dealt with under MARRIAGE, and the subject of the dissolution of marriage will be found under ALIMONY, DIVORCE, JUDICIAL SEPARATION, and MARRIAGE. This article is restricted to the rights and obligations arising from the relationship of husband and wife. The older theory of Rom. law contemplated the wife as a mere chattel of the husband, and gave her no superior rights to those of her own daughters. The later Rom. law went to

the opposite extreme, allowed the relationship of husband and wife to be contracted and dissolved by the slenderest forms, and left the parties all but independent of each other. This evolution has found its parallel in the social systems of many modern states, both as regards the personal freedom of the wife and the immunity of her separate property from the dominion of her husband.

Theoretically each spouse has a legal right to the society and presence (*consortium*) of the other, but in Eng. law neither the petition for restitution of conjugal rights nor any other proceeding will avail to enforce that right. A husband has no legal right to restrain his wife from leaving him, and will even be ordered by the court to abstain from molesting her if she choose to stay away. Indeed, any physical compulsion put upon a wife is illegal, and in many cases would amount to cruelty so as to found a claim for judicial separation (*q. v.*). On the other hand, if a wife choose to leave her husband without adequate cause, he is entitled to refuse to admit her into his home again, and the converse probably also applies. The suit for restitution of conjugal rights is more than a formal condition precedent to the subsequent formulation of a charge of desertion. The practical value of *consortium* lies in the right of the husband to bring an action of damages against a third party who has enticed away his wife, though the archaisms of the law still survive in the denial to a wife of a corresponding action. The action of *crim. con.* (criminal conversation), as it was called, for damages in trespass against a man who has committed adultery with the plaintiff's wife was abolished on the establishment of the Divorce Court in 1857, and probably damages can only be obtained against an adulterer by citing him as co-defendant in a divorce petition, for it seems to be the better opinion that even the above noticed action for enticing away is competent only to the case of one who is deprived of the services of his employees (see further on this, *Jenks, Husband and Wife in the Law, 1909* and *Pollock, On Torts*). But each spouse may sue for damages for the loss of the 'comfort and society' of the other spouse where the latter has been physically injured by the negligence or intentional wrongdoing of a third party. By a legal anomaly, however, the claim for damages when death results is restricted to the actual pecuniary loss sustained.

By the old common law the father as the legal guardian by nature and nurture has the complete control over the person, the education, and religious upbringing of his children during his lifetime, but covenants in separation deeds not to insist on the custody of children will bar the right, as will an order of the Divorce Court with respect to the custody of children. But either parent convicted of cruelty to a child under sixteen may be deprived of the custody of it.

*Rights of husband and wife in one another's property, and obligations arising from marriage.*—The ancient maxim of the

common law, and one eminently in accordance with feudal principles, was that H. and W. were one in the eye of the law. But this unity on its proprietary side was entirely for the benefit of the husband. The wife's freeholds became vested in the husband and herself jointly during coverture (*q. v.*) but the husband had the sole management and took the rents and profits, while if the wife predeceased him, he had a life estate in the wife's freeholds called a tenancy by courtesy (see under *COURTESY*). Further the wife's personal property, comprising leaseholds, and choses in action when reduced into possession (see under *CHOSES IN ACTION*), passed to the husband on marriage or became his if it was subsequently acquired by the wife. In equity (*q. v.*) and then statutorily encroached upon and finally whittled away practically all these marital rights. Equity modified the common law by the doctrine of the 'separate use,' by which any property expressly given to the wife before or after marriage for her separate use was held from the husband's control subject to the husband's claim to any part of it unless disposed of by her death and by the restraint or anticipation which, when attached to a gift of property to her effectually kept that property free from her husband's persuasive influence, so far as prospective income was due, by the simple fact that she herself could not anticipate it. The Married Women's Property Act, 1882, effected a radical change in the wife's proprietary position, though the old law, as modified by equity and statute law prior to 1882 still applies to women married before Jan. 1, 1883. The Act of 1882 made a married woman able to enter into contracts as a *feme sole* (i. e. an unmarried woman), and under that Act her contracts bound her separate estate so far as not restrained from anticipation and, generally speaking, the Act put a married woman in the same position as an unmarried woman with respect to all her property. But the husband still had the right to her property by survivorship if she died intestate (see further under *SUCCESSION, INTESTATE*). Further, the Act applied to all women married before Jan. 1, 1883, 'regards all property acquired by them since that date.' An Act passed in 1893 makes notable changes in the law relating to the capacity of property, and habilitates married women in all respects as if she were a single woman, so that she is now able to hold and to dispose of any kind of property, render herself, and be rendered, liable in respect of any contract, debt, or tort (see *TORT*), sue and be sued in contract or tort, and be subject to the law of bankruptcy and to the enforcement of judgments and orders, in all respects as if she were a single woman. All property which immediately before the passing of the Act was the separate property of a married woman or held for her separate use in equity, or belonged to her at the date of her marriage or, after the Act, has been acquired by her or devolves upon her, belongs to her in all respects as if she were a single woman and

may be disposed of by her accordingly. The Act also abolished the restraint on anticipation (*see supra*) as to instruments effected after Jan. 1, 1936. Notwithstanding the existence of a clause restraining the wife from anticipation, the court may, under the Conveyancing Act, 1881, bind her interest for her benefit and with her consent, and in any case the clause will not save her property from liability for her ante-nuptial debts, except to the extent of any part of her property that had not actually reached her hands when the debt was incurred. With this enfranchisement of the wife's property there have been corresponding augmentations of such rights as she had in the property of her husband. At common law a widow was entitled to a dower or a life income of one-third of her husband's freeholds of inheritance, whether he had disposed of them prior to his death or not; but as this right was illusory by reason of the conveyancing device known as 'uses to bar dower,' equity gave her a right to dower out of her husband's equitable estates of freehold so far as not disposed of by him. The wife is still legally entitled to dower, but in practice settlements usually contain declarations against dower (Jointure (*q.v.*) also bars dower.) But, on the other hand, a wife now has stronger claims on her husband's personality, assuming he dies intestate (*see DISTRIBUTIONS, STATUTES OF*). There is nothing to prevent the husband, any more than the wife, from willing away the whole of his personality from his wife.

Husbands generally make their wives a periodical allowance for house-keeping. Strictly the wife can be called upon to account for every penny of this. If she saves any of it, the balance belongs to her husband, and if she invests such savings or puts them into her banking account the husband can get an order of the court summarily transferring such investment or savings into his own account, though if the wife disputes his title, he must prove that he had no intention of giving her any surplus. Each spouse can sue the other and bring criminal proceedings against the other for the protection of his or her separate property. But a married woman may not proceed criminally against her husband while they are living together, nor after they are separated, as to wrongs to her property committed before separation, except in respect of property wrongfully taken by the husband on leaving or deserting her.

It is a dogma of Eng. law that the husband has the right to choose the house, and if the house is in his name, it follows, not from the matrimonial relationship, but as an ordinary result of the law of contract, that the husband has the right to allocate the rooms for various purposes, and, generally speaking, regulate the domestic arrangements. If, of course, the wife leased or bought the house, or if it stands in her name, she can legally exclude the husband from entering it.

Each spouse is assumed to have undertaken the maintenance of the other and of the children of the marriage (including

such illegitimate or other children as the wife may have had in marriage). But apart from payments ordered by a magistrate to be made for the support of a deserted wife on a separation order, the only means of enforcing the undertaking to maintain is through the Poor Law Authority, if and when the children or wife become chargeable to par. relief. But the wife may pledge her husband's credit for necessities for herself and the children, even where she has separate property of her own. The wife's liability for maintenance apparently only arises on the entire failure of the husband. But the law is by no means clear as to the exact circumstances when the wife's property can be resorted to for this purpose. Apart from the purchase of necessities, the wife has no right to pledge her husband's credit, and it is unwise for tradesmen to assume that she has, for the reason that the husband can rebut the presumption that he has authorised his wife to pledge his credit, by proving either that he has expressly or impliedly forbidden her to do so, or that he makes her a sufficient allowance. If the husband by paying bills leads a particular tradesman to believe his wife has authority, he must give the tradesman express notice that he gives no further authorisation, if he desires to prevent the wife from further pledging his credit with that tradesman. The mere fact that a tradesman enters purchases in the wife's name and that she invariably pays with her own cheques, and that the tradesman did not know she was a married woman, will not make her separate property liable if, in fact, she did not contract otherwise than as her husband's agent (*Pagani v. Bettwiler*, 1906, A. C. 118).

Before the Act of 1935, the husband was liable for the wife's ante-nuptial debts to the extent of any property he may have acquired through her, but the new Act abolishes his liability for his wife's ante-nuptial debts and obligations. The Act, however, makes no change in the law regarding the husband's liabilities for his wife's necessities. For his wife's ante-nuptial civil wrongs the husband's liability is similarly restricted, but he is liable without limitation jointly with the wife for civil wrongs (torts) committed by her during marriage, provided the parties were cohabiting at the time. But the wife incurs no liability in respect of her husband's debts or civil wrongs. As to the presumption that a married woman's crimes are presumed to have been committed under the coercion of her husband, and as to the criminal liability generally of married women, *see under CRIMINAL LAW*. Neither spouse can give evidence against the other when the latter is charged with a criminal offence; but by the Criminal Evidence Act, 1898, such spouse can give evidence on behalf of the other if requested so to do by the accused spouse. But in all civil proceedings both H. and W. can, generally speaking, be compelled to give evidence for and against each other (*see EVIDENCE*). In the absence of fraud a policy taken out

by the husband and expressed to be for the benefit of his wife or children or both can never be touched by his creditors. A husband is liable for his wife's income tax, and apparently if she refuses to pay and he cannot, he can be kept in prison until she does pay. An important change was introduced by the Administration of Estates Act 1925, which affected the rights of a wife in her husband's property. Dower (or the right of a widow to a life estate in certain lands of the husband) was practically abolished. On the death of an intestate husband the wife takes (1) all personal chattels absolutely, i.e. furniture, plate, pictures, household effects, etc.; (2) £1000 free of death duties with interest at 5 per cent from date of death; (3) the income of the whole residue for life if the husband leaves no issue, and of half the residue if he leaves issue. The life interest may be capitalised should this be desired in order that the residue may be freed for immediate distribution to other beneficiaries.

The Scots law of husband and wife is not now markedly dissimilar to the Eng., since the passing of the Married Women's Property (Scotland) Act, 1881. But the Act of 1933 (noted above) does not apply to Scotland (or to N. Ireland). The wife has a separate estate in her movables, and the rents and profits of her heritable property belong to her. Parties married before the Act can come under its operation by mutual deed and in any case come under the Act unless the husband before marriage has by irrevocable deed made reasonable provision for his wife in the event of her surviving him. The wife is not entitled to assign her prospective income from movables or dispose of her movables without her husband's consent. The husband has a right of succession to his wife's movables if she die intestate. The widow is entitled to a life rent of one third of her husband's estate and one half or one third of the movable estate (one half if he were without issue, one third if he left issue). See K. Jenks, *Husband and Wife in the Law*, 1909; Lush, *Law of Husband and Wife*; Pollock, *On Torts*.

Husi, Hushi, or Hush, tn. of Moldavia, Rumania, situated 9 m. W. of the Moldavian S.S.R. border. Wine is largely produced and there is noted yearly fair. The treaty of Pruth between Turkey and Russia was here signed in 1711. Pop. 16,700.

Huskisson, William (1770-1830) British statesman, after a preliminary grounding in affairs as private secretary to Lord Gower, the Brit. ambas. at Paris, and then as secretary to the Admiralty, took his seat in Parliament in 1796. From 1801 he held various minor offices, and in 1827 became colonial secretary and leader of the House of Commons under Godrich, and retained these positions under Wellington, with whom, however, he presently disagreed, and from whose ministry he then retired. He was run over by an engine at the opening of the Manchester and Liverpool Railway on Sept. 15, 1830, and died on the same day. See life by J. Wright, 1831.

Huss (or Hus), John (c. 1373-1415), Bohemian religious reformer, b. at Husinec in Bohemia. Hus was the name which he adopted himself about 1396 as before then he was known as Johann Hussinec, or de Hussynec. He was educated at an elementary school and the Univ. of Prague, where he became B.A. in 1393, Bachelor of Theology in 1394 and M.A. in 1396. In 1400 he was ordained and in 1402 was made rector of the Univ. of Prague. The pro-Wycliffe sentiments of H. gradually made him suspected of heresy and his protest against the burning of Wycliffe's books by the archbishop of Prague in 1410 caused his excommunication. His support of the king in his policy towards the papal schism made him exceedingly popular, and although in 1411 the whole city of Prague was laid under an interdict H. still preached and carried on his duties as usual. In the following year, however, he was obliged to quit Prague and whilst in seclusion he wrote his *De Ecclesia*, his greatest work. In 1414 he was summoned to attend the

JOHN HUSS

council at Constance between King Sigismund and Pope John XXIII., and was granted a "safe conduct" by the former. Nevertheless he was imprisoned soon after his arrival, and, on his appearance before the council in 1415, was ordered to recant all his doctrines which were held to be heretical. On his refusal he was condemned to the stake and met a martyr's death with exemplary fortitude on July 6. H. was a scholar of deep erudition, as is proved by his *Super IV Sententiarum*, but he is chiefly remarkable for the inspiration he gave to the cause of Bohemian nationalism. His works may be divided into four classes: (1) dogmatical and polemical, (2) homiletical, (3) exegetical, (4) epistolary. See also HUSSARS, WARS OF THE. See V. Flajshans (ed.), *Joannes Hus Opera Omnia*, 1904. See also W. Berger, *Joannes Hus und König*

*Sigmund*, 1871. Count F. Lützow, *Life and Times of Master John Huss*, 1809. J. Herbon, *Huss and his Followers*, 1926. E. Denis, *Huss et la guerre des Hussites*, 1930.

**Hussars**, originally the name of the Hungarian cavalry raised by Matthias I in 1458. The word is derived from the Hungarian *husz* meaning twenty, as every twentieth house had to furnish a man for the corps. The term was applied to light cavalry whose duties were mainly scouting, reconnaissance, and roving commissions. Speed being an essential feature in their employment, they had to travel light a factor which also governed the distance they could cover in a given time. The success of this arm in the Hungarian service caused it to be adopted in most European armies and in the British service some Light Dragoon regiments were converted into H. at the beginning of the nineteenth century. The distinctive features of the dress of H. are the bushy ribbed short jacket and pelisse (or hanging jacket) worn over the left shoulder. In the process of time the tactical employment of the various kinds of cavalry has become unified and no distinction is now made. Up to 1922 the H. regiments in the British service were the 3rd 4th 7th 8th 10th 11th 13th 14th 15th, 16th 19th and 20th but in that year, on the reduction of the cavalry establishment, the following pairs of regiments were amalgamated to form one regiment each—13th 18th 14th 20th and 1th 10th. In 1928 the 11th was converted into a cavalry armoured car regiment five years later the 1th 19th were redesignated the 1th King's Royal Hussars. Under the subsequent Army reorganisation most of the remaining Hussar regiments were converted into light tank units or armoured car companies. The roll of battle honours of the H. regiments (or their predecessors the Light Dragoons) commenced with Dettingen (1743) and they have taken a conspicuous part in all campaigns since that date. During the Peninsular Campaign the 1th gained particular distinction in actions at Sahagun and Buena Vista (21 1808) when they routed a far superior body of French cavalry. Waterloo (1815) on their roll, also the victories in the Crimea. The 1th formed part of the Light Brigade at Balaklava. The type of fighting in the South African War, 1899-1902 was peculiarly suited to cavalry action and the H. had their full share of actions. During the early stages of the First World War they were employed as cavalry but with the development of trench warfare they fought in France and Flanders in a dismounted capacity. The 7th and 13th were sent to Mesopotamia where they did effective work as cavalry.

In the Second World War units of the H. which fought on the Western Front from Normandy to the Elbe included 8th King's Royal Irish H., 11th H., 13th 18th Royal H., 15th 19th The King's Royal H., and the 23rd H. With the Eighth Army in Italy were the 3rd The King's Own H., 4th Queen's Own H., and the 10th Royal H.

**Hussein (Husein) ibn 'Ali** (1853 or 1854-1931), sometime king of the Hejaz, b. at Mecca, son of the Amir 'Ali ibn Muhammad, succeeded his uncle the Amir Abdullah as Grand Sherif of Mecca, 1909. He was an opponent of Turkish influence, and sided with the Brit. in the First World War after having espoused the opposite cause for a short period, proclaimed himself king, 1916, and aspired to the position of king of pan Arabia, thereby incurring the hostility of Ibn Sa'ud. He sent a representative to the Peace Conference, 1919. But, as he refused to be bound by the treaties there made he got into difficulties with neighbouring states. In 1921, on the deposition of the Ottoman Caliph by the Turkish Grand National Assembly, H. was offered and accepted the vacant Caliphate but was unable to retain it in the face of internal faction. In the same year he abdicated in favour of his son Ali after being defeated by Ibn Sa'ud (q.v.) and retired to Akaba whence he was removed to Cyprus. There he spent five years of exile only retiring in 1930 to Amman the cap. of his son Abdullah the emir (now king) of Transjordan where he died. See further under ARABIA. H. F. A. See M. BOURCI, *Vom Wüdrsturm I stürm* 1938.

**Hussein, Kamil** (1883-1917) sultan of Egypt who on the death of the khedive, Abbas Hilmi in 1914 was proclaimed sultan and continued at the head of affairs till his death.

**Hussites** War of the name given to the struggle between the Bohemian followers of Huss (q.v.) and King Sigismund which began in 1419. Popular feeling was stirred up by the news of the martyrdom of Huss and in 1411 the nobles of Bohemia and Moravia sent the *prophet of Bohemia* Huss, couched in very strong terms to the council at Constance the contemptuous attitude of Sigismund who declared that he would drown all Hussites and Hussites finally brought on the war. The Hussites were victorious at Ziskaberg, as it afterwards came to be called from Zis (q.v.), the leader and saviour of the war, in 1420. Deutsch Brod in 1422 Aussig in 1424 and Taus in 1431 and invaded Silesia Saxony and Franconia many times with success. After Taus negotiations were begun, and by the compact of Prague the moderate party of the Hussites gained their ends. There were, however, two opposing parties in the Hussite movement, the Trinitarians and the Tabornites. The former, who were also known as Calixtines (Lat. *calix*, chalice) derived their name from the fact that their demand was for the communion in both kinds (*sub utraque specie*). The Tabornites (from Taborn their headquarters) were more advanced in their views and rejected most of the ceremonial of the Roman Church. The latter party refused to accept the compact of Prague, but was totally defeated by the Trinitarians at Jihon in 1344. The Utraquist creed was that of the established Church of Bohemia, until all non-Roman creeds were prohibited in 1620. For a later development of the Tabornites, see BOHEMIAN

**BREITEN.** See I. Krummell, *Ultrakristen und Taboriten*, 1871; E. Denis, *Russ et la guerre des Hussites*, 1878; H. Toman, *Husitské Veleníctví*, 1878; and Countess Lützow, *The Hussite Wars*, etc.

**Husum**, tn. of Schleswig-Holstein, Germany, situated on the Humber Au, about 3 m. from the N. Sea. Pop. 10,000.

**Hutcheson, Francis** (1694-1747), Irish philosopher, b. at Drumalig, co. Down, and educated at Glasgow, where he studied philosophy, classics, literature, and theology. On leaving Glasgow he was ordained and was on the point of accepting a Presbyterian ministry when he was persuaded to start a private academy in Dublin. While employed here, he pub. an *Inquiry into the Original of our Ideas of Beauty and Virtue* (1725), followed by an *Essay on the Passions and Affections* (1728). These writings probably led to his election to the chair of moral philosophy at Glasgow in 1729, where he spent the remainder of his life lecturing on a variety of subjects. His ethical writings constitute his chief claim to fame, and the best account of his teaching is in T. Fowler's *Shaftesbury and Hutcheson*, 1882. His greatest work is *A System of Moral Philosophy* (1755). He adopted Lord Shaftesbury's view in this direction, and exercised a great influence upon the Scottish philosophy of the modern school. See lives by W. Scott, 1900; and C. de W. Thorpe, 1935.

**Hutchinson**, city of Kansas, U.S.A., in Reno co. It is situated on the R. Arkansas, and has salt works, sugar factories, and meat-packing works. It is a distributing centre and has a large export trade in grain, flour, dairy products, etc. The Kansas State Fair is held here. It is served by three railways. The State Industrial Reformatory is situated here. Pop. 27,000.

**Hutchinson, Anne** (c. 1590-1643), Amer. religious enthusiast, daughter of a Lincolnshire clergyman named Marbury. She married in 1631 and emigrated to Boston, Massachusetts, where she lectured, and was a follower and admirer of the Rev. John Cotton. She denounced the Massachusetts clergy, and was tried for heresy and sedition, and banished. She then estab. a settlement on Rhode Is., and set up a democracy (1638). Four years later, after the death of her husband, she settled on Long Is. Sound in what is now New York State, and was killed in an Indian rising. A. H. and her followers were known as Antinomians, a name first used by Luther for the followers of John Agricola (see ANTINOMIANISM). See C. F. Adams, *Antinomianism in the Colony of Massachusetts Bay*, 1894.

**Hutchinson, Arthur Stuart Menteth** (b. 1879), Eng. novelist; son of Lt.-Gen. H. J. Hutchinson. He pub. three novels—*Once Aboard the Luger* (1908), *The Happy Warrior* (1912), and *The Clean Heart* (1914)—before his spectacularly successful best-seller *If Winter Comes* (title a quotation from Shelley, 1921). It is the garrulously story of a chronically-unfortunate person, Mark Sabre, who has the First World War to assist

his misfortunes, and whom H. has brought into some of his later works—which include: *This Freedom* (1922), *The Eighth Wonder* (1923), *One Increasing Purpose* (1925), *The Uncertain Trumpet* (1929), *The Golden Pound* (1930), *The Book of Simon* (1930), *Big Business* (1932), *The Soft Spot* (1933), *As Once You Were* (1938), *He Looked for a City* (1940), *It Happened Like This* (1942).

**Hutchinson, John** (1615-64), Eng. Puritan statesman, b. at Nottingham. Educated at Nottingham and Lincoln free schools and later at Peterhouse, Cambridge. He entered Lincoln's Inn in 1637 to study law, but devoted himself rather to music and divinity. In 1643 he entered the Parliamentary army with the rank of lieutenant-colonel, and was appointed governor of Nottingham castle and tn. In 1646 he was returned to Parliament as member for Nottinghamshire. He was elected member for the first two councils of state of the Commonwealth, but with the expulsion of the Long Parliament in 1653, retired into private life. After the Restoration he was falsely accused of treasonable conspiracy and confined to the Tower and Sandown Castle from 1662 till 1664, dying at the latter place.

**Hutchinson, John** (1674-1737), Eng. theological writer, b. at Spennithorne, Yorkshire. He first served as steward to the duke of Somerset, and other families of position, but ultimately devoted himself to religious studies. In 1724 he pub. *Moses Principia* (Part I.), followed in 1727 by Part II., and by many other works, including: *Moses Sine Principio* (1721), *Power Essential and Mechanical, Glory or Gravity, The Religion of Satan*, etc. According to H., the Bible contained the elements of all rational philosophy as well as of true religion. See life by Spearman in H.'s *Works*, 1748-65.

**Hutchinson, John** (1832-1910), Scottish sculptor, b. in Edinburgh. He became an academician in 1867. His prin. work consists of statues of Robert Bruce, John Knox, Queen Victoria, the Prince Consort, etc.

**Hutchinson, Sir Jonathan** (1828-1913), Eng. surgeon, b. at Selby, Yorkshire, where he was educated, and afterwards entered St. Bartholomew's Hospital. In 1881 he was elected a member of the Royal Commission on Smallpox Hospitals, and in 1890-96 was on the Vaccination Committee. In 1889 he was president of the Royal College of Surgeons. Amongst his pub. are: *Rare Diseases of the Skin* (1860), *A Clinical Memoir on Certain Diseases of the Eye and Ear consequent on inherited Syphilis* (1863), *Illustrations of Clinical Surgery* (1878), *The Pedigree of Disease* (1881), *A Smaller Atlas of Illustrations of Clinical Surgery* (1895), and *Fishing and Leprosy* (1906).

**Hutier, Oskar von** (1857-1933), Ger. soldier who came to the fore during the First World War as an army commander. He was of Fr. extraction; his grandfather is said to have served in the Fr. army. He distinguished himself in Aug. 1917, when he defeated the Russians in the Riga area. He was transferred to the W. Front, and

appointed to the command of the Eighteenth Army. For the Ger. offensive in March 1918 his army was specially organised and augmented in order to break through the Flesquères salient. During the Allies' counter-offensive in Aug. 1918 his army suffered severely at the hands of the Brit. and Fr. in the Avre-Oise sector. After the war he became president of the Ger. Officers' Society.

Hutt, Lower, and Upper, see LOWER HUTT; UPPER HUTT.

Hutton, Philip von (c. 1515-46), Ger. adventurer, b. at Birkenfeld, and a relative of Ulrich von H. He joined a band of 600 adventurers from all parts of Europe in 1533, who went out to conquer the prov. of Venezuela granted to the Welsers of Augsburg by Charles V. In 1541 he set out at the head of an expedition to seek the mythical El Dorado, and after wandering about for some years returned to Venezuela to find the vicereignty usurped by Juan de Carvajal, who seized H. and treacherously put him to death. See *Zeitung aus India* Junkher Philipps von Huten, 1785.

Hutton, Ulrich von (1488-1523), Ger. poet and author, b. at the castle of Steckelberg, near Fulda, Hesse. He was the eldest son of a noble but undistinguished family and was destined by his father for the cloister, being of feeble health. He was sent to the monastery of Fulda, but greatly disliked the life there, and in 1505 fled, going first to Cologne and afterwards to Erfurt and Frankfurt-on-Oder, where he took his master's degree and pub. his first poem. He went from there to Wittenberg and Leipzig, and then passed into Italy, where he was plundered in the war between Charles V. of Spain and Francis I. of France at the siege of Pavia, and later took service in the emperor's army. Later he returned to Germany and had bestowed upon him by the Emperor Maximilian the laureate crown. While in Italy H. became imbued with a hatred of the papacy, and on his return to his native land he estab. a small printing press of his own, and issued pamphlets in Ger. violently denouncing the Rom. clergy. He in turn was denounced at Rome by the Archbishop Albert, and availed himself of the protection of Franz von Sickingen, the champion of the knightly order. He was, however, soon forced to flee from the latter's castle and went to Basel, where he quarrelled with Erasmus, who did not approve of his extreme measures. From this time onwards till his death at Zürich, he lived a wandering life. His chief works were: *Ars versificandi*; *Nemo*; *Vadimus*; *Epistolæ* and many admirable poems in Lat. and Ger. His works were ed. by F. Bocking, 1859-70. See lives by D. F. Strauss, 1858 (trans. 1874); O. Flake, 1929; and H. Holborn, 1929; also P. Kalkoff, *Hutton und die deutsche Reformation*, 1920. P. Held, *Ulrich von Huten, seine geistige Auseinandersetzung mit Katholizismus, Humanismus und Reformation*, 1928.

Hutton, James (1726-97), Scottish geologist, b. at Edinburgh and educated

at the univ. there. He took up successively law, medicine, and agriculture. From 1768 he devoted his life to literary and scientific research. In 1783 he pub. his *Theory of the Earth*, followed in 1792 by *Dissertations on Different Subjects in Natural Philosophy and An Investigation of the Principle of Knowledge and of the Progress of Reason from Sense to Science and Philosophy* (1794). For biography of H., see J. Playfair, vol. v. of *Transactions of the Royal Society of Edinburgh*.

Hutton, Leonard (b. 1917), Eng. cricketer: Yorkshire professional, first playing in co. cricket in 1931. In Aug., 1938, he scored 364 runs in a Test match against Australia at the Oval, beating Don Bradman's Test record of 334 made in 1930.

Hutton, Richard Holt (1826-97), Eng. journalist and critic, b. at Leeds. His best work is shown in *Essays, Theological and Literary* (1871), and he also wrote lives of Sir Walter Scott and Cardinal Newman. See J. Hogben, *Richard Holt Hutton of the Spectator*, 1899.

Huxley, Aldous, Eng. author, b. in 1894; brother of Julian Sorrell Huxley (q.v.), educated at Eton and Balliol, Oxford. In 1919 he was on the staff of the *Athenæum*, and, later, dramatic critic for the *Westminster Gazette*. His early poetry allied him with the Imagist school, but, beyond *Leda*, a poem which combines gorgeous description with a frank but unexceptional interpretation of the classical myth, his poetry is mostly to be described as scientifically satirical, a method which he continued with success in his novels. The short story is perhaps his most successful medium; but he first attracted wide attention with his novel, *Antic Hay* (1923), and enhanced his reputation with *Point/Counter Point* (1928). This latter book was dramatised by another author, but the dramatic method is directly opposed to H.'s method, which is deliberately to flatten all emotion and incident to the same level, the resulting impression being that nothing is worth while in a world altogether negative. His negative philosophy limits him to a range of characters who best exemplify it, and, for this reason, his interest is brief, but always sustained by brilliance of observation, wit, and satire. He has the mocking humour of a Hogarth. Each new novel is a fresh exploitation of his box of puppets; he talks to them and makes them talk to him with the most brilliant ventriloquial virtuosity in modern fiction. His earlier work was in the style of Thomas Love Peacock; but later he changed to the manner of H. G. Wells, whose use of the novel as a forum of social ideas has done so much to transform the novel of this century. This may be illustrated by his *Brave New World* (1932), a brilliant satire on Utopia realised, after development according to plan by modern science, philosophy, and morality. The vision of society here depicted may be awful, yet it is assumed to be the logical result of the apotheosis of latter-day ideals cultivated by machine-made humans. He has also written essays on philosophical and social subjects.

His other works are: *Limbo* (1920), *Leda* (1920), *Crome Yellow* (1921), *Mortal Coils* (1922), *Little Mexican* (1924), *Those Barren Leaves* (1925), *Along the Road* (1925), *Two or Three Graces* (1926), *Jesting Pilate* (1926), *Proper Studies* (1928), *Do What You Will* (1929), *Brief Candles* (1930), *Music at Night* (1931), *Brave New World* (1932), *Beyond the Mezique Bay* (1934), *Eyeless in Gaza* (1936), *The Olive Tree and other Essays* (1936), *Ends and Means* (1937), *After Many a Summer* (1939), James Tait Black Memorial Prize for 1940, *Grey Eminence* (1941), *The Art of Seeing* (1942), *Time Must have a Stop* (1944), *Perennial Philosophy* (1946), *Science, Liberty and Peace* (1947), *The Joyous Smile* (play, 1948), *Apes and Essence* (1949); (ed.) *The Letters of D. H. Lawrence* (1932). See A. Honderston, *Aldous Huxley*, 1935.

Huxley, Julian Sorell, Eng. biologist; b. 1887; eldest son of Leonard H. (the oldest son of Thomas Henry H.). Educated at Eton (King's Scholar), Balliol College, Oxford (Brakenbury Scholar); Newdigate prizeman, 1908; first in natural science (zoology) 1909; Naples Scholar, 1909-10. Lecturer in zoology, Balliol College, 1911-12. Research associate of Rice Institute, 1912-13. Assistant prof., Rice Institute, Houston, Texas, 1913-16. Staff-lieutenant, G.H.Q., Italy, 1918. Fellow, New College, and senior demonstrator in zoology, Oxford, 1919. In Oxford Univ. expedition to Spitzbergen, 1921. Prof. of zoology, King's College, London, 1925-27—since then honorary lecturer. Fullerian prof. of Physiology, Royal Institute, 1926-29. Biology editor, *Ency. Brit.*, 14th ed. Visited E. Africa to advise on native education, 1929. Secretary, Zoological Soc. of London, 1935-42; Romanes Lecturer, 1943; Member of Commission on Higher Education in W. Africa, 1944; Director of UNESCO 1946-48; Elected F.R.S. in 1938. H. is endowed with wonderful powers of lucid exposition. His writings have popularised the most abstruse secrets of biology in the same way as those of Jeans and Eddington did in the realms of astronomy and modern physics. Pub.: *Hollywood* (Newdigate poem, 1908), *The Individual in the Animal Kingdom* (1912), *Essays of a Biologist* (1923), *The Stream of Life* (1926), *Essays in Popular Science* (1926), *Religion without Revelation* (1927), *Bird-Watching and Bird Behaviour* (1930), *Science, Religion, and Human Nature* (1930), *Africa View* (1931). Has ed. textbooks of animal biology: *An Introduction to Science* (with E. N. Da C. Andrade) vols. 1-4 (Simple Science) (1931-35), *Problems of Relative Growth* (1932), *The Elements of Experimental Embryology* (with G. R. de Beer, 1931), *Scientific Research and Social Needs* (1931), *If I were Dictator* (1931), *We Europeans* (with A. C. Haddon, 1935), *At the Zoo* (1936), *The Living Thoughts of Darwin* (1939), *The Uniqueness of Man* (1941), *Democracy Marches* (1941), *Evolution, the Modern Synthesis* (1942), *Evolutionary Ethics* (1943), *On Living in a Revolution*

(1944), *Evolution and Ethics, 1893-1943* (part author, 1945) (with D. Clevedon), *Julian Huxley on T. H. Huxley* (1945), *Religion as an Objective Problem* (1946), *Man in the Modern World* (1947).

Huxley, Thomas Henry (1825-95), Eng. scientist, b. at Ealing. He matriculated at London Univ. in 1842, and afterwards obtained a scholarship at the Charing Cross Hospital. Here he accomplished a great deal of work, and in 1845 announced his discovery of that layer of cells in the roof-sheath of hair which now bears his name. The same year he graduated M.B. in London Univ., and from 1846 to 1850 was assistant-surgeon on H.M.S. *Rattlesnake*. During the voyage he devoted himself to the study of animals, and estab. a morphological plan, dividing Hydrozoa into Radiata and Nematophora. In 1851 he was made F.R.S., became lecturer on natural hist. at the Royal School of Mines in 1854, and naturalist to the geological survey the following year. In 1855-59 he pub. works chiefly dealing with fossil forms, the most important of which are his memoirs on Cephalopods and Pteraspis (1858), the accounts of the Eurypterina (1856-59), and the description of Diconodon, Rhynchonellid, and other reptiles. One of his most brilliant successes was his *Theory of the Vertebrate Skull* (1858), which was read before the Royal Society. In 1863 he pub. *Zoological Evidence as to Man's Place in Nature*, as well as *On the Causes of the Phenomena of Organic Nature*, both of which were widely read and discussed. In 1866 appeared his *Elementary Lessons in Physiology*, his *Manual of the Comparative Anatomy of Vertebrate Animals* (1871), and *Elementary Biology* (with Martin, 1875). In 1880 there appeared his well-known monograph *The Crayfish*, which led to the introduction of this animal into elementary courses on zoology. But H.'s pubs. do not represent all his work; he also filled many important posts. He was an active member of four royal commissions, including that of the Fisheries of the United Kingdom (1861-65), Hunterian prof. at the Royal College of Surgeons (1863-69), Fullerian prof. at the Royal Institution (1863-67), president of the Royal Society (1883-85), inspector of fisheries (1881-85), and rector of Aberdeen Univ. (1872-74). Besides this he took a great interest in education and was one of the original members of the School Board for London (1870-72). He was also active as a champion of Darwin's theory of natural selection, propounded in the latter's *Origin of Species* (1859).

Huy, tn. in the prov. of Liège, Belgium. It stands on the Meuse, about 17 m. S.W. of the tn. of Liège, and is engaged in distilling and the manuf. of paper. It possesses a citadel, and near by are the ruins of the abbey of Neumünster, the burial-place of Peter the Hermit, its founder. Pop. 16,000.

Huygens, Christian (1629-95), Dutch mathematician and physicist, b. at The Hague. He studied at Leyden and Breda, and in 1649-53 resided successively

in Denmark, Holland, France, and England. He soon developed a strong mathematical bent and his future greatness was predicted by Descartes. In 1651 he entered the lists of science, and his first essay, *Exercitatio quadraturæ circuli*, was quickly followed by *Theoremata de quadratura hyperbolæ, ellipsis, et circuli*. In 1655 he discovered a satellite of Saturn, and in 1659, the ring of Saturn. He was one of the first to apply the circuli pendulum to the construction of clocks, in 1656. In 1690 he pub. important treatises on light and weight. He also improved the telescope and developed the wave theory of light. His *magnum opus* was the *Horologium Oscillatorium* (1673), containing innumerable original discoveries. His researches in physical optics, however, constitute his chief claim to immortality. See P. Hating, *Christiaan Huygens in zijn Leven en Werken geschiedt* 1868.

**Huysmans, Camille**, Belgian statesman b. at Bûsen 1811. Leader of the Belgian socialist party and burgomaster of Antwerp 1833-40 and since 1844. From 1903 to 1921 he was secretary of the I and International and between the first and Second World Wars held posts in the Belgian cabinet. He was Prime Minister in a coalition gov. 1946-47 and thereafter minister of education, a post for which his early professorship at Ypres and Brussels particularly fitted him. Publs. *Étude sur les Assurances Sociales* (1912). *Recherches politiques. Mystère de Michel de Suacq* (1927).

**Huysmans, Joris Karl** (1848-1907), novelist of Dutch descent, but Fr. by

J. K. HUYSMANS

birth and culture. His progress from the influence of Baudelaire and later of the Fr. realists to devout Catholicism is

evident in his works, from the realistic *En Ménage* (1881), through the transitional *A Rebours* (1884), and *En Route* (1885), to the great climax *La Cathédrale* (1888), the epic of Chartres. This last work is scarcely a novel—it is too devoid of incident too purely introspective—but it is full of beautiful writing and delicate insight into Christian symbolism and is one of the greatest pieces of mystic literature ever penned. *L'Obélisque* (1903), and *Les Roules de Lourdes* (1906), are his chief later works.

**Huysum, Jan van** (1682-1749) Dutch painter b. at Amsterdam. His best pictures are those of flowers and fruits, in which the exquisite colouring and truth of detail produce a close imitation of nature herself. His works are to be found in many of the Continental galleries and also in London.

**Huyton with Roby**, par. and tn. of Lancashire, Eng., 5 m. E. of Liverpool, with coal mines. Pop. 3000.

**Huzara, sec HAZARA**  
**Hvar** (st. Lesina), is 70 m. long, of the Adriatic Sea. Dalmatian Yugoslavia. The islanders are engaged in the cultivation of olives, grapes, figs, rosemary, etc. and in marble quarrying, fishing, and boat building. At the vil. of St. Nedelja there are prehistoric caves. The cap. is Hvar, a town rich in buildings and art treasures of the Middle Ages, which is also a popular seaside resort. Pop. (1913) 20,000. (tn.) 2000.

**Hven or Hveen**, 1 of Sweden situated in the Sound 3 m. N.W. of Landskrona. Pycho 111. the livd here in his observatory until 1141.

**Hwaining**, (or Anking), cap. of Anhwei Prov. China on the Yangtzeckiang 364 m. W. of Shanghai. Pop. 38,000.

**Hwan-ho**, see Yellow River.

**Hwaithsang**, or Hsiouen-thsang (c. 600-644) Buddhist monk of China b. near Honan. Between A.D. 629 and 645, he visited 110 different countries and places in India, studying the sacred books and dist. His *Memoirs of the Countries of the West* are an invaluable source for the hist. of the times. This work and a bibliography were trans. into Fr. by Stanislas Julien (1823-33). See *Houen Tsang* (Tripitaka Oriental Library), 1898.

**Hyacinth**, also called *Jacinth* (It. *giacinto*) in mineralogy a variety of Zircon. It is an uncommon mineral and is found in the gem gravels of Ceylon—some fine stones having been found in the form of pebbles in parts of New S. Wales. The jacinth is described by some ancient writers as a yellow stone whilst others refer to it as blue which would appear to be our sapphire. Many of the gems sold as Hs. are in reality garnets, orange-brown, hematite or cinnamon stone. Optically it is simple to tell the difference as the garnet has a single and the H. a double power of refraction.

**Hyacinth**, name applied to various plants of the family Liliaceæ, especially to those of the genus *Hyacinthus*. There are thirty species of this group, and all occur in Africa and round the Mediterranean; in Britain *H. orientalis*, with all

its numerous varieties, is a favourite cultivated plant of the springtime, and the soil and climate of Holland seem peculiarly adapted to it. The wild H., well-known to Brit. woods, called at times the Eng. blue-bell, is *Scillanum*, another liliaceous plant. It is bulbous, and the flowers are borne in graceful racemes. The grape hyacinth, which also occurs in Britain, is *Muscari racemosum*.

HYACINTH

some time at Lyons, going from there to Paris, where he attracted great crowds at the churches of St. Sulpice and Notre Dame. In 1869 he was suspended on a charge of indiscipline, but obtained a dispensation from his monastic vows and became l'Abbé Loyson. In 1871 he became a member of the Old Catholic Congress at Geneva, and the following year he married in London. In 1879 he estab. a Gallican congregation at Paris, having resigned his curacy in the Old Catholic Church at Geneva some years previously. See J. A. F. Puaux, *Le Père Hyacinthe et songlise*; and L. W. Bacon, *Father Hyacinthe*, 1871.

**Hyacinthus**, in anc. mythology, the youngest son of the Spartan king Amyclas and Diomedes; a youth of extraordinary beauty, beloved of Apollo and Zephyrus (Boreas). He returned the love of the former, but was indifferent to the latter, who, jealous of his rival, drove the discus of Apollo against the head of H. when they were playing quoits. The youth was killed by the blow, and from his blood there sprang the flower of the same name (hyacinth). H. was worshipped at Amyclia as a hero, and the Hyacinthia, the second most important of Spartan festivals, was held in his honour.

**Hyades** (Gk. ὕαδες, the rainy), in Gk. mythology, were seven nymphs who were supposed to have nursed and protected Dionysus, and for their reward were placed in the constellation of the Bull. Their name is probably derived from the fact that their heliacal rising foretold wet weather.

**Hyæna**, name applied to the species of carnivorous mammals belonging to the family Hyænidæ, which range over Africa and Asia. They are massive animals, cat-like in appearance, with coarse, shaggy fur marked with irregular vertical stripes or large black spots; there are generally four toes furnished with non-retractile claws; the hind limbs are shorter than the fore, which adds to the ungainliness of their movements. The only living

genus is *Hyæna*, whose species are mainly carrion-eaters; they produce a wailing, almost human-sounding, howl and are the subject of many superstitions. *H. crocuta*, the spotted H., is limited to S. Africa, and *H. striata*, a striped species, is found in N. Africa and S. Asia. *Proteles cristatus*, the aard wolf of S. Africa, is sometimes included in this family.

**Hyæna Dog**, or **Cape Hunting-dog**, name given to *Lycaon pictus*, a species of carnivorous mammals belonging to the Canidae and ranging over a portion of S. Africa.

**Hyastan**, see ARMENIA.

**Hybla**, name of three anc. Sicilian cities: (1) *Hybla Major*, situated on the S. slope of Mt. Etna. (2) *Hybla*, called 'the Little,' and called Megara from the fact that the latter was built on nearly the same spot. (3) *Hybla Heræa*, on the route from Agrigento to Syracuse. The famous Hyblæan honey was obtained from one of these towns.

**Hybrid** (Lat. *hybrida*, a cross-breed or mongrel) progeny of two distinct varieties, as in the mongrel; of two distinct species, the common acceptance of the term; or, much more rarely, of two different genera. Early investigators declared that Hs. were sterile, but Darwin's experiments clearly demonstrated that this is not always so, as he was able to rear healthy young from a pair of Hs. between the domestic goose and the Chinese goose, which represent distinct species. The production of Hs. does not appear to be possible between widely differing parents. In the animal kingdom many variety-Hs. have been obtained, and rather less species-Hs. Genus-Hs. are rare, though the hog and ewe have been successfully crossed, as also have the star-fish and sea-urchin. In the case of species, possibly the commonest examples are the production of the *mule* from the male ass and mare, and of the *hinny* from the horse and female ass; other examples occur in the case of the dog and fox; lion and tiger; hare and rabbit; canaries and linches, etc. Hybridism is spoken of by Broca as being (a) *natural*, when it occurs in the undisturbed natural conditions (the relatively few cases of this quoted are open to suspicion); (b) *incited*, when it is under direct human control; and (c) *artificial*, as in the mixing of the male elements with eggs, as in the case of fish and frogs. Hybridism has become of importance to florists, in the production of new varieties of garden plants, and their successful experiments date back to the seventeenth century. Genus-Hs., which are rare, occur, as in the rhododendron, orchid, and azalea. The other forms are more common. *Graft hybridism* has been chronicled, as in the case of Adam's laburnum, and in the buzzarra from the bitter orange and citron. Usually Hs. resemble one parent more than the other, and generally they do not breed true (see BREEDING and HEREDITY). In many cases the hybridisation results in definite economic gain, as in the case of the H. Euro-Amer. vine, which is more capable of resisting Phylloxera than either of its parents; Prof. Biffen at Cambridge

was similarly able to produce H. wheats which combined good cropping qualities with resistance to attack by the 'rust' fungus.

**Hydaspes, Battle of**, fought between Alexander the Great and Porus, an Indian king, whose dominions lay between the Indus and the H. The date is given as about 326 B.C., and from the graphic account of it in Plutarch we learn that our knowledge of the details comes from the letters of Alexander. According to these, the R. H. was between the opposed forces, and Porus drew up his elephants on the banks opposite the Macedonians, with their heads towards the stream to guard it. Alexander, under cover of a stormy night, effected a landing on an is. in the riv., and therefrom advanced to the opposite bank and easily defeated the cavalry and chariots of Porus. Historians agree that the latter was of such huge stature that though he rode a very large elephant, 'he appeared but proportionably mounted.' This elephant gave extraordinary proof of sagacity and care of the king's person throughout the battle; but though Porus was defeated and captured, Alexander not only restored to him his dominions, but made him his lieutenant over them and over large accessions to them from the tens of conquered free peoples. According to Plutarch, it is on the authority of Onesicritus that Alexander is said, when coming to land on the slippery and treacherous riv. bank, to have uttered the famous observation, 'Will you believe, my Athenian friends, what dangers I undergo to have you the heralds of my fame!' See also under **JHELM**.

**Hydaspes**, see **JHELM**.

**Hydatid Disease**, **Hydatid Cyst**, or **Echinococcus Disease** (Gk. *hýda*, a watery vesicle). Certain immature forms of tape-worms—in particular of *Tania echinococcus*—are sometimes present in the body, and it is from these that a H.C. arises. Cysts are formed and the brain, liver, lungs, and kidneys are liable to this disease. The cyst may vary in size from the size of a hazel nut to that of a child's head; and the danger depends upon the size and position of the cyst. The disease can only be treated surgically. H. arises in man through dogs being kept too much about a person, for the adult worm, being small, lives socially in the intestines of the dog, jackal, and wolf. Man becomes infected by eating food contaminated with animal faeces in which are the eggs of the tapeworm. The H.C. is the immature stage (*cysticercus*) of the worm. The disease is most prevalent in Iceland, although it is found in most European countries. See **TAPEWORMS** and **BLADDER WORMS**.

**Hyde**, municipal bor. in the co. of Cheshire, Eng., about 4 m. N.E. of Stockport. Its prin. industry is the manuf. of cotton goods, but coal mining and engineering are also carried on. Pop. 32,000.

**Hyde**, Douglas (1860–1949), Irish scholar, linguist, and writer, known as 'an Craibhin Aobhinn', b. at Frenchpark, co.

Roscommon, and educated at Trinity College, Cambridge. Early in life he took up the study of Irish literature, Gaelic songs, and folktales; his *Literary History of Ireland* (1899), being the first attempt to write a comprehensive and systematic hist. of Gaelic literature. He also wrote: *Love Songs of Connaught* (1894), *The Story of the Early Irish Literature* (1897), plays in Eng. and Irish for the Irish theatre; trans. from anct. Irish. Editor of *Lia Fáil*, 1925. Prof. of Irish in the National Univ. of Ireland, 1909–32. Senator in the Irish Parliament, 1925 and 1938; Chairman of the Folklore Institute of Ireland, 1930–34; Gregory Medal, 1937. Became the first president of Éire, being chosen by agreement between the Fianna Fáil and Fine Gael political parties as a non-party man, in 1938. He was a protestant.

**Hyde, Edward**, see **CLARENDON, EARL OF**.

**Hyde, Thomas** (1636–1703), Eng. Orientalist, a native of Billingsley in Shropshire. He was a student at Cambridge, and in 1658 became Heb. lecturer at Queen's College, Oxford, afterwards chief librarian at the Bodleian Library. He was also made canon of Salisbury and archdeacon of Gloucester, and eventually canon of Christ Church. He helped Walton with the Persian and Syriac texts of the *Polyglot Bible*, and wrote *Historia Religiosa Vederum Persarum* (1700).

**Hyde Park**, enclosed space of about 360 acs., situated between Piccadilly and Kensington, London. It belonged originally to the manor of Hyde, the property of the Abbey of Westminster, but was appropriated by Henry VIII. after the dissolution of the monasteries, and is now a royal park. In times gone by duels were fought here, but in the seventeenth century it became a meeting-place of fashionable people, and during the London season is still used for this purpose. It is also a favourite place for various political meetings. Among its points of interest may be mentioned the Marble Arch, now isolated from it; the Gateway at Hyde Park Corner; the Serpentine, a lake formed on the course of the Westbourne R.; and Rotten Row, the famous riding track. Kensington Gardens adjoin H. P. on the W.

**Hyderabad**: (1) Prin. native state of India, and occupies a large portion of the Deccan, the central plateau of S. India. It is also called the Nizam's Dominions, and has an area of 82,313 sq. m. The Nizam of H. is the chief Muslim ruler in India.

H. is very mountainous and densely wooded in some parts, whilst in other dists. it is flat or undulating. Vast areas are almost uninhabited. There are two prin. tracts called Jelingana and Marathwala. The chief rvs. watering the dist. are the Godavari, Dudna, Manjira, Pranbha, Wardha, and Krishna, with their tribs. The chief products are oil seeds, rice, cotton, and the sugar cane. The total area under cotton exceeds three million acs. There are large cotton mills, and a number of tanneries and flour mills.

There are seven art colleges and three professional colleges. The mineral wealth of the country is indifferent, but there is a huge coal mine at Singareni. Pop. 16,338,500, of whom 13,000,000 are Hindus.

*History.*—Moslem rule and traditions in H. have their remote origins in the Muslim conquest of the Deccan 700 years ago; in the foundation of H., the cap. of the State, in 1589, by Kutāb Shāh Muhammad Kuli, a descendant of Sultān Kuli Kutāb Shāh, founder of the dynasty at Golkonda in 1512; and in the estab. of the present Asaf Jahi dynasty in H. in 1713, when Kamr-ud-din Asaf Jah, a distinguished soldier of the Emperor Aurangzeb, was made Nizām-ul-mulk ('Regulator of the State') and Sulahdar of the Deccan (but, later, secured his independence of the Delhi court). After the death of Asaf the right of succession to his power and authority was disputed by his descendants, the Eng. and Fr. supporting rival claimants in the struggle to promote their own influence in the Deccan; but Clive's victories compelled the Fr. to withdraw from the support of Salabat Jang, who was dethroned and murdered by his brother Ali (1761). Ali afterwards devastated the Carnatic (1763) but retreated before the Brit. The Brit. Gov., however, compromised with Ali because they wanted his assistance against Hydar Ali (q.r.), and a treaty was concluded with the Nizam in 1766. In 1799 the Brit. Gov. concluded a military alliance with the Nizam in the war with Tippon, son of Haider Ali, and Tippon had to buy peace at the price of half his realm, which was assigned to the Nizam. On the capture of Seringapatam and the death of Tippon, the Nizam's dominions were still further augmented. The Nizam came under the protection of the Brit. Gov. in 1799. In 1857, with the outbreak of the Indian Mutiny, the state of H. and the Nizam's dominions became critical. An attack on the Brit. residency was repulsed by the H. contingent, who displayed all their wonted loyalty to the Brit. connection; and in 1860 a new treaty was made by which the Nizam's territories were further enlarged so as to be coterminous with H. In 1902, in a treaty made by Lord Curzon, the dist. of Berar was assigned in perpetuity to Great Britain and the H. contingent was incorporated into the Brit. army. The N. thus became the prin. Moslem ruler in India.

The long and bitter controversy over constitutional reform between the H. State Congress, supported by the Indian National Congress, and the Nizam's Gov., came to a head some months after the partition of India (Aug. 1947). The immediate causes of conflict were the demands of the Indian Union that the Nizam must accede to the Union, in the same way as every other Indian State, and must at once grant 'responsible gov.' to his people and accept the principle of majority Hindu representation in the cabinet and legislature, and eventually also in the public services. This demand derived its

justification from the fact that Hindus constitute 85 per cent of a total pop. of seventeen million. In theory the Indian Union had a valid case on both heads, although the Nizam claimed that he was repeatedly assured by the Brit. Gov. that he would be at liberty to choose whether to accede or remain independent, and it seems evident that H. was deserted by Britain when she transferred power to Indian hands, leaving the Nizam's gov. to fend for itself against the rising tide of Congress sentiment. By early 1948 all the other Indian States had been induced to accede to the Union; only H., the premier principality, remained aloof and defiant. When in June 1947, it was known that India was to be partitioned the Nizam announced in a *firman* that he did not intend to accede to either India or Pakistan but would preserve his independence. This was the signal for the launching of a civil resistance movement by the H. State Congress, a movement sponsored by the Indian National Congress; but after some thousands of arrests had been made many leaders of the State Congress fled to adjacent Union ter., while their president conducted a propaganda tour of India. A still more dangerous challenge to authority came from the communists acting chiefly from adjacent areas of N. Madras, where they were disrupting the Nizam's régime. Local Muslims in H. banded themselves together to resist communist raiders. This was the origin of the *Razakar* or volunteer movement—which soon became a thorn in the side of the Indian Nationalists, for they were in effect the private army of the Moslem party in H. Actually started in the spring of 1947, the 'Association for the Unity of Muslims' (*Ittehad-i-Muslimeen*) became the mouthpiece of militant Islamic elements and much the most influential party in the State. They regarded themselves as the champions of the Nizam against both Congress and communists. Negotiations between the Indian Gov. and the Nizam went on slowly and by Nov. (1947) an agreement on the terms of accession had been drafted, but it was abruptly dropped under vehement pressure from the Ittehad. The most that was agreed on was a 'standstill agreement' for a year, during which the Nizam retained internal autonomy but entrusted the control of foreign relations to India. In the meantime the Nizam undertook to frame a more liberal and progressive constitution and introduce a number of Hindu ministers into his Administration. But hopes of settlement faded in face of the hostility of the Razakars. In June 1948 the Nizam sent a former premier, Sir Mirza Ismail, to negotiate fresh terms at Delhi; but a draft agreement was rejected by the Nizam, again at the instance of the Ittehad or Razakars. The Indian Gov. thereupon decided that no agreement could be hoped for until the influence of the Moslem militants had been offset, and thereupon called on the Nizam to allow Indian troops to return to the camp at Secunderabad from which they had been

withdrawn (Nov. 1947) after the standstill agreement. This request too, was rejected. Thus the long wrangle between the Govs. of India and H. came at last (Sept. 1948) to a decision by force of arms. Indian troops entered H. on Sept. 13. The invaders, moving from all quarters of the compass, had soon advanced deep into H. meeting with some opposition from the Razakars. Meanwhile the H. Gov. appealed to the Security Council of the United Nations but there were juridical obstacles to the hearing of the case of a non member of the United Nations, and in any case the appeal was too late. By Sept. 1) the invasion had achieved its purpose: the Indian column came under receiving the formal surrender of the H. army at a point near Secunderabad and soon afterwards Indian troops entered it. In having thus gained control the Gov. of India showed that it had no intention of depriving the Nizam of ending his dynasty in spite of popular clamour for this. In 1911 the Nizam transferred to the State Gov. about 7000 sq. m. of land (about one tenth of the state) which he held as his personal property. (2) Name of the cap of the above state is situated on the left bank of the R. Musi and is the fourth largest city in India. It possesses many fine buildings, chief amongst which are the Mecca Mosque and the Char Minar or Four Minarets. The city is surrounded by a stone wall with thirteen gates, and resembles a parallelogram in shape. The beautiful grounds of the residency and many fine buildings were devastated by floods caused through the overflow of the R. Musi in 1904. The Omandal Div. is situated here. Pop. 467,000. (3) Name of a city in Bombay, formerly the cap of Sind. It stands on a hill, which serves as an excellent natural fortress. Pop. 102,000.

**Hyder Ali (1728-82)** Indian ruler and commander, the second son of a Mohammedan chieftain. He was turned out by his father to seek his own fortune. His brother commanded a brigade in the Mysore army and H. occasionally acted for him, but spent most of his time in studying European tactics. He induced his brother to purchase artillery and firearms, and enrol European sailors as gunners. In 1743 he obtained an independent command and during the next twelve years became complete master of the Rajah of Mysore and his kingdom. By the conquest of Kanara he gained the treasures of Bednur, and his destruction of the military caste of Nairs of the Malabar coast caused the gov. of Madras to send Col. Smith with a small force to check his advance, a fierce battle was fought at Chengam, 1767 and H. was defeated, he rejected the terms of peace and collecting a larger army he came within five m. of Madras. A treaty was arranged providing for mutual aid in defensive war. The Brit. broke faith and H. commenced to revenge himself, in one encounter Col. Baillie's force of 2800 men was utterly destroyed. Finally Sir Eyre Coote defeated him in three different battles, and

the Brit. fleet seized Negapatam. He sent his son Tippoo to gain help from the Brit. but died suddenly before his return. This man could neither read nor write, was a mere adventurer, yet became the most formidable rival the Brit. encountered in India and threatened the extinction of the E. India Company.

**Hydra**, in Gk. legend, a celebrated monster with a number of heads, inhabiting the marshes of Lerna in the Peloponnese. Hercules had to destroy this monster as one of his twelve labours, and he accomplished the feat with the aid of Polaxus. The middle head was immortal, and they imagined to sever it and bury it under a huge rock.

**Hydra**, name of the single genus of fresh water polyps belonging to the subgenus Hydra. The species are widely distributed, being found in Europe, N. America, New Zealand, Australia, and tropical Africa. In Britain they are

HYDRA CATCHING CYCLOPS

found it is held to weed or plant stalks in still fresh water. These solitary polyps have a tubular body wall, and the generative products are developed in the ectoderm, the mouth is placed at the summit of the hyaline dome and there is a crown of long, slender hollow tentacles, varying in number from six in *H. vulgaris* and *H. oligactis* to eight in *H. viridis*. All species are carnivorous and will swallow Entomostraca of considerable size, until the body wall expands to twice its usual dimensions.

**Hydra** (anc. Hydrea), is in the Grecian Archipelago off the coast of Morea, forming with the neighbouring is. of Dokos the bay of H. It has an area of about 21 sq. m. and its greatest length is 11 m. Its surface consists of barren rocks, only a few trees growing in favoured spots. H., the chief tn., is built round the principal harbour, and practically the entire pop. of the is. is centred in this tn. There is a fairly active trade in weaving, tanning,

and shipbuilding. The Hydriots were renowned seafarers and traders in the past, their business leading them to the Baltic and the Americas. Pop. (14.) 3700, (15.) 3000.

**Hydra**, or 'The Water-Snake' one of the old constellations, being mentioned by both Aratus and Ptolemy. From the time of the former it has always been a triple figure—a long snake, represented as trailing upon the ground, bears upon his back a cup (Crater), and near to his tail is seated a crow (Corvus). The mythological meaning is altogether unknown. *Hydra* must be distinguished from *Hydrus* the S. Snake, a constellation of Lacaille which is situated between the bright star Achernar and the S. pole.

**Hydracids** are acids which consist of hydrogen united to an element or group of elements which do not contain oxygen. Hydrochloric acid (HCl) and hydrocyanic acid (HCN) are examples of H. *Oxyacids*, on the other hand may be regarded as compounds of water with a non metallic oxide, e.g. sulphuric acid ( $H_2SO_4 = H_2O + SO_3$ ).

**Hydragogues**, see under AFFRIGENTS.

**Hydrangea**, genus of Saxifragaceae, contains about 15 dozen species which flourish in N. lands. They are hardy flowering shrubs with opposite leaves and some are of a climbing habit. They require a rich loam soil which should be well drained but not dry. Only in favoured situations in warm parts of the country will they remain out of doors all the winter in safety. They are useful shrubs to grow in tubs or pots the commonest example found in Britain being the *hortensis* (*H. hortensis*) or 'lacecap' which is a favourite plant for hotel lounges. When in full bloom they are covered by numerous large, creamose corymbs of brightly coloured flowers. White, blue, rose are the more usual colours, and will change from season to season on the same plant if alum or copper is dissolved in the water in order to change its colour. Blue flowers may also be obtained by artificial treatment. Some kinds of *H.* grow to 10 ft. high but the more usually cultivated kinds are about three or four ft. high. *H. macrophylla* is a very good garden plant with superb massed colour effects. They have a flat flower head like that of the wild geranium. Other varieties are the handsome white macrostema, the pink *Mariesii* and the varieties of woodland *H.* (*H. arborescens*) such as 'greywood', with beautifully shaped flowers that open white and turn crimson, and *H. acuminata*, with attractive blue flower.

**Hydrant**, see WATER SUPPLY.

**Hydrate**, term applied to compounds of water with other compounds (or, more rarely, with elements). The water is usually loosely held, and may be driven off by heat or by the action of dehydrating agents such as concentrated sulphuric acid. It is known as *water of hydration* or *water of crystallisation*. Many crystalline salts are *hydrates*, thus blue vitriol or copper sulphate crystals consist of copper sulphate pentahydrate,  $CuSO_4 \cdot 5H_2O$ , while washing soda is sodium carbonate deca-

hydrate,  $Na_2CO_3 \cdot 10H_2O$ . When the water of crystallisation is driven off from hydrated crystals, the crystalline form is lost, and the resulting powder is known as the *anhydrous* form of the substance. The colour of the hydrated substance is frequently different from that of the anhydrous; thus copper sulphate pentahydrate is blue, while anhydrous copper sulphate is white. The term *H.* should not be confused with the somewhat similar term *Hydrazide* (q.v.).

**Hydraulic Machinery** includes all those machines which depend upon water power. They may be divided into two classes. (1) Motor machinery and (2) pumps. Water falling from a high to a low level can obviously be used to drive machines, which are thus deriving their energy from water, and these are typical of the first class. The second class would include steam pumps for raising water from a low to a high level, or from a low to a high pressure. Thus under the term *H. M.* are included several branches of engineering and these branches are dealt with separately (see ACCUMULATOR, BRACK, CRANE, HYDRAULIC PRESS, HYDROKINETICS, LIFT, PUMP, TURBINES).

Most hydraulic machines depend upon the principles explained in hydrodynamics and typified by the hydraulic press (q.v.), while Lord Armstrong's hydraulic accumulator (see ACCUMULATOR) establishes the success of storage and power transmission machinery. Pipes for carrying water under pressure are made of cast iron or steel, and the thickness and diameter vary with the average pressure of the water transmitted. A 6 in. pipe 1½ in. thick, will carry water at 70 lb. per sq. in. If *P* represent the pressure of water in lb. per sq. in., *d* the internal diameter of the pipe, then the thickness *t* of the pipe can be calculated from the formula

$$t = 0.000125 Pd + x,$$

where *t* equals thickness of the pipe, and *x* = 0.37 in. for pipes less than 12 in. in diameter, 0.5 in. for pipes from 12 to 20 in. and 0.6 in. for pipes from 30 to 40 in.

Hydraulic power is utilised in many ways because of its convenience for occasional use, and of its freedom from smoke and noise, its capability of being transmitted and used without any attention, and also because of its practical freedom from danger.

**Hydraulic Press**, see MINING.

**Hydraulic Press**, invented by Joseph Bramah (q.v.) in 1781, and therefore known as 'Bramah's press'. The principle used in this machine is a well known one in hydrostatics (q.v.), viz. that a pressure on any part of the surface of any liquid is transmitted equally in all directions through the mass.

As will be seen from the accompanying diagram, a force pump *C* can force water from the tank *B*, by way of a strong pipe *E* into a strong cast steel cylinder *D*. *C*, the plunger or ram, is thus forced upwards. On the top of the plunger is a table *H*, between which and the plate *A*—sometimes known as the entablature—any-

thing, e.g. a bale or a number of books, can be pressed. The power of the press is calculated as follows: Let  $D$  and  $D_1$  be the diameters of the pump plunger  $G$  and

BRAMAH'S OR HYDRAULIC PRESS

the ram  $C$  respectively. Then, if  $W$  be the force exerted on the pump,  $W \cdot \frac{D_1^2}{D^2}$  will be the force exerted by the ram. As an example: if a force of 50 lb.-wt. be exerted on the pump plunger of diameter 1 in., then, if the diameter of the ram be 10 in., the force exerted will be  $50 \times \frac{10^2}{1^2} = 5000$  lb.-wt. It is thus a very efficient machine, and it is used for pressing cotton and wool bales, bending iron plates, lifting weights, and raising bridge girders into place (hydraulic jacks); the pump  $G$  being either worked by hand by a lever  $F$  as shown, or by a steam engine.

**Hydraulic Ram**, see PUMPS.

**Hydrazine** ( $H_2N \cdot NH_2$ ), colourless strong-ly alkaline liquid (boiling point  $114^\circ C.$ ), obtained by heating  $H_2$  hydrate with barium oxide. Its salts are prepared from ammonia and hypochlorite; if the product is evaporated with sulphuric acid the sparingly soluble sulphate separates out.  $H_2$  forms many derivatives in which hydrogen is replaced by alkyl groups, the most important being phenyl  $H_2$  ( $C_6H_5 \cdot NH \cdot NH_2$ ), an oily liquid, which forms crystalline compounds with aldehydes and ketones.

**Hydrazoic Acid**, or **Azoimide** ( $NH \cdot N_2$ ), poisonous, highly explosive liquid made by acting on hydrazine with nitric acid. Its lead salt, lead azide, has replaced mercury fulminate as a detonator.

**Hydra**, see HYDRA.

**Hydrides**, compounds containing hydrogen, combined with a single other element, but the term is generally restricted to such compounds where the element is a metal. Thus  $H_2O$  and  $HCl$  would be regarded as oxide and chloride, respectively, rather than as  $H_2$ . Compounds of hydrogen with metals such as arsenic, antimony, sodium, calcium, etc. ( $AsH_3$ ,  $SbH_3$ ,  $NaH$ ,  $CaH_2$ , respectively), may be regarded as true  $H_2$  in the limited sense of the term. With acids or water  $H_2$  evolve hydrogen, use having been made of this in the preparation of the gas for military balloons.

**Hydriodic Acid**, or **Hydrogen Iodide** ( $HI$ ), colourless gas, fuming strongly in moist air, and easily soluble in water to a solution, which when saturated has a sp. gr. of 1.70, and contains about 52 per cent of  $HI$ . Light turns it brown with deposition of iodine. It may be obtained by distilling potassium iodide with phosphoric acid, but is more easily prepared by acting on red phosphorus and iodine with water, or by passing hydrogen sulphide into water containing iodine in suspension. On heating,  $H_2A$  is decomposed into its elements. The salts of  $H_2A$ , the iodides, are crystalline, and as a rule soluble in water. Silver iodide is used in photography, and potassium iodide in medicine to lessen secretions and absorb the products of inflammation.

**Hydrobromic Acid**, or **Hydrogen Bromide** ( $HBr$ ), colourless, fuming gas with a pungent smell, forming a fuming solution with water, which acts as a strong acid. In the presence of light it is decomposed with separation of bromine.  $H_2A$  is formed by the action of phosphoric acid on potassium bromide; it is most conveniently prepared, however, by dropping bromine on to a paste of red phosphorus and water, the gas evolved being passed into water. The bromides, or salts, derived from the acid are crystalline, and, as a rule, soluble in water. They are employed in photography, silver bromide being one of the most important salts that are sensitive to light. Potassium, sodium, and ammonium bromides are also used in medicine, and act as powerful hypnotics and depressants. If taken habitually they are apt to set up a variety of poisoning known as 'bromism.'

**Hydrocarbons**, compounds of hydrogen with carbon, may be regarded as the parent substances of all organic compounds. There are many classes of  $H_2$ , of which the following are the most important: (1) the paraffins, of general formula  $C_nH_{2n+2}$ , which are 'saturated' compounds, with the carbon atoms in an open or a branched chain; (2) 'unsaturated'  $H_2$  of the ethylene, acetylene, and other series, which will unite with elements, such as chlorine or bromine, without undergoing rearrangement of the molecule; (3)  $H_2$  containing a ring structure, such as benzene, naphthalene, anthracene, in which the carbon atoms are arranged in one or more closed rings. Combination of the above types is possible, giving rise to an enormous number of  $H_2$  derivatives of many of them being found in nature. Petroleum and other mineral oils consist almost entirely of  $H_2$ , those of the paraffin series being usually the most plentiful.

**Hydrocele**, dropsy of the serous membrane surrounding the testis. It may occur as the result of inflammation, or from a blow, but its cause is usually unknown. It can be distinguished from other disorders in the same position by reason of the fact that when the tumour is held between the observer and the light it is seen to be translucent. It can be distinguished from rupture since it gives no impulse when the sufferer coughs. It

usually occurs in middle age, in persons of weak power or with tendency to gout. It does occur in children either as described above or as *congenital hydrocele*.

*Palliative* treatment consists in using suspending bandages and tapping frequently. The *curative* treatment consists in setting up inflammation by injecting iodine, or by excision of the whole or part of the sac. Injection of chloride of zinc is sometimes used, as causing no pain or inflammation.

**Hydrocephalus, see under DROPSY.**

**Hydrocephalus**, means, literally, 'water on the brain,' but includes three distinct diseases:

(1) *Acute hydrocephalus*, or rather *tubercular meningitis*, is due to inflammation of the membranes of the brain because of the presence of tubercles (*q.v.*). Fluid frequently forms within the brain, and it is a fatal disease, which is common in childhood, although it does occur less frequently among adults.

(2) *Chronic hydrocephalus* is distinct from acute H., since it is a dropsy. A watery fluid forms in the skull, before the bones have united to form the brain case, and by pressing outwards it increases the size of the head of a foetus by forcing the bones apart. This may commence before birth, but is more usual in early childhood. It has been known to occur at about the eighth or ninth year, and the fontanelles (gaps between the bones on top of the head) and sutures have been forced open under the pressure. If they do not yield, death quickly results. Fluid also collects within the brain (in the ventricles) causing the cerebral hemispheres to swell and their convolutions to become flattened. Children suffering from H. usually die in infancy; some may survive, but they carry their complaint with them through life. Not a few cases of blindness, deafness, palsy, and stoccy are due to this, although the sufferer is not always so affected. Since the skull enlarges and the face only grows at the usual rate, cases can be diagnosed by the disproportion between the head and face which ensue. Not much can be done in the way of treatment, though attempts are sometimes made to tap off the fluid. Occasionally the disease attacks adults, as in the instance of Dean Swift, who succumbed to it.

(3) *Spurious hydrocephalus* resembles acute H., and is often mistaken for it. It is, however, due to a poor supply of blood to the brain, and is a disease of debility. As a result of this disease, the little patient will have a pale, cool cheek, half-shut, regardless eye, interrupted, sighing respiration, and an unclosed fontanelle. It can be distinguished from acute H. by the fact that in acute H. the surface of the fontanelle will be convex, while in spurious H. it will be concave or depressed because it lacks support and originates in emptiness. Spurious H. readily yields to treatment, by means of nourishing diet and small doses of wine, ammonia, etc.

**Hydrocharitaceae**, family of monocotyledonous plants containing thirteen

genera and about fifty species. All occur as water-plants in tropical and temperate lands, and a few are marine; they usually inhabit ditches, lakes, and rivers. Nearly all have ribbon-like, submerged leaves, and some have floating leaves; the male and female flowers usually occur on different plants. They are generally in parts of three, with a two-whorled perianth; the stamens are in from one to five whorls; the carpels form an inferior ovary, are united, and vary in number from two to fifteen; the ovary is unilocular, with numerous ovules. The chief genera are *Valisneria*, *Elodea* (*E. canadensis*, Canadian Pondweed, a very common submerged plant in Great Britain; other species are often grown in tropical aquaria), *Hydrocharis* (*H. morsus-ranae* is the Frogbit, with kidney-shaped leaves, all floating in the water surface) and *Halophila*.

**Hydrochloric Acid**, or **Hydrogen Chloride** (HCl), colourless gas, closely resembling hydrobromic and hydriodic acids. It is readily soluble in water to a fuming, strongly acid solution, which is known under the name of 'spirits of salt.' H. A. is formed by the direct union of hydrogen and chlorine, but is most conveniently obtained on a small scale by heating common salt with sulphuric acid, thus:

the acid sodium sulphate formed being capable of decomposing another molecule of salt at a high temp. thus:

A concentrated aqueous solution of H. A. has a sp. gr. of 1.2, and contains nearly 40 per cent of the pure acid. The acid is very stable, being unaffected by heat or light; with many metals it reacts with liberation of hydrogen, the chloride of the metal being formed. In the presence of nitric acid, manganese dioxide, and other oxidising agents, chlorine is produced. The chlorides, or salts of H. A., are, as a rule (exceptions: silver, lead, and mercurous chlorides), soluble substances. Common salt, or sodium chloride (NaCl), is the most important of the chlorides, and is the substance from which all chlorine-containing compounds, such as bleaching powder, potassium chlorate, etc., are prepared. H. A. is largely used as a cleaning and scouring agent for metals, e.g. iron before galvanising, etc., and in the dyestuffs industry. Common salt is used as a preservative, and is a necessary article of food with all animals living on a vegetable diet. Medicinally, it is used internally as an emetic, externally in baths for the relief of sciatica, rheumatism, etc.; and it is injected, in solution, to replace loss of blood.

**Hydrochoerus**, name of a genus of Lysenormorphous rodents belonging to the family Cavidae, and consisting of a single species *H. capybara*, the capybara. This is the largest of all rodents, and attains a length of 4 or 5 ft. It is aquatic, having webbed digits furnished with boat-like nails, and is a native of S. America.

Diagrammatic Section of Reaction Type Water Turbine and Generator  
 English Electric Co Ltd

**Hydrocyanic Acid, or Prussic Acid** ( $\text{HCN}$ ) first obtained by Scheele in 1792 from the substance known as Prussian blue. It is formed in the decomposition of the glucoside amygdalin which is present in almonds and other plants. A solution of the acid is conveniently prepared by distilling potassium ferrocyanide with dilute sulphuric acid. The anhydrous acid may be prepared by the action of sulphuric acid on potassium cyanide, or by dehydrating an aqueous solution of the acid with calcium chloride. Techni-

cally it is made by heating trimethylamino ( $(\text{CH}_3)_3\text{N}$ ) to a temp of 800–1000 C.

When pure HCN is a light colourless liquid freezing at  $-15^\circ\text{C}$  and boiling at  $26^\circ\text{C}$  having the odour of bitter almonds (though many people cannot detect the smell). It is extremely poisonous, a single drop taken internally causing instantaneous death due to paralysis of the heart. Smaller doses cause pain in the head, giddiness and nausea accom-

panied by paralysis of respiration and of the spinal cord. In cases of poisoning, emetics, followed by injections of ether or alcohol, inhalation of ammonia, and artificial respiration, may be of service. Chemically, HCN is a feeble acid, faintly reddening litmus. Its salts, the cyanides, resemble the halides, but are poisonous and enter into complex acid radicals such as the ferrocyanides and ferricyanides. Potassium cyanide is used as a flux and reducing agent in metallurgical work, as a fixing agent in photography and sodium cyanide chiefly as a solvent for gold in the working of low grade ores. Potassium cyanide ( $KCN$ ) is prepared commercially either from the ferrocyanide, or sulphocyanide, or more recently, by the action of ammonium upon a fused mixture of potassium carbonate and coke. The similar sodium salt sodium cyanide,  $NaCN$ , is made by fusing a mixture of sodium ferrocyanide and metallic sodium or more usually by heating a mixture of sodium and carbon in a current of gaseous ammonia. Medically HCN is used in very dilute solution, externally to diminish itching in skin diseases and internally as a sedative, and to allay vomiting in severe coughing.

**Hydrodynamics**, see **HYDRODYNAMICS**

**Hydro-electric Power.** Wherever the old water mill, the earliest contrivance for harnessing a natural source of energy was purely local in application, a modern hydro power station is usually linked with a number of others by a network of electric transmission lines including one or more steam power stations, making the energy available over large regions sometimes remote from the source and transcending geographical boundaries. The advantage of such an interconnected scheme lies in the flexibility of operation: the ease of adjusting the power generated to the varying demand, in hydro power stations can be quickly started up and may be operated by telecontrol or automatically, and continuity of service in case of local breakdown is ensured. The increasing demand for electric power during the present century is mainly due to the developments of metallurgical and chemical industries requiring a steady supply of large blocks of power. This need can best be met where water power is readily available. The electrolytic production of aluminium from bauxite and fixation of atmospheric nitrogen by the high power electric arc are the most familiar examples. The parallel development of highly efficient hydraulic turbines and of electric transmission technique, at voltages up to 380 kV, together with the rapidly rising fuel prices and depletion of coal and oil deposits has turned the attention to water power resources previously deemed unworthy of exploitation. The estimates of 'available energy' are being continually revised towards higher values in all countries. In Switzerland the energy obtainable was given 20 years ago as  $16 \times 10^9$  kWh per annum, the figure being successively raised to  $21 \times 10^9$  kWh and lately to  $27 \times 10^9$  kWh. Sweden gave a figure of  $32 \times 10^9$  kWh

GENERATORS IN A POWER HOUSE AT  
LAKE LAKE SAGUENAY RIVER, QUEBEC

in 1932 the recent value (1948 being  $60 \times 10^9$  kWh, of which about half is already developed). Norway has lately revised its estimate from  $80 \times 10^9$  kWh (1918) to  $120 \times 10^9$  kWh. Looking at the world as a whole, about 5 per cent of total electric energy generated derives from water power. In countries with plentiful hydro resources such as this proportion is much greater: in Sweden it amounts to 25 per cent and in Norway over 99 per cent come from hydro power developments. Switzerland and Italy are particularly placed, and in Britain the proportion is 36 per cent. Norway and Canada have by far the lowest consumption of electric energy per head of population at home. Sweden, Switzerland and the U.S.A. of the total electricity generated in Norway and Sweden about 1 per cent is absorbed by industries such as metal refining and chemical plant, paper and wood pulp plant, whereas the Swedish electrified railway system takes a further 10 per cent. In view of the frequent revision of data, which are not always calculated on the same basis, a list of the water power resources of the world is misleading and further omits to inform on the great waterfalls of Brit. Guiana, India, Australia, New Zealand and S. Africa, Brazil, and Argentina is not yet available. The U.S.A. and Canada are without doubt the richest, the carrying capacity of the order of  $180-200 \times 10^9$  kWh per annum—as far as is at present known. Norway with  $120 \times 10^9$  kWh, France, Austria, Sweden, Spain and Italy are about the same order ( $50 \times 10^9$  kWh) and Switzerland a little less. Great Britain is comparatively poor in water power resources: most of them are in Scotland (Kinlochleven,  $30,000$  hp or  $0.2 \times 10^9$  kWh pa), and Galloway  $13,000$  hp or  $0.9 \times 10^9$  kWh pa) or in

N. Wales; the total energy is estimated at  $6 \times 10^5$  kWh.

That 'water costs nothing' is of course a fallacy. Any water-power development requires considerable civil engineering works, reservoir, dam, conduits, and riv. regulation, besides power-house and machinery, and to this must usually be added the cost of water rights (drilling, timber flotation) and land. But the cost consists mainly in charges against capital, interest, depreciation, taxes, and insurance. And the life of a hydro-power installation is generally longer than that of a thermal power station: reservoir, dam and conduits are practically permanent, and the cost of operation and maintenance of a hydro-power station is low.

The total power that can be obtained from a waterfall of  $q$  cub. ft./sec. with a drop ('head') of  $h$  ft. is  $62.4qh/550$  h.p., and if the efficiency of the turbine is  $\eta$ , the power at the turbine shaft is  $62.4qh/550 \times \eta$  h.p. corresponding to an ann. output of  $732 \eta qh$  kWh. Investigations preliminary to a hydroelectric project involve determination of the flow and the head that are or can be made available. The actual flow in a stream is best measured by erecting a weir across the stream, but where this is impracticable, the cross-section is measured and the velocity is obtained with a current-meter, by floats or by injection of colouring matter or a chemical into the water (see WATER MEASUREMENT). The flow varies according to the season and from year to year and depends on the discharge from the catchment area. This ultimately depends on the precipitation and is affected by the topography and geology of the area, the vegetation, the climate, and the character of precipitation, whether heavy or gentle showers, rain, snow or hail. Careful examination of these factors, and especially of seasonal and ann. variation of meteorological data, maxima and minima of precipitation, probable frequency and duration of dry and wet periods, flood conditions and occurrence of ice, is essential. The effect of dry periods was strikingly illustrated by the depletion of the water storage in Sweden, following the drought of 1946-47, which forced the authorities to introduce strict rationing of power in 1948.

The final project depends on the natural conditions, and thus no two hydro-power developments are exactly alike; yet, roughly, two main types may be distinguished: (1) high-head schemes characteristic of mountainous countries, utilising a head of 500-5000 ft., and (2) low-head schemes of 2-100 ft. The latter use reaction turbines, sometimes submersed. Pelton wheels are used for heads above 500 ft., though the modern tendency is towards the employment of reaction turbines up to 1000 ft. Intermediate schemes use either Pelton wheels or turbines, according to the quantity of water. The highest head so far utilised (5700 ft.) is at Chaudoin in the Rhône valley (Switzerland), with 3 Pelton wheels of 42,500 h.p.

The power that can be supplied continuously is determined by the minimum flow. If it is feasible to shut down at least some of the turbines during the hours when demand is low, the water so saved may be impounded for use during high-load hours. This is called 'pondage' as distinguished from 'storage' of water during seasons or longer periods of increased flow, which demands a large reservoir. Where no lake or other natural storage is available, flooding of a considerable area is necessary. Storage is characteristic of high-head schemes. In a low-head development where large quantities of water are involved, adequate flooding is too costly. The quantity of water obtainable by storage is determined from run-off records over a number of years; the longer the record, the more reliable are the final figures. Successive monthly run-off values are added cumulatively and the results plotted as a mass-curve against time, or tabulated values may be used in a step-by-step method for calculating debits and credits. The final choice of reservoir size is dictated by the cost of land and the output required of the power station as a component of the network.

Almost every hydro-power scheme requires a dam, to close the reservoir or as a means of forming or increasing the head as part of the intake to the turbines. Gravity dams, built of timber, earth or rock-fill, or concrete, rest on a wide base and the weight of the dam alone is sufficient to give stability. Buttressed or hollow dams of reinforced concrete slope at  $45^\circ$  on the up-stream and the water pressure ensures stability. Arched dams are usual in narrow gorges. The recently completed Lunel dam in Italy has both horizontal and vertical curvatures.

In high-head stations the reservoir is often at a considerable distance from the power house, and the water is conveyed from the intake to a convenient point on the hill-side above the power-house in a conduit which may be an open canal, a flume, a tunnel, or a pipeline, but generally following a level curve. The conduit leads into the forebay from which the penstock, a group of steep pipe-lines, convey the water to the turbines. At the lead in from the penstock to the turbine gates a vertical surge tank is often provided to relieve pressure variations in the penstock caused by sudden opening or closing of the turbine gates. The conduit leading out of the power-house is known as the tail race. In low-head power schemes the power-house is usually adjacent to or built into the dam.

Hydraulic Turbines are either of the impulse type, of which the Pelton wheel is the only design in actual use, or the reaction type, such as the Francis or the Kaplan turbine. In the Pelton wheel the water issues from a nozzle at the velocity  $v$ , theoretically  $= \sqrt{2gh}$  ft./sec. gained by falling through the head  $h$  ft., in actual practice multiplied by a coefficient (about .99) dependent on the shape of the nozzle. The kinetic energy of the jet is  $\frac{1}{2}mv^2$  where  $m$  is the mass of

water, and if the cross-section of the jet is  $S$  sq. ft. the mass issuing per sec. is  $S \times v \times 62.4$  and the h.p. of the jet is  $62.4 \times S \times v \times \frac{v}{2g}$  or nearly  $.8Sh\sqrt{h}$ . The

best cross-section of the jet is circular, and the largest practicable diameter is 8 in., giving a cross-sectional area of about  $1/3$  sq. ft. The quantity of water that can be used is therefore limited, and the Pelton wheel is best suited to high-head schemes. The jet impinges on buckets fixed on the rim of the wheel and thus provides the driving force. As a rule, only one nozzle per wheel is used, although in some cases two nozzles at an angular distance of  $90^\circ$  from one another have been used, whereby the power is, theoretically, doubled, though the efficiency is decreased by interference between one jet and the splash of the other. The nozzle carries an axial 'needle' which is used for regulation of the jet or for closing the nozzle, in a way similar to that of a needle valve. Speed-regulation of modern Pelton wheels is effected by deflection of the jet or, as this method is wasteful, by means of 'needle regulation and deflection, the needle and deflector being operated by the governor mechanism. Pelton wheels are usually mounted on a horizontal axis as this arrangement is the simplest.

In the reaction turbines, water enters the runner along the whole circumference through a series of guide vanes so shaped that no shock or eddy formation occurs on passing into the vanes of the runner. The driving force on the runner derives partly from the pressure of the water, partly from the reaction on the runner vanes due to the change in direction of the velocity of the water. By discharging the water through a draft or suction tube, the full pressure can be utilised, even if the turbine is mounted at some distance above the tail-race level so as to give easy access for inspection and repair. The earliest reaction turbine was the Fourneyron outward-flow turbine, in which the runner surrounded the fixed guide vanes. The later Jonval turbine was of the axial-flow type, the guide vanes being placed above the runner, with axial discharge. The Francis turbine is of the inward-flow type, the fixed guide vanes surrounding the runner, but in the modern designs, the runner is tapering downwards, and the flow is gradually turned in the axial direction. The Kaplan turbine is an axial-flow type, the runner being shaped like the impeller of a centrifugal pump, with only a few (3-6) vanes. The guide vanes of a reaction turbine are surrounded by a spiral volute chamber for delivering the water at an uniform rate around the circumference. This chamber is sometimes (in low-head installations) moulded in the concrete of the foundation. For higher heads ( $> 100$  ft.) a steel casing is used. Speed regulation may be effected by a cylinder gate inserted between the guide vanes and the runner and slid axially by the governor. This method

gives rise to eddy formation with consequent loss of efficiency and is only used in small plants. In modern plants of larger size the guide vanes are pivoted and their angular position is regulated by the governor. In Kaplan turbines the pitch of the blades of the runner is regulated. Large reaction turbines are usually mounted on a vertical axis. If the unit is placed in the forebay, the shaft rests and turns on a submerged lignum vitae bearing pad. In larger units the runner and generator rotor are suspended from a thrust bearing sometimes mounted above the generator. The design of a bearing of this kind presents some delicate problems. Roller bearings and Michell sequenced bearings have given good results.

The electrical parts of a hydro-power station do not differ essentially in design from those of a thermal power station. Outdoor switchgear and transformers are favoured wherever possible. See D. B. Rushmore and E. A. Lof, *Hydro-electric Power Stations*, 1920; A. H. Gibson, *Hydro-electric Engineering*, 1921; G. Gerard, *Hydro-electric Engineering*, 1919; and Reports of the Conférence Internationale des des Grands Reservoirs Electriques, (C.I.G.R.E.) held annually in Paris.

**Hydrofluoric Acid, or Hydrogen Fluoride (HF)**, colourless liquid, boiling at  $19^\circ\text{C}$  and giving off irritating and dangerous fumes. It is obtained in aqueous solution by heating calcium fluoride (fluorspar) with concentrated sulphuric acid in a leaden retort, and passing the gas evolved into water

To obtain the pure acid, hydrogen potassium fluoride,  $\text{HF} \cdot \text{KF}$ , is distilled in a platinum retort, the H. A. being collected in a cooled receiver of the same material. H. A. is an extremely active acid, and is especially valuable on account of its solvent action on silica and silicates, being used to etch glass. For this purpose the article is covered with wax, and the marks or other designs required are cut upon the wax with a steel tool; on exposing to the acid, the parts laid bare are etched, and the rest of the article is untouched. The fluorides, or salts of H. A., with the exception of those of the alkali metals, are insoluble in water. Of these calcium fluoride is the most important.

**Hydrofluosilicic Acid ( $\text{H}_2\text{SiF}_6$ )** obtained together with silicic acid by passing silicon fluoride (prepared by the action of concentrated sulphuric acid on a mixture of fluorspar and fine sand) into water. H. A. is only known in aqueous solution, which is colourless. It behaves as a dibasic acid, and forms sparingly soluble potassium and barium salts. It is used in hardening objects made of gypsum.

**Hydrogen** (symbol H; atomic number 1, atomic weight 1), derived from the Gk. *hydro*, water, and *gênai*, to produce, is a gaseous element, discovered by Cavendish in 1766, that occurs in nature chiefly in combination with oxygen as water,  $\text{H}_2\text{O}$ . It is the lightest element known, and was formerly taken as the standard for

measuring gas density and atomic weights.  $H_2$  is most conveniently prepared on a small scale by the action of sodium on water, or by the action of zinc on sulphuric acid,  $Zn + H_2SO_4 = ZnSO_4 + H_2$ . On the large scale, scrap-iron is used in place of zinc, or the gas is prepared by passing steam over red-hot iron, or by electrolysis of water. More often nowadays it is obtained by removing the carbon monoxide from water-gas (*q.v.*). It is also obtained as a by-product in the manuf. of many other chems., *e.g.* sodium and caustic soda. When pure,  $H_2$  is a colourless, odourless gas, which condenses at a low temp. and under great pressure to a liquid boiling at  $-253^\circ C.$  and freezing at  $-259^\circ C.$  The liquid, which was first produced by Dewar in 1898, has a density only  $\frac{1}{8}$ th that of water, whilst the gas has a density  $\frac{1}{14}$ th that of air.  $H_2$

THE PREPARATION OF HYDROGEN  
Obtained by pouring hydrochloric acid  
on granulated zinc

is very insoluble in water, and is incapable of supporting respiration, although not actually poisonous. It burns in air with a non-luminous flame, water being formed; if mixed with air or oxygen and ignited a violent explosion is produced.  $H_2$  is a powerful reducing agent combining with the oxygen, chlorine, etc., of bodies with which it is heated. It unites with many elements to form hydrides of very varying properties, such as water, hydrochloric acid,  $H_2S$ , sulphide, and ammonia. The metal palladium has the power of absorbing about 900 times its vol. of  $H_2$ , and being made of this property in purifying and storing small quantities of gas.  $H_2$  is present in all acids, in fact, the acids may be regarded as the salts of  $H_2$ . It is also present in hydrocarbons, oils, fats, starch, and in almost all natural and artificial compounds of organic chem. Commercially,  $H_2$  is used as a reducing agent, as a means of producing high temps. in the oxy- $H_2$  flame, and for filling airships and balloons. Its prin. use is in the synthetic manuf. of ammonia (*q.v.*) from nitrogen and  $H_2$ .  $H_2$  is also used for hardening oils (*e.g.* in the manuf. of artificial lard and margarine) and in the preparation of quick-drying varnishes. Although  $H_2$  was originally taken as the standard for atomic weights, it has been customary of late to take oxygen = 16 as the basis, owing to the fact that the

compounds of the elements with oxygen are more numerous and more readily analysed than those with  $H_2$ . On this arrangement  $H = 1.008$  instead of unity.

*Heavy H.* See DEUTERIUM.

Hydrogenation of Coal, see COAL, HYDROGENATION OF.

Hydrogenation. Direct combination of gaseous hydrogen with a substance—usually restricted to those examples where direct addition of hydrogen to an unsaturated organic substance takes place.

Sabattier and Senderens (1897) invented the method whereby the body to be hydrogenated reacts with gaseous hydrogen in the presence of catalysts such as nickel, cobalt, iron, platinum, and copper, at a moderate temp. Thus when a mixture of ethylene and hydrogen is passed through a tube containing nickel at  $130-150^\circ C.$  ethane is readily formed:  $C_2H_4 + H_2 = C_2H_6$ . At higher temps. the reverse process of dehydrogenation is liable to occur. Other examples are: the conversion of acetylene into ethane; aldehydes and ketones into alcohols; nitriles into amines; whilst nickel, which is the most active of the catalysts, can even cause direct addition of hydrogen to benzene derivatives.

Ipatiev (1901) used similar metals and their oxides as catalysts, but worked at high pressures (up to 130 atmospheres). Colloidal metal catalysts have also been employed at almost normal temps. and pressures.

Industrially, unsaturated oils (*e.g.* whale, linseed, and cotton-seed oils) are hardened by hydrogenation, using nickel catalysts to give products suitable for edible purposes, and for the manufacture of soap.

Hydrogen Blowpipe, Atomic. When hydrogen is blown through the electric arc the atoms composing its molecules are forced apart from one another. If this atomic hydrogen is then burnt immediately in a blowpipe, tremendous heat is evolved and very high temps. are produced. The atomic hydrogen blowpipe is largely used in metallurgy, engineering, etc.

Hydrogen Bromide, see HYDROBROMIC ACID.

Hydrogen Chloride, see HYDROCHLORIC ACID.

Hydrogen Fluoride, see HYDROFLUORIC ACID.

Hydrogen Iodide, see HYDRIODIC ACID.

Hydrogen Ion (Hydron). The hydrogen atom is an electrically neutral system composed of a central nucleus of one solitary proton (the unit of positive electricity), revolving round which is a single electron (the unit of negative electricity). If such a hydrogen atom loses the attendant electron, it is left with unit positive charge, and is, indeed, a proton. In this condition it is called the (positive) hydrogen ion. (In some circumstances a hydrogen atom can take up an electron to form a negative  $H^-$ ). These solitary protons can be formed from hydrogen by electric discharge (see DISCHARGE TUBES), or by bombarding gaseous nitrogen with  $\alpha$  particles, when

some protons are shot away from the nitrogen nucleus.

All acids possess the property of giving H. I. in solution. For example, in an aqueous solution of hydrogen chloride (HCl), ions of hydrogen and of chlorine are present. For every hydrogen atom which has lost an electron, an atom of chlorine has gained one. If an electric current is passed between carbon poles immersed in such a solution, the hydrogen ions are directed towards the cathode, and, on reaching it, their charge is neutralised, when ordinary hydrogen results. Similarly ordinary chlorine appears at the anode. The sour taste and other specific properties of acids are due to the presence of colourless hydrogen ions. 'Strong' acids give a larger proportion of these ions at moderate dilutions than 'weak' acids do. When a metal liberates hydrogen from an acid, it gives up electrons to the H. I., thereby becoming itself positively charged.

The H. I. is also capable of relatively rapid movement, and it can also function as a catalyst in many operations such as the inversion of cane sugar, and the hydrolysis of esters, amides, etc. Thus the properties of H. I. are entirely different from those of ordinary hydrogen.

The H. I. in water is hydrated and has the formula  $H_3O^+$ .

Hydrogen ion concentration ( $H^+$ ) is expressed in terms of equivalents of H. I. present in grammes per litre. Thus, pure water contains 0.0000001 gm of H. I. per litre. Therefore  $(H^+) = 10^{-7}$ . It can be determined usually by (1) measurement of electrical conductivity, (2) determinations of the E.M.F. between the solution tested and an un-ionised hydrogen electrode, (3) the use of special indicators, (4) osmotic pressure methods, pH value is given by

$$pH = -\log_{10} (H^+)$$

Thus for pure water

$$pH = -\log_{10} (10^{-7}) = 7.$$

Suitable conditions for pH values are essential for many biological, chemical and other operations.

(See ACIDS; INDICATORS; NEUTRALISATION; IONISATION).

Hydrogen Peroxide, or Dioxide ( $H_2O_2$ ), is, when pure, a colourless, slightly viscid liquid having a sp. gr. of 1.45, freezing on cooling to a solid, having a melting point of  $-2^{\circ}C$ . It is readily soluble in alcohol or water. The aqueous solution is obtained by the action of dilute sulphuric acid on hydrated barium peroxide, barium sulphate being precipitated.  $BaO_2 + H_2SO_4 = BaSO_4 + H_2O_2$ . Sodium peroxide,  $Na_2O_2$ , is often used in place of  $BaO_2$ . The aqueous solution obtained may be concentrated by evaporation, followed by distillation under reduced pressure. The pure substance has a bitter taste, a faint odour resembling nitric acid, and is unstable, decomposing explosively under various conditions into oxygen and water. The aqueous solution is more stable, especially in the presence of a mineral acid, and may be kept for a considerable time. It is usually sold in

'vols.' '20 vols.' for instance, indicating that 1 vol. of the solution will liberate 20 vols. of oxygen on decomposition. H. P. is a powerful oxidising agent, liberating iodine from potassium iodide, oxidising sulphides and sulphites to sulphates, and bleaching by oxidation. It also has the property of setting free the oxygen, together with its own available oxygen, from certain metallic oxides and highly oxidised salts, thus apparently acting as a reducing agent. H. P. is largely used in the arts for bleaching ivory, feathers, hair etc.; as a disinfectant, and also for restoring old oil paintings, by oxidising the black lead sulphide (formed by the action of sulphur compounds in the air on the lead contained in the paints) to the white sulphate. Sodium carbonate and barium percarbonate, prepared electrolytically, have recently been used with success for the manuf. of H. P. H. P. has been used as a fuel in rockets and submarines.

Hydrogen Sulphate, see SULPHURIC ACID.  
Hydrographic Surveying, see SURVEYING AND LEVELLING.

Hydrography, scientific description of the waters of the globe. The subject will include: (a) Marine surveying, or the measurement and mapping of the water areas; this will result in the preparation of maps and charts showing the position of seas, lakes, and rivers. Navigation demands from the nautical surveyor some knowledge of the contour of the ocean bed and an accurate outlining of all shallows, depths, and reefs. The Hydrographic Dept. of the Brit. Admiralty, which was established in 1795, undertakes the making of such charts under the charge of the Hydrographer to the Admiralty. The advent of fast, deep-draught vessels in recent times has made necessary the re-charting of the oceans of the world, and a new survey with new instruments was commenced by the Hydrographic Dept. in 1948 (see CHART). (b), or Hydrology. Physical properties of the water masses. The actual composition of the waters must be ascertained, and their varied and varying salinities introduce the wide question of oceanic circulation, to which is related the identification of thermal areas in both horizontal and vertical distributions. The tidal circulation has important bearings on questions of navigation, and the hydrographer is concerned in the preparation of tables showing the 'etabs. of ports.' An important economic study in H. has for its objective the analysis of the distribution and movements of those myriads of micro-organisms, *plankton* and *nekton*, which play so great a part in the life hist. of the various food fishes. Not only does the subject cover the investigation of the salt-water areas, but rivers and fresh-water lakes also demand special treatment. To realise some of the classes of investigation comprised under a heading, reference should be made to the *Official Reports of the Scientific Results of the Voyage of H.M.S. 'Challenger' (50 vols.)*. See also OCEANOGRAPHY. See A. E. Meyer, *The Elements of Hydrology*, 1928.

**Hydrokinetics, or Hydrodynamics,** science dealing with fluids in motion. It forms a theoretical introduction to the practical subject of hydraulics. Fluids at rest are dealt with in hydrostatics (*q.v.*). A fluid may be defined as that which yields to the slightest tangential stress, if it be continued long enough. Thus, though a piece of pitch may be easily smashed into small fragments by a blow of a hammer, in course of time, if left to itself, it will spread itself out over a surface and flow like a liquid by virtue of its weight alone. Hence pitch is a fluid, but since its change of form takes place gradually, it is termed a viscous fluid. All fluids are viscous to some degree, and as the molecules move over one another, friction forces exist which tend to generate heat. But in the case of water, and, in fact, in most liquids, especially alcohol and ether, the viscosity is so small that actual results coincide very closely with the action of a perfect fluid—the ideal fluid, which is inviscid, i.e. which cannot sustain any tangential stress. So the theory of H. deals almost entirely with perfect fluids. Fluid motion may be *steady* or *unsteady*. By steady motion is meant that at any point fixed in space the motion of successive particles of fluid is always the same in magnitude and direction, though it may vary from point to point. If the motion is the same at all points of the fluid, so that the fluid moves like a solid body, it is termed *uniform*. Moving masses of fluid, bounded partly or completely by solid boundaries, form a *stream*. A stream bounded by the same fluid moving differently is termed a *current*, and when bounded by different fluid is termed a *jet*. An *eddy* or a *vortex* is formed by fluid with a circular or spiral motion. It is proved that a vortex must be endless or have its ends on the free surface of the liquid. The actual path of any particle of fluid is called a *stream line*, and if the stream lines are drawn through all points of a closed curve a *tube of flow* is formed. Thus there can be no flow across the lateral boundaries of a tube of flow. A *line of flow* is such that at any point of its length the tangent coincides with the direction of motion of the point. Stream lines and line of flow are coincident when the motion is steady.

The usual methods for forming the general equations of fluid motion are by means of differential and integral calculus and will be given later, but certain particular cases may be dealt with in a more elementary way. Thus the 'equation of continuity' is obtained from the principle that the amount of incompressible fluid flowing into any completely bounded space, supposed continuously filled with liquid, must be equal to the amount that flows out. If  $a_1$  and  $a_2$  are the areas of any two cross sections of a stream, and  $v_1$ ,  $v_2$  the components of the velocity of the fluid normal to the cross sections, then the amounts of fluid flowing across the sections in a unit of time are  $a_1 v_1$  and  $a_2 v_2$ . Hence  $a_1 v_1 = a_2 v_2$ , and these velocities are inversely proportional to the areas. Again, consider a liquid moving in a horizontal straight line uniformly—

that is, like a solid body—with no relative motion of its parts, and suppose a small portion of the liquid in the shape of a circular cylinder with its axis along the line of motion to become solidified. Let  $a$  be the area of its cross section,  $l$  its length,  $p_1$  and  $p_2$  the fluid pressures at its ends,  $m$  the mass of a unit vol. of the fluid, and  $f$  its acceleration. Then  $mal$  is the mass of the cylinder and  $(p_1 - p_2)a$  is the component of the resultant force on it in the direction of motion, since the ends are considered so small that the pressure over them may be taken as constant. Hence, by Newton's second law,  $(p_1 - p_2)a = mal$ , and thus so long as there is an acceleration the pressure varies along a horizontal straight line. Now if  $p_1$  and  $p_2$  are the pressures due to depths  $h_1$  and  $h_2$  below the free surface, it follows that  $p_1 - p_2 = mg(h_1 - h_2)$ , since the principle estab. in hydrostatics for pressure at given depths holds in this case.

$$\therefore h_1 - h_2 = \frac{p_1 - p_2}{mg} = \frac{mlf}{mg}$$

FIG. 1

Therefore the free surface of the liquid slopes downwards in the direction of motion at an angle to the horizon (Fig. 1)

$$\tan^{-1} \frac{h_1 - h_2}{l} = \tan^{-1} \frac{f}{g}$$

Hence the free surface of a liquid in a vessel carried along at an acceleration makes an angle with the horizontal, and this angle increases if the acceleration increases. If there is no acceleration, the surface is horizontal.

Again, if a vessel, in the form of a right circular cylinder with vertical axis, and the liquid within it rotate about the axis with a constant angular velocity  $\omega$ , then any particle of liquid distant  $r$  from the axis will have an acceleration  $\omega^2 r$  towards the axis. This increases as  $r$  increases. The pressure is therefore least on the axis of rotation and gradually increases further from the axis. Hence the free surface will be lowest in the middle and will gradually rise towards the side of the vessel (Fig. 2). It is found that a section of the surface by a plane through the axis of rotation gives a parabola, and the whole surface is a paraboloid of revolution. When the liquid only, and not the vessel, rotates, the outer layer of the liquid in contact with the vessel is at rest. The next layer rotates slowly, and for a

time each successive layer has a bigger angular velocity. As in the previous case, the velocity in the middle is zero, and gradually increases outwards, and hence

FIG. 2  
A, liquid and vessel rotating  
B, liquid only rotating

the layer of greatest velocity is somewhere intermediate between the axis and the side of the vessel. The free surface then takes the form shown in the figure. The accumulation of mud near the inner bank of a riv. at a bend may be accounted for by continuing the argument.

The same general principle of the pressure gradient, as it is called, has been used to correct the common mistake that as a fluid passes through a pipe of varying cross section, it exercises greater pressure on the sides where the pipe is narrower. In fact, the opposite is true. Let AL

FIG. 3

BM, CN, DP (Fig. 3) be small vertical pipes let into such a pipe. Then the height to which the liquid rises in each of these gives the pressure. It is found that at L and P where the cross section is largest, the heights AL and DP are greatest. Account has to be taken in this experiment of the action of friction, which tends to lessen the height of the columns, and has a bigger effect the further the water travels along the pipe. This principle has a practical use in the Venturi water meter.

The principle of the conservation of energy gives a simple proof of an important equation of motion. Let  $a_1, p_1, v_1$  and  $a_2, p_2, v_2$  be the area of the cross section, the pressure, and the velocity respectively at two ends of a thin tube of flow,  $a$  being so small that  $p$  and  $v$  may be considered constant for the area. Since there is no flow across the boundaries, the equation of continuity gives  $a_1 v_1 = a_2 v_2$ . By the conservation of energy, the difference between the work done by the fluid crossing the two sections is equal to the total difference between the energy in the

two cases. In a unit of time the difference between the work done is  $p_1 a_1 v_1 - p_2 a_2 v_2$ , the difference between the potential energy in the two cases is  $m(a_1 p_1 V_1 - a_2 p_2 V_2)$ , where  $m$  is the mass of a unit vol. and  $V_1, V_2$  the potential energy at the two sections, and the difference of kinetic energy is

$$\begin{aligned} & \frac{1}{2} m a_1 v_1^2 \times v_1 - \frac{1}{2} m a_2 v_2^2 \times v_2 \\ \therefore p_1 a_1 v_1 - p_2 a_2 v_2 &= m(a_1 p_1 V_1 - a_2 p_2 V_2) \\ &+ \frac{1}{2} m a_1 v_1^2 - \frac{1}{2} m a_2 v_2^2 \\ \therefore p_1 + m V_1 + \frac{1}{2} m v_1^2 &= p_2 + m V_2 + \frac{1}{2} m v_2^2 \end{aligned}$$

and this is the same for any two points of the tube of flow.

*The Equation of Continuity.* This is the fundamental equation of the hydrodynamics of a perfect fluid. It may be derived as follows. Suppose P is a point ( $x, y, z$ ) (referred to rectangular co-ordinates axes) in the fluid and let ( $u, v, w$ ) be the components of the velocity, parallel to the co-ordinate axes, of the fluid at P at time  $t$ . Then if the motion is continuous, i.e. if  $u, v, w$  are finite and continuous and  $\frac{\partial u}{\partial x}, \frac{\partial v}{\partial y}, \frac{\partial w}{\partial z}$ , etc., are also finite, then if we consider any closed surface drawn in the fluid, the increase in the mass of the fluid within the surface in any time  $\delta t$  must be equal to the excess of the mass of the fluid that flows into the surface over the mass that flows out of it. Let  $\rho$  denote the density of the fluid at P ( $x, y, z$ ) and consider a small parallelepiped  $\delta x \delta y \delta z$  with P as centre. Then the mass of fluid that flows in across the face parallel to the plane  $yz$  nearest the origin in time  $\delta t$  is

$$\left[ \rho u - \frac{1}{2} \frac{\partial \rho u}{\partial x} \delta x \right] \delta y \delta z \delta t,$$

and the mass flowing out across the opposite face in the same time is

$$\left[ \rho u + \frac{1}{2} \frac{\partial \rho u}{\partial x} \delta x \right] \delta y \delta z \delta t.$$

Hence the increase in the mass of the fluid inside the parallelepiped due to this pair of faces is

$$-\frac{\partial \rho u}{\partial x} \delta x \delta y \delta z \delta t \text{ in time } \delta t.$$

Similarly we can find the increase in the mass of the fluid due to the other pairs of faces and we get for the total gain in mass in time

$$\delta t, - \left[ \frac{\partial \rho u}{\partial x} + \frac{\partial \rho v}{\partial y} + \frac{\partial \rho w}{\partial z} \right] \delta x \delta y \delta z \delta t. \text{ But since the mass inside the parallelepiped at time } t \text{ was } \rho \delta x \delta y \delta z, \text{ the gain in mass in time } \delta t \text{ is } \frac{\partial \rho}{\partial t} \delta x \delta y \delta z \delta t.$$

Hence equating these expressions we get

$$\frac{\partial \rho}{\partial t} + \frac{\partial \rho u}{\partial x} + \frac{\partial \rho v}{\partial y} + \frac{\partial \rho w}{\partial z} = 0.$$

This is called the Equation of Continuity.

For a homogeneous and incompressible liquid  $\rho$  is constant and the above equation reduces to

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0.$$

This is approximately true for liquids, but the more general equation must be used for gases.

*Euler's Equations of Motion.*—These are the general equations of motion of the perfect fluid; if  $p$  denotes the pressure at the point ( $x, y, z$ ) in the fluid and  $X, Y, Z$

the components of external force per unit mass at the same point, it may be shown that the equations of motion are

$$\frac{\delta u}{\delta t} + u \frac{\delta u}{\delta x} + v \frac{\delta u}{\delta y} + w \frac{\delta u}{\delta z} = X - \frac{1}{\rho} \frac{\delta p}{\delta x}$$

and two similar equations.

The study of H. is concerned with the integration of these equations, subject to the equation of continuity, applied to the special circumstances of each problem under review. The practical importance of H. has increased with the study of aeronautics.

For elementary work see E. Edser *General Physics for Students*, 1911. For advanced work A. Ramsey, *Treatise on Hydromechanics, Part II*, 1920; H. Lamb, *Hydrodynamics*, 1916; S. L. Green, *Hydro- and Aero-dynamics*, 1937; W. H. Besant and A. S. Ramsey, *Hydromechanics*, 1940.

**Hydrolysis** (literally splitting by water), term applied to those chemical reactions in which decomposition is brought about by the action of water, and must not be confused with hydration, in which water is taken up without causing disruption of the molecule, e.g. as in the conversion of quicklime into slaked lime. Examples of H. are numerous, e.g. the splitting up of the salts of weak acids by solution in water, the conversion of esters into acid and alcohol, the 'inversion' of cane sugar, and the formation of ammonium salts from nitrates. In some cases H. takes place by mere addition of water, but more usually heat is required, and in addition a small quantity of acid or alkali to hasten the reaction.

**Hydromechanics**, term generally applied to the science dealing with the mechanics of fluids, it includes hydrostatics (q.v.) and hydrodynamics or hydrokinetics (q.v.).

**Hydrometer**, instrument for finding the densities of liquids. By density is meant

HYDROMETER

the weight of a unit vol., usually the weight in grammes per cub. centimetre. The relative density of any substance is the ratio of its density to that of water. The most elementary form of H. consists in a thin glass tube AB ending in two spheres C and D. D is loaded so that the instrument floats in a vertical position. By Archimedes' principle, if any body floats in a liquid, its weight is equal to the weight of the liquid displaced. Hence the H. will sink deeper in lighter liquids, and the density of a liquid is inversely proportional to the vol. immersed. Since the tube AB is thin, only a very small additional vol. is immersed where the H. sinks lower, and hence the instrument is open to the objection that only liquids whose densities are nearly equal can be compared by means of any one H. Thus a H. constructed for heavy liquids will sink entirely in light

liquids. Let the H. sink to the mark X in water, and to Y in any given liquid; then, if V and V' respectively be the vols. immersed in the two cases, the relative density of the given liquid is  $\frac{V}{V'}$ .

In practice a graduated scale is usually fixed to the stem AB, and the reading opposite the surface of any liquid in which the H. is immersed is the density of the liquid. A common form of H. in general use is the lactometer, for finding the density of milk and hence testing its quality.

**Sikes's H.** is used for ascertaining the strength of spirits. It is a gold-plated brass H. somewhat similar in shape to the usual pattern of H. It is used with a series of gold-plated brass weights that can be slotted on to the base of the stem. The 'proof' of spirit can be determined from standard tables when the reading of the H. has been taken in the spirit under test.

There are many other forms of H., such as Twaddle's (used for finding the specific gravity of mixtures of sulphuric acid and water), Baumé's, and Nicholson's H. The latter is well known as a constant displacement H., and it can be used to compare the densities of different liquids and to find the sp. gr. of solids, but it is of little practical importance outside the school laboratory. Generally speaking the principle of all Hs. is the same. In practice it is found to be very difficult to get an extremely accurate result with a H., because of the surface tension and capillarity of liquids, which gives the surface of the liquid a curved form where it touches the stem. The possibility of error is diminished, however, by making the stem as thin as possible, and by keeping the instrument clean. In finding the density of a liquid to some degree of accuracy, attention must be paid to its temp., as a rise in temp. lowers the density. Hs. are used extensively in industry because they are sufficiently accurate for general purposes and they are convenient and easy to use. They can be tested against standard instruments for a small sum at the National Physical Laboratory at Teddington in England. See also HYDROSTATICS.

**Hydrometridae**, name given to a family of hemiptera-heteropterous insects, often called pond-skaters or water-striders. They live on the surface of water and feed on insects and aquatic debris. *Hydrometra*, *Velia*, and *Mesorelia* are common Brit. genera.

**Hydromys**, generic name of certain species of rodents belonging to the sub-order Simplicidentata and the family Muridae. *H. chrysogaster*, the best-known species, is limited to Australia, and is aquatic in habit; it is a ft. or so in length, with a somewhat long tail and yellowish fur; the feet are webbed, and there are only two molars in each half of either jaw. *Xeromys* is an allied genus confined to Queensland.

**Hydrophathy**, name of a curative system in which the external and internal use of water is the chief remedial measure. General H., introduced by Asclepiades,

made rapid progress between 334 B.C. and A.D. 180, when nearly 2000 public baths, including the famous baths of Caracalla and Diocletian, were built. Water was conveyed by aqueducts to the baths, and in many, like those of Pompeii, there were elaborate hypocausts. The Romans had baths built also in their colonies, and so H. spread throughout Europe. The first natural springs first used extensively in hydropathic treatment were the thermopylae of Greece, the thermæ at Baiae, and those in the Roman colonies. Of these, Aix-le-Bains, Baden-Baden, Aachen, Wiesbaden, and Bath are still famous hydropathic centres. The value of water applications of various kinds is recognised by all classes of physicians, and the name hydrotherapy (q.v.) or hydrotherapeutics is applied to measures involving the use of water. H. is by common consent held to mean a definite theory of cure in which the value of water transcends all else, and the administration of other medicinal agents is looked upon as generally deleterious. The fame of H. originated with the work of Vincent Priessnitz (1801-51), a farmer of Grafenberg in Silesia. Priessnitz had administered cold-water bandages to sick and injured persons with marvellous success, and extending his practice to human beings, including himself, wrought such wonderful cures that the water system became the vogue, and estab. for the direction of the cure were instituted in England, Germany, France, and America. The new practitioners and the orthodox school of physicians denounced each other as quacks for many years; but in course of time ordinary medical practice has absorbed many ideas of the water cures, while the hydropathic estab. of to-day are less extreme in their regulations than those of former generations.

**Hydropericardium**, see under DROPSY.

**Hydrophilids**, name of a family of polymorphous coleoptera (beetles), which are widely distributed and chiefly aquatic. *Hydrophilus*, the typical genus, contains the species *H. piceus*, one of the largest of Brit. beetles.

**Hydrophil**, see HYDROPS.

**Hydrophobia**, see RABIES.

**Hydrophone**, instrument for listening to sound transmitted through water. There are various kinds, one of which receives electric transmissions from the ship on which it is placed after striking the sea bottom. The principle was used during the First World War to locate Ger. U-boats, but was superseded by Asdic (q.v.). See also under ECHO.

**Hydrophyllaceae**, family of dicotyledonous plants, most of which occur in N. America. They are allied to the Boraginaceae. All are herbs or small shrubs and are generally hairy in appearance. The flowers are regular and hermaphrodite, and are generally in parts of five; the sepals and petals are five in number and united, the stamens are five and are epipetalous (i.e. attached to the petals); the ovary is superior, and consists of two united carpels, usually with numerous ovules in each loculus; the fruit is often a loculicidal capsule. The chief genera

are *Hydrophyllum* and *Nemophila*. The latter genus is common in gardens in Great Britain.

**Hydroplane**. The earliest type of H. was invented by Glenn Curtiss, and was in the form of an aeroplane with a pontoon fitted to the under portion to enable it to rest upon water. Its were greatly improved through the Schneider Trophy (q.v.) contest, in which they were largely employed with success by Italy, U.S.A., and Great Britain (see AERONAUTICS). A development of the H. was the coastal motor boat (C.M.B.), which did good work for the Brit. Navy during the First World War. Success required a speed of at least 16-18 m.p.h. and the C.M.B.s. were capable of 30 knots per hour. They were upwards of 40 ft. in length, and carried one torpedo, which was discharged aft and fell first on the assumption that the swift craft would be able to turn clear of the torpedo after it had been discharged. They were smooth-water craft, and could travel a little faster than Ger. destroyers. Their value lay in a combination of high speed with inconspicuousness. They were most effective at night, but in daylight or moonlight the Ger. destroyers could hunt them down. Those attached to the Dover Patrol were employed to lay mines off Zeebrugge.

**Hydroponics**, Amer. term coined to describe the growing of plants by water-culture or soilless methods, by Dr. W. F. Gericke, a pioneer in this field. Broadly, the method consists of raising plants—tomatoes, potatoes, roots, bulbs, carnations, herbaceous flowers, etc.—in a porous moist seed-bed of inert material (peat, leaf mould, sawdust, straw, wood shavings, spun glass), suspended on a netting of wire over a brief air-space and tank containing a water solution of nutrient salts. Anchored in the seedbed, the plant stems grow upward normally, and the roots downward to feed in the solution. Nutrient solutions are made up of major plant foods (nitrogen, potassium, phosphorus, calcium, magnesium) and others needed in smaller amounts (sulphur, boron, copper, iron, manganese, zinc) to give an effective nutritive balance for the plants grown. Success depends largely upon adequate sunshine, aeration of roots and control and circulation of the solution. H. succeed best in warm countries (California, for example), and in greenhouses. Capital costs are high, offset by heavier yields per given area, which are likely to be most profitable when consisting of luxury crops, or when produced in barren tropical areas on air routes. In Britain, the climate apparently does not favour true hydroponic methods, and more use and attention is being devoted to sand- or gravel-culture methods in which plants are grown in beds of sand, gravel, cinders, part-peat, or similar inert materials watered by a nutrient solution, collected by sub-irrigation and pumped for re-distribution through the bed. As yet, owing to high capital costs and relatively poor results under temperate conditions, H. is unlikely to compete seriously or to supplant soil culture. See Dr. W. F.

Gerike, *The Complete Guide to Soilless Gardening*, 1940, C. Isabel Hilver, *Hydroponics*, 1941, A. H. Phillips, *The Science of Soilless Culture*, 1943

Hydropsy, see DROPSY

Hydroquinone, see QUINOL

Hydroquinone, Quinol, or Para-dihydroxybenzene ( $C_6H_4(OH)_2$ ), colourless, odourless, crystalline substance (melting point  $165^\circ C$ ) having a slightly sweet taste and readily soluble in alcohol ether and hot water. It is prepared by the oxidation of aniline to quinone by means of potassium bichromate and sulphuric acid, followed by reduction of the product with sulphur dioxide and extraction with ether. It acts as a reducing agent being used for that purpose in photographic developers.

**Hydrostatics** (Gk. *hup* water) science dealing with the mechanical problems of fluids in equilibrium. Fluids are either liquids or gases. The latter are easily compressible, whilst the former are only very slightly so. The perfect fluid to which gases and ordinary liquids such as water approximate is defined as an aggregation of molecules which yield at once to the slightest effort to separate them from each other. From this definition the following fundamental property follows immediately: *The pressure of a perfect fluid at rest is always normal to any surface with which it is in contact.* Actually this property extends to all fluids whatever their viscosity, for the molecules of any fluid cannot indefinitely resist the slightest effort to separate them from each other.

The pressure at a point in a fluid is defined as the force per unit area on a very small area surrounding that point. It can be demonstrated theoretically (see bibliography) that in a fluid at rest the pressure is the same in all directions. Two further important relations are: (1) the pressure in a fluid at rest is the same at all points in the same horizontal plane, and (2) the pressure at a point due to the fluid in a fluid at rest is directly proportional to the depth of the point below the surface of the fluid. The first proposition is established by considering the equilibrium of a thin horizontal cylinder of the liquid. The pressure over the vertical ends of the cylinder may be regarded as constant over each since they are small. By resolving the external forces acting on the cylinder in a horizontal direction it is seen that the two forces on its ends are equal and therefore the pressures also must be equal. Hence it follows that the free surface of any liquid at rest is a horizontal plane.

In order to establish the second proposition suppose P (Fig. 1) be any point in a liquid at rest at a depth  $h$  below the surface. Consider again a thin circular cylinder extending vertically from P to the surface M. The forces on the curved surface are all horizontal. Hence the upward force at P supports the weight of the cylinder. If  $a$  be the area of the small horizontal end at P and  $w$  the weight of a unit vol of the liquid, then the upward force is  $aw$ . Hence the pressure at a depth  $h$  in a liquid at rest is equal to  $wh$ , where  $w$  is the weight of unit vol of the

liquid. An elementary experiment for testing the pressure at various depths of a liquid may be made as follows. Take a metal disc D (Fig. 2) supported by a string S and a hollow glass cylinder open at both ends A and B. Pass the string through the cylinder and pull it tight so as to hold the disc firmly against the lower end B.

FIG 1

FIG 2

Lower this into a vessel of water. It will be found that when the end B is sufficiently low, the string may be let go, and the upward pressure of the water alone will be sufficient to hold the disc in position. By using discs of various weights and measuring the depth at which each is just held in position by the water the law may be verified. In actual practice the reservoir supplying water to a tank is placed on a high level in order to obtain an adequate pressure on the water main. Similarly canal banks and dock gates are made stronger towards the bottom to stand greater pressures.

Seeing that the pressure in a liquid due to the liquid varies as the depth below the surface, the total pressure on any plane surface is best found by methods of integral calculus. But certain cases are simple. The total pressure on a horizontal plane area has been mentioned above. Thus if a number of vessels of varying shapes have bottoms of the same area and are filled with water to the same depth the total pressures on the bottoms AB (Fig. 3) are all the same no matter how

FIG 3

much water is put into each vessel, for each is the weight of a column of water of the same height and on the same base. In a similar way the resultant vertical pressure on a portion of any surface is the

weight of the liquid enclosed by vertical lines drawn through all points bounding the portion of surface up to the level of the free surface of the liquid. To determine in general the total normal pressure on one side of a plane figure immersed in a liquid, by means of integral calculus, the figure is divided into a large number of very thin horizontal strips; the pressure at all points of the same strip may be considered constant. Let  $\theta$  be the angle the plane makes with the vertical,  $x$  the vertical distance of any strip whose corresponding length is  $y$ . Then the total pressure is  $\int_{x_1}^{x_2} wcy \sec. \theta \, dx$ , where  $x_1$  and  $x_2$  are the depths of the top and bottom strips respectively. The *centre of pressure* of any plane area immersed is the point of action of the resultant pressure, and this also is best found by means of integral calculus. In the case of a rectangular area with one side in the surface of the liquid, the centre of pressure is two thirds of the way down. If the pressure on the surface of a liquid is  $P$ , then it follows from the second proposition mentioned above that the pressure at a depth  $h$  in a liquid at rest is  $P + wh$ ; in other words a liquid transmits pressure applied to its surface. This principle is employed in the Bramah press (*see* HYDRAULIC PRESS). Fig. 4 explains this. A and B are two

FIG. 4

pistons, one of very much larger area than the other, working in cylinders which are connected as shown. The vessel is filled with water. Suppose A has an area of cross section of 1 sq. in., and B an area of cross section of 100 sq. in. Then a pressure of 1 lb weight per sq. in. on A will result in an increase of pressure of 1 lb. weight per sq. in. on B. Hence the force on B is increased by 100 lb weight when a force of 1 lb weight is applied to A as shown.

**Atmospheric Pressure.**—The earth is surrounded by a limited atmosphere which gets less dense at higher altitudes. It may be proved that air has weight by weighing a flask from which the air has been exhausted and weighing it again when full of air. So, as in the case of liquids, the weight of a column of air is supported by the surface on which it rests, and this weight at the surface of the earth is known as atmospheric pressure. It amounts to about 15 lb. on every sq. in. Since, in general, vessels contain air at atmospheric pressure inside as well as outside, this pressure is apt to be un-

noticed. A common experiment is performed by means of the Magdeburg hemispheres, which consist of two metal hemispheres made to fit exactly together. They may easily be pulled apart by means of handles provided. If, however, the air is exhausted from the interior when they are fitted together, a very large force is necessary to overcome the atmospheric pressure and to separate them. The atmospheric pressure is measured by means of the barometer (*q.v.*), in which the column of air is balanced by a column of mercury, about 30 in. high. When much water vapour is present in the air it is lighter, and sometimes a column of mercury 25.5 in. high is sufficient to balance it. In a similar way if the barometer is carried up a mt., and thus the column of air diminished in height, the mercury falls. A barometer constructed with water would be about 34 ft. high. The suction pump depends on the same principle as the water barometer, viz. that the pressure of the air on the surface of the water outside the pipe drives the water up the pipe where the air pressure is less. Since the air pressure is only equivalent to a column of 34 ft. of water, water cannot be raised by means of a suction pump through a height greater than 34 ft.

**Archimedes' Principle** states that if a body be immersed in a liquid its apparent loss of weight is equal to the weight of the liquid displaced. Further, a floating body displaces a vol. of liquid whose weight is equal to its own. Thus a piece of cork totally immersed in water will rise to the surface because it displaces more than its own weight of water. In a similar way a balloon rises because its total weight is less than that of the air displaced. An iceberg whose specific gravity (*q.v.*) is about ten-elevenths will float in water with about ten-elevenths of its vol. beneath the surface (for density and sp. gr., *see* HYDROMETRY). A most important practical application of the question of floating bodies occurs in shipbuilding. A

FIG. 5

ship will not be safe unless its shape and the arrangement of its cargo are such that it will right itself after a considerable roll to either side. The first thing then is to ensure that its vertical position is one of stable equilibrium, that is, that the forces on the ship will restore it to the vertical after a roll to either side. In Fig. 5 let

G be the centre of gravity of the ship and cargo, H that of the water displaced in a vertical position, and  $H'$  that of the water displaced after the roll. Let the vertical through  $H'$  meet the centre line of the ship through G at the point M. Then M is called the *metacentre*. The equilibrium is not stable unless M is above G. It may be shown that M is the centre of curvature at H of the locus of H which is known as the curve of buoyancy. See T. Barraclough and E. J. Holmgard, *Mechanics for Beginners*, 1931; C. J. L. Wagstaff, *Properties of Matter*, 1933; A. S. Ramsey, *Hydrostatics*, 1936; T. Barraclough, *Elementary Mechanics and Hydrostatics*, 1940; W. H. Besant and A. S. Ramsey, *Hydrostatics*, 1940; E. Dixon Grubb, *Simple Hydraulics for Firemen*, 1941; E. E. Preidel, *Intermediate Hydrostatics*, 1948. See also CAPILLARITY; PUMPS; SURFACE TENSION.

**Hydrotherapy**, or **Hydrotherapeutics**, system of cure which involves the internal or external administration of water. It is a branch of ordinary medical practice, and so to some extent is distinct from hydropathy, in which the use of water is claimed as the supreme general cure for disease. The internal administration of water is of course necessary for the maintenance of life, but there are many reasons for supposing that fairly copious drinking of water is calculated to help the normal process of metabolism. By supplying the body with abundance of fluid, the carrying away of waste products is facilitated, and the morbid effects of poisonous waste matter are thus avoided. If the practice of waterdrinking is indulged in without consideration for times and seasons, the results are apt to be unsatisfactory, as undue dilution of certain secretions is bound to impair their efficiency. Good general rules for a person in ordinary health are the following: A glass of cold water on rising, one about an hour before each meal, and one before retiring at night. In this way the dilution of the gastric juices is avoided, the water is supplied when the body needs fluid for preparation of gastric juices, and the action of the bowels is likely to be complete and easy. The action of natural water depends on the mineral substances they contain. Sulphates are present in the waters of Cheltenham and Cheltenham, and those of Harrogate and Bath contain sulphur. All these waters are purgative, and, by removing waste matter from the body, have a stimulating effect, and may be useful in the treatment of gout and rheumatism. Similarly, waters that are diuretic (i.e. promoting the flow of urine) may be stimulating, whereas others, such as the bromo-iodine waters of Woodhall Spa, are sedative.

The external application of water has two general purposes: that of skin cleansing, as in the ordinary soap and hot-water bath, and the application in a convenient form of a certain required temp. To these may be added the more doubtful effects of substances in solution being absorbed by the skin, of possible radium emanations, and the stimulating effects of

water containing gases dissolved under pressure. (See BALNEOLOGY.) By far the greater number of water applications for curative purposes are simply temp. applications. Among them may be mentioned cold packs and poultices, hot and vapour baths, and shock baths. The ordinary wet pack consists of a sheet wrung out of cold water and wrapped closely around the body; on this are superposed a number of dry blankets, the patient being kept practically immovable for an hour, when the packing is removed and the patient subjected to a bath at a little above body-temp. The effect is soothing and provocative of increased cutaneous excretion. The cold pack aims at a lower temp. still; the body is surrounded somewhat loosely with a wet sheet, and the other coverings are loosely arranged to allow evaporation as uniformly as possible. The cold pack is used in cases of hyperpyrexia, that is, in extreme fever. The Turkish bath is really a hot-air bath; it consists of a number of chambers heated to different temps., so that the patient is exposed to a temp. gradually rising to 150° F. or higher, and is then allowed to regain the ordinary temp. of the air by gradations. The effect is to relieve internal congestion by bringing blood to the surface and to excite the peripheral excretory organs to increased activity. A prolonged application of heat locally is sometimes resorted to in order to cause congestion, and thus lead to a greater activity of disease-fighting corpuscles (see BIER'S CONGESTION TREATMENT). Shock-baths, such as shower-baths, douches, wave-baths, etc., depend upon the sudden application of a particular temp. or the rapid alternation of two different temps. The effect is stimulating. Brine baths have been extensively used with beneficial results for children suffering from general weakness, rheumatic diseases, and other ailments. Baths aerated with carbon dioxide are prescribed for certain affections of the circulatory system. Saline baths have lately been much used in the treatment of extensive burns.

See F. Howard Humphris and R. S. Webb, *Physiotherapy: Its Principles and Practice*, 1930; R. M. Quene, *Hydrotherapy*, 1936; M. B. Ray, *Hydrotherapy and Climatotherapy*, 1936.

**Hydrothorax** (water on the chest), collection of serous fluid in one or both of the pleural cavities, associated with disease of the heart, kidneys, and other organs. See also under DROPSY.

**Hydroxide**, in chem., the term applied to a compound containing one or more hydroxyl (OH) groups, generally in combination with a metal. Thus NaOH is sodium H., Ca(OH)<sub>2</sub> calcium H., and Al(OH)<sub>3</sub> aluminium H. The most important H. are caustic soda (NaOH), caustic potash or potassium H. (KOH), and slaked lime of calcium H. Ca(OH)<sub>2</sub>. In solution, metallic H. yield hydroxyl ions, OH<sup>-</sup>.

**Hydroxybenzene**, see CARBOLIC ACID. **Hydroxyl**, the -OH group of atoms. It is present in many classes of compounds,

including hydroxides (*q.v.*), alcohols, sugars, phenols, and many acids.

**Hydroxylamine** ( $\text{NH}_2\text{OH}$ ), unstable substance forming colourless deliquescent needles (melting point,  $33^\circ \text{C}$ ). It may be prepared by the action of sodium nitrite on sodium bisulphite, followed by hydrolysis, or by the action of nascent hydrogen, from tin and hydrochloric acid, on ethyl nitrate or nitric oxide. It is also prepared electrolytically by the reduction of nitric acid. It, which is usually prepared in the form of its salts, is a powerful reducing agent, and forms compounds (oximes) by condensation with aldehydes and ketones.

**Hydrozoa**, name given to a class of Ctenophora belonging to the sub-phylum Cnidaria; it is coincident with Hydro-medusae or Ctenophora, with the addition of the Aequorea. This class includes polyps, colonies of polyps which produce medusae by budding, and medusae which rise directly from the egg. The polyps, which are small in size, are generally attached permanently to foreign bodies, but sometimes, as in Siphonophora, such as the 'Portuguese Man of War,' the whole colony may be free-swimming. The first polyp assumes an upstanding position termed the *Hydranth*, which lengthens and buds until it forms a colony or hydrosome. The generative cells which are always ripening and discharging may arise in a variety of places, but always migrate to the ectoderm of the gonophore. It feeds chiefly on animal substances, and with few exceptions are marine organisms. The class is divided into the orders Hydridae (*e.g.* the fresh water hydra) Hydrocorallinae (the coral), Tubulariae, Campanulariae, Trachomedusae, Narcomedusae and Siphonophora.

**Hydruntum**, see ORFANTO.

**Hydrus**: Fabulous water-snake or sea-serpent. Formerly the name of a genus of venomous sea-snakes, now called *Hydrophis*; the hinder part of the body and tail is much compressed and raised vertically to facilitate swimming.

**Hydrus** (constellation), see HYDRA.

**Hyères**, or **Hieres**, tn. of the Riviera, in the dept. of Var, S. France, 11 m. E. of Toulon. Like its suburb Costebelle, it is a noted winter health-resort, facing the Mediterranean (about  $2\frac{1}{2}$  m. away). It is (anc. *Stes. hader*), including Port Cros, Porquerolles, Ile du Levant, form a roadstead. The tn. hall has a bust of Mazarin (1663-1742), and the church of St. Louis and old ruined castle are interesting. Silk twist, essences, brandy, and oil are manufactured, and there is much trade in fruit, flowers, and salt. Pop. 23,600. See O. Lenthéric, *La Provence Maritime antique et moderne*, 1880.

**Hygieia**, goddess of health, was in Gk. mythology the daughter of Asclepius, and was worshipped at Corinth, Athens, and other places. She is represented as a virgin wearing a long robe, and having by her side a snake which drinks from a cup in her hand.

**Hygiene**, derived from the Gk. *Hygieia*, the mythical goddess of Health—embraces all the factors, environmental and

personal, which affect the health, physical, mental and emotional of the individual or the community. Its main concerns are the *prevention* of disease and the *promotion* of better health. Improvement in H. is brought about principally by three processes: (1) The efforts of voluntary organisations formed to meet specific needs which pioneer new ways, until the possibilities are successfully demonstrated and nation-wide acceptance follows. (2) Legislation which is then administered both nationally and especially by local gov. (3) The education of the individual to practise in his daily life the increasingly clear laws of healthy living and to make fuller use of the facilities provided by society for the promotion of personal and community H.

Hitherto the major emphasis has been on environmental H. and in the past hundred years enormous improvement has taken place, evidenced by the complete disappearance of scourges such as plague and cholera, the almost complete control of such diseases as typhoid and dysentery, the very much reduced death rates from other infectious diseases, the much improved infant and maternal mortality rates, increased expectation of life, etc. These advances are undoubtedly due largely to the vast changes effected in environmental H., of which the most important are: (a) provision of ample running water supplies which have been rendered pure by protected storage, followed by physical filtration and chemical treatment; (b) the easy and safe disposal of sewage made possible by running water, by which it is transported through drains to sewage works where tanks, filter beds, etc., result in an effluent which can be safely discharged into river, sea or on to land without danger to health; (c) slum-clearance and improvements in housing conditions with reduction in overcrowding and the better provision of fresh air, ventilation and sunlight, the better provision of both natural and artificial lighting, the increased use of electricity and gas with diminished atmospheric pollution of urban areas as well as the contribution to cleanliness, comfort, and warmth in the home, the provision of parks, recreation grounds and open spaces where exercise, fresh air and sun are more readily available; (d) regular collection of refuse and its disposal by incineration or controlled tipping, with the diminution of nuisance generally and the reduction in breeding grounds for flies and vermin in particular; (e) the control of food from the abattoir through the channels of wholesale and retail distribution, preparation and consumption, to promote both improved quality and freedom from contamination of the nation's diet. Special legislation controls the production, handling, heat treatment and sale of milk, which is of particular importance in the diet of the young and a potential danger if infected.

The control of infections varies very much with the disease concerned. An outbreak of a serious infectious disease, *e.g.* typhoid, is kept under control by the

provision of immediate notification, prompt isolation of the patient at home or in a fever hospital, and through investigation to find and control the source of infection before the epidemic spreads. Infections for which there is a proved prophylactic, e.g. diphtheria, have been greatly reduced by the widespread immunisation of young children. New drugs for treatment have reduced the incidence of serious complications in measles and whooping cough, while the use of new chemical insecticides, such as D.D.T. and gammexane, has much simplified control of insects such as flies, lice and bedbugs. The entry into this country of communicable diseases such as smallpox is prevented by Port H. which includes control of all arrivals both at sea and air ports, the quarantine of suspects and the subsequent disinfection and disinfection of ships and aeroplanes.

Personal H. is of more recent growth and is promoted principally by services which start before the individual is born and follow his varied needs up to adult life. The foundations of personal health are laid within the months before birth, and so the care of the pregnant woman is of considerable importance. The observance of simple rules for healthy living, with adequate rest, exercise and above all a balanced diet with extra vitamin supplements will go far to give the baby a good start. Infants of mothers with inadequate diets during the early months of pregnancy show a higher death rate and succumb more quickly to infections during their first few months of life. Repeated and regular examinations by doctor and midwife detect the earliest departures from normality and ensure that corrective treatment can be applied as soon as possible to avert graver conditions. The provision of experienced obstetrical care, the increasing use of analgesics during labour, the growing interest in the training in methods of relaxation ensure a low mortality and morbidity during delivery. Obstetrical hospital beds and emergency mobile obstetric units deal with complications or accidents. Post-natal care helps in the return of the mother to normal health and provides a chance for the prevention of chronic disabilities which may occur after childbirth. The increasing availability of trained home helps to tide the mother over this difficult period in the home is a recent and welcome development.

After birth the infant becomes the focus of expert care. Prematurity, until recently so potent a cause of neonatal mortality, has received special attention of late years and in some areas of the country premature baby wards have been opened and ambulance units are specifically trained in life-saving methods for the frail infants. 'Flying squads' equipped to deal with gastro-enteritis, still the most fatal disease of infancy, are being developed in the larger cities. Increasing emphasis is being laid on the regular and frequent physical examination of the infant after birth with special attention to his growth, development, care and feeding. The encouragement of breast feeding,

better methods of artificial feeding, the provision of vitamin supplements, talks and demonstrations in the practical problems of mothercraft, visits by health visitors to give advice and help in the home environment are all measures which are bringing about a steady decrease in the infant mortality rate, one of the best available indices for judging the H. of a community.

As the infant grows there is often the provision of day nurseries and nursery schools where the working mother can leave her child under trained supervision and where the toddler gets his first opportunity to adjust to a social milieu. The increased rate of infections in the day nursery, however, and the need of infants for individual mothering make it advisable that the day nurseries (for children under two) are used only for really necessitous cases. Children of three and four, on the other hand, who have had a year or so in a nursery school fit in much more quickly to ordinary school life at five and gain many psychological as well as social and physical advantages. Children whose psychological development is disturbed are referred to Child Guidance Clinics. Much maladjustment can be traced to the impressionable days of early childhood, and these clinics are being more and more widely used as centres where 'difficult' children or children showing the early symptoms of anxiety and failure to adjust, can be treated. In this way the more serious later stages of neurosis may be prevented. Often the more important work of these clinics is to help parents to understand the mental needs of the child in order to promote healthy, normal development.

The health and hygiene of the child during his school years is the special responsibility of the school medical service, with its periodic physical examinations. The early detection and treatment of defects does much to improve his well-being. The child suffering from physical or mental handicaps is discovered early and the provision of special schools of varying types provide education suitable for him. Thus there are different schools for the blind, partially blind, deaf, partially deaf, crippled, educationally subnormal, delicate (open-air schools), maladjusted, and in certain cases, diabetic children. For the ineducable child there is increasing provision of occupation centres and institutional care where necessary, while careful supervision is maintained throughout life. Residential schools and hospital schools, whether temporary or permanent, provide for children who need long periods of convalescence or for whom the home is unable to provide proper care. The school dental service with its emphasis on conservative treatment of the child's teeth is producing a marked improvement in dental health. The provision of school meals and the milk-in-schools scheme has done much to improve the physique of the school child, while after-care agencies help to place the child when he leaves, in employment for which he is physically and mentally capable.

As the school leaver enters industry he comes under the care of the industrial health service which was much extended during the past war. Canteens providing well balanced and cheap meals help to ensure the nutrition necessary for good work. In the larger firms the worker is put to the work for which, physically and mentally, he is most suited, and shifts from one dept. to another are often made in consultation with the medical officer or psychologist. Absenteeism, sickness rates, output of work, the techniques of different processes and intra-dept. relationships are studied from both psychological and medical aspects an endeavour to make conditions of employment and H. of surroundings such as to promote the greatest efficiency, health and happiness with a resultant increase in production. In cases of injury or long illness the provision of rehabilitation units raises morale and trains the worker to return to efficient employment.

The breakdown of mental health often arises from the home and emphasis on the individual as part of his family unit is therefore coming more to the forefront of social H. Experiments such as the Pioneer Health Centre (q.v.), Peckham, emphasise the necessity for the family to be considered as a social unit, while Marriage Guidance Councils and Family Planning Associations, among others, are concerned with the need for proper sex education of children, preparation for marriage, advice and counselling within marriage, education in parentcraft, and in ways of increasing the health and happiness of the family. Social H. also includes the more negative aspects of family health as in the campaign against venereal disease and the wide-spread provision of centres for early recognition and treatment.

The H. of old age is beginning to receive attention as the proportion of the pop. over sixty-five is rapidly rising. The loneliness, boredom and physical disabilities of old people are gradually being accepted as a problem for society to tackle and welfare committees, Darby and Joan clubs, special housing accommodation, hostels, travelling canteens, and home helps are all efforts in this direction which are being made to alleviate this problem.

*Tropical Hygiene* includes most of the scope of H. in this country but concentrates much more on the avoidance and control of diseases almost or quite absent from Britain which are still the major scourges of warm climates. The largest group of these are those spread by insects, of which malaria (q.v.) spread by certain anopheline mosquitoes (q.v.), is the most widespread, though plague, yellow fever and typhus are more lethal. Other groups of disease widely endemic in the tropics are the intestinal such as typhoid, dysentery and cholera and the parasitic, both internal and external. In the vast majority of all these diseases the cause, origin and modes of spread are sufficiently understood by W. science to make their control possible by tropical H. See Sir G. Newman, *The Building of a Nation's Health*, 1939; J. D. Kershaw, *An Approach to Social Medicine*, 1946; W. W. Jamieson and

Hyginus, Caius Julius, Lat. writer, appointed librarian of the Palatine library by Augustus. He was, according to some, a native of Spain, or, according to others, a native of Alexandria, and a, though originally a slave, was freed by the emperor. His works are mostly lost, but the *Fabularum Liber* (see M. Schmidt's ed., 1872) and *Poeticum Astronomicum Libri IV* (see B. Bunte's ed., 1875) are assigned to him. See Suetonius, *De Illustri Grammaticis*; Van Slevaren, *Mithographi Latini*, 1742; B. Bunte, *Dissertatio de vita Hygini*, ... 1816.

**Hygrometer**, instrument for measuring the relative or absolute amount of aqueous vapour in the air. A hygrograph measures and records the humidity on a chart similar to that used in a barograph.

*Principles of Hygrometry*: (a) *Properties of vapours*.—It is a matter of common observation that water exposed to the air disappears more or less quickly. The floors of shops sprinkled with water in the hot weather quickly dry. A damp cloth exposed to the air becomes quite dry; on some days it dries rapidly, on other days very slowly, so that laundresses speak of a 'good drying day' and a 'poor drying day'. The scientific term for the disappearance of the water is evaporation. The water becomes a gas which mixes with the air. This gas is called aqueous vapour. To elucidate the laws governing the evaporation of liquids, Dalton caused them to evaporate under the simplest possible conditions, viz. in a vacuum space, by introducing them into the vacuum above the mercurial column in a barometer. If a small drop of water is allowed to ascend to the top of the column it disappears very rapidly, filling the space above the mercury and producing a depression of the column. Another drop will also evaporate and produce a further depression, and so on. A stage is reached, however, at which a drop does not evaporate but forms a thin layer of water on the top of the mercury. The introduction of more liquid is not attended by a depression of the mercury column if the temp. is kept constant. The liquid merely floats on top of the mercury, showing that evaporation has ceased. The space above the mercury cannot take up any more vapour; it is therefore said to be saturated, and the vapour in the saturated space is called a saturated vapour. The pressure of a saturated vapour is called the maximum vapour pressure. It increases with the temp., but is quite independent of the vol. of the space occupied

by the vapour. If the vapour pressure at a given temp. is less than the maximum vapour pressure for that temp., the vapour is said to be unsaturated. It has been proved by Regnault that the presence of a gas does not affect the quantity of vapour which a space can contain. The rate of evaporation is decreased by the presence of the gas, but ultimately the quantity of vapour in a given space at the saturation point is the same whether the space is vacuum or contains air or any other gas which does not react chemically with water. Regnault determined the maximum vapour pressure of water vapour at various temps by observing the depression produced by the vapour in a barometer tube. Since the quantity of vapour required to saturate a given space depends solely on the temp., the pressure exerted by saturated water vapour in a space containing air can be found from the tables of saturated vapour pressures compiled by Regnault. (b) *Humidity in the atmosphere.*—Air contains a proportion of water vapour which varies considerably from place to place and time to time. The ratio of the mass of water vapour to the mass of dry air is called the mixing ratio, if, at the same temp., the water vapour were saturated in the presence of a plane water surface this would be called the saturation mixing ratio with respect to water. The percentage ratio of the density of the water vapour actually in the air to the density of the saturated water vapour at the same temp. is defined as the relative humidity. This is approximately the same as the percentage ratio of the mixing ratios and almost identical with that of the vapour pressure to the saturated vapour pressure. Given the temp. of the air, then either of the quantities, mixing ratio or relative humidity, will determine the amount of water vapour in the atmosphere. If the air is cooled a temp. will be reached at which the saturation vapour pressure is the same as the vapour pressure of the air, condensation will then take place. This temp. is called the dew-point, and it is also a measure of the humidity of the atmosphere. Most H<sub>2</sub> measure one of these three quantities. The absolute quantity of aqueous vapour in the air does not determine its dampness, but merely the proximity to saturation. For example, suppose that, on a summer's day, the temp. is 21° C., and that the pressure of the aqueous vapour is 15 mls., the air would feel dry because the saturation pressure at 25° C. is 31.7 mls. On the other hand suppose that, on a cold winter's day when the temp. is 1° C., the aqueous vapour pressure is 3.3 mls., the air would feel very damp because the saturation pressure is 8.7 mls. at 1° C. The mixing ratio in the former case is low, in the latter case high.

The hair hygrometer depends on the fact that the human hair expands with increasing relative humidity, the instrument is not very accurate and has to be calibrated, but it is used almost universally for autographic records. The expansion in length is magnified by a simple

lever mechanism. Hair is also subject to a temp. effect, and it is therefore being replaced by gold beater's skin, particularly in Brit. radio-sondes (see RADIO-SONDE). These H<sub>2</sub> have an additional disadvantage in that they have a slow response or 'lag,' which becomes greater at the very cold temps. experienced at high levels.

*Dew-point Hygrometers.* If an atmosphere containing aqueous vapour is gradually cooled, a temp. will be reached at which the vapour will condense. This temp. is called the dew point. At this temp. the quantity of vapour in the air is just sufficient to saturate it. In an unconfined atmosphere the pressure of the vapour will not change during the cooling, hence the actual pressure of the vapour in the air is equal to the maximum vapour pressure at the temp. of the dew point. If, therefore, the dew point is determined, the maximum vapour pressure for this temp. is found from the tables of vapour pressures, and this is the actual pressure of the vapour in the air.

*Regnault's Hygrometer.* In this instrument air is aspirated through ether contained in a silver thimble which closes the lower end of a glass tube. Cooling is produced by the evaporation of the ether, when the temp. of the silver surface reaches the dew point, the polish of the surface becomes dimmed owing to the deposition of moisture. The temp. at which this happens is read on a thermometer. The moment at which the dew appears on the thimble attached to the tube can be ascertained with great delicacy by comparing its surface with that of the surface of a similar thimble attached to the upper end of the glass tube which contains nothing but air.

*Dobson-Brewer frost point hygrometer.*—This instrument was invented during the 1919-20 war by Dr G. M. B. Dobson and A. W. Brewer. It works on a similar principle to Regnault's hygrometer but is faster in operation and more suitably adapted for use in an aircraft and with very low temps. In its modern form the cooling fluid (liquid air) is pumped into a black thimble, a jet of air from outside the aircraft is directed on to the thimble and watched by a photo electric cell. When the current from the photo electric cell is constant the deposition of frost on the thimble is balanced by the rate of evaporation and the temp. of the thimble is then the frost point of the air. With this instrument were made the first accurate measurements of humidity in the high atmosphere, and in 1913 Brewer found the stratosphere to have a very low relative humidity.

*Wet- and Dry bulb Hygrometer.*—This instrument, which is also known as a psychrometer, is used at most observing stations throughout the world, consists of two delicate thermometers attached to a wooden stand (see Fig.). One of the bulbs is covered with muslin and is kept moist by being connected with a reservoir of water by means of cotton wick. Evaporation takes place more or less rapidly from the wet muslin, and the bulb of the thermometer which it covers

is more or less cooled according to the hygrometric state of the air. If the air is quite saturated no evaporation will take place, and the temp. of the wet bulb is the same as that of the dry bulb. The drier the atmosphere the greater will be the difference in temp. between the two

WET- AND DRY-BULB HYGROMETER

bulbs. The formula connecting the vapour pressure, dry and wet-bulb temps was first suggested by E. F. August in 1825 and was modified by Regnault in 1845. Tables based on Regnault's formula were brought into use in England in 1926, replacing Glaisher's empirical tables. Assmann found that the wind speed past the thermometer bulbs was important, and he devised an instrument, the 'Assmann psychrometer,' which sucked air mechanically at a known rate over the bulbs; he produced tables for use with his instrument and for other conditions. A sling psychrometer is used in the U.S.A. and tables very similar to Assmann's are used with it. At Washington, in 1917, the Conference of Directors of the International Meteorological Organisation recommended the adoption of the new Goff-Gratch tables of saturation vapour pressure over pure liquid water; these have been used in calculating new humidity tables for aircraft observations. See *Hygrometric Tables*, 4th ed. H.M. Stationery Office (reprinted 1949). Meteorological Office Discussion: 'The measurement of humidity,' *Met. Mag.* (London), 78, 1949, p. 169.

**Hygroscope**, instrument used to indicate whether the air is more or less moist. It gives no indication as to the quantity of moisture present. Its action depends on the property which organic substances have of elongating when moist and contracting as they dry. On one of the most common forms, a male and female figure are so suspended (by catgut) with reference to the doors of a toyhouse that when the air is moist the man comes out of one door while the woman goes in at the other, the converse taking place when it is dry. As these figs. only indicate the humidity of the atmosphere they are moved by a weather change and are therefore usually belandhand with the state of the weather.

**Hyksos**, or 'shepherd kings,' a people from the E. who conquered Egypt 'with out a battle,' destroyed her cities and temples, and reduced the inhabitants to slavery. Manetho and other authorities on the hist. of Egypt place the arrival of the H. at the end of the twelfth dynasty, and their expulsion at the beginning of the eighteenth dynasty. The Egyptians were not by nature warlike; they were lovers of home and of peace; necessity at times drove them to extremes, but the whole nature of the country was 'to live and let live.' This lack of military spirit must have caused the yoke of the barbarian to be very heavy; it had, however, the desired effect upon the country. At the final expulsion of the H., when the Egyptians at last rose and learnt to combine, their fate was vile enough for the barbarian, and no Egyptian who was able to bear arms refused to enlist. Of the many theories concerning the H., one assumes that, after the downfall of the thirteenth dynasty, a confederation of Semitic tribes from the E. Syrian desert migrated into the Delta during the internal trouble of the country, combined, and then assumed the mastery of Lower Egypt. It is a more attractive theory to believe they were non-Semitic, and may have been related to, or formed part of, the Kheta or Hittite people (*q.v.*). These H., having estab. themselves, elected a king called Salatis, who reigned at Memphis and made all Egypt tribut. to him. The great fortress at Avaris in the Sethroite nome or dist., E. of Bubastis and close to Tanis, became their stronghold. Josephus gives us a few names of the H. kings, such as Salatis, Beon, who succeeded him, Apicinas, Apophis, Jonias, and Assi. Another king, Apopi, or Apope I., whose name is inscribed on a granite slab at the temple of Bubastis, appears to have tried to suppress the worship of the auct. gods of Egypt and struggled to force the country to pay homage to Set (the wicked one). A king Khyan, whose headless statue was found at Bubastis, seems to have spread his authority widely, and been either known or recognised as far as Bagdad, and also at Cnossus in Crete, where his name occurs on the 1 of a jar. The scarabs of the H. have been found chiefly at Tell-el-Yehudiyeh. Their rule in Egypt may have lasted 500 years, or, as other authorities say, 100 years. Correct dates are still impossible to obtain. See R. M. Engberg,

*The Hyksos Reconsidered* (Or. Inst. Univ. Chicago Studies 18), Chicago, 1939.

**Hylas**, in Gk. mythology, a youth who was a favourite of Alkaios (Hercules), and who was abducted by the Naiads, who fell in love with him while he was drawing water from a fountain in Mysia.

**Hylobates**, name of a genus of mammals, belonging to the Primates, family Anthropomorphidae or Simiidae, and commonly known as the gibbons. *H. syndactylus*, the siamang, is the best-known species.

**Hylomorphism**, see under STOICISM.

**Hylton**, or **Hilton**, vil. in the co. of Durham, Eng. It stands on the R. Wear, about 3 m. W. of Sunderland, and the people are engaged in shipbuilding and the manuf. of iron goods. Pop. 3000.

**Hymans**, Paul (1865-1911), Belgian Liberal statesman and diplomat, b. at Ixelles. Called to the Bar, 1885. Prof. of comparative parl. hist. in Brussels Univ., 1898-1914. Elected to legislative chamber for Brussels, 1900. In 1914, after Ger. invasion of Belgium he went to America on a mission to President Wilson. Belgian minister in London, 1915-17. Minister of economic affairs, 1917. Minister of foreign affairs: 1918-20, 1921-25, 1927-34, and 1934-35. Attended Council at Versailles, 1918. Represented Belgium at Peace Conference, 1919. Presided, 1920, at the first Assembly of the League of Nations. Belgian delegate to Disarmament Conference, 1932. Member of the Council of ministers, 1935-36.

**Hymen**, in Gk. mythology, the god of marriage, though originally the marriage song. He is generally supposed to be the son of Apollo and one of the Muses, and is represented as a beautiful youth carrying a bridal torch.

**Hymenaea**, genus of leguminous plants found in tropical America. There are eight species in all, the commonest being *H. courbaril*, the locust or gum-animo tree. The wood is very heavy and takes a fine polish; the resin known as gum-animo exudes from the stem; the seeds are enveloped in a sweet mealy substance eaten by the Indians.

**Hymenoptera**, name given to a large order of Insecta which includes the bees, ants, wasps, etc.; its members are characterised by four membranous wings with few veins, well-developed mandibles, movable abdomen, bearing in the case of the female an ovipositor which may or may not be retractile; certain families are furnished with a sting, and others with sawing or boring appendages; in the honey-bees, the subordinate mouthparts are produced into a long, tongue-like proboscis, with which the insect extracts honey from flowers. The head is globular in shape, and mobile, with compound eyes and six ocelli on the crown. The larvae are cruciform and have a distinct head. There are over 30,000 species of H., which are grouped into two sub-orders, the *Membrivores* and the *Petiolata*. To the first belong *Tenthredinidae*, the saw-flies; *Siricidae*, the wood-borers, etc. The *Petiolata* comprise the series *Parasitica*, with *Cynipidae*, the gall-wasps;

*Ichneumonidae*, the larva-wasps, etc.; the series *Tubulifera*, consisting of *Chrysididae*, the burnished wasps, and the series *Aculeata*, containing *Apidae*, the bees, *Formicidae*, the ants, and many other important families.

**Hymettus**, auct. mt. range of Attica, Greece, over 3000 ft. high, about 5 m. from Athens, now called Trelo Vuno (Vouni). It has always been famous for its honey. The anets, quarried a much-prized bluish-grey marble.

THE REMAINS OF THE PNYX OR PEOPLE'S ASSEMBLY IN ATHENS, WITH THE ACHOPOLIS ON THE LEFT, AND HYMETTUS RANGE IN THE DISTANCE

**Hymns** (Gk. *hymnoi*). The word was employed among the Gks. to denote songs or poems in honour of gods or of heroes, or composed for some special occasion, and in Greece the number of H. was legion. Hesiod, Homer, Pindar, Euripides, all make use of the term and testify to the frequency with which the compositions are used. Oldest among these are the Homeric H., a series of brief addresses to the gods. Among the latest pagan Gk. productions are the Orphic H., which deal with the rites of initiation into the Hellenic mysteries. In considering the question of hymnology from a Christian point of view, however, the early Heb. poetry is especially valuable. It shows, indeed, the greatest heights to which religious poetry had risen before the beginning of the Christian era. The unique position which the Davidic psalter has ever held in the worship of Christendom shows the recognition of this fact by all nations. The last great burst of Heb. hymnody is closely connected with the Incarnation, and as such has always held a high place in the services of the church. For centuries the song of Zacharias (Luke i. 68-79), 'Blessed be the Lord God of Israel,' and the song of the Blessed Virgin Mary

(Luke i. 46-55), 'My soul doth magnify the Lord,' have been used daily in the choir offices.

As we consider the question of Christian hymnody, it will be well to begin with a definition, that of St. Augustine of Hippo: A H. 'is singing with the praise of God. If you praise God and do not sing you utter no hymn. If you sing and praise not God you utter no hymn. If you praise anything which belongs not to the praise of God, though in singing you praise, you utter no hymn.' This definition gives the distinction characteristic to the H. which belong to the four centuries preceding it.

*Eastern Hymnody.* The preface to the hymnary of the Mozarabic Breviary tells us that as Christianity itself came from the E., so also did the custom of hymn-singing. The words of Pliny, in the famous letter to Trajan (c. A.D. 110), carry us further than this by showing at how early a date the custom was estab. in Bithynia. Early Gk. H. must be divided into two classes, the first consisting of those written in the rapidly dying classical metres, the second, and more important, of H. written in a more Oriental and often Hebraic type. To the first class belongs the oldest of all Christian H., the *Στοιμαὶ παλαιοὶ ἀδωναι*, ascribed to Clement of Alexandria. This H. is simple and child-like, containing nothing but what could be found in the pages of Scripture. A higher mystical level is shown in the H. of St. Gregory of Nazianzus (also classical in form) in the fourth century, dealing chiefly with the doctrines of the sacramental symbol and the contemplation of the Most Holy Trinity. Trans. of all may be found in A. W. Chatfield's *Songs and Hymns of the Earliest Greek Christian Poets* (1876). To the same school belong Synesius (375-430), Sophronius, and St. John of Damascus. Of all their works only three canons by St. John of Damascus have received a place in the Gk. service-books. The later Gk. H. are to be found chiefly in the various church service books, viz. the twelve vols. of the *Menaia*, giving the Prayer of Saints; the *Greater Octoechus* or *Paracleticus*, containing the Ferial office; the *Lesser Octoechus*, containing the ordinary Sunday services; the *Triodion* (Lenten season); the *Pentecostarion* (*Charnosynon* (Easter and Pentecost); the *Euchologion*, containing the occasional offices; and the *Horologion* or *Hours of Prayer*. These books contain a vast number of H. of which the best selection is to be found in Christ and Parankas's *Anthologia Græca*, etc. They are best known in England by the trans. of J. M. Neale, of which mention may be made of 'Christian, dost thou see them?' (St. Andrew of Crete, 680 c. 732), 'Tis the day of Resurrection' (St. John Damascene), 'Jesus, Lord of life eternal' (Joseph the Hymnographer), 'Jesus, Name all names above' (Theoclitus of the Studium). But numbers may be found in any modern hymnal.

*Syriac.* From the second century until almost the close of the Middle Ages, the churches of Syria, Mesopotamia, and W. Persia produced many excellent H.,

which are, unfortunately, almost unknown in the W. The names of Harsaenus (Bar-Halsan, b. 154), and Ephraem Syrus (d. 378) must be mentioned. The H. of this writer still hold an important position in the service books of the Syriac churches.

*Latin Hymnology* cannot be traced further back than the beginning of the fourth century, the earliest name with which any H. can be connected being that of Hilary of Poitiers, of whom Isidore of Seville says that 'he was the first who flourished in composing hymns in verse.' Sev. H. in the Mozarabic Breviary are ascribed to him. Contemporary with Hilary was Pope Damasus, to whom two extant H. are ascribed, but the real founder of Lat. hymnody comes somewhat later. This title is unanimously given to St. Ambrose (d. 397), to whom a large number of extant H. is attributed. The twelve which the Benedictine editors give as genuine include some of the best known office H. Among them are *Æterna Christi munera* (The eternal gifts of Christ the King), for apostles and evangelists; *O Lux beata Trinitas* (O Trinity of blessed light), Saturdays in Trinity tide; and *Splendor Paternæ gloriæ* (O splendour of God's glory bright), Mondays from Epiphany to Lent. From the fourth to the eleventh century we have a regular stream of religious poets and hymn-writers, mostly of considerable merit. At the end of the fourth century comes Aurelius Clemens Prudentius, a Spaniard, from whose poems many of the Ferial H. (e.g. 'Lux ecce surgit aurea') were taken. But his best-known H. is that for the Nativity, 'Corde natu ex parentis' (Of the Father's love begotten). In the fifth century we have the layman Sedulius, the author of the well-known Christmas H., found in almost all the breviaries. 'A solis ortus cardine' (From east to west, from shore to shore). The latter part of this, 'Hosti- Herodes imple' (Why, iniquitous Herod, should'st thou fear?), forms the office H. for the Epiphany. Venantius Fortunatus, bishop of Poitiers (d. c. 609), is far better known. To him belongs the glorious *Pascentide* H., 'Vexilla Regis prodeunt' (The Royal banners forward go), and 'Pange lingua gloriosi' (Sing, my tongue, the glorious battle), both of which occur in the Rom. Breviary, but in a mutilated form. St. Gregory the Great, from whom the Gregorian melody takes its name, wrote much, but is less known. Some twelve H. are attributed to the one Eng. Father, the Venerable Bede (673-735). In the next century Fulbert of Chartres wrote the triumphal Easter H., 'Chorus novæ Hierusalem' (Ye choirs of New Jerusalem). From the eighth century dates also the 'Urbs beata Hierusalem,' which became the H. throughout Europe for the dedication of a church. This period closes with the mention of St. Bernard of Clairvaux, the representative of the later mystic school, whose 'Jesu dulcis memoria' (Jesus, the very thought of Thee) is known to all. By the end of the eleventh century the liturgical use of H. was well estab. throughout W. Christendom, and

such H. found a place in all service books. The next few centuries are important for the spread of the Sequence, a H. sung before the Gospel at Mass, which was developed from the *Allicula* by Notker of St. Gall (d. 912). The greatest of the medieval sequences, however, is the 'Dies ira, dies illa' (Day of wrath, O day of mourning), the authorship of which is ascribed to Thomas of Celano, the friend of St. Francis of Assisi.

**English Hymnody.**—It would be possible to trace the beginnings of Eng. hymnody to the time of Caedmon (seventh century), but this would lead us by too long a path. It will be well to take the hist. up at the Reformation. When the trans. and adaptations of the old service books were made for the new Book of Common Prayer, it was Cranmer's intention that the old H. should be trans. likewise. But he had not himself the poetic ability for this task, and the work remained undone until the nineteenth century, when sev. trans. of the whole body of the anc. Sarum H. were made. During the two centuries that followed the beginnings of the Reformation there was no book of H. for use in the Eng. Church. In the Prayer Book itself there was but one trans., that of the 'Veni, Creator' in the Ordinal. Their place was taken, however, to some extent by the metrical paraphrases of the Psalms. 'Til almost the end of the seventeenth century the most popular was the version by Sternhold and Hopkins, commonly known as the 'Old Version.' This later gave way to the 'New Version' of Tate and Brady. Sev. from this latter work still find their place in hymnals, such as, for example, the H. 'As pants the hart for cooling streams.' In 1623 appeared George Withers's *Hymns and Songs of the Church*, the first attempt at a comprehensive hymn-book, but it never secured any measure of success. Many excellent H. were written also by Bishops Taylor and Ken. But the first hymn-book definitely designed for use with the service of the Church of England appeared in 1737, with the title *Collection of Psalms and Hymns*. It was compiled by John Wesley, chiefly from the writings of Isaac Watts, and pub. at Charleston in Georgia. Two years later came the official foundation of Methodism, and all later eds. of the book must be classed as Methodist. The next step was taken by M. Madan, who in 1769 pub. *A Collection of Psalms and Hymns extracted from various Authors*, etc., containing 170 H. It is noteworthy that during the rest of the century all the church hymn-books that appeared were built on the foundation of the various Nonconformist collections, and that no great hymn writer arose within the church until the production of the *Olney Hymns* by Newton and Cowper. At the beginning of the nineteenth century there was a great outburst of hymn-writing and collecting, which had seen considerable advance even during the first twenty years. The productions of this period are characterised by a striving for uniformity and harmony with the Book of

Common Prayer, and by a desire to secure official recognition which presages the later general return to the old Gk. and Lat. H. and their trans. Meanwhile, the thirty years which bring us to the middle of the century saw an even greater increase in the number of hymn-books produced. Seventy-four of these are quoted in Julian's *Dictionary*, and these are but a selection of the most important. Bishop Heber's *Hymns* (1827), containing the hymns of H. H. Milman, was an extremely influential collection, and E. Bickersteth's *Christian Psalmody* (1833) was also important. This last was supplanted by the *Hymnal Companion* by the Rev. E. H. Bickersteth, son of the above-named. The influx of these H., more definite in doctrine and more robust in style, led to a gradual exclusion of the Nonconformist and Calvinistic element which had hitherto bulked so large. Moreover, the standard of religious poetry had been raised considerably by the influence of Keble's *Christian Year*. The *Hymnal* *Noted* of 1852 and 1854 confined itself entirely to Lat. hymns, their excellence being enhanced by the beauty of Neale's trans. But the hundreds of hymnals which had now issued from the press had left Eng. hymnody in great confusion, and this resulted in the pub. of *Hymns* (later *Hymns Ancient and Modern*), 1861, a collection which at first contained only 130 H., but which rapidly increased in size and in popularity until it almost entirely supplanted all other collections. At the beginning of the twentieth century sev. new hymn-books, all aiming at a higher level of scholarship, were produced. The most important of these are the *English Hymnal* (1906) and the *Oxford Hymnal* (1908).

**Nonconformist Hymnody.**—The Baptists long resisted the practice of singing H. Their first hymn-writer was B. Kirch, about 1673. The names of J. Stennett (1663-1713), S. Stennett, grandson of the former (1728-95), and W. Noel (1799-1873) are also worthy of mention. Both the Particular Baptists and the General Baptists now have official hymn-books. The Congregationalists have produced many hymn-writers of great merit, (greatest of these is Isaac Watts (1674-1748). The names of Philip Doddridge and Josiah Conder are also well known. In 1859 was pub. officially the *New Congregational Hymn Book*. Since that date, however, sev. other Congregational hymnals have been issued. The greatest hymn-writer of Methodism is Charles Wesley, to whom sev. thousand H. of varying merit are ascribed. Many of them are among the most popular of H., both in the Church of England and among the various Methodist bodies.

Mention may now be made of the H. known as carols. The word was originally applied not to a song, but to a dance. The song was later added, and the name included both. Finally the dance was dropped, and the song retained the name. Carols, secular and religious, both in the vernacular, were very popular during the Middle Ages, being sung at festivals both

in and out of church. Their hist. is especially connected with the miracle and mystery plays. Odd scraps of Lat. which seemed to link these popular songs to the liturgical service of the church are frequently found in them. From the Reformation to the nineteenth century we have almost an entire blank in the hist. of the carol. Then collections of modernised versions of the old carols were made and new ones were written. To this period belongs *Good King Wenceslas*, by J. M. Neale. The most popular collections are those by Choape and Woodward. See J. Julian, *Dictionary of Hymnology*, 1892 (last ed., 1907), to which this article is much indebted; J. M. Neale *Hymns of the Eastern Church*, 1863; J. Pauly, *Hymni Breviarii Romani*, 1868-70; C. A. G. Chevallier, *Poésie liturgique du moyen-âge*, 1893; Norman, *Hymnarium Salutarissime*, 1851, and H. A. Daniel, *Theatrum Hymnologium*, 1853, with J. M. Neale's dissertation: Hastings, *Encyclopædia of Religion and Ethics* (1911), vol. 7; F. J. Gillman, *The Story of Our Hymns*, 1921; W. Procter, *The Story of Sacred Song*, 1925; N. Mable, *Popular Hymns and their Writers*, 1918.

Hyndman, Henry "Ayers" (1842-1921), Eng. socialist leader; b. in London; eldest son of John Beckles H., barrister. Educated privately, and graduated at Trinity College, Cambridge. He travelled widely and occupied himself with journalistic work. In 1881 he founded the Social Democratic Federation. He was always an active agitator for social remedies, and in 1887 was tried with John Burns and others at the Old Bailey in connection with W. End riots, but acquitted. In 1911 the Social Democratic Federation was merged in the Brit. Socialist Party, with H. as chairman. This new party split into fragments during the First World War—most members joining the Communists; and in 1920, under H.'s auspices, the S.D.F. was revived. Amongst his numerous publs. are: *Indian Policy and English Justice* (1874), *England for All* (1881), *Historical Basis of Socialism in England* (1883), *Socialism and Slavery* (a reply to Herbert Spencer, 1888), *The Economics of Socialism* (1896). See R. T. Hyndman, *The Last Years of Henry Mayers Hyndman*, 1923.

Hyne, Charles John Cutcliffe Wright (1866-1941), Eng. novelist and traveller, b. at Billbury, Gloucestershire, son of Rev. Charles Wright Noble H. Educated at Bradford Grammar School and Cambridge. Travelled widely in search of literary material. His most popular story is *Adventures of Captain Kettle* (1898), which appeared in the *Illustrated Magazine*. Other stories include *The Lost Continent* (1900), *Mr. Horrocks, Purser* (1902), *Thompson's Progress* (1902), *Red Herrings* (1918), *People and Places* (1930), *My Joyful Life* (1935), *Steamboatmen* (1942) and various sequels to the *Adventures of Captain Kettle* which continued until 1938.

Hyoid Bone, U-shaped bone lying immediately above the thyroid cartilage of the larynx, and near the root of the

tongue, to the muscles of which it gives attachment. It consists of a more or less rectangular body (*basihyal*), and two pairs of unequal *cornua* or horns; the greater curve upwards and backwards; the smaller, about  $\frac{1}{2}$  in. in length, are attached to the basihyal near its junctions with the great *cornua*.

Hyosine, or Scopolamine, important alkaloid of the formula  $C_{17}H_{21}O_3N$ . It is used in medicine, in combination with morphine (*q.v.*), to produce narcosis and 'twilight sleep.' Hyosine was discovered by Schmidt in 1888; it is alternatively known as scopolamine, and occurs in the plants *Hyoscyamus niger*, *Datura stramonium* and *Scopolia carniolica*, etc.

Hyoscyamine, poisonous crystalline alkaloid, obtained from henbane (*q.v.*). When moist, it has a stupefying odour; it is used as a sedative and as a mydriatic. It is found occurring with hyosine, is an alkaloid  $C_{17}H_{21}O_3N$ . It is an optically active form of atropine, and has a mydriatic action on the pupil of the eye.

Hypatia (c. 370-415), female philosopher and mathematician, daughter of Theon, b. in Alexandria. She lectured for a time in her native city, and then became the head of the Neoplatonic school there. Her deep erudition, sound judgment, and fine elocution gained for her the admiration of all her hearers, and her house became the resort of men of learning and distinction in Alexandria—amongst others, Orestes, the prefect of the city, with whom she was accused of being too intimate, and was barbarously put to death by a mob of savage Nitrian monks. For the little authentic knowledge about H., see *Socrates, Hist. ecclesiastica*, vii. 15. See also G. Kingsley, *Hypatia* (novel), 1853; R. Assmus, *Hypatia in Tradition and Dichtung*, 1907.

Hyperæsthesia, excessive sensibility of the nervous system, due to diseased conditions; it is particularly characteristic of hysteria. The sensory nerves are extremely sensitive to the slightest impressions, and may react without the presence of any external stimulus at all. It is sometimes induced by rheumatism, scintia, or any acute nervous complaint. The treatment involves removal of the cause; local applications of heat, cold, or electricity often afford temporary relief.

Hyperbola, plane figure obtained by cutting a right circular cone by a plane inclined to the horizon at an angle greater than that of a generating line (see *GEOMETRY*). Hence it is known as a conic section. It is a symmetrical figure of two branches, each extending to infinity. Any point on a H. is such that its distance from a fixed point, known as the *focus*, always bears a constant ratio to its distance from a fixed straight line called the *directrix*; and this ratio, which is greater than unity, is called the *eccentricity* of the H. A second focus and directrix also exist, for which the same property is true. In the figure S, S' are the foci, KX and K'X' the directrices. SS' is the transverse axis, and CB the conjugate axis. C, the middle point of

$SS'$ , is the centre, and  $A, A'$  are the vertices. The straight lines  $CY, CY'$  through the centre, known as *asymptotes*, gradually approach the curve, but actually only meet it at points infinitely distant. If the tangent at any point  $P$

HYPERBOLA

on the curve cut the asymptotes in  $Q$  and  $R$ , the area of the triangle  $CQR$  is the same for all positions of  $P$ . An  $H$  is thus sometimes defined as the envelope of the line which forms with two given straight lines a triangle of constant area. In analytical conics the equation of an  $H$  referred to its axes is  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ , and

referred to its asymptotes is  $xy = c^2$ . When the asymptotes are at right angles to one another, the  $H$  is called *rectangular*.

**Hyperbole** (*hyperbole* over-shooting, excess) figure of rhetoric which lies without deceiving. It consists of exaggerated and extravagant statements used through excitement or to express strong feeling and arrest the attention and not intended to be taken literally. Formal compliments are often  $H$ s. They form the basis of many metaphors and occur frequently in high-flown or poetic language. The exact opposite is *litotes*, or *Meiosis*.

**Hyperbolic Function**: name given to a set of six functions which are closely connected with the six trigonometrical ratios. The hyperbolic sine is written  $\sinh$ , and may be defined by  $\sinh \theta = \frac{e^\theta - e^{-\theta}}{2}$ .

Similarly the hyperbolic cosine is given by  $\cosh \theta = \frac{e^\theta + e^{-\theta}}{2}$ . The remaining four are obtained from the equations  $\tanh \theta = \frac{\sinh \theta}{\cosh \theta}$ ,  $\coth \theta = \frac{\cosh \theta}{\sinh \theta}$ ,  $\operatorname{sech} \theta = \frac{1}{\cosh \theta}$ , and  $\operatorname{cosech} \theta = \frac{1}{\sinh \theta}$ . Since  $\sin \theta = \frac{e^{i\theta} - e^{-i\theta}}{2i}$  and  $\cos \theta = \frac{e^{i\theta} + e^{-i\theta}}{2}$ , where

$i = \sqrt{-1}$ ,  $\sin i\theta = \frac{e^{-\theta} - e^\theta}{2} = -\sinh \theta$ ,  $\cos i\theta = \frac{e^{-\theta} + e^\theta}{2} = \cosh \theta$ , and  $\operatorname{adv} \cosh \theta = \frac{e^\theta + e^{-\theta}}{2} = \cosh \theta$ , and are the connection with the trigonometrical ratios may be established. A series of

formulae parallel with the ordinary trigonometrical formulae can be deduced, e.g. —

$$\begin{aligned} \cosh^2 \theta - \sinh^2 \theta &= 1 \\ \sinh(\theta \pm \phi) &= \sinh \theta \cosh \phi \pm \cosh \theta \sinh \phi \\ \sinh 2\theta &= 2 \sinh \theta \cosh \theta, \cosh 2\theta = \cosh^2 \theta + \sinh^2 \theta, \text{ etc.} \end{aligned}$$

**Hyperboloid**, name given in solid geometry to two surfaces belonging to the general class of conoids which in three-dimensional analytical geometry are represented by equations of the second degree in  $x, y$  and  $z$ . The two forms of  $H$ s are known as the  $H$  of one sheet (shown in the figure) and the  $H$  of two sheets. The simplest forms of their

$$\begin{aligned} \text{equations are respectively } \frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} \\ = 1 \text{ and } \frac{x^2}{a^2} - \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1. \text{ Both may be} \end{aligned}$$

generated by a variable ellipse moving parallel to itself, and both are intersected by three mutually perpendicular planes in two hyperbolas and one ellipse. The  $H$  of two sheets is formed by two distinct surfaces extending to infinity, and each is touched at infinity by an asymptotic cone, in the same way as the hyperbola has two branches and a pair of

asymptotes. The  $H$  of one sheet is a ruled surface, and is such that through every point of it two straight lines, called generators, may be drawn so as to lie wholly on the surface. It may also be defined as the locus of the intersection of corresponding planes of two homographic pencils of planes.

**Hyperborean Mountains**, see URAL MOUNTAINS.

**Hyperborei** (Gk *ὑπερβόρειοι*, Hyperboreans, 'beyond the North wind'), a mythical race supposed by the Greeks to dwell in the far N. They enjoyed perpetual youth and lived in constant sunshine and unclouded happiness. The Rhiparian Mts separated them from the rest of the world. The name was transferred to any people who lived far N. See Pindar, *Pylæ* x 502, Herod. iv, O. Crusius, 'Hyperboreer' in W Roscher's *Lexikon*, 1884-97.

**Hyperchlorhydria**, see DYSPEPSIA.

**Hyperides**, or **Hypereides** (c. 395-322 B.C.), Athenian orator, one of the ten of the Alexandrian canon, ranking next to Demosthenes. After studying under Plato and Isocrates, he became an advocate at Athens. He warmly supported the Athenian opposition to Macedon headed by Demosthenes and Lycurgus, and was a staunch friend of the former until they fell out over the case of Alexander's absconding treasurer, Halpalus. In the Lamian War that followed, he shared in the defeat at Crannon (322), and was captured and killed by Antipater at Aegina. His writings are witty, graceful, and ironical, the best known being the funeral oration over the dead in the Lamian War. See eds. of speeches and fragments by C. Babington, 1813, and F. Blass, 1894; Sir F. Kenyon (ed.) *Against Athenogenes*, and *Against Philipides*, 1893 and Oxford Text, 1907; also Sir R. Jebb, *Athenian Orators*, II, 1850.

**Hyperion**, in Greek mythology, a Titan son of Uranus and Gaea (Heaven and Earth), father of Helios (Sun) and Eos (Dawn), and patronymic for the sun god himself, and hence the attribute of beauty is connected with the name. See the novel by Holderlin, 1797-99 and the epic by Keats.

**Hyperite**, name which has been given at various times to different rocks allied to diabase and diorite and containing plagioclase, iron ore, biotite, hypersthene, etc. It is especially abundant in the Rocky Mts. the Andes, Japan, Java, and the Philippines, and may be observed in the volcanoes of Hungary and the old volcanic systems of the Lake District, N. Wales, the Oghills, etc. whilst it issues from the more or less active volcanoes of La Soufrière of St. Vincent, Krakatoa, and Pele in Martinique.

**Hypermetropia**, condition of long sight caused when the cornea is too flattened or the eyeball too short, as a result rays of light, instead of converging to a focus on the retina, are brought to a focus behind the membrane. It is corrected by the use of spectacles with convex lenses.

**Hypermetra**, in Greek mythology, one of the daughters of Danus and wife of Lynceus, alone of the daughters of Danus who spared her husband.

**Hypersthene** rock forming mineral consisting of silicates of iron and magnesium, formula  $(Fe, Mg)_2Si_2O_6$ . It belongs to the pyroxene group of metasilicates, and differs from the other members of the orthorhombic series of pyroxenes in possessing more iron.

**Hyperpyrexia**, see under FEVER.

**Hyperstheneite**, rock whose chief constituent is hypersthene (*q.v.*). It is a member of the pyroxene group and different species are named according to the other minerals present. It is of igneous origin and occurs in great abundance in the N. of Scotland, New Zealand, Saxony, E. America, and elsewhere.

**Hyperthyroidism**, a condition of the body caused by excessive activity of the thyroid gland. In certain districts, such as the Alpine regions of France, an en-

largement of the gland is liable to occur, progressing to the formation of a large tumour or goitre, which may hang down as far as the breast but the secretion, thyroxin, of the gland is deficient, owing to a shortage of iodine (an essential constituent of thyroxin) in drinking water. A variety known as exophthalmic goitre, from a protrusion of the eyeballs which is characteristic of the disease, appears to be associated with increased activity of the thyroid gland. The symptoms, which include palpitation of the heart, raised basal metabolic rate, and excessive nervous irritability, are similar to those produced by an overdose of thyroid extract, and the treatment of the disease includes partial removal of the thyroid gland (thyroidectomy) by surgical means, or the use of antithyroid drugs such as thiouracil. The opposite condition, hypothyroidism or underactivity of the thyroid, causes cretinism in infants and myxoedema in adults. See further under GOITRE.

**Hypertrophy**, abnormal growth of an organ or tissue, generally due to increased nutrition, e.g. well developed muscle. Protective hypertrophy occurs in the formation of a callus or hard covering, or in the case of local super-development of tissue in the neighbourhood of an embedded bullet or tumour. *H.* of the heart (*q.v.*) occurs as the result of the heart's effort to increase its efficiency which has been otherwise impaired, frequently a diseased condition of one organ causes *H.* in another, as in the case of disease of one kidney. The condition may be either congenital or acquired, and may be accompanied by an increase in the number of constituents of any particular tissue (hyperplasia), and it may occur without any increase in bulk of the complete organ. Other examples of *H.* are obesity, goitre (see HYPERTHYROIDISM), elephantiasis. See also ATROPHY.

**Hypnerotomachia**, fantastic work probably written by Francesco Colonna (c. 1441-1527) under the pseudonym 'Poliphilus' (Venice, 1499) in 'Italo-Carome' but produced later by the Aldine Press. It contains fables, architectural and historical antiquities and touches that all human passions are our dreams. See ed. 1545 Eng. trans. 1912, A. Lang, ed. (reproduction in the unit) 1901.

**Hypnone**, hypnotic or soporific drug known in chemistry as acetophenone. Its formula is  $CH_3COCH_3$ . It is a colourless crystalline solid m.p. 20° C. It is made by the action of acetyl chloride upon benzene in the presence of anhydrous aluminium chloride.

**Hypnoanalysis**, see HYPNOTISM, Uses.

**Hypnos**, see SLEEP.

**Hypnotics** are used to induce sleep by lowering the excitability of the nervous system, or by producing temporary anaemia of the brain, the latter being induced in natural sleep. Thus warmth applied to the feet, a warm bath, a full meal, or various drugs, by diverting the blood from the brain, act as *H.* Drugs which dull the brain cells are known as narcotics (*q.v.*), and neither *H.* nor narcotic drugs should be used except on medical advice.

**Hypnotism**, condition of artificially induced sleep, or trance resembling sleep, in which a patient is rendered more susceptible to suggestion. It includes the series of phenomena which from time to time have been termed animal magnetism, mesmerism, induced somnambulism, *odyllo force*, etc.

**History.** From time immemorial forms of H. appear to have been known, e.g. certain states of ecstasy which are more or less self-induced in types of fanatics are related to H., and while affected, the individuals appear capable of resisting what would be pain and fatigue under normal circumstances. Definite investigations of the state have been made since the sixteenth century: Paracelsus at the end of that century estab. to his own satisfaction the existence of a sympathetic system between the human and the stars and other objects. Gassner, a Rom. Catholic priest of Swabia, in the middle of the eighteenth century stated that disease was due to demoniacal possession, and that a supernatural power with which he claimed to be invested, could be used to expel all forms of disease. In 1774 Mesmer, a Viennese physician, gained a large measure of success in the treatment of certain disorders. He proceeded to Paris in 1778, and by continued successes he gained a large following, and his suggestion of the actual transference of a 'magnetic fluid' continued in vogue until within quite recent times. His treatment necessitated much apparatus, magnets, connecting wires, etc., with usually a central tub of water or other liquid round which the patients were seated. A pupil, Marquis de Puységur, in 1780, proved that the accessory magnets, etc., were unnecessary, and the claims of 'mesmerism' became so insistent that a Fr. commission was appointed in 1785 to investigate the matter fully. Their report was unfavourable, and this, coupled with its later association with the notorious Cagliostro, brought it into disrepute. In 1831 Bertrand estab. the affinity of magnetic sleep to somnambulism, and suggested its use as a therapeutic agency, and a second Fr. commission of that year reported rather more favourably. In 1841 Dr. Braid, a Manchester physician, discovered that a subject could be entranced by gazing at a bright object, and he suggested the name 'hypnotism,' from (Gk. *hypnos*, sleep). On the Continent schools of H. were estab. under the direction of the distinguished physiologist, Richet of France, and such physicians as Charcot (Salpêtrière), Liebhaut, Bernheim, Preyer and Heldenbain. In Britain Dr. Elliotson (editor of *Zoist*) supported H., and his advocacy resulted in his being driven out of the profession. But the discovery of chloroform in 1845 meant the possession of an anaesthetic of wider application and more certain results, and, in consequence, H. tended to become neglected. In 1882 Mr. Gurney carried out investigations in the subject, and the Brit. Medical Association, after a long period of doubt and vacillation, reported favourably on its use in 1892. The

names of Drs. Bramwell and Tuckey are associated with valuable work, and in 1907 the Medical Society for the Study of Suggestive Therapeutics was founded.

**Methods.** The usual methods employed to bring about the hypnotic condition are either (a) peripheral, as in the gazing at a bright object so placed as to cause some slight muscular eye strain, flashing of mirrors, slow, monotonous 'mesmeric' passes, and even the flicking of a watch in very sensitive persons; (b) central stimulations as by verbal suggestions. Frequently there is a combination of these methods (Braid and Bernheim) as when the operator places a bright object slightly above the level of the subject's eye, and suggests to him the idea of sleep, at the same time making hand passes before the face. It is found in practice that about 90 per cent of persons are susceptible to H., and the proportion always appears to be higher in individuals trained to obey, e.g. soldiers, sailors, school children, etc., than in others, though it bears little relation to age, sex, or intelligence. Liebhaut had some 1700 successes in 1756 persons treated. Bramwell had but two failures in his first 500 subjects, and no less than 210 became somnambules. The persons who give exhibitions of H. on the stage are in reality not specially gifted. It is quite possible for a psychiatrist to induce equally profound hypnosis, but lighter stages are more suitable for purposes of healing. Many animals, e.g. cats, dogs, lizards, crocodiles, etc. can be hypnotised.

**Symptoms.** There are three well marked stages of hypnosis: (1), slight, in which the voluntary muscles are affected, without loss of consciousness in the patient and without amnesia on returning to the normal condition; (2), deep, in which the symptoms vary greatly: the sensory system is affected, there may be tonic contractions of the muscles (induced catalepsy of Heldenbain), or marked flexibility; there is frequently an increase of muscular strength, or a maintenance of an awkward attitude without muscular fatigue; there may be paralysis of one side, or one organ, by open or overt suggestion, or suggestion may be used to cause alterations of sensation. Visible symptoms include: change in pulse beat and in rate of respiration, dilated pupils, drooped eyelids, protruding eyeballs, and frequently flushed face and highly increased perspiration. This stage is usually marked by amnesia on waking, though a second hypnotic state will generally contain memories of the first. No satisfactory explanation has been given of post-hypnotic suggestion by which the subject can be made to carry out some action (not foreign to his nature) after the lapse of a given interval, as for example, the hypnotised person may be told to, write his name, note the time, purchase some article, etc., after the expiration of, say, 5000 mins., and although on waking he may have no cognition of the command, yet punctually to time he will endeavour to carry out the suggestion, usually doing

so with some more or less plausible explanation. The third stage is somnambulism, in which the subject rarely makes any response to suggestions. This condition can seldom be reached during the first experiments with a new subject.

*Uses*—Although H is extensively used, yet the treatment does not fulfil all the claims of its early exponents. There is no doubt that it can be made to yield sleep without the use of drugs, which of itself is a valuable property, and during this sleep the subject is peculiarly open to suggestion so that definite advantage follows its use in cases of blindness, loss of speech, hysterical paralysis, etc. Pain can be relieved, *e.g.* during childbirth or surgical operations (*see above*). Its use

hysteria, (4) due to the establishment of a special rapport between hypnotist and subject, and (5) due to the establishment of conditioned reflexes. *See* A. Forel, *Hypnotismus*, 1906; E. L. Ash, *ABC of Medical Hypnosis*, 1931; Brannan and Gill, *Hypnotherapy*, 1914; A. Salter, *What is Hypnosis?* 1914; L. J. Karnosh and E. M. Zucker, *Handbook of Psychiatry*, 1945; Doctor Mesmer, *Mesmerism*, 1918.

*Hypo*, popular name for the chemical substance used in developing photographic negatives, commonly known as hyposulphite of soda, the correct name is thio-sulphate of soda.

*Hypocaust*, arrangement used by the Romans for heating their baths and villas

*Journal of Hellenic Studies*

#### A HYPOCAUST

has been treated as an educational agent even in the Continent for the reformation of criminals as it has been claimed that considerable improvements have followed its application in dipsomania, morphinomania, etc. It is sometimes possible by H to produce alterations in unconscious attitudes underlying psychological symptoms (with disappearance of the symptoms) and mental analysis may often be expedited by the use of H (Hypnolysis). Exaggerated statements have been circulated as to the extent of control consequent on H and experiments show that it is extremely difficult in many cases impossible to induce an individual to carry out actions which are normally abhorrent to his character, i.e. H cannot make a normal individual carry out a criminal campaign, though an unbalanced or perverted mind may be rendered criminal.

*Theories*—Numerous theories have been advanced but the nature of the H state is still uncertain. It has been considered (amongst other theories) to be (1) an abnormal state of the brain, (2) due to a temporary abolition of some cortical functions, (3) a psychomotoric, allied to

The furnace (hypocaust) was placed below the room to be heated and the H was a low space under the 'caldarium,' where the hot air was accumulated and thence distributed round the walls and to other rooms by means of pipes and passages (see above).

*Hypochlorous Acid* ( $\text{HClO}$ ) is only known in aqueous solution and may be obtained by distilling bleaching powder with dilute nitric acid or by dissolving chlorine monoxide in water. The solution obtained has a peculiar 'chlorous' smell, and strong bleaching properties, the acid being readily resolved into hydrochloric acid and oxygen. Its salts, the chlorites, are almost unknown in the free state, and are obtained, together with the chlorides, when chlorine is passed into a cold solution of the hydroxide of an alkali or alkaline earth. Bleaching powder ( $\text{CaO} \cdot \text{Cl}_2$ ) or 'chloride of lime,' is prepared by passing chlorine over slaked lime, and consists of a mixture of calcium hypochlorite,  $\text{Ca}(\text{OCl})_2 \cdot 4\text{H}_2\text{O}$  with basic calcium chloride,  $\text{CaCl}_2 \cdot \text{Ca}(\text{OH})_2 \cdot \text{H}_2\text{O}$ —roughly equivalent to  $\text{Ca}(\text{OCl})_2$ . It is used in large quantities for bleaching in the textile trade. With small quantities of acid,

H. A. is set free from hypo-chlorites, and with larger quantities chlorine is evolved. *Eau de Javelle*, formerly much used for bleaching, consists of a solution of potassium chloride, KCL, and potassium hypochlorite, KClO.

**Hypochondriasis**, name obtained by its supposed connection with the hypochondriac regions of the abdomen (*q.v.*), a mental illness causing disorder of digestive and biliary, and often other, functions. It is characterised by palpitations, extreme sensibility, morbid feelings that simulate disease, and great uneasiness about the health. In extreme cases it develops into melancholia. It is more frequently met with amongst the rich than the poor, and the best cure consists in physical and mental exercise, and interests outside oneself, or psychiatric treatment in severe cases.

**Hypodermic Injection** (*ὕποδερμα*, under, *δέρμα*, skin), introduction of a drug beneath the skin. It is effected by means of a hypodermic syringe, which is armed with a sharp hollow needle, so that the tissues underlying the skin can be reached without much inconvenience to the patient. The advantages of H. I. are that a drug can be introduced more directly to the tissues than by way of the stomach, the quantity required is therefore less, the treatment can be made local if required, and the operations of a possibly deranged stomach are not further interfered with. The method is used chiefly in connection with the group of drugs known as alkaloids, notably morphine and cocaine.

**Hypogeum**, underground chamber anciently used as a burial place, storage room, or dwelling place. In archaeology the term is restricted to the first of these. Various types are found: dug from the earth; cut from rock, as were the Roman catacombs; or constructed of masonry, as at Mycenae.

**Hyponitrous Acid** ( $H_2N_2O_2$ ), colourless, crystalline substance, soluble in water, readily decomposing (often explosively) into nitrous oxide and water. Its salts, the hyponitrites, are formed by reduction of the nitrites by means of sodium amalgam. The silver salt is a yellow insoluble substance.

**Hypophosphorous Acid** ( $H_3PO_2$ ), colourless crystalline compound, melting point  $27^\circ C.$ , formed by the action of sulphuric acid on the barium salt, which is obtained by boiling phosphorous with a solution of baryta. On heating strongly, H. A. is decomposed into orthophosphoric acid and gaseous phosphoretted hydrogen. It is a powerful reducing agent, precipitating gold, silver, and mercury in the metallic state, and copper in the form of its hydride, from solutions of their salts. The hypophosphites are largely used in medicine as tonics.

**Hypophyll**, see **HRACT**.

**Hypostasis** (*ὑποστάσις*, subsistence), Gk. term meaning substantial existence, much used in the Trinitarian controversies of the fourth and fifth centuries. At first used as equivalent to *ὁusia* (divine essence), its meaning in theology has

changed considerably. It was regarded as synonymous with *ὑπόστασις* or *persona* (person) at the council of Alexandria, A.D. 362, and is used to denote the distinct personal existence of each Person in the Trinity. See G. P. Fisher, *History of Christian Doctrine*, 1896; C. G. Harnack, *The History of Dogma* (iv.), 1898.

**Hyposulphite of soda**, see **HYPO**.

**Hyposulphuric Acid**, obtained by dissolving zinc in a solution of acid sodium sulphite. It is a strong bleaching agent.

**Hypothec**, in Scots law, a security over any part of a debtor's property, the property being allowed to remain in the possession of the debtor; hence distinct from both a mortgage and a pledge. The idea is borrowed directly from civil law (*q.v.*), but in practice Scots law allows of few Hs. Hs. are either implied (legal Hs.) or based upon express contract (conventional Hs.). The latter class is restricted to bottomry (*q.v.*), and respondentia (*q.v.*) bonds. The former includes the Hs. of (a) a landlord over movables (*inrecla et illata*) brought on to the leased premises, for rent current and due (but not for arrears); over produce and perhaps machinery and implements; for royalties payable under a lease of minerals; and over crops for current ten duties due in respect of agric. land; (b) a law agent over his client's writs and title deeds, for his expenses (properly a lien), and (c) of seamen, who have a tacit H. over the ship, and the freight due to the shipowner, for their wages; of a shipowner over the cargo for freight due, and of cargo-owners over the ship for loss by improper stowage. Generally speaking, the creditor enforces his security by getting the subject of the H. assigned to him. See Abbot, *Shipping* (14th ed.); Gloag and Irvine, *Rights in Security*.

**Hypothesis** (*ὑπόθεσις*, foundation), in general, a supposition, proposition, or principle assumed as true for the purpose of argument, in order to draw conclusions or inferences for proof of some point in question, or to account for some occurrence. In science a conjecture or tentative theory adopted provisionally as a guide in investigating phenomena. If this conjecture is found after careful tests and examination entirely satisfactory in explaining the phenomena in accordance with known facts and principles, it is accepted as a scientific theory. See E. Naville, *La logique de l'hypothèse*, 1880; Logic text-books by W. Jevons, B. Bosanquet, H. W. Joseph, W. Jevons, *Principles of Science*, 1874; H. Poincaré, *La Science et l'hypothèse*, 1902 (trans. 1905).

**Hypsilanti**, see **YPSILANTI**.
